Owing to the gaseous substances contained in coal, and given off not only on exposure to heat, but also to a certain extent by pressure, many kinds of coal cannot safely be left during the process of extraction, without some defence from the open lights required by the miner in the mechanical operations of removing the coal from its bed, and conveying it to the pit bottom. An explosive gaseous compound is readily produced by the admixture of the gases given off by the coal, with common air, made to circulate through the workings, and, if neglected, this compound accumulates and travels on till it meets with flame, and then explodes, causing frightful destruction not only to the property of the mine-owner, but also to the life of the miner. Many contrivances have been suggested from time to time; on the one hand, to improve the ventilation of the mines, and on the other, providing means of illumination which would render accidents from explosion less probable, by removing the immediate cause. Examples of both will be found amongst the models and instruments exhibited in this class, and to these the reader is referred. It is not likely that any contrivances can render absolutely safe an employment which of necessity involves so many and such serious risks as are connected with coal-mining; but much may, no doubt, be done to diminish the danger both from imperfect ventilation and open light.

In concluding this notice of mineral fuel, it may be worth while to draw attention to the vast and overwhelming importance of the subject, by a reference both to the absolute and relative value of the material, especially in the British Islands. It may be stated as probably within the true limit, if we take the annual produce of the British coal-mines at 35,000,000 tons, the value of which is not less than 18,000,000*l.* sterling, estimated at the place of consumption, and therefore including, to a certain amount of transport cost, necessary to render available, the raw material. At the pit mouth the value of the coal is probably about half this, or 9,000,000*l.* sterling, and the capital employed in the coal trade is estimated at 10,000,000*l.* The average annual value of all the gold and silver produced throughout the world has been estimated to have amounted, in 1847, to nearly thirteen millions and three quarters sterling. We have therefore the following summary, which will not be without interest:—

	£.
Value of the coal annually raised in Great Britain, estimated at the pit mouth	9,000,000
Mean annual value at the place of consumption	18,000,000
Capital engaged in the coal trade .	10,000,000
Mean annual value of the precious metals obtained from North and South America and Russia . .	5,000,000
Total value of precious metals raised throughout the world in 1847 .	13,710,000
Mean annual value at the furnace, of iron produced from British coal .	8,000,000

(See the adjoining map for the relative positions of the coal-fields of Europe, and of the United States, and British North America.)

Sect. I.

Class 2.

CHEMICAL AND PHARMACEUTICAL PRODUCTS.

INTRODUCTION.

The results of the science directly illustrated by this Class will probably be more generally appreciated than the means by which such results are attained. But these are not to be sought among the chemical and pharmaceutical products, any more than are the beautiful mechanisms of other Classes to be found in association with the raw mineral which supplied the material for their formation.

This Class is principally contained in the South Gallery, and is most conveniently reached by ascending the stair near the south entrance at the transept. The objects in the Class are immediately encountered on gaining the Gallery. The Class is divisible into the following heads :—A. Chemical substances used in manufacture. B. Rarer chemical substances for the scientific chemist; and C. Chemical substances used in medicine.

The objects in this Class do not admit of more than a general grouping, into the chemicals of the chemical factories, and the more delicate and refined compounds produced in the laboratory. The former of these, inclusive of large specimens of alum, protosulphate of iron (copperas), and soda are interesting as representing a department of British commerce which has grown into importance within a very recent period. The manufacture, especially of caustic and carbonate of soda on the great scale, has originated and developed itself in a degree almost unparalleled in the history of commerce within twenty or thirty years of the present time. The fires of the kelp burners on the shores of the islands of Scotland are scarcely now extinct, when vast factories, employing large numbers of individuals appear to produce in enormous quantities the same alkali, which was until recently scantily derived from the fused ashes of marine plants. The manufacture of this alkali, by an ingenious decomposition of common salt by the simple aid of sulphuric acid, chalk, sawdust, and coal, is now prosecuted to a vast extent for the supply of the industrial arts generally, the quantity used in medicine and pharmacy being comparatively insignificant. At some alkali works fifty and sixty tons and upwards of common salt are decomposed every week, and converted into caustic or carbonate of soda. The alum factories are not less extensive. At those establishments crystallizations on a scale emulating those of nature are constantly in progress. Some very large specimens of these crystals, and of those of other chemical compounds are placed in the Central Avenue, some of the masses being 8 feet in height. The manufacture of sulphuric acid, and of the compounds used by the dyer and calico-printer, also occupies a prominent feature of commercial enterprise. The prussiates of potash forming large masses of yellow and red crystals, and the green, but perishable crystals of copperas, are illustrations of substances largely used in the arts, and the colours and dyes produced by their assistance, present themselves in every direction, when the classes relating to textile printed fabrics are examined.

The chemical works of this country are principally situated at Liverpool, at Newcastle-upon-Tyne, and at Glasgow. The area of ground occupied by some of them equals that covered by the Exhibition Building, and in the various departments as many as five or six steam-engines are employed. The chimneys of these works are in one or two instances 500 feet in height, and the workmen employed form a little population resident in the immediate vicinity of the works.

The application of scientific chemistry to the purposes of medicine is scarcely less recent than the commercial development of chemical manufacture. Medicinal substances appeared for a period to have been overlooked by the chemist, and little attention was given to their preparation. This cannot now be said. The specimens of vegeto-alkaloids, the minerals used in pharmacy and of their compounds—of beautiful crystalline forms, indicate the progress made in the application of philosophic chemistry to the production of pharmaceutical preparations. A variety of compounds obtained by delicate chemical reactions, and from substances requiring great carefulness in manipulation, are also included in this Class.

The whole Class, though not an extensive one, represents the growing attention of men of eminence to chemistry as a manufacture; and of men of science to the application of chemical philosophy to the processes carried on on the smaller scale in the laboratory. The same facilities which exist in this country for the prosecution of other departments of commercial and industrial enterprise have carried chemical manufactures to their present important and commanding position. The direct dependence of many of the arts upon the existence of and the accuracy of production in these chemical works cannot now be questioned.—R. E.

1 **PONTIFEX & WOOD**, *Shoe Lane, Fleet Street*—Manufacturers.

A series of chemical and metallurgic products, illustrating the different processes employed for the reduction of lead from its ores, and its subsequent conversion into white lead.

Specimens of various colours and pigments, employed by artists and paper-stainers; crystals of tartaric and citric acid, sulphate of copper, &c.

2 **MELINCRYTHAN CHEMICAL COMPANY**, *Neath, Wales*—Manufacturer.

Sugar of lead, or acetate of lead.

3 **BUTTON, CHARLES**, 146 *Holborn Bars*—Manufacturer.

Chemical products:—Acids—boracic, chromic, carbazotic, gallic, pyrogallic, metagallic, phosphoric and glacial anhydrous, and uric.

Alum—pure ammonia—chrome—potash—and soda alums.

Ammonia nitrate, benzoate, and oxalate; and binoxalate (impure), remarkable for the size of the crystals.

Arsenic iodide; barium chloride—oxide, and oxide hydrate; barytes nitrate; bismuth chromate and nitrate; cadmium chromate; calcium phosphuret; cerium oxide and oxalate; cobalt acetate, nitrate, phosphate, and chloride; copper protoxide and suboxide; glucina iron sulphuret; lead nitrate, pure; lead chromate, fused; manganese sulphate; mercury nitrate, bichromate, and bicyanide; nickel sulphate; phosphate of soda and ammonia; potash, pure; potash chromate, silicate, and binarseniate; potassium iodide, bromide, and fluoride; silver nitrate; soda, pure; soda, nitrate; strontia nitrate; tin bisulphuret; tungstic acid; tungstate of soda; bitungstate of ammonia; uranium nitrate and oxide; zinc chloride and sulphate, pure; phosphorus; iodine, pure; and bromine, pure.

3A **READE, Rev. J. B., F.R.S.**, *Stone Vicarage, Aylesbury*—Inventor and Patentee.

Cyaniodide of iron, or soluble Prussian blue, and iodide of potassium free from alkaline reaction.

These products, the first of them being a new compound, are obtained by adding iodide of iron, with iodine in excess, to yellow prussiate of potash, the quantities being in proportion to the equivalents of the final products. Prussian blue remains on the filter, and is perfectly soluble when washed and dried; and pure iodide of potassium, as a residuary product, is obtained by evaporating the colourless filtered liquor, fusing and crystallizing.

Equivalent of Cyaniodide of Iron.

Iron	7 . .	196 . .	30·8
Cyanogen	9 . .	234 . .	36·8
Potassium	2 . .	80 . .	12·6
Iodine	1 . .	126 . .	19·8
Cyaniodide of iron .	1 . .	636 . .	100·0

Hence, if we take prussiate of potash . .
Iodine 126 } to form iodide of iron . .
Iron . . 28 }
Iodine in excess to be dissolved in iron.

336·2

We have, on the whole, the following elements and final products:—

Elements.		Products, viz., Prussian Blue, from	Iodide of Potassium from
Iron . . .	50	50	..
Cyanogen .	61	61	..
Potassium .	62	20·4	41·6
Iodine . . .	163·2	32·2	131·0
	336·2	163·6	172·6

Thus the iron and cyanogen, with a portion of the potassium and iodine, form Prussian blue of an intense colour, and perfectly soluble; and the remainder of the potassium and iodine form iodide of potassium, which, unlike the purest that can be purchased, has no alkaline reaction, when dissolved, on turmeric paper.

The properties of this new Prussian blue make it valuable as a writing fluid and a dye; and the pure iodide of potassium, produced by this new process, is found to possess advantages in the preparation of calotype paper.

In the preceding experiment water is not decomposed, and there is no formation of hydriodic acid; but iodine appears to play the part of oxygen, and imparts to the Prussian blue the same rich tone that is obtained from a per-salt of iron. Without excess of iodine, the precipitate is nearly white, but rapidly absorbs oxygen from the atmosphere, and is soluble.

4 **BUCKLEY, J.**, the Trustees of the late, *Manchester*—Manufacturers.

Crystal of copperas, or sulphate of iron.

[This substance is in reality an impure sulphate of iron. The copperas of commerce is obtained by exposing heaps of bisulphuret of iron, or iron pyrites, to moisture and air for a considerable period. The elementary constituents of the iron pyrites, sulphur and iron, are oxidized, and a sulphate of the protoxide of iron is obtained, which is washed out and crystallized. It is largely used in the arts for dyeing, ink-making, and also in chemistry and medicine.—R. E.]

5 **EVANS, F. J.**—Manufacturer.

Naphthaline, from coal.

6 **WILSON, JOHN**, *Glasgow*—Manufacturer.

Alum slate, raw, in the condition of bisulphuret of iron and alumina; found resting on the top of the coal in the mines. Three other specimens of the same slate, showing the progressive stages of decomposition.

Sample of the same slate calcined.

Tub of alum in the last stage of manufacture.

Crystals of alum. Large specimen of the same.

Bisulphuret of iron (iron pyrites).

Iron pyrites decomposed.

Sulphate of iron (copperas) obtained from the same ore.

Sulphate of ammonia obtained from ammoniacal water, one of the products of the distillation of coal.

Naphthaline, obtained from naphtha; rare, in consequence of its size and purity.

A group of the crystals of sulphate of iron is exhibited in the engraving, page 186.

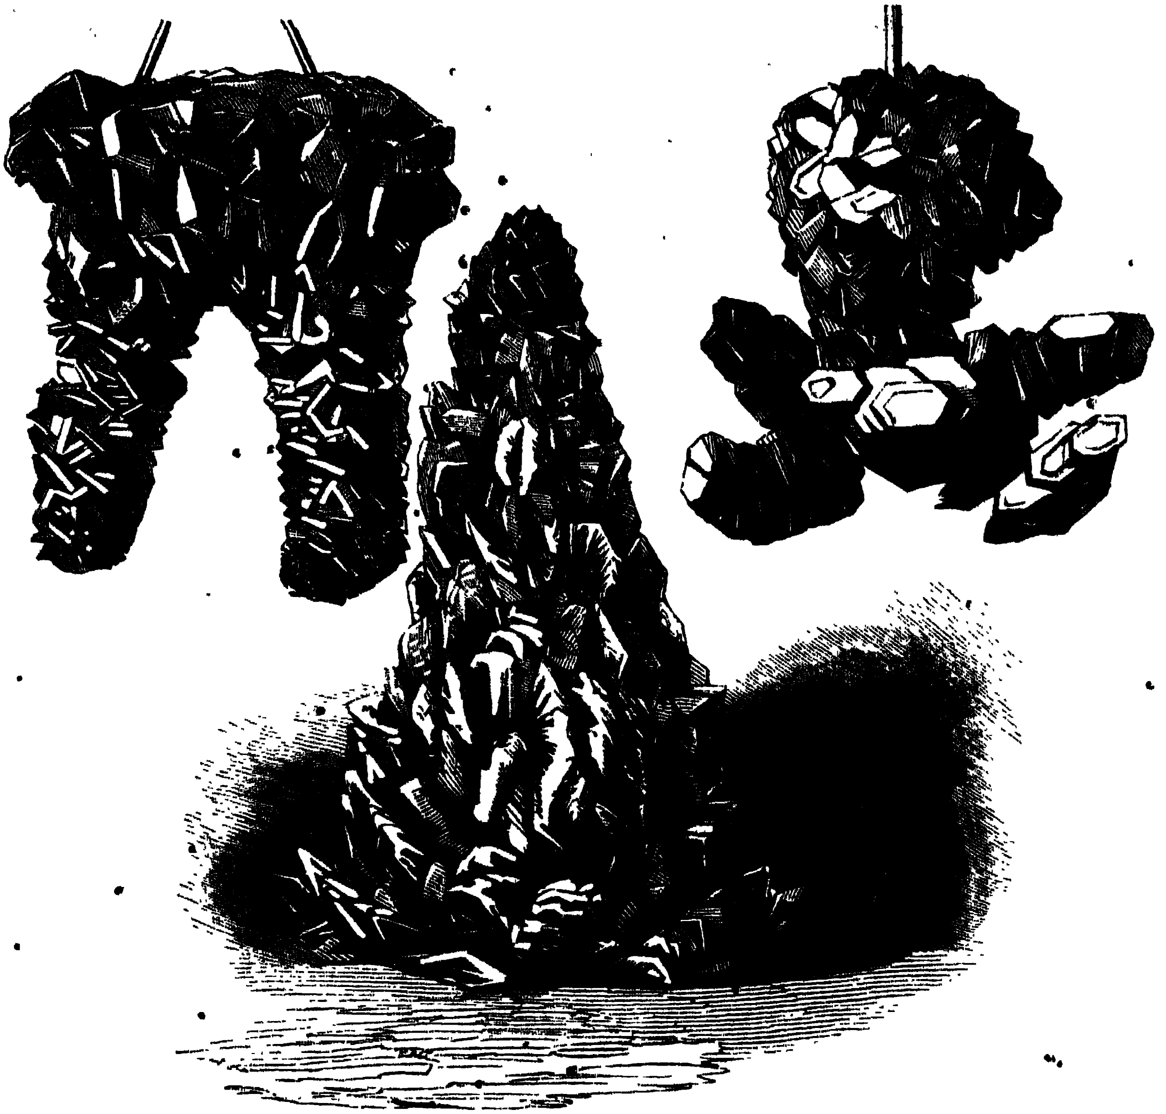
7 **SPENCE, PETER**, *Pendleton Alum Works, Manchester*—Inventor and Manufacturer.

Iron pyrites.—Bisulphuret of iron, obtained in nodules interspersed in coal; its most general use is to furnish copperas or sulphate of iron by spontaneous decomposition, when spread on the ground, on what are technically called copperas beds.

Refuse pyrites, after being burned for the manufacture of sulphuric acid; used for the patent manufacture of copperas, by digesting it with sulphuric acid diluted.

Copperas crystals.

Sulphate of protoxide of iron, manufactured by patent process.



Crystals of Sulphate of Iron.

The forms of the crystals of sulphate of iron are represented in the above cuts.

Schale, or schist, found overlying and underlying all the coal veins, and brought up in immense quantities in nearly all the coal workings, and also in the ironstone mining, the nodules of ironstone being imbedded in the shale. By a patent process, its own weight of alum can be produced, by acting on it with sulphuric acid, &c., one ton of shale, of average quality, yielding one ton of alum.

Shale, calcined for the manufacture of alum.

Shale in the process or manufacture of alum.

Alum of the first and second crystallization.

Alum finished for the market.

Patent zinc cement, or hydraulic mortar.

Specimens of the waste materials from which the cement is manufactured.

Bust composed of the cement.

The cement laid on to wall. Manufactured entirely from refuse matters.

The refuse shale, after the patent alum process, affords the silica and alumina; the refuse lime, after purifying gas for illumination, affords the calcareous ingredient; and the metallic constituent, zinc, is obtained as sulphate of zinc from the refuse of Wicklow pyrites, after its use in the manufacture of sulphuric acid. The cement is hydraulic; the affinity of oxide of zinc for oxygen prevents the oxidization of any iron, and its deleterious effect on vegetation prevents the growth of moss on it surface.

[Iron pyrites may be made to yield at least two valuable chemical products, sulphur, and sulphate of iron, or copperas. The first is obtained by heat, sulphate of iron by simply exposing the iron pyrites, which is a bisulphuret of iron, to the weather. The mass absorbs oxygen from the air, a sulphate of iron is formed, and is washed out and crystallized. The shale or schist employed in the alum manufacture is a slaty clay found both overlying and underlying coal strata, and containing much pyrites.—R. E.]

7A **TENNANTS, CLOW, & CO.**, *Manchester*—Manufacturers.

Sulphate of copper. Sulphate of zinc. Muriate of tin in crystals. Bichloride of tin. Nitrate of lead. Bichromate of potash. Prussiate of potash. Prussiate (red). Chlorate of potash. Garancine. Stannate of soda. Bisulphate of potash. Soda-ash. Sal-ammoniac; and pink salt.

[The compounds here exhibited furnish a remarkable illustration of the extensive applications of chemistry to modern arts and manufactures. The series exhibited contains many compounds unknown to commerce a few years ago. They are all employed in various processes of either dyeing or calico-printing.—R. E.]

7B **YOUNG, J.**, *Ardwick Bridge, Manchester*—Inventor.

Mineral oil. Paraffine. Stannates, with models of apparatus

[This mineral oil occurs as a natural spring in a coal-pit at Riddings, near Alfreton. It is used largely for machinery, the paraffine being very anti-frictional. Paraffine is one of the most remarkable of products, and has received its name from its not having chemical affinity for any substance whatever. It is a result of the distillation of tar-oils.—R. E.]

7C **BROWN & CO.**—Manufacturers.

Muriate of ammonia. Sulphate of ammonia.

7D **DICK, DAVID, & CO.**, *Burgh Chemical Works, Carlisle*—Manufacturers.

Copperas manufactured by Spence's patent process.

8 **DENTITH, W., & CO.**, *Manchester*—Manufacturers.

Ornaments of bichromate of potash, and of nitrate of lead.

Chromate of potash, prussiate of potash, and Whitby alum, used by calico-printers and dyers.

Green oxide of chromium, and oxide of zinc, used by china and earthenware manufacturers.

[By taking advantage of the elegant forms which various chemical substances assume on crystallizing, and inserting baskets of wire, or similar articles, into a crystallizable solution, the form of the article is preserved. but the character is altered by the development of exquisite crystals, which give the objects a peculiar and remarkable appearance.—R. E.]

9 **KURTZ & SCHMERSAHL**, *Cornbrook Works, Manchester*—Manufacturers.

New colouring matters, and preparations for printing and dyeing in cotton, linen, silk, and wool.

Specimens of printing and dyeing by means of the preparations.

Ultramarine, in different qualities.

[Lapis lazuli is usually found in granite and crystalline limestone. The finely-coloured varieties are employed for vases, in mosaics and furniture, and are much prized. The pigment ultramarine is prepared from the mineral, by slightly igniting it, shaking the mass in water, and after reducing it to fine powder, mixing it with a resinous paste. This paste is then kneaded in cold water, which washes out the ultramarine, the impurities being retained by the paste. From the costliness of ultramarine its use was formerly confined to the artist; since, however, the discovery by M. Grumet (guided by the analysis of the pigment by MM. Clement and Desormes) of a method of preparing it artificially, its price has become gradually so much reduced as to admit of its very general employment in the arts. For, although M. Grumet kept his process a secret, M. Gmelin and other chemists have published prescriptions for its production, and its manufacture has been of late years much extended, particularly in Germany, though only very recently introduced into England. Ultramarine is a very permanent colour under atmospheric influences, but is decolorized by the presence of acids with liberation of hydro-sulphuric acid; hence, in its employment, the presence of acids should be avoided. Artificial ultramarine may be prepared, according to C. Gmelin, by rapidly igniting a mixture of equal parts of silica, carbonate of soda, and sulphur, first adding a sufficient quantity of a solution of soda to dissolve the silica. The result is a bluish-green mass, which, by ignition in contact with air, becomes blue. Ultramarine consists essentially of silica, alumina, soda, and sulphur; a small quantity of iron appears to be beneficial, but an excess impairs the beauty of the colour.—W. D. L. R.]

10 **HATMEL & ELLIS**, 9 *Sugar Lane, Manchester*—Manufacturers.

Copper and its compounds—Copper ore from the Burra-Burra mine, Australia; sheet, oxide, and sulphate of copper.

Lead and its compounds—Lead ore; protoxide of lead; nitrate of lead.

Tin and its compounds—Tin ore from Cornwall; tin granulated; tin salts, or protochloride of tin; sulphate of soda, or salt cake.

Sulphur—Rough sulphur from Sicily; roll, flowers, crystallized, lac, and black sulphur.

Archill—Orchella weed from Angola; red archill; blue archill; cudbear.

Ammonia—Muriate and sulphate of ammonia.

[Copper, lead, and tin furnish highly important compounds for the use of the dyer and calico-printer. Sulphate of copper, or blue vitriol, nitrate and acetate of lead, and protochloride of tin are the compounds most largely in use for these purposes, and are consumed in quantities altogether enormous in the Lancashire print-works.—R. E.]

11 **HOWARDS & KENT**, *Stratford, Essex*—Manufacturers.

Barks yielding quinine and cinchonine, viz. 1, various descriptions of calisaya bark (*Cinchona calisaya*). 2, Carabaya bark (*Cinchona ovata*). 3, Cusco bark (*Cinchona pubescens*). 4, Carthagena bark (*Cinchona cordifolia*). 5—8, Specimens of red, crown, grey, and loxa barks. 9, Various descriptions of barks used for adulteration. 10, Cinchona Australis. 11, Cascarilla macrocarpa. 12, Cascarilla corua. 13, Cascarilla magnifolia. 14, Buena hexandra. 15, Exostema Peruviana or tacumez bark. 16, Laplacea quinoderma.

Salts of quinine and cinchonine:—Disulphate, sulphate, citrate, hydrochlorate, phosphate, and tartrate.

Nectandra Rodiæi, or green-heart bark, and its alkaloid bebeerine.

[The tree from which the green-heart bark is obtained belongs to the natural order *Lauraceæ*, a family of plants yielding many powerful and valued medicinal agents. *Nectandra Rodiæi* has been shown by Dr. Maclagan to contain an important alkaloid, called from the native name of the tree (*Bebeeru*) *Bebeerine*, or *Biberine*. Its effects are comparable to those of quinine. The tree flourishes in Demerara, and its wood is extremely hard.—R. E.]

Refined camphor, with different kinds of rough camphor, &c.:—1, Japan or Dutch camphor. 2, China or Formosa camphor. 3, Borneo or native camphor. 4, Refined camphor. 5, Camphor in the glass in which it was sublimed.

[The tree which yields camphor is *Laurus camphora*. Japan camphor is considered the best, and is imported in tubs into the United Kingdom, but not in large quantities. Crude camphor from China is principally obtained from the island of Formosa, whence its commercial designation. Crude camphor is obtained from the trees yielding it by chopping up the branches and boiling them in water, when the camphor is separated either by cooling or sublimation. It is refined in this country by being re-sublimed.—R. E.]

Refined borax, and articles from which it is made:—1, Commercial boracic acid. 2, Purified boracic acid. 3.

Tincal, or natural borax. 4, Artificial tincal. 5, East India refined borax. 6, English refined borax. 7, Modified crystals. 8, Octohedral borax.

[The origin of boracic acid is extremely interesting. Its principal sources are the celebrated lagoons of Tuscany, where it is obtained by a singularly simple and ingenious process. It rises with steam from the heated earth in a region where volcanic tumult is conspicuously manifest, and was formerly avoided by the superstitious peasantry in its vicinity. This steam is condensed by being passed into basins partly filled with water, the boracic acid is held in solution, purified, evaporated, and crystallized. From 10,000 to 12,000 lbs. of this acid are thus obtained every day. Boracic acid is chiefly employed as a source of borax.

Borax consists chemically, when pure, of a biborate of soda. It is, in its impure state, the tincal of commerce, and is obtained in large quantities from a lake in Thibet, on the edges of which it crystallizes, and is collected by the natives. It is also procured from lakes in China and Persia. The greater part of the borax of commerce is obtained from the saturation of boracic acid with soda. Borax is greatly used in the arts as a flux, and for glazing porcelain; also in medicine, and pyrotechny for making "green fire."—R. E.]

Tartaric acid, with specimens of the argols and tartars from which it is made:—1, Argols, various kinds. 2, Tartars, various kinds. 3, Crystallized tartaric acid. 4, The same, in the first stage of manufacture. 5, Powdered tartaric acid.

Citric acid and the articles from which it is made:—1, Concentrated lemon juice. 2, Citrate of lime. 3, Crystallized citric acid. 4, Citric acid, in the first stage of manufacture.

Antimony and preparations:—1, Antimony. 2, Black sulphuret of antimony. 3, Oxysulphuret of antimony. 4, Emetic tartar. 5, Antimonial powder. 6, Kermes mineral.

Silver and preparations:—1, Silver. 2, Lunar caustic. 3, Crystallized nitrate of silver.

[*Nitrate of silver,* commonly called *Lunar caustic,* is a preparation obtained by the solution of metallic silver in nitric acid. Chemical union takes place, and the solution being evaporated and crystallized, a solid nitrate is obtained. This is, for medical purposes, fused and run into moulds. This compound of silver, in a pure state, is of special value as a re-agent to the chemist; it is also extremely useful in the hands of the physician and surgeon. Very pure crystallized nitrate of silver is employed for the production of photographic pictures on paper, glass, and porcelain. When deposited on these surfaces, under peculiar circumstances, it is highly sensitive to the light.—R. E.]

Bismuth and preparations:—1, Bismuth. 2, Oxide of bismuth. 3, Pearl white.

Iron and preparations:—1, Iron. 2, Ammonio chloride of iron. 3, Tartrate of iron. 4, Oxide of iron. 5, Green vitriol. 6, Ammonio citrate of iron. 7, Ammonio tartrate of iron. 8, Citrate of iron and quinine.

Mercury and preparations:—1, Mercury. 2, Oxide of mercury. 3, Binoxide of mercury. 4, Red precipitate. 5, White precipitate. 6, Crude calomel. 7, Crystallized calomel. 8, Calomel. 9, Hydro-calomel, sublimed under water. 10, Corrosive sublimate. 11, Sub-sulphate of mercury.

Magnesia and preparations:—1, Magnesian shale. 2, Magnesian limestone. 3, Epsom salts. 4, Carbonate of magnesia. 5, Calcined magnesia.

[The well-known substance called Epsom Salts is an [illegible]t preparation of magnesia. It is, in some in[illegible] procured by an ingenious system of employing the residual hydrochloric acid of alkali works, which is made to act upon native magnesian limestone; the lime is dissolved out by the acid, and the residual matter, consisting chiefly of magnesia, is dissolved in sulphuric acid, purified and crystallized. In other cases it is largely obtained by simply acting upon magnesian limestone with diluted sulphuric acid; it is also obtained from the residual salts of sea-water, from which common salt has been separated.—R. E.]

Preparations of potassium:—1, Potashes. 2, Pearlashes. 3, Carbonate of potash. 4, Bicarbonate of potash. 5, Sulphate of potash. 6, Soluble tartar. 7, Commercial saltpetre. 8, Purified nitre.

[The difference in the chemical composition of the potashes and pearlashes of commerce, is, that the one is chiefly a caustic form of the alkali, and the other contains more of the carbonate. Both are alike derived from the combustion of wood. America is the chief source of this alkali at present. Her immense primeval forests, upon which the efforts of man make but little impression, present an inexhaustible source of this valuable alkali. The wood is piled up in a pyramidal heap, and the ashes are collected, partly purified, and fused. Pearlash is prepared from the "black salts," or impure caustic and carbonated alkali, by fusion in an open furnace. Potash is largely employed in medicine and the arts. About 100,000 cwt. are annually imported into Great Britain from America alone.—R. E.]

Preparations of sodium:—1. Soda ash. 2. Subcarbonate of soda. 3. Subcarbonate of soda, absolutely pure. 4. Sesquicarbonate of soda. 5. Bicarbonate of soda. 6. Rochelle salt in the first stage of manufacture. 7. Pure Rochelle salt. 8. Rochelle salt, powdered. 9. Phosphate of soda. 10. Cubic nitre. 11. Purified nitrate of soda. 12. Glauber salts. 13. Hyposulphate of soda.

[The last-named preparation of soda—hyposulphate of soda—is a substance of great importance and peculiar interest to the photographer. It is readily soluble in water, and the solution dissolves, with great facility, the compounds of silver. After a Daguerreotype picture has been taken and developed by mercurial vapour, the coating of iodide and bromide of silver formed on the surface of the plate is instantly dissolved by washing it with this solution. The picture is afterwards dried and gilded. In the Talbotype, hyposulphate of soda is employed to remove the sensitive coating of silver, and thus fix the impressions so as to render them insensible to the further influence of light.—R. E.]

Zinc and its preparations:—1, Zinc. 2, Oxide of zinc. 3, Acetate of zinc. 4, White vitriol.

Iodine and its preparations:—1, Seaweed, yielding iodine. 2, Kelp. 3, Commercial iodine. 4, Resublimed iodine. 5, Hydriodate of potash. 6, Biniodide of mercury.

Opium and its preparations:—1, Opium. 2, Morphia. 3, Acetate of morphia. 4, Muriate of morphia.

[Morphia is a powerful alkaloid, being the active principle of opium. The acetate and muriate are its most common preparations for pharmaceutical purposes.—R. E.]

---

12 BELL, ISAAC LOWTHIAN, *Washington Chemical Works, Newcastle-upon-Tyne*—Manufacturer.

Specimens of Pattinson's patent oxichloride of lead; also three landscape pictures, painted with colours prepared from the same.

---

13 KING, JOHN, *Glasgow*—Manufacturer. (Sole partner of the Hurlet and Campsie Alum Company.)

Alum, slate, or schist, from the mines of Campsie, Stirlingshire, in three different strata, overlying each other in the coal measures.

The same ores in process of decomposition, and in a state of complete decomposition. The insoluble portion of the decomposed ores mixed with alum schist in its natural state, after having been subjected to combustion. Muriate of potash, used in the alum manufacture. Manufactured alum, once, twice, and thrice crystallized; or finished alum. A miniature roaching tun, showing the mode in which the finished alum is crystallized. Iron pyrites. Specimens of prussiates of potash.

[At the foot of the Campsie hills there occur two or three beds of coal of the South Scotch coal-field, and some beds of alum slate, which decompose on exposure to the air. The beds have been much disturbed, and often exhibit intruded masses of trap.

In preparing the alum obtained in an impure state from the decomposition of the bituminous and pyritous schist, much careful management is necessary. The admixture of a certain quantity of muriate of potash in these processes, renders the whole rather a mineral manufacture than a simple preparation of raw material.—D. T. A.]

---

14 **May & Baker**, *Battersea, Surrey*—Manufacturers.

Specimens of nitric acid. Crystals of nitrate of silver. Trinitrate of bismuth. Rough camphor, as imported. Refined camphor in refining glass; camphor, prepared for sale. Precipitated chalk. White precipitate of mercury. Corrosive sublimate. Crude calomel. Prepared calomel. Red precipitate of mercury. Turpith mineral. Ponderous magnesia. Acetate of potash; acetate of zinc. Oxide of zinc. Sulphate of zinc, and chlorate of potash.

[*Nitric Acid.*—The aquafortis of commerce consists of impure nitric acid. It is obtained from the distillation of concentrated sulphuric acid mixed with nitrate of potash or soda. The commercial substance called Chilian, or Peruvian saltpetre, is nitrate of soda, and has largely been used lately in the preparation of this acid. This acid is of immense importance in the arts, chemistry, and medicine.—R. E.]

---

15 **Cook, Thomas Ainsley**, *Newcastle-upon-Tyne*—Manufacturer.

Crystallized carbonate of soda. Manufactured by the Walker Alkali Company.

---

16 **Lindsay, G.**, *Sunderland*—Manufacturer.

Green vitriol, or copperas of commerce, a proto-sulphate of iron, extensively used in dyeing silks, woollens, and cottons, making writing inks, Venetian red, &c. It is manufactured from iron pyrites, procured from the coal mines, exposed to air and moisture; the excess of acid being saturated by digesting the lixivium with iron plates and turnings.

[By heating proto-sulphate of iron to redness, it is decomposed, sulphurous and sulphuric acids being evolved, and sesqui-oxide of iron (Venetian red, colcothar, jeweller's rouge) remaining.—W. D. L. R.]

---

17 **Moberley, W.**, *Mulgrave Alum Works, Landsend, near Whitby*—Producer and Manufacturer.

Raw alum shale, as cut from the cliff, showing embedded nodules of cement stone; the same after calcination. Alum meal, or alum as first crystallized. Half a cask of finished alum.

Rough sulphate of magnesia, being the residuum obtained in the manufacture of alum, used for making refined Epsom salts. Refined sulphate of magnesia, or Epsom salts, purified by a new patent process.

Patent double salt of ammonia and magnesia, for a manure for top dressing.

Bones dissolved in sulphate of magnesia, for a manure.

[Alum is manufactured at Whitby, by the combustion of the schists of the upper lias, which contain a certain quantity of iron pyrites and bituminous, or carbonaceous matter. The temperature being properly regulated, and water occasionally supplied, a double decomposition takes place, producing sulphate of alumina and sulphate of iron, together with a portion of sulphate of magnesia, if any magnesia is present in the alum schist. A subsequent separation of the ingredients takes place. A certain quantity of the sulphate or muriate of potash is added, and the alum is crystallized. Alum is a triple salt consisting of a hydrated sulphate of alumina and potash, soda, or ammonia; but a portion of the alumina is occasionally replaced by iron.—D. T. A.]

---

18 **Pattinson, William Watson**, *Gateshead, Newcastle-upon-Tyne*—Manufacturer.

Large mass of crystallized alum, or sulphate of alumina and potash. Masses of pure sulphate of alumina, called in commerce concentrated alum. Specimen of bi-carbonate of soda.—Manufactured at the Felling Chemical works.

[The alum of English commerce is obtained in large quantities from manufactories at Whitby, in Yorkshire. A horizontal bed of fuel, composed of brushwood or of small coal, is first made, and upon it pieces of aluminous rock are piled. The fuel being kindled, the whole mass slowly ignites. More rock is piled upon it, until, in some instances, a vast heap of inflamed material, 100 feet high and 200 feet square, is raised, and continues to burn for months. The aluminous schist being thus disintegrated, and its chemical constitution changed, is lixiviated, the solution evaporated in large cisterns and purified, and sulphate of potash or ammonia is then added. The alum thus formed is dissolved, and crystallized by pouring the solution into casks made with moveable staves, called "rocheing casks." On removing the staves, an apparently solid barrel of alum is exposed. This is pierced with an instrument near the bottom, when the uncrystallized solution runs out. The mass, broken into lumps and dried, is the alum of commerce. The shipments of alum from Whitby in 1841 amounted to 3,237 tons. Alum is employed in medicine, in chemistry, and in the arts. Its most important use is as a mordant for dyers.—R. E.]

---

19 **Richardson Brothers & Co.**, 17 *St. Helen's Place*, and 11 *East Street, City Road*—Manufacturers.

Specimens of refined saltpetre or nitrate of potash, obtained chiefly from the East Indies, and shipped from Calcutta. This substance is used in the manufacture of gunpowder, oil of vitriol, aqua-fortis, and other chemical products, and also in curing provisions.

[Saltpetre is distinguished as the special natural product of the surface soil of warm countries. India, Egypt, Persia, Spain, and Italy, yield our chief supply. It is obtained from the soil, on the surface of which it makes its appearance like hoar, by lixiviation. The solution is then filtered, evaporated, and crystallized. It is principally imported into Great Britain from Calcutta and Madras. The amount imported from the East Indies and Ceylon in 1841, was 261,552 cwts. Its uses in chemistry, medicine, and the arts are familiar.—R. E.]

---

20 **Stevenson, William**, *Jarrow Chemical Works, South Shields*—Manufacturer.

Crystals of soda converted into bi-carbonate of soda by exposure to carbonic acid gas.

---

21 **Tulloch, A.**, *Waltham Abbey*—Producer.

Saltpetre, charcoal, and sulphur, used in the manufacture of gunpowder at the Royal Gunpowder Mills at Waltham Abbey.

22 **MASON, CHARLES, & SON**, 11 *Munster Street, Regent's Park*—Manufacturers.

The royal premier blacking, shown on new calf-skin, blocked on large model of a foot; polished 12th April last. The same on old calf leather; polished 29th Nov., 1850.

The French varnish, shown on ordinary calf leather.

The waterproof varnish, shown on cow-hide shooting boot and patent leather harness.

23 **HILLS, F. C.**, *Deptford*—Patentee and Manufacturer.

Nitrate of potash (saltpêtre), made by the decomposition of muriate of potash (chloride of potassium) by nitrate of soda, a patent process; the muriate of potash being obtained from sea-weed or kelp.

Dome of sal ammoniac, sublimed from rough muriate of ammonia, made from the ammoniacal liquid produced at gas works, by the addition of muriatic acid.

Cake of sesqui-carbonate of ammonia, or common smelling salts, sublimed from rough sesqui-carbonate of ammonia, made by the decomposition of sulphate of ammonia by carbonate of lime; the ammonia being produced at gas-works.

[Nitrate of soda has lately assumed high commercial importance from its value to the chemical manufacturer, and to the agriculturist as a manure for wheat. It is found in immense quantities in South Peru, being obtained by lixiviation of the saline deposit in the soil, and is then evaporated and crystallized, dried and packed in bags, and conveyed to the coast by mules. In 1841, the imports of this article from Iquique amounted to 173,884 quintals.

The term "kelp" is applied to the fused ashes of several species of sea-weeds. The plants are collected, dried, and burnt, and the ashes form a melted mass, consisting of sulphates, carbonates, and chlorides of potash and soda, together with carbonate and sulphate of lime, alumina, and silica.—R. E.]

24 **HEMINGWAY, A. W.**, *Portman Street*—Producer.

Double salts of iron.

25 **PONTING, THOMAS CADBY**, 32 *High Street, Bristol*—Inventor and Manufacturer.

Marking ink and illustrative specimen; for writing and drawing on linen, silk, and cotton, without preparation. Shaving cream. Medicinal vegetable fluid extracts, made with cold water.

26 **CLIFFORD, G.**, 5 *Inner Temple Lane*—Producer.

Specimens of deeds, writings, books, maps, engravings, &c., injured by fire, water, age, dirt, smoke, &c., in a restored and unrestored state.

The specimens exhibited show an indenture that was taken from the ruins of the great fire at Lincoln's Inn, January 14, 1849. The restored half, "without having been separated from the dirty half," cleansed, and flexibility imparted to it: having become hard, horny, and brittle, from the effects of the fire and water, any ordinary attempt to open it would have broken it. The writing on it has sustained no injury by the process. Two leaves of a book, two leaves of the "Jurist" newspaper, and portions of parchment taken from the same fire, which were injured by fire, water, &c., are exhibited, with the one-half of each cleansed; also the halves cleansed of a map and several engravings injured by age, smoke, mildew, water, and dirt, &c., the whole having been previously in the dirty state.

BRAMWELL, THOMAS, *Heworth Chemical Works, Newcastle-upon-Tyne*—Manufacturer.

ls of prussiate of potass of commerce.

yanide of potassium of chemists, used for dyeing place of indigo.

[*Ferrocyanide of potassium* is one of the most important chemical products to the dyer and calico-printer. It is obtained on the large scale by fusing animal matter with carbonate of potash and iron filings; cyanide, and subsequently ferrocyanide of potassium, are produced. Its compound, formed on the addition of a salt of iron to ferrocyanide of potassium, is of the most beautiful blue colour, and is called Prussian blue.—R. E.]

28 **WINSOR & NEWTON**, 38 *Rathbone Place*, and *North London Colour Works, Kentish Town*—Manufacturers.

Artists' pigments, in the raw and manufactured states, and in the various forms of preparation, for use in water-colour and oil painting, and in decorative art; including manufactures and preparations of the madder colours, cochineal, lapis lazuli, uranium, cadmium, chromium, and all the rarer kinds of chemical pigments.

Sable, badger, hog hair, and other brushes and pencils employed in drawing and painting.

Preparations of canvas, panels, millboard, apparatus, and boxes fitted for the use of artists. Palettes, and various other implements and materials employed in the fine and decorative arts.

Oxide of zinc.

[Several of the rarer metals yield oxides, which form brilliant pigments. Some of these are useful in enamel painting, in consequence of their not undergoing alteration by the heat employed in that art. Oxide of zinc has lately been much employed as a substitute for white lead.—R. E.]

29 **FAWCETT, BENJAMIN**, *late of* 73 *Snow Hill*, and 7 *Sumner Street, Southwark*—Producer.

Plain and ornamental specimens in graining or flatting, produced by a kind of paint free from noxious effluvia, and adapted for purposes to which white lead may be applied.

30 **CHESHIRE, JOHN, jun.**, *Northwich*—Manufacturer.

A pyramid of best table salt, with several other specimens of salt. The salt springs in Cheshire are the greatest in Europe, and their annual production is upwards of 800,000 tons of salt.

31 **SPENCER, JOHN ALEXANDER**, 9 *Westbourne Place, Hyde Park*—Manufacturer.

Case, containing chemical preparations:—Naphthaline (from coal-tar); sulphate of magnesia (Epsom salts); benzoic acid (prepared by sublimation); caffeine (prepared from coffee); hydriodate of quinine; samples of cod-liver oil, 1849-50.

32 **WATT, WILLIAM**, *Dunchattan Chemical Works, Glasgow*—Manufacturer.

1. Sea-weed, collected dry on the sea-shore; which is burned and converted into
2. Kelp; which, on lixiviation, is crystallized for
3. Sulphate of potash; and
4. Chloride of potassium; and
5. Carbonate of soda (crude).

The liquor is then decomposed by sulphuric acid, converting the iodides contained in the liquor into hydraiodic acid; which, on oxidation and sublimation,

6. Iodine, is separated from it.

33 **PICCIOTTO, MOSES HAIM**, 8 *Crosby Square*—Inventor and Manufacturer.

Specimens of decolorized and purified gum arabic, obtained by a patent chemical process. When dissolved, it forms a clear mucilage, and may be used for pharmaceutical purposes, for confectionery, for dressing silks, lace, tulle, printing, &c.

Sample of the original gum arabic from which the specimens were prepared.

Specimen of ultramarine blue, for the first time manufactured in London by Hochstaetter's process.

Pure crystallized mannite, prepared in Italy, and used for medicinal purposes.

[Mannite is obtained from manna, the concrete juice of a species of ash (*Ornus Europæa*), by dissolving in hot alcohol and crystallizing. It is a peculiar variety of sugar.—R. E.]

---

34 **BULLOCK, JOHN LLOYD**, 22 *Conduit Street*—Manufacturer.

A series of chemical products derived from substances used as food or medicine.

35 **NAYLOR, WILLIAM**, 56 *James Street, Oxford Street*—Manufacturer.

Decorative copal varnish, made from Sierra Leone gum copal. White hard varnish, made of picked gum sanderach; and mastic varnish, made of picked gum mastic.

Specimens of deal wood, stained to imitate different woods, without sizing; calculated to endure exposure, and admit of polish or varnish. The novelty claimed is the production of the stain without sizing.

36 **NISSEN & PARKER**, 43 *Mark Lane*—Inventors.

Specimens of tinted paper, chemically prepared in the pulp, for printing bank cheques upon. The chemical preparation renders any extraction of the writing by acids or alkalis immediately apparent.

37 **BULLOCK, EDWARD, & Co.**, *Galway, Ireland*—Producers.

Arran kelp, muriate, nitrate, chlorate, and sulphate of potash.

Sulphate of soda, pure sulphur, commercial iodine, pure sublimed iodine, iodide of potash, iodide of lead, biniodide of mercury.

Preparations from sea-weed.

38 **SPURGIN, T.**, *Saffron Walden*—Producer.

Root, stem, flower, and stigmata of saffron.

[This plant is said to have been brought to England in the reign of Edward III. It was first planted at Walden, in Essex, a town to which it afterwards gave its name as a prænomen.]

---

39 **HAWTHORNE, JAMES**, 77 *Charrington Street*—Inventor.

A new ink for staining oak and mahogany. Specimen of a common oak stave, cut in pieces, and stained various shades of colour. A stained mahogany frame.

40 **HALL, JOSIAH**, *Queenborough*—Producer.

Specimen of copperas, from the works at Queenborough, in the Isle of Sheppey, with specimens of pyrites and of copperas in a granulated form. It is used in dyeing and in the composition of colours, and, in its new and granulated form, may be used for purifying gas. The pyrites are found on the shore of the north-east side of the Isle of Sheppey; about eight tons are produced weekly. The granulated form is claimed as the peculiar merit of the specimen; it is effected by a refrigerator, and is used for dry mixing.

River copperas has hitherto been objected to as being crystallized in a soft and imperfect manner: the present specimen is freed from such defects by a strict attention to the copperas bed.

[Copperas is chemically an impure protosulphate of iron, and is obtained commercially by the decomposition of iron pyrites, or bi-sulphuret of iron, by atmospheric oxygen and water which is poured upon the beds. R. E.]

41 **HOPKIN & WILLIAMS**, 5 *New Cavendish Street*—Manufacturers.

Pure tannin.

Crystallized chromic acid.

Benzoate of ammonia.

Bin-iodide of mercury.

Pure aconitine, used in neuralgic affections.

Valerianate of zinc, iron, quinine, bismuth, and of iron and quinine.

Cardole, said to be a new and powerful vesicating agent.

Bromoform, per-bromide of formyle, a new anæsthetic agent said to be of greater power than chloroform.

Dutch liquid, chloride of olefiant gas, a new anæsthetic agent, said to be less irritating than chloroform.

Iodoform, periodide of formyle.

Pyrogallic acid, used in photography.

Cyanuret of potassium.

Citrate of iron and quinine.

Sulphate of iron and quinine, a new and powerful tonic.

Arseniate of soda, containing 15 atoms of water.

Kreatine, from the juice of the flesh.

Iodide of iron and quinine.

[Tannin (tannic acid) is obtained from nut-galls, and exists in the bark of all the oak tribe. It is the active agent of the barks used in the art of tanning, forming insoluble compounds with the components of the skins of animals (leather), which it preserves from putrefaction.

Chromic acid is a compound of the metal chromium and oxygen of a fine red colour: it parts readily with half its oxygen, and hence is a powerful oxidizing and bleaching agent. The salts of chromic acid are termed chromates, they are chiefly of a yellow colour; the chromates of baryta, strontia, and lead are beautiful yellow pigments much used in distemper and oil painting and printing.

Aconitine is a poisonous vegetable alkaloid, obtained from aconite (wolfstane, monkshood); it is used as a remedy in neuralgia.

Valerianic acid (valeric acid) is a volatile acid belonging to the same class as acetic acid: it is obtained by oxidizing hydrated oxide of amyle (oil of potato spirit), as acetic acid (vinegar) is obtained by oxidizing hydrated oxide of ethyle (alcohol). It exists ready formed in the aromatic root of the *Valeriana officinalis*, from which it is obtained by distillation with water. Valerianates (valerate) are compounds of valerianic acid with bases. Used as a nervous stimulant.

Formyle is a compound of carbon and hydrogen: it bears the same relation to wood spirit (hydrated oxide of methyle), as acetyle does to ordinary alcohol (hydrated oxide of ethyle): it is the radical of formic acid, as acetyle is of acetic acid. Its compounds with iodine and bromine are iodoform and bromoform.

Dutch liquid (oil of the Dutch chemists, olefiant gas) is the hydrochlorate of chloride of acetyle: it is obtained by mixing equal volumes of moist chlorine gas and olefiant gas.—W. D. L. R.]

[Pyrogallic acid is obtained by heating the dried extract of gallnuts, when it is collected by sublimation. In photography it is employed in extremely minute quantities. The pictures come out without requiring to be developed by a second wash. But the action of this agent is so energetic that it is extremely difficult to manage. A solution of the proto-nitrate of iron possesses similar properties for the use of the photographer. —R. E.]

---

42 **BOWER, J.**, *Hunslet, Leeds*—Manufacturer.

Carbonate of soda, containing 59 parts soda, and 41 carbonic acid, particularly adapted for scouring wool or woollens, as it removes grease without injuring the animal fibre.

43 JENKINS, WILLIAM HARRY, *Truro*—Inventor.

Arsenical powders—"Arsenical compound:", a general preventive of foulness, barnacles, &c., on ships' bottoms, buoys, &c., and of dry-rot in buildings.

---

44 FOX & BARRINGTON, 9 *Clarence Street, Manchester*—Manufacturers.

Common salt. Brimstone (sulphur). Salt cake (of soda). Barilla, or black ash (ball soda). Soda-ash (impure carbonate of soda). Bleaching-powder. Nitrate of lead. Chlorate of potash. Super-sulphate of soda. Tin crystals (chloride of tin). Blue or Roman vitriol (sulphate of copper). Nitrate of copper. Yellow prussiate (ferrocyanide of potassium). Red prussiate (ferricyanide of potassium). White, mottled, and yellow soda-soaps.

---

45 BARNES, JAMES BENJAMIN, 143 *New Bond Street*—Manufacturer.

Valerianic acid—produced from the hydrated oxide of amyle, or oil of corn spirit, by oxidation with chromic acid.

Valerianate of potassa and soda—employed in the formation of most of the following salts:—Valerianate of ammonia, baryta, strontia, lime, magnesia, alumina, oxide of chromium, protoxide of nickel and cobalt, and oxide of manganese.

Valerianate of oxide of iron, sesqui-oxide of iron, and oxide of zinc—employed in medicine as tonics and anti-spasmodics.

Valerianate of oxide of lead—oxide of silver—sub-oxide of mercury—oxide of mercury—ter-oxide of bismuth—oxide of copper—oxide of cadmium—ter-oxide of antimony—oxide of tin—morphia—quina—cinchonia—strychnia—and oxide of ethyle.

[This Valerianic acid and series of its salts, have been manufactured by the exhibitor, in the laboratory of Messrs. Savory & Moore, New Bond Street. Valerianic acid was discovered some years since, by Prince Lucien Buonaparte, and by him successfully introduced into medicine. It is of considerable interest to the chemist from the fact of its having been artificially prepared by M. Dumas, by acting upon amylic alcohol (oil of corn spirit) with caustic potash.

The valerianic acid is naturally contained in the volatile oil obtained by the distillation of the *valerian root*, in very small proportions. The same acid, however, may be produced artificially, by the indirect oxidation of the fusel-oil separated from crude spirits in the process of rectification, which is the cause of the whiskey flavor of grain spirit before rectification. The fusel-oil is heated with a large proportion of caustic potass, when hydrogen is disengaged and valerianate of potash remains. The acid is easily separated from the remaining valerianate of potash by distillation with sulphuric acid.

This offers a beautiful and striking example of the artificial formation of an acid naturally formed by the process of vegetation of the officinal valerian. It has the same composition and properties as the latter, and may therefore be advantageously substituted for it in all pharmaceutical preparations.

The valerianates comprised in the series exhibited, were prepared with the artificial acid and obtained by oxidising the amylic alcohol with chromic acid; it is a colourless oily fluid, having a peculiar and disagreeable odour, and possesses all the properties and qualities of that which is obtained from the root of valerian; it forms soluble salts with bases, which are distinguished by the disagreeable smell of the acid, and also by a sweetish taste. The first specimen in the series consists of the pure acid; then follow the salts, being twenty-three in number, namely,—those of potash, soda, ammonia, baryta, strontia, lime, magnesia, alumina, chromium, nickel, cobalt, manganese, sesqui-oxide of iron, zinc, silver, sub-oxide of mercury, bismuth, copper, cadmium, antimony, quinine, morphia, and the oxide of ethyle (valerianic ether). Of these the potash salt resembles phosphorus in appearance, is soft like it, and when cut has a waxy lustre, is deliquescent, and when struck with any hard body produces a peculiar metallic sound, somewhat like that occasioned when a ball of camphor is struck in a similar manner. The valerianate of soda is in masses made up of small crystals and is deliquescent. The valerianate of ammonia, also in crystals, and likewise deliquescent; of baryta, and of strontia also crystalline; of lime in crystalline scales; of alumina as a white powder; of chromium as a grey, of nickel as a green, and of cobalt as a beautiful peach-coloured powder; of manganese in fine rose-coloured scales; the persalt of iron, orange yellow, pulverulent, and soluble in alcohol; zinc as a granular crystalline powder; silver as a grey, mercury and bismuth white powders; copper blue and pulverulent; cadmium in white crystalline scales; antimony white and pulverulent; quinine, in no definitely formed crystals; morphia, in fine tufts of acicular crystals. The valerianic ether is a colourless fluid of a penetrating and disagreeable odour, its specific gravity is 0·894. Of the foregoing the valerianates of zinc, iron, and quinine have been the most extensively and the most advantageously used in medicine, and there exists no doubt but that those of potash, soda, ammonia, bismuth, oxide of ethyle, and other bases may be also very beneficially employed by the physician.]

---

46 PARROTT, W., 7 *Cleveland Street*—Producer.

Illustrations in oil and water colour, of an intense and semi-transparent brown colouring substance, derived from the smut of corn.

47 WOOD & BEDFORD, *Leeds*—Manufacturers.

Specimens of the varieties of lichen used in the manufacture of cudbear, orchil and litmus, including *Roccella fuciformis, Roccella tinctoria, Ramalina farinacea, Parmelia perlata, Parmelia tartarea, Umbilicaria pustulata*, and *Gyrophora murmia*.

Substances obtained from the preceding, by chemical analysis, including erythric, lecanoric, and roccellic acids, picro-erythrine, orcine, and ashes of Roccella fuciformis. Specimens of cudbear and orchil, and of their applications in dyeing and staining.

[Chemists have shown the presence of a variety of singular chemical principles in lichens used by the dyer. The colouring principles are *Orcine, Erythrine, Vulpuline, Strycknochromine, Lecanorine, Usnine*, &c. The colouring matter is used largely by the dyer, and by the chemist for the preparation of test-papers.—R. E.]

---

48 BLUNDELL, SPENCE, & CO., *Hull*, and 9 *Upper Thames Street*—Inventors and Manufacturers.

Brunswick or chrome greens, of various tints and shades, used in oil painting and paper-staining.

Greens.—For painters, paper-stainers, &c., having a base of copper, viz., emerald green, green verditer, mineral greens, &c., &c.

Blues.—Chinese, Prussian, refiners, verditers, ultramarine, &c.

Ochres.—Yellow, red, brown, &c.

Yellows.—Chromes, all shades, King's yellow, patent yellow, Dutch pink, &c., &c.

Reds.—Red chrome, mineral and vegetable reds.

Lakes.—Carmines. Lakes of all colours and shades.

Browns.—Vandyke brown, umbers, terra de Sienna, York brown, &c.

Blacks.—Vegetable, animal, and mineral.

Whites.—Oxide of zinc, Cremnitz white, flake white, enamel white, satin white, Paris white, barytes (sulphate and carbonate), &c.

Leads.—Red, orange, grey, black, white (carbonate). White lead (oxi-chloride); a new invention, patented by H. L. Pattinson, Esq., of Newcastle-upon-Tyne.

Paints ground in oil, of every colour and variety of shade. Zinc white paint.—Unaffected by sulphurous gases, employed for a delicate dead white oil paint. Also a specimen of new drying oil, which assists its drying without impairing the delicacy of colour. Permanent and Paris green paints. Brunswick green paints. Metallic red paint. Anti-corrosion, of all colours and shades. Stucco paint, an oil paint used with water; invented by the exhibitors. Patent dryer. Composition for ships' bottoms. Oils.—Linseed oil, raw, refined, and boiled. Rape oil.—Brown, refined for locomotive engines, and double refined for burning in lamps.

Varnishes for coachmakers.—Body, carriage, filling, black japan.

Varnishes for painters.—Oak, mahogany, black japan, furniture, japanners' gold size, quick-drying copal for furniture. Mastic or picture. White hard spirit. Paper varnish. Turpentine varnish.

Green varnish for Venetian blinds, &c.

Black varnish for ships and iron work.

French polish.

---

49 **Bankart, F.**, *Swansea*—Producer.

Crystals of sulphate of iron.

---

50 **Godson, Septimus H.**, *Tenbury, Worcestershire,* and *Rutland Gate, London*—Proprietor.

Samples of native mineral waters.

These mineral waters concentrated and tested, to show their mineral constituents.

A phial showing the bromine present in the waters, extracted by ether, and floating in it.

A phial with salts found in the Tenbury mineral water.

---

51 **Dinneford & Co.**, 172 *New Bond Street*—Inventors and Manufacturers.

Specimens of magnesian minerals, and chemicals.

Samples of Dinneford's pure fluid magnesia.

[The principal minerals, of which magnesia forms an important part, are the sulphate (Epsom salts), the carbonate (magnesite), the silicate (meerschaum, talc and serpentine), and the carbonate of lime and magnesia (dolomite). From any of these may be obtained the hydro-carbonate much used in pharmacy (*magnesia alba*), and also the earth *magnesia* (prot-oxide of magnesium); but they are chiefly manufactured either from the carbonate or sulphate.—D. T. A.]

---

52 **Schilling & Sutton**, *Brighton*—Manufacturers.

Samples of soda, Seltzer, and Fachingen water.

Effervescing lemonade.

52a **Struve & Co.**, *Royal German Spa, Brighton*—Manufacturers.

Artificial mineral waters, of similar composition to the springs at Spa, Pyrmont, Marienbad, Kissingen, Seltzer, Fachingen, Püllna, and Vichy. The factitious chalybeates are said to contain the carbonate of iron in solution, whereas in those imported, a part, or the whole is precipitated.

---

53 **Kane, William Joseph**, *Dublin*—Manufacturer.

Specimen of salt cake (sulphate of soda), made in brick furnaces, with complete condensation of the muriatic acid evolved.

Specimen of bleaching powder, made from the muriatic acid condensed.

[Bleaching powder is procured by exposing, in a stone chamber, powdered hydrate of lime, or slaked lime, to the fumes of chlorine gas, developed from a mixture of binoxide of manganese, chloride of sodium (common salt), and diluted sulphuric acid. After an exposure of certain length, the lime absorbs, and appears to combine with the chlorine, which it afterwards retains. It is, therefore, valuable for all purposes where the powerfully bleaching effects of chlorine are required, and is employed in vast quantities in the calico bleach-works, and similar establishments for the bleaching of linen and other goods.—R. E.]

Specimen of iron pyrites (bi-sulphuret of iron), from Messrs. Williams and Sons' Tigroney Mines, county Wicklow, Ireland.

Specimen of manganese ore, containing 90 per cent. of per-oxide of manganese, from Glandore Mines, county Cork, Ireland.

---

54 **Ward, Smith, & Co.**, *Glasgow*—Manufacturers.

Iodine. Muriate of potash. Sulphate of potash. Alkali salt.

---

55 **Fowler, John**, 35 *Bedford Street, Covent Garden*—Chemist.

Specimens of pure benzoic acid.

---

56 **Lawrence, William**, 163 *Sloane Street*—Manufacturer.

Specimens of cod-liver oil.

---

57 **Brown, Frederick**, 12 *Eccleston Place, Pimlico*—Patentee and Manufacturer.

Colours manufactured from the oxide of zinc, applicable for painting in distemper, on porcelain and boards, for paper staining, and for oil-cloth.

The qualities of these paints are stated to be their freedom from noxious properties, their permanency, and economy. They are not acted upon by gases. Specimen board painted with various colours in zinc paint.

---

58 **Ellam, Jones, & Co.**, *Markeaton Mills, Derby*—Manufacturers.

Emery—Granular rhombohedral corundum-stone, from Naxos, in Asia Minor: consisting of alumina, 86·0; silica, 3·0; oxide of iron, 4·0; and crocus (oxide of iron), for polishing fine steel and plated ware.

Mineral and vegetable colours (native and manufactured).

Mineral — sulphate of barytes, carbonate of barytes, carbonate of lime, syenite, cannel coal, mineral white, mineral black, blue-black, lapis calaminaris, cream ochre, gold ochre, mineral yellow, metallic red, umber, white rotten-stone, brown rotten-stone, bole armeniac.

Vegetable colours—Dutch pink, English pink, Brunswick green, Saxon green, Derby red.

---

59 **Russell & Robertson**, *Omoa Foundery, Holytown, Lanarkshire*—Inventors.

Specimens of white-lead paint, or ceruse, yellow chromate of lead, and red di-chromate of lead; manufactured by a new process, and solely in the humid way.

The usual mode of converting blue lead into white lead, by the action of acetic acid, occupies six weeks or two months, whereas by the new process the same end is attained in one day, without endangering the health of the workmen.

[White lead is the well-known pigment, which when ground in linseed oil is used in house painting. It is a carbonate of lead, generally containing hydrated oxide of lead, which is sometimes combined in the proportion of one atom of hydrated oxide to two of carbonate of lead. The most usual method (the Dutch) of manufacturing white-lead is likewise the oldest. It consists in exposing lead to the joint action of acetic acid vapour, moist air, and carbonic acid gas. The lead is cast in the form of stars or gratings, and supported a little above the bottom of earthen pots (in shape like garden pots), into each of which a small quantity of weak acetic acid is placed. The pots are then built up in alternate layers, with spent tanner's bark, until a stack is formed; each layer of pots being covered with boards. The fermentation, which soon takes place in the tan, serves the double purpose of furnishing carbonic acid, and raising the temperature of the stack, which reaches 140° Fah. After a lapse of six or eight weeks the metallic, or blue lead, as it is called, is converted into porcelain-like masses of white lead, which are levigated in water, washed and dried. About 16,000 tons are annually made in England by this process. A very small quantity of acetic acid suffices for the conversion of a large amount of metallic into white-lead; as, after it has combined with a portion of lead oxide to form neutral acetate of lead, this salt dissolves another atom of lead oxide, which is removed by the carbonic acid as carbonate of lead, and the neutral acetate set free, again, to take up a fresh portion of newly-formed oxide of lead, produced by the action of the air on the metallic lead. Most of the new processes depend on similar reactions, with this difference, that oxide of lead (litharge) is employed instead of metallic lead: it is either made into a paste, with a small quantity of acetate of lead and water, or else dissolved either in a solution of neutral acetate, or neutral nitrate of lead, and submitted to the action of carbonic acid, produced by the combustion of coke or charcoal, which precipitates the dissolved litharge, leaving the acetate or nitrate at liberty to dissolve fresh portions. Another of the new plans consisted in precipitating a neutral salt of lead (the nitrate, for example) with an alkaline carbonate.—W. D. L. R.]

---

60 **Johnson, J. R.**, 12 *Bankside*—Inventor.

Extract of munjeet. Patterns of calico printed and dyed with the extract. Extract of madder. Patterns printed "topically" with the extract. Exhibited to illustrate a new process of extracting, economically, the colouring principle of the Rubiaceæ.

Printed calicoes, to illustrate a new process of madder dyeing, which is intended to replace garancine.

Pieces of calico printed topically with extract of madder.

[Extract of munjeet, or munjeeth, is obtained from the roots of *Rubia cordifolia*, an East Indian plant. It is imported into England from Calcutta. It is not so largely used as madder, which is furnished by the roots of another plant allied to *Rubia cordifolia*. The colour produced is said not to equal that of madder in brilliance and permanence.—R. E.]

---

61 **Scott, Langston**, 41 *Moorgate Street*—Manufacturer.

Large vase and small glasses containing white oxide of zinc.

Various small painted boards.

Patent white zinc is principally used for house-painting in lieu of white-lead as being less noxious; but may be applied in the manufacture of crystals, paper-staining, card-enamelling, bleaching of lace, glazing of ware, for the down of artificial flowers, &c. It possesses great whiteness, gives a fresh tone to all colours, renders the paint or material prepared impervious to the action of gases, damp, &c., reflects artificial light, and preserves the materials. It is produced by destructive distillation, from zinc ore, or spelter, which is principally imported in large flat slabs from Silesia, Galicia, and Prussia: Russia, Belgium, and China send smaller supplies; the great European depôt is Hamburgh.

[Oxide of zinc is now largely employed instead of ceruse, and is much less noxious than that preparation of lead.—R. E.]

---

62 **Davy, Mackmurdo, & Co.**, *Bermondsey*—Manufacturers.

Samples of carbonate of ammonia; corrosive sublimate; calomel; benzoic acid; citric acid; gallic acid; oxalic acid; salt of sorrel; acetate of zinc; nitrate of silver; chloride of barium; nitrate of baryta; tartar emetic crystals; sulphite of soda; nitrate of ammonia; acetate of lead; glycerine; bisulphate of mercury; red precipitate; calomel in powder.

---

63 **Dauptain, Gorton, & Co.**, 17 *Wharf Road, City Road*—Manufacturers.

Four samples of ultramarine.

---

64 **Estcourt, Samuel**, 2 *Green Terrace, New River Head*—Inventor and Manufacturer.

Sample of refined Indian blue, for the laundry.

---

65 **Coppock, John**, *Bridport*—Inventor.

A chemical liquid for imparting the colour of mahogany and rosewood to common woods. A specimen of the prepared wood, polished, with a bottle containing the liquid; the sides of the block are left unstained, to show the natural wood.

[The liquid commonly employed for staining wood so as to communicate to it the appearance of antiquity is a caustic solution of potash. The same effect is also produced by the use of soap leys, simply in consequence of the free alkali contained in that liquid. Other chemical fluids are likewise used for the same purpose.—R. E.]

---

66 **Bell, Geo., & Co.**, 2 *Wellington Street, Goswell Street*—Manufacturers.

Mineral paints, which quickly dry under water, and on metals exposed to extreme heat. They are suitable for ships' bottoms, or for damp walls.

---

67 **Leifchild, J.**, *High Hill Ferry, Upper Clapton*—Producer.

Specimens of dyes for silk.—Carmine from safflower, blue from indigo, and blue from prussiate of potash.

[Safflower is yielded by a plant known botanically as *Carthamus tinctorius*, belonging to the *Asteraceæ*. The flower is alone used in dyeing. The plant is an annual, cultivated in Egypt, the Levant, &c.—R. E.]

Marshall, John, *Leeds*—Manufacturer.

Nos. 1, 2, & 3. Acid and neutral extracts of indigo.

4 & 5. Carmine and liquid extract from purified indigo.

6. Refined indigo.

[Indigo is the produce of plants belonging chiefly to different species of indigo-tree; it is also obtained, to a smaller extent, from others. The state in which it exists in the juice of these plants is not well understood. It appears to be in the form of a colourless, soluble compound, and is generally obtained by fermenting the bruised plant, during which ammonia is evolved, and a yellow liquor obtained, which, on the addition of lime-water, and exposure to the air, deposits the insoluble blue substance called indigo. For the purposes of dyeing, the indigo is dissolved in sulphuric acid, with which it forms a distinct chemical compound.—E. F.]

7 & 8. Red and blue orchil paste.
9 & 10. The same, of medium quality.
11 & 12. The same, of fine quality.
13 & 14. Red orchil liquor for silk dyeing.
15 & 16. Concentrated red and blue orchil liquor.
17 & 18. Cudbear.
19 & 20. The same, of good and best quality.
21 & 22. Violet carmine, and best concentrated cudbear.
23, 24, 25, & 26. Valparaiso, Angola, Madagascar, and Cape de Verd orchella weed.

[These substances are prepared from various lichens, amongst which the *Roccella tinctoria*, *R. corallina*, *Lecanora* *tartarea*, *Variolaria lactea*, and *V. dealbata*, have been especially resorted to. These lichens are found on rocks on the sea-coast. The modes of treating them for the manufacture of the different dyes is the same in principle, though varying slightly in detail. They are carefully cleaned, and ground into a pulp with water, an ammoniacal liquor is from time to time added, and the mass constantly stirred, in order to expose it as much as possible to the action of the air. Peculiar substances existing in these plants are, during this process, so changed by the combined action of the atmosphere, water, and ammonia, as to generate the colouring matter, which, when perfect, is pressed out, and gypsum, chalk, or other substances are then added, so as to give it the desired consistency; they are then prepared for the market under the forms now exhibited.—E. F.]

27, 28, 29, 30, 31, 32, 33, & 34. Ground lac-dye,—X, OO, O, A (medium quality), D (medium quality), G (good quality), H (fine quality), and I (finest quality).
35. Essence of lac-dye.

[The lac-dyes are prepared by extracting the peculiar colouring matter of the "stick-lac" of commerce. This latter is a resinoid substance, the result of a secretion of several different plants—the *Ficus Indica*, *F. religiosa*, *Croton lacciferum*, and others—occasioned by the punctures of a small insect (the *Coccus ficus*) made for the purpose of depositing its ova. The branches become encrusted with a reddish-coloured concretion, which consists of the inspissated juice of the plant, imbued with a peculiar colouring matter derived from the insect. The preparation of them is usually carried out in India, the remaining substances, seed-lac and shell-lac, being also articles of commerce. The colouring matter, or dye, is extensively used as a substitute for cochineal.—E. F.]

36. Ground Bengal turmeric.

[Prepared from the roots of the *Curcuma longa*. Used as a dye, and also as a condiment.—E. F.]

Specimens of 36 kinds of European and native manufacture of lac-dye in India.

69 **LEE, CHARLES**, 119 *Lower Thames Street, City*—Importer.

Newly-invented black dyeing material, for dyeing silk.

70 **DAVIES, JOHN**, *Cross Street, King Street, Manchester*—Inventor and Manufacturer.

Preserved size, clear and strong, for any climate; suitable for carvers and builders, bonnet-makers, paper-hangers, and varnishers.

71 **LAMPLOUGH, HENRY**, 88 *Snow Hill*—Inventor and Proprietor.

1. Socotrine Aloes, obtained from Aloes perfoliata.
2. Common Aloes, from Aloes Barbadensis.
3. Smyrna Opium, from Papaver Somniferum. Nat. Ord.—Papaveraceæ.
4. Myrrh, from Balsamodendron Myrrha. Nat. Ord.—Burseraceæ.
5. Russian Castor, from Castor Feber. Class.—Mammalia. Order.—Rodentia.
6. Aleppo Scammony, from Convolvulus Scammonia. Nat. Ord.—Convolvulaceæ.
7. Brown Annulated Ipecacuanha, from Cephaelis Ipecacuanha. Nat. Ord.—Cinchonaceæ.
8. Red Annulated Ipecacuanha.
9. Rhubarbs—English Rhubarb.
10. Dutch Trimmed Rhubarb.
11. Chinese or Indian Rhubarb.
12. Russian Rhubarb.

Residual salts from the destructive decomposition of animal substances. Specimens of chlorophospate of soda and potash; of effervescing salts; of crystals of prussiate of potash; and of sulphate of iron.

Specimen of Prussian blue.

72 **COULSON, JUKES, & CO.**, 12 *Clements Lane, Lombard Street*—Proprietors.

Mineral substances used for the manufacture of paint; in their natural state, and pulverized.

73 **PEACOCK, GEORGE**, *Southampton Docks*—Inventor.

New description of metallic paint or composition, named "Anti-Sargassian," for protecting the bottoms of ships, &c., from the attack of the "Teredo-navalis;" preserving iron and copper sheathing from wear or fouling, and preventing wood from decay, with specimens of iron, wood, and copper, in the protected and unprotected state.

[Those substances which prevent the decay of wood by chemical means, are generally such as combine with its nitrogenous principles, and in such a manner as to prevent or retard those principles from undergoing putrefactive change. Experience has fully proved the fact that the ordinary duration of unprepared wood exposed to causes of decomposition varies with different kinds, but that decay ultimately takes place in all. By the saturation of timber with different fluids, it is possible to avert or defer considerably these changes, and to communicate to the wood a durability far exceeding that originally possessed by it.—R. E.]

74 **STEPHENS, HENRY**, 54 *Lower Stamford Street, Blackfriars*—Inventor and Proprietor.

Samples of wood stained by the colour manufactured by the exhibitor, intended to show that deal or other woods may be ornamented, and the beauty of the natural graining exhibited to the best effect, thus saving the expense of painting and graining.

75 **HAYES, P., & CO.**, *Salford*—Manufacturers.

Rosin in the raw state. Spirits extracted from rosin, used for making varnish. Refined rosin oil, for coarse machinery, ships' masts, &c. Common rosin oil, for tramways, &c.

Pine tallow, manufactured from rosin, for railways. Pitch. Rosin acid. Pine varnish made from rosin, for vessels.

76 **DUNCAN, WILLIAM L.**, *Sydenham, Kent*—Inventor and Producer.

Cotton waste, used for cleansing purposes by railway and steam navigation engineers, &c.

Sample, in its dirty state, after having been used for railway purposes.

Cotton waste after a cleansing process, by which it is again reclaimed to its original value and usefulness.

77 **MASON, MRS. BETSEY**, 38 *Doughty Street, Mecklenburgh Square*—Inventor.

Pooloo's Chinese cement, for repairing china, glass, porcelain, marble, all kinds of wood, jewellery, musical instruments, furniture, and metals; useful to the manufacturer of and dealer in all goods, in the construction of which an adhesive composition is employed, especially for their repair. It is impervious to warm or cold water, and will resist the effects of intense heat. It also possesses the advantage of being perfectly clean, and free from any unpleasant smell.

Specimens of articles repaired by the cement.

[The cement commonly used for joining broken china and glass is composed of isinglass soaked in water till it is soft and then dissolved in alcohol; to this is added a little solution of gum resin, ammoniac, or galbanum and resin mastic, also in alcohol. When applied, it has to be gently heated to liquify it.—D. T. A.]

78 **HUMFREY, C.**, *Farnham Place, Southwark*—Inventor and Manufacturer.

Colours produced by the combination of fatty acids with metallic oxides and peroxides. Candles and refined fatty matters.

---

79 **DICKSON, GEORGE, & Co.**, 46 *Dundas Street, Edinburgh*—Manufacturers.

Medicinal cod-liver, ling-liver, and skate-liver oils. Used in cases of pulmonary consumption, asthma, lumbago, rheumatism, glandular swellings, and all diseases of a scorbutic or strumous nature.

[Cod-liver oil has been long employed in the arts, but its use in medicine is recent. It has been given very extensively within the last two years in a variety of diseases. It appears to be principally efficacious in tuberculous affections, in the treatment of which many other remedies are often employed without success.—R. E.]

Cod-liver ointment. Ninety per cent. of the constituents of the oil is contained in this ointment.

80 **BREAREY, WM. ARTHUR**, *Douglas, Isle of Man*—Inventor.

Refined oil. Pure oleine, for watches, clocks, chronometers, fine machinery, and instruments; free from acid or mucilage; not affected by change of temperature, and having no chemical action on metals.

[For some purposes in the arts it is necessary to separate oil into its proximate constituents, *elaine*, or *oleine* and *stearine*. The former is the fluid portion, the latter the solid part which separates, at low temperatures, from the oleine. The separation is effected by cold and pressure.—R. E.]

---

81 **ROBERTSON, W.**, *Banff, Scotland*—Manufacturer.

Cod-liver oil, manufactured by the exhibitor. Extracted by steam-heat, and rendered almost colourless, without the use of charcoal or any other decolourising agent. Manufactured at the various fishing villages along the coast of the Moray Frith.

Skate-liver oil. Manufactured by the same process. This article is more difficult to obtain. Change of temperature scarcely affects it. By some it is preferred to cod-liver oil.

Sulphate of baryta and chloride of barium.

[Chloride of barium is a crystalline compound of chlorine and barium, soluble in water. Its solution produces a white insoluble precipitate of sulphate of baryta in sulphuric acid and solutions of sulphate; hence its use as a chemical re-agent for the detection and quantitative determination of sulphuric acid in analysis.

Sulphate of baryta (permanent white), is a compound of sulphuric acid and oxide of barium; artificially prepared, it is extensively used as a pigment for water-colouring, but has not sufficient body to be employed as an oil paint. The native sulphate of baryta is used as an adulterant of white lead paint.—W. D. L. R.]

---

82 **LINKLATER, J.**, 5 *Sidney Street*—Producer.

Specimens of cod-liver oil.

---

83 **OWEN, CHARLES**, *Edinburgh*—Manufacturer.

Specimens of pure cod-liver oil.

---

84 **KING, WILLIAM WAUDBY**, *Soho Street, Liverpool*—Manufacturer.

Effervescent citrate of magnesia, manufactured by the exhibitor.

This article is exhibited as an agreeable and efficient saline aperient, adapted for family use, for travellers and residents in warm climates, and as an economical medicine in general. Mixed with cold water it forms a plea- effervescing draught equal to soda water or lemonade.

85 **BURT, STEPHEN JOHN**, 26 *Farringdon Street*—Proprietor.

Cantharides (*Cantharis vesicatoria*), imported from Russia.

Cantharidine, the active principle of the cantharides, alone, and in combination with alkaline and other bases. Cantharidine and potassa. Cantharidine and soda. Cantharidine and lead.

[The *Cantharis vesicatoria* of pharmacy is an insect belonging to the order *Coleoptera*, or beetles. Sicily, Spain, and Astracan are sources of our supply. In the present instance Russia has furnished the insect, and there is a large annual importation from that country. The Russian insects are larger than those of other countries. Cantharidine is obtained from an alcoholic tincture of the powdered insect, and possesses in an intense degree the blistering properties of the powdered cantharides.—R. E.]

---

86 **HUSKISSON, J., W. & H.**, 77 *Swinton Street, Gray's Inn Road*—Manufacturers.

Crystals of the following chemical substances :—

1. Bi-carbonate of soda.
2, 3. Rochelle salts, refined and unrefined.
4. Iodide of potassium.
5. The same, commercial.
6. Iodide of lead.
7. Bin-iodide of mercury.
8. Iodide purified.
9, 10. Tartaric acid and citric acid crystals.
11. Acetate of zinc.
12. Sulphate of potash crystals.
13. Purified sulphate of zinc.
14. Phosphate of soda.
15. Sulphate of iron crystals.
16. Carbonate of soda.
17, 18. Purified nitrate and bi-carbonate of potash.

---

87 **MURRAY, Sir JAMES, M.D.**, *Monktown, Dublin*—Inventor.

Bi-carbonate of magnesia, dissolved in distilled water; free from impurities. Specimen of fluid camphor and magnesia. Carbonate of magnesia in crystals, a dentifrice.

3 **STURGES, JOSEPH**, *Kettering*—Inventor.

Preparation for preserving the turnip plant from the ravages of the fly.

[The turnip-plant often suffers in its earliest growth, from the attacks of a small beetle, called the *Haltica nemorum*, which devours its cotyledon leaves, and thus arrests its further growth. A fine tilth and plenty of good manure generally ensure such a vigorous growth that the plant is enabled to throw out its second pair of leaves before any serious injury has been sustained.—J. W.]

A proposed remedy for the smut in wheat, and also a preventive from the ravages of the slug, grub, and wire-

89 **WARD, JOHN**, *Ramelton, County Donegal*—Producer.

Specimens of kelp manufactured from sea-weed.

Iodine, muriate of potash, sulphate of potash, and alkali salt; all manufactured from kelp.

---

90 **KENT, JAMES HENRY**, *Stanton, near Bury St. Edmunds*—Inventor and Manufacturer.

Dried pharmaceutical indigenous plants, in glass vessels, the lower parts of which exhibit the plants prepared for pharmaceutical purposes, and the upper portions of some of which display the botanical characters of the plants.

Powdered conium, digitalis, and other indigenous pharmaceutical plants.

Dried roots of indigenous pharmaceutical plants.

Dried immature poppyheads, and extract made from the same.

Specimens of pharmaceutical extracts, prepared from indigenous plants.

[The plan commonly practised for preparing herbs is as follows:—The herb collectors in the country put both stalks and leaves of the medicinal plants in bunches to dry on kilns. These bunches are afterwards hung up in the herbalists' shops, and exposed to the decomposing effects of light and of the atmosphere.

The present plan is to reject all the stalks and dead leaves of the plants, to collect them fresh, and dry them immediately in a room heated with currents of *pure air*, and preserve them in glass or tin vessels free from the access of light and air. They will keep thus for an indefinite period of time.—R. E.]

91 TRUMAN, HANBURY, & BUXTON, 174 *Brick Lane, Spitalfields*—Producers.

Malt and hops of various qualities, exhibited in the proportions used in brewing one gallon of porter and one gallon of ale, of medium strength.

[Some conception of the quantity of hops annually produced in Great Britain, principally in Kent, Sussex, Worcester, and Hereford, may be obtained from the fact that in 1842, the duty (2*d.* per lb.), amounted to 260,978*l.* The plant belongs to the same natural family as hemp, *Cannabinaceæ.* Its botanical name is *Humulus lupulus.*

Of malt, the year 1842 produced in England and Wales, alone, nearly 31,000,000 bushels, the duty on which amounted to 4,176,742*l.*—R. E.]

92 GODFREY & COOKE, 31 *Southampton Street, Covent Garden*, and 30 *Conduit Street*—Manufacturers.

Carmine, the colouring matter of cochineal (*Coccus cacti*). Lake, from cochineal, soluble in alkalies and ammonia. Oxide of bismuth. Carbonate of ammonia, the basis of smelling salts, spirit of sal volatile, &c. Oil of amber. Salt of amber. Artificial musk, and tincture of artificial musk. Watchmakers' oil, for fine machinery. Spirit of sal volatile. Essence of ambergris. Tincture of myrrh, and sundry drugs and chemicals.

[The beautiful pigment, *Carmine*, is a result of the precipitation of an infusion of the cochineal insect (*Coccus cacti*) in water, by means of alum. The carmine of commerce is so costly an article, that it is seldom to be met with in a state of purity. Pure carmine dissolves in ammonia. It is said, by some manufacturers, that a bright and clear state of the atmosphere is necessary to the preparation of carmine of the most brilliant colour.—R. E.]

93 SQUIRE, PETER, 277 *Oxford Street*—Inventor and Manufacturer.

A variety of pharmaceutical extracts and preserved juices of medicinal plants. Liquor of taraxacum (dandelion). Solution of bi-meconate of morphia. Fluid extract of Jamaica sarsaparilla. Cod-liver oil. Red rose leaves (dried without heat). Fine crystals of red ferro-prussiate of potash. Large perfect crystals of yellow ferro-prussiate of potash.

[Pharmaceutical extracts were, for a considerable period, the most fallacious of all medicinal preparations. The high temperature to which they were subjected in the manufacture destroyed the active principle sought to be concentrated. Of late they have been prepared, in some instances, by evaporation in the cold; a current of air being driven over the surface of the liquid. They are also safely obtainable by using an apparatus similar to that employed in the sugar manufacture.—R. E.]

A chloroform and ether inhaler. An apparatus for preparing infusions.

94 SMITH, T. & H., 21 *Duke Street, Edinburgh*, and 69 *Coleman Street*—Inventors and Manufacturers.

Specimens of aloine, the cathartic principle of the aloes, discovered by the exhibitors in 1850; of gallic acid, in crystals; of crystallized mannite, extracted from dandelion root; of crystallized mannite, extracted from monkshood root, also discovered by the exhibitors in 1850; and of cantharidine, in crystals, the blistering principle of the Spanish fly, one part being equal to 400 parts of the powder of Spanish flies.

95 BASS, JAMES, 81 *Hatton Garden*—Inventor.

Specimens of concentrated medicinal infusions and decoctions intended to obviate the inconveniences connected with infusions and decoctions as usually prepared.

[The infusions of medicinal substances prepared in the ordinary way are extremely liable to decomposition, and soon become covered with fungi. The concentration of such infusions in a form in which they can be preserved for some time is consequently of importance. The preparations are used medicinally by dilution with water; the infusions in their concentrated form preserving a degree of strength above that which it is advisable to adopt for medicines in their administration.—R. E.]

96 MCCULLOCH, CHARLES, *Covent Garden Market*—Producer.

English and American herbs and roots.

97 TUSTIAN, J., *Melcombe, near Banbury*—Manufacturer.

Petals of the red rose. Confection of the red rose. Extract of henbane.

98 TUSTIAN & USHER, *Melcombe, near Banbury*—Manufacturers.

English rhubarb, trimmed and untrimmed, and in powder.

[Many attempts have been made to cultivate in Europe the rhubarb plant for the sake of its medicinal roots. In France, more especially, a place called Rheumpoli has been the scene of a great experiment in this culture; and in the like manner Banbury, in Oxfordshire, has long been celebrated in the source of English supply. All these European rhubarbs have been found very inferior to that imported from Asia, the natural country of the drug.—J. L.]

99 JENNINGS, H. C., 97 *Leadenhall Street*—Producer.

Starch, gums, and vegetable wax, from potato and wheat starch.

100 HOPWOOD, HENRY, *Richmond, Surrey*—Proprietor.

Sugar of milk, crystallized in the usual manner; and crystallized at a temperature of 120° Fahrenheit, in the dark.

101 TENNANT, M. B., *Brighton*—Producer.

A chemical production for labels or artists' designs, a product of a silvery hue to be thrown over drawings of every description by means of chemical agency said to be hitherto unknown.

102 KEATING, THOMAS, 79 *St. Paul's Churchyard*—Importer.

Kuosso, from Abyssinia (*Brayera anthelmintica*).—The blossom of a tree 20 feet high, the native remedy so much esteemed for the removal of tape worm.—Discovered by Dr. Brayer.

Sarsaparilla, from Paraguay (*Smilax Papyracea*).—The finest species of sarsaparilla known. The product of which has been found to possess valuable medicinal properties, especially in its direct efficacy on the system, in the cure of a number of chronic complaints. Introduced by Dr. H. Scott.

Radix Jalapæ and Croci in Fœno, from Asia Minor.—Exhibited as the first medicinal products of these species imported from that country.

Matico.—The new medicinal styptic, and vegetable astringent; efficacious in the suppression of hæmorrhage from wounds, leech bites, dysentery, diarrhœa, and the dangerous prognostics of cholera, introduced by the late Dr. Jeffrys, of Liverpool.

103 WATTS, JOHN, 107 *Edgware Road*—Manufacturer.

Daphne Mezereum, bark of the root and stem. Daphne Laureola, bark of the root and stem. Cod-liver oil, made without water. Oleine of cod-liver oil. Tincture of hops, made with home-dried hops; and made with kiln-dried hops. Hydrochlorate of morphia, pure, in crystalline mass.

The following extracts are prepared in open vessels, at a temperature of from 110° to 130° Fahrenheit:—Acetic extract of colchicum, from the fresh corms. Extract of gentian, from the dried root. Pure aqueous extract of aloes, from hepatic aloes. Extract of deadly night-shade, from the flowering plant. Extract of liquorice, from the fresh root. Extract of Turkey rhubarb, from the dried root. Extract of fetid goosefoot, from the flowering plant. Extract of hemlock, from the flowering plant. Elaterium, from the fresh fruit when nearly ripe. Inspissated ox-gall. Extract of henbane, from the flowering biennial plant. Extract of white poppies, from the fresh capsules. Extract of dandelion, from the fresh roots monthly, from October to February. Powdered hemlock, the leaves of the flowering plant. Powdered foxglove, the leaves of the flowering plant.

104 DUNCAN, FLOCKHART, & Co., *Edinburgh*—Manufacturers.

Specimen of chloroform.

[The inestimable results which have attended the introduction of the anæsthetic or painless mode of operating in surgery, renders the principal medical product employed highly interesting. For this purpose it is inhaled from various forms of apparatus, and the inhalation is continued at intervals during the period of operation. Chloroform is obtained by distilling alcohol with a solution of chloride of lime. Its peculiar fruity odour has also rendered it available for the production of artificial fruit essences.—R. E.]

105 LEA, ALFRED, 150 *Oxford Street*—Inventor.

Specimen of myrrhine, a preparation for medical use.

106 MORSON, THOMAS N. R., & SON, 19 *Southampton Row*, and *Hornsey Road*—Manufacturers.

Specimens of crystallized salts of morphine, strichnine, cinchonie, with the pure alkaloids from which they are obtained, of pure aconita and veratric, gallic, tannic, and meconic acids, pyro-gallic and pyro-meconic acids, kreosote, &c.

[To the chemist the preparations known as alkaloids, or vegeto-alkaloids, present many features of peculiar interest. They are also of the highest medicinal importance, acting, as many of them do, with extraordinary power over the animal economy, and supplying to the physician remedies of such energetic action as to enable him, in many cases, to reduce the bulk of medicine from an inconvenient and uncertain, to a convenient form. The crystallization of the vegeto-alkaloids is peculiarly beautiful, and their chemical constitution is extremely complicated. Morphia, quina, strychnia, and brucia, are among these peculiar products, and possess intense medicinal energies.—R. E.]

107 MACFARLAN, JOHN FLETCHER, & Co., 17 *North Bridge, Edinburgh*—Manufacturers.

Series illustrative of the manufacture of the salts of morphia, embracing opium, impure muriate of morphia, pure muriate, and sulphate of morphia.

Specimens of gallic and tannic acids, embracing galls; tannic acid, impure and pure; gallic acid, impure; commercial, pure.

Specimens of sulphate of bebeerin, from green-heart embracing the bark, and impure and commercial sulphate and of the alkaloid.

[Green-heart bark is yielded by the *Bebeeru* tree of Guiana. Its active principle, bebeerin, is employed in the form of sulphate, as a febrifuge tonic.—R. E.]

108 POUND, MATTHEW, 198 *Oxford Street*—Importer and Manufacturer.

Imports from Calcutta: Indian bael, bela, bilva, matrura; the sliced and dried half-ripe fruit of the Ægle Marmelos, a native of the East Indies, more particularly the Malabar coast; a perfect ripe fruit also accompanies it. Extract of bael; combining all its properties, soluble both in spirit and water. Wine of bael, prepared with sherry; its medicinal properties consist in a modification of tannin, combined with a large proportion of mucilaginous and aromatic principle. Bark of the root of the Ægle marmelos, much esteemed on the Malabar coast for melancholia, hypochondriasis, &c.

Soap berries, the fruit of a Sapindus; used in the East Indies instead of soap for washing. Capsules of the same, the portion in which its peculiar properties exist; its medicinal preparations are the tincture and extract of the capsules, which are tonic and detersive.

Jujube fruit, from the Zizyphus vulgaris of the south of Europe—imported from Paris; its properties are nutritive, mucilaginous, and pectoral, and from the jelly of this fruit the jujubes of commerce are prepared. Flaked cold cream. Ammonia tartrate of iron; ferri ammonio tartras; tartrate of iron and ammonia, a tonic.

[*Ægle marmelos*, called "Bel" in India, and by the English "Bengal quince," is a shrub of the orange tribe, producing a very delicious fruit, the astringent rind of which affords a yellow dye.

The soap-worts to which the genus *Sapindus* belongs are tropical plants. The fruit of many species of *Sapindus* is used as a substitute for soap, as *Sapindus saponaria*, a West Indian plant, and *Sapindus acuminata, Laurifolius emarginatus*, and *Detergens*, all East Indian plants. The species alluded to by the exhibitor is probably that last named.

The jujubes of the South of Europe are the fruit of *Ziziphus vulgaris*, those of India of *Ziziphus jujuba*, both plants of the buckthorn tribe.—E. F.]

109 COLLINS, ROBERT NELSON, *Oxford Court, Cannon Street*—Inventor and Producer.

Disinfecting powder, for the removal of offensive smells.

110 HATTERSLEY, W., 15 *Lisle Street, Leicester Square*; and 136 *and* 137 *St. George's East*—Inventor.

Elixir of sarsaparilla prepared without heat.

111 DAVENPORT, JOHN THISTLEWOOD, 33 *Great Russell Street, Bloomsbury*—Producer.

Iodide of iron, saccharated 50 per cent. in brilliant lamellæ, neutral and soluble, remains unaltered by the air; iodide of quinine in a neutral crystalline form; iodide of quinine and iron, in the form of syrup; iodide of iron, in the form of syrup; iodide of lead, crystals. Chloride of lead, crystals. Citrate of prot-oxide of iron, powder. Ammonia, citrate of prot-oxide of iron lamellæ. Citrate of sesqui-oxide of iron in lamellæ. Ammonio-citrate of sesqui-oxide of iron (lamellæ). Quinine, neutral sulphate, crystals, soluble. Citrate of quinine and iron, neutral soluble. Phosphate of iron, soluble lamellæ; phosphate of quinine and iron, soluble lamellæ. Benzoic acid, crystals. Caffeine, crystals. Hydrochlorate of morphia, crystals. Collodion, liquid plaster. Nitrate of silver, crystals. Fluid extract of dandelion, prepared by spontaneous inspissation of the pure juice. Solution of bi-meconate of opium entirely free from narcotine. Preparations of cotyledon umbilicus.

[Collodion is a remarkable fluid prepared by dissolving gun cotton in rectified ether. It is used in surgery. Cotyledon umbilicus has lately been used as a remedy for epilepsy. Its employment has been attended in several instances with success.—R. E.]

---

112 NIXEY, W. G., 22 *Moor Street, Soho*—Producer.

Specimen of cement.

---

113 OYLER, S., 2 *York Street, Camden Town*—Producer.

Lint made of linen of different degrees of fineness.

---

114 AUSTIN, JAMES B., *Banbury*—Manufacturer.

Decoctions and infusions of medical substances. Super-phosphate of lime. Sulphate of lime or gypsum. Fine white sand, found at Todmarton, near Banbury.

---

115 SAVORY & MOORE, *New Bond Street.*

Kousso; a new remedial agent, imported by the exhibitors, for the removal of tape worm. That it is destructive of that parasitic disease has been satisfactorily shown. The plant has long been known in the East, and actively employed in Abyssinia. Dr. Pereira has given an elaborate account of this plant, which is known by the name of *Brayera anthelmintica*, from its properties and the name of its discoverer, Dr. Brayer. Wittstein and Martin have given chemical analyses of the plant.

Sumbul; another new medicine, the introduction of which into practice in this country is due to the exhibitors. It is very beneficial in many nervous diseases, and in the treatment of epilepsy. Dr. Granville has given a minute account of its medicinal properties.

---

116 BELL, J., M.P.

Cod-liver oil, stearine, sarsaparilla, juice of taraxacum, otto of roses, &c. Salt, from the Droitwich Patent Salt Works.

---

117 THE LONDON DRUGGISTS—Producers.

Balsams, &c.: Copaiba, storax calamita, black Sonsonate, balsamito, and of Tolu.

Barks: Canella, cusparia, winter's, mezereon, cascarilla, Simaruba, Mudar, pomegranate, crown, ashy crown, loxa and jaen.

Extracts, &c.: Dragon's blood, catechu, liquorice, aloes, churrus and rhatany.

Expressed oils: Mace, cod-liver, linseed, castor, and croton.

Essential oils: Peppermint, mint, dill, anise, angelica, geranium, citronelle, cloves, cinnamon, camomile, winter green, ginger grass, cubebs, cajuputi, verbena, Indian grass, bitter almonds, lavender, sassafras, &c.

Roots: Rhubarb, orris, cassava, angelica, mezereon, calumba, hellebore, ipecacuanha, marshmallow, rhatany, smilax aspera, sarsaparilla, ginseng, salep, pariera brava, valerian, colchicum cormus, cuscus vitiver, &c.

Seeds: Cardamoms, castor-oil, croton-oil, colchicum, cumin, anise, cedron, angelica, cocculus indicus, &c.

Woods: Calumba, quassia, jalap, guaiacum, myraspermum of Sonsonate, sanders, &c.

Spices, peppers, &c.: Guinea pepper, chillies, nutmegs, mace, cassia lignea, cinnamon, cubeb pepper, cloves, almonds, calamine, camomiles, patchouli, gangah, manna, litmus, crabstones, pearls, red coral, dolichos, lactucarium, chiretta, &c.

Fruits, &c.: Colocynth, pomegranate, tamarinds, vanilla, tonka, and cassia fistula.

Gums and resins: Ammoniacum, bdellium, frankincense, galbanum, gamboge, benzoin, styraceum, larch turpentine, New Holland resin, mastic, myrrh, Arabic, olibanum, sarcocol, scammony, opoponax, sagapenum, tragacanth, tacamahac, guaiacum, &c.

Leaves, &c.: Petals of damask and cabbage roses, senna, buchu, kousso, myrospermum, &c.

Mosses: Ceylon, Corsican, Iceland, and Irish.

---

118 COPNEY, WILLIAM, *Plough Court, Lombard Street*—Manufacturer.

Crystals of citric acid, sulphate of copper, sulphate of magnesia, and octahedra of alum.

---

119 STURGE, JOHN EDMUND, *Birmingham*—Manufacturer.

Specimen of amorphous phosphorus, and crystallized chlorate of potass.

---

120 OXLAND, J. & R., *Plymouth*—Manufacturers.

Specimens of sugar, produced by the patent process of refining, invented by Robert and John Oxland, in which the acetate of alumina is used as a substitute for the blood and animal charcoal usually employed for defecation and the removal of colour.

---

121 PINTO, PEREZ, & Co., *Chemical Works, Limehouse*—Manufacturers.

Specimen of acetate of lead, in very large crystals, rhombic prisms, slightly coloured, but exhibiting in a high degree its peculiar crystalline structure. Another specimen, in large groups of crystals, perfectly pure, and freed from colour.

This salt is prepared from pyroligneous acid and litharge, which, when combined and purified by repeated crystallizations, yields such crystals as are exhibited. The salt is extensively employed in the colouring arts, especially in calico printing, and is also a powerful medicinal agent. It is highly poisonous.

---

122 STEVENSON, J. C., *Jarrow Chemical Works, South Shields*—Manufacturer.

Large crystal of soda.

---

123 RILEY, E., *Museum of Practical Geology, Piccadilly, and Wandsworth, Surrey*—Producer.

Specimens of hippuric acid and compounds.

---

124 GREENISH, T., 20 *New Street, Dorset Square*—Manufacturer.

Superphosphate of iron; a new preparation of iron recently introduced by Dr. Routh, supposed to be the same salt contained in the blood. It is free from any ferruginous taste, and so, well adapted for children; believed to be more speedy in its action than the other salts of iron in cases of nervous debility, where there is a large quantity of phosphates voided by the urine, probably because it supplies directly to the brain the phosphorus, on the undue diminution of which the nervous derangement depends. Syrup of superphosphate of iron, adapted for administering the remedy to children, and probably the best form for general use.

Syrup of poppies, deprived of vegetable albuminous matter, without injury to its medicinal properties; it may by this means be kept without the possibility of fermentation.

Syrup of saffron, deprived of vegetable albumen, so that it may be kept without the deposition of the colouring matter.

Tincture of columba and tincture of hops. Both tinctures are deprived of the albumen, and perfectly bright.

---

125 TRIX, J., *Exeter*—Producer.

Extract of henbane from the wild herb.

126 DIXON, SON, & Co., *Newton Heath, Manchester*—Producers. ARTHUR ALLBRIGHT—Patentee.

Specimens of matches, made with Professor A. Schrotter's amorphous phosphorus. These matches are free from offensive smell, and from effluvia injurious to the workers while they are making them. They give out a brilliant and sure light, when rubbed on the sanded part of the box. They will not take damp so readily as matches made in the usual way. They will keep in hot or cold climates, and in dry or comparatively damp places. They are as cheaply and easily made as the common matches, and are less liable to fire in the process of making. They can be made to light sulphured wood, or stearine matches. The patent safety phosphorus employed in their manufacture may be known by its producing no light in the dark under 400 degrees.

SECT. I.

CLASS 3.

SUBSTANCES USED AS FOOD.

INTRODUCTION.

MOST of the objects exhibited in this Class are so familiar as to require little preliminary notice. Substances used as food are derived either from the animal or from the vegetable kingdom, and may, consequently, be arranged under these two divisions—Animal and Vegetable. The latter are necessarily the most varied and the most important. Vegetable substances used as food may be arranged under the following heads:—A. Agricultural produce, such as cereals, pulses, oils, seeds, &c.; B. Dried fruits and seeds; C. Substances used in the preparation of drinks; D. Intoxicating drugs, fermented liquors, &c.; E. Spices and condiments; F. Substances belonging to the starch; and G. Substances belonging to the sugar series. Preserved meats, soups, honey, gelatine, &c., belong to the subdivision of animal substances.

This Class is situated in SOUTH GALLERY P, and is entered immediately on leaving the preceding Class, situated in the same gallery.* Like the last, the amount of space occupied by it is very moderate, but the substances it comprises are interesting, and deserve attention, not, as in the last case, from their connection with commercial enterprise and prosperity, but from their relation to the support and healthy condition of the artificer himself.

The Class comprises a variety of agricultural produce—wheats of various kinds and of differing degrees of productiveness, together with specimens illustrative of the remarkable effect of hybridization, or the crossing of one variety of wheat with the pollen of another. Wheat is also shown in its various states of preparation for the purposes of food, or for the preparation of fermented liquors. Extensive collections of seeds of grasses, fodder-plants, and others for cattle food, are also exhibited, together with an arranged series of the vegetable productions of Scotland, including plants cultivated for their farinaceous seeds; plants cultivated for their herbage or forage, for their roots, for their uses in the arts, manufactures, &c., for their medicinal properties, and for their timber. Preserved fruits and seeds of various countries are also contained within this Class, representing those articles of luxury removed by their character and costliness out of the ordinary category of human food. Specimens of hops of different varieties, adapted for different purposes, are also shown, and represent a department of agriculture more important in this country than in any other in the world. It has been estimated that upwards of 52,000 acres of land are devoted in England to the cultivation of this plant, about the half of which is in the county of Kent. The duty on hops amounts to about a quarter of a million sterling annually.

A variety of substances used in the preparation of drinks is comprised in this Class. Specimens of different kinds of cocoas, in the natural and manufactured state, of coffee, and of tea, represent the ingredients contributing to form the liquid diet of millions of the human race, and each containing, according to recent discoveries, a peculiar nitrogenous principle, identically similar in each, though recognised under different names. New substances are also shown, intended to form substitutes for these articles. Starches, spices, and condiments represent the remaining division of vegetable substances.

The division—animal substances—includes a variety of articles of preserved food; among these are cases containing food preserved in air-exhausted canisters for lengthened periods. Isinglass, gelatine, honey, preserved soups and meats, belong also to this division. There are also some preparations from blood, and combinations of vegetable and animal substances for the purposes of food, together with milk reduced by evaporation to a dried state.—R. E.

1 **LIGHTON, JAMES,** *Frampton, near Boston, Lincolnshire*—Producer.

Glass of honey, 19 lbs., produced under an improved system of bee management.

The honey is worked in the glass by the bees, and the glass requires no protection except a small piece of black calico, 18 inches square, to stand upon.

DOUBLEDAY, H., *Coggeshall, Essex*—Producer.

Fine specimen of honeycomb.

3 **CARLETON, EDWARD,** *Blaris, Lisburn, Ireland*—Producer.

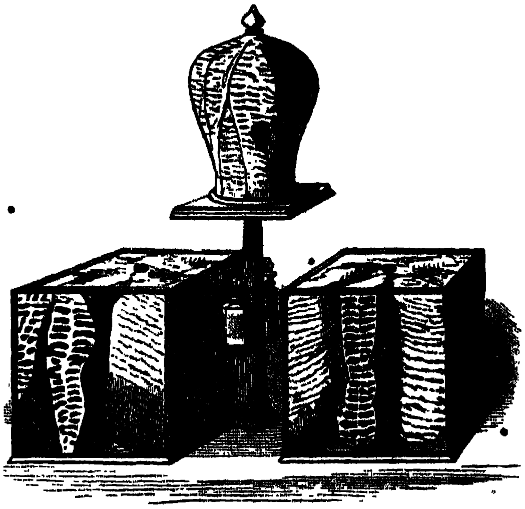
Specimen of camomile flowers.

---

4 **BENTLEY, JOHN FLOWERS,** *Stamford, Lincoln*—Producer.

Specimens of honey in the comb, free from pollen and brood cells, collected under Nutts' system of management, by ventilation. The weight of the produce of one stock of bees in 1849 is stated to have been 50 lbs.

The accompanying cut represents the combs produced in the glass hives of the exhibitor.



5 **Kitchener, Wm. Cripps**, *Newmarket, Cambridgeshire*—Producer and Inventor.

Two specimens of honey taken in 1850, from the same hive, and at the same time.

Ventilated communicator, for obtaining honey free from impurity or discoloration.

6 **Dutton, Robert William**, 146 *Fleet Street*—Proprietor.

A glass containing a honeycomb.

6A **Hamilton, George & Peter**, *Oldham*—Manufacturers.

Specimens showing the different stages in the manufacture of flour from the wheat to the biscuit.

7 **Hills & Underwood**, *Eastcheap*—Inventors and Manufacturers.

Samples of malt vinegar when first acetified, and when clarified; samples of brown malt vinegar, distilled vinegar, and distilled vinegar with vegetables.

8 **Biven & Co.**, *St. John's Lane, Gloucester*—Manufacturers.

Six bottles of champagne wine, manufactured in England from rhubarb stalk.

10 **Roberts, William Henry**, *British Wine Works, Lavcrock Bank, Edinburgh*—Maker.

Samples of "champagne and sparkling hock," made in 1847 from Valentia raisins, grapes, sugar, sugar-candy, and honey, the extract being duly fermented.

"Madeira," made in 1836, from malt and sugar extract.

"Constantia and Frontignac," made from Valentia raisins, sugar, and sugar-candy. The "Frontignac" is flavoured by an infusion of elder flowers distilled.

"Keeping beer," brewed in February, 1845, and October, 1847.

In the manufacture of this beer, which was not made for sale, sugar was introduced as an auxiliary to the malt and hops. Its value in this connection is great, as the beer thus brewed will keep sound for an unlimited period.

11 **Copland, Barnes, & Co.**, 46 *Botolph Lane, Eastcheap*—Producers.

Specimens of a new process of preserving fruits, jams, jellies, provisions, &c. These are hermetically sealed, and retain for years all their freshness of flavour and quality; and are prepared for use in the East and West Indies, and other tropical climates; also for passenger ships on long voyages.

12 **Gamble, John Henry**, 33 *Royal Exchange*—Manufacturer.

Canister, containing boiled mutton, found by Captain Sir John Ross, on Fury Beach, in latitude 72 deg. 47 min., and longitude 91 deg. 50 min. This is one of the canisters of preserved food, prepared by the exhibitor for the Arctic Expedition in 1824. It was landed from H.M.S. "Fury," on the beach where the ship was wrecked in Prince Regent's Inlet, and found by Captain Sir John Ross, in August, 1833, still in a perfect state of preservation, although annually exposed to a temperature of 92 deg. below, and 80 deg. above, zero. In 1849, when Captain Sir James Ross visited Prince Regent's Inlet in H.M.S. "Investigator," he found the provisions still in excellent condition. That the canister exhibited has been preserved above twenty-six years, and is still fit for food, is attested by Captain Sir John Ross. The food in this canister was preserved without salting.

Three canisters of preserved mutton and vegetables, preserved by the same process by Donkin, Hall, and Gamble, at Blue Anchor Road, Bermondsey, in the year 1813.

Canisters of preserved fresh beef, mutton, and veal; of fresh milk, cream, and custards; of fresh carrots, green peas, turnips, beetroot, stewed mushrooms, and other vegetables; of fresh salmon, oysters, cod-fish, haddock, and other fish; and of real turtle soup, mock-turtle soup, ox-tail and other soups.

Preserved hams for use in India, China, &c.

Callipash, callipee, and green fat for making real turtle soup, all preserved by the same process. Also soup and bouilli, for emigrants and troops at sea.

Pheasants, partridges, &c., preserved. The whole preserved so as to keep in any climate, and for an unlimited length of time.

[This method is the invention of M. Appert, in France, and was first practised in England by Messrs. Donkin, Hall, and Gamble. The process consists in placing the partially-cooked provisions into tin canisters, with a little bouillon or juice of the meat, then soldering on the covers, which have a small hole perforated therein. The tins are, after this, immersed, to a great portion of their depth, in a saline-bath heated above the boiling point of water, and left therein until the air has been expelled as completely as possible by the steam generated within them; the hole in the cover is now hermetically closed with a little solder, the tin being momentarily touched with a damp sponge to stop the egress of steam. The minute portion of oxygen still remaining in the tins enters into combination with the animal or vegetable matter at the induced temperature, and thus, further change is prevented. After the sealing of the tins, they are submitted to the ordeal of the testing-room, heated to a temperature above 100° Fahr.; if putrefaction takes place, the generated gases burst the tins, but those which pass uninjured remain perfectly good.—W. D. L. R.]

13 **Colquhoun, J. L., Lieut.-Col., R.A.**—Producer.

Fruit of the plantain (*Musa paradisiaca*) dried in the sun when fully ripe, and in that state analogous to the dried fig, raisin, date, &c.; from the province of Jalisco (Guadalajarra), Mexico, called "Platano pasado."

It is prepared in considerable quantities in the hot region (*tierra caliente*) of the western coast of Mexico, for consumption in the elevated districts of the interior.

The specimen exhibited was imported in 1835, and is the remainder of a package of 75 lbs. weight, made up as customary in the leaves and fibre of the plant, after having been subjected to considerable pressure. The cost of production is very moderate.

14 **SMITH, MICHAEL**, *Copper Alley, Dublin.* (Agent in London, J. KENDELL, 8 *Harp Lane, Great Tower Street*)—Producer.

Preserved pig; large and small hams, cured upon the "mild-cure" principle.

15 **RITCHIE & MCCALL**, 137 *Houndsditch*—Producers.

Specimens of preserved meats, poultry, fish, &c., the produce of the United Kingdom; and of beef, the produce of Moldavia, preserved at Galatz. "Goldner's Patent."

The process is by forming a vacuum in the canister by means of steam, and preserving the meat, &c., in that vacuum.

[It is a well-known fact that, in the absence of atmospheric oxygen, putrefaction is suspended, often entirely so. Such is the principle upon which the patent here adverted to depends. The vacuum must be very complete to render the preservation of food successful.—R. E.]

17 **CLAY, JOHN**, *Woodley Corn Mills, Bridbury, near Edgeley, Stockport*—Producer.

Specimens of maize or Indian corn, with a specimen of American hominy produced from Maize, as used in America; imported at Liverpool from New York.

Specimens of English manufactured hominy from maize, and maize flour as a substitute for rice, flour, meal, potato, &c.

20 **LEONARD, J. & T. P.**, *Hull*—Proprietors.

Beef, prepared, cured, and rolled, so as to keep good for any length of time. The process of curing and mode of preparing were invented by John Tupling, in the exhibitors' employ.

21 **WARRINER & SOYER**, 7 *Upper St. Martin's Lane*—Producers.

Osmazone, or essence of meat.

22 **PAYNE & SON**, 328 *Regent Street*—Importers and Manufacturers.

Specimens of curry powder, curry paste, mulligatawny paste, Delhi chutnee, and curry sauce. Pickled mangoes (*Mangifera*), Limes (*Citrus acida*), bamboo (*Bambusa*), and green and red bird's-eye chili, from the East Indies. Bengal Club chutnee and curry and mulligatawny pastes, manufactured in Calcutta. Pistachia nut and kernel (*Pistacia*), used in confectionery, East Indies. Cashew nut (*Anacardium*), West Indies. Betel nut, the fruit of the *Areca catechu*, East Indies. Soy bean (*Soja hispida*), from which soy is made. Wild liquorice seed (*Glycyrrhiza*). Turmeric root and prepared turmeric (*Curcuma*), East Indies. Dahl, a species of lentil, much used in India. Paddy, rice in the husk. Gram (*Cicer arietinum*). Preserved ginger, from the East and West Indies; candied ginger, China; green ginger, West Indies. Cum-quot, or China orange, preserved in China. Guava jelly, Jamaica. Litchis, East Indies.

23 **UNDERWOOD, G. H.**, *Pendleton, Manchester*—Inventor and Proprietor.

Preserved meat. This article is preserved without the use of salt, and it may be kept an indefinite length of time without deteriorating its quality; when cooked, it retains its nutritious qualities, and eats almost as fresh as recently-killed meat.

24 **LINKLATER, J.**, 5 *Sidney Street, Commercial Road*—Producer.

Specimens of preserved meats.

26 **WHITNEY, JAMES**, *Calver Hill, Hereford*—Inventor.

Beef preserved in a dry state, peculiarly adapted for the use of sailors, being free from salt.

27 **WEATHERLEY, H.**, 54 *Theobald's Road*—Manufacturer.

Specimens of honey drops.

27A **WHEELER, FREDERICK**, *Rochester*—Importer.

Specimens of free-labour produce, loaf-sugar, coffee, rice, &c., as distinguished from the slave-labour produce of Cuba, Carolina, Brazil, &c.

28 **SNOWDEN, ROBERT**, *City Road* and *East Road*—Inventor and Patentee.

Samples of coffee, showing the woody fibre.

Sample of the whole berry coffee, roasted in patent enamelled cylinders.

Specimen of the crushed berry, showing the woody fibre, which is removed before grinding, by patent process.

Sample of the woody fibre removed from the heart of the coffee berry, which, by the ordinary processes, is ground up with the coffee.

Sample of patent purified coffee nibs, ready for grinding.

29 **LEBAIGUE, HONORE**, 10 *Little Titchfield Street*—Importer and Manufacturer.

Trinidad cocoa pod; cocoa from Grenada, St. Lucia, red Trinidad, grey Trinidad, Guyaquil, Maragnan, Caracas; Jamaica sugar, lump sugar, powdered sugar, arrow-root, tapioca; Iceland moss; Persian salep; cinnamon from Ceylon; cassia from China; vanilla from Mexico.

Chocolate and cocoa, showing the various stages of manufactures: roasted cocoa, cocoa nibs, cocoa milled, butter of cocoa, cocoa mixed with sugar, chocolate, cocoa powder, chocolate powder.

Chocolate of different kinds and shapes, and coffee.

Samples of chocolate for invalids. Imitations of Lisbon, Italian, and Spanish chocolate, in cake. Fancy chocolate in drops, silvered, marbled, &c. Vanilla, coffee, cinnamon, pistachios, liqueurs, pralines, cream, cigars, &c.

Cake of chocolate, three hundred pounds weight.

30 **PARIS CHOCOLATE COMPANY**, 252 *Regent Street*—Manufacturers.

Large and small tablets of chocolate, of various qualities.

Bourbon chocolate, of different kinds and qualities.

French syrup of all kinds of fruit; almond and gum syrup.

New chocolate-pot; new coffee-pot; and other articles.

Chocolate is said to be superior to cocoa in powder, or, as it is called, "soluble cocoa," for its nutritive qualities, and its facility of digestion. The new chocolate-pot is intended to render the preparation of this article for food more easy over a common coal fire.

31 **FRY, JOSEPH STORRS, & SONS**, *Bristol*—Producers.

Specimens of the leaves, flowers, branches, and other parts of the cocoa-tree (from Trinidad) Theobroma Cacao (*Theobroma* signifies "Food of the Gods").

Trunk of the cocoa tree.

Cocoa, or cacao nuts.

Specimens of the ripe fruit from Trinidad and Grenada, with some cut open, showing the nuts within the pods.

Cocoa nuts—dark red, grey, pale red, and Spanish cured, imported from Trinidad.

Cocoa nuts—dark, ripe, and bright; imported from Granada.

Cocoa nuts—imported from Guayaquil and Para.

Other varieties from South America.

Vanilla pods from South America, used for giving a flavour to chocolate.

Roasted cocoa nuts from Trinidad and Grenada.

Husks of the nuts, called in commerce "cocoa shell."

The kernel of the nuts, called in commerce "cocoa nibs."

Pure chocolate and cocoa, ground and fit for use.

Specimens of some of the chief varieties of chocolate and cocoas. Paste chocolate. Broma and chocolate powder. Granulated, soluble, and flaked cocoa.

View of Port of Spain, in Trinidad, the principal shipping port of cocoa.

View of Naparima in Trinidad, the chief locality for the growth of cocoa.

Illustrations of the cocoa tree.

Drawing, showing the processes of the manufacture of chocolate and cocoa.

View of a "drying house" and "cocoa walk" at Arima, in Trinidad, which was constructed solely with the timber of one single tree of the cedar kind.

[*Theobroma cacao* is the tree which yields the cocoa of commerce. It belongs to the natural order *Byttneriaceæ*. Large forests of this tree, which does not attain a great size, exist in Trinidad, from which island, in 1841, upwards of two million pounds were imported into Great Britain. The total imports in the same year were upwards of three million pounds.—R. E.]

32 White, George Bailey, 147 *Shoreditch*—Importer and Manufacturer.

Different specimens of the West India cocoa, raw, roasted, and manufactured. Chocolate in its various stages of manufacture, with samples of the different kinds.

33 Shinton, Richard, 29 *Spencer Street, St. George's-in-the-East*—Inventor.

Samples of fine cocoa, free from all deleterious properties.

34 Monteiro, Luis Antonio, 2 *Upper Phillimore Place, Kensington*—Manufacturer.

Samples of sweetened chocolate, made of Caraccas cocoa, without any adulteration or farinaceous admixture; of Caraccas and British West India cocoas; and of British West India Islands' cocoa. Chocolate lozenges and confection of Caraccas cocoa, with other ingredients.

35 Lane, William Raynerd, 226 *Strand*—Inventor and Manufacturer.

Essence of coffee, manufactured by a machine invented by the exhibitor.

36 Grut, Benjamin, 1 *Sambrook Court*—Importer.

Cocoa (*Theobroma cacao*), a variety known in commerce as *Caraccas cocoa;* little known in England, and consumed chiefly by the Spaniards of Spain and South America. It is produced on a plantation in the interior of New Granada; will keep in any climate, and improve with age, if kept safe from moisture.

37 Budd, Joshua Thomas, 82 *Mount Street, Grosvenor Square*—Manufacturer.

Extract of cocoa.

38 Benham, W. A., *Cross Street, Queen's Square, Bloomsbury*—Producer.

Samples of Trinidad cocoa in its separate stages; the cocoa-nut (cacao), in its raw state, as imported from Trinidad; the nut as roasted; nibbed and divested of its outer bark or shell; and finally, its manufactured state.

[The consumption of cocoa, as an article of food, has greatly increased within the last few years. The West Indian kinds generally contain a larger proportion of the peculiar fatty matter (oil or butter of cocoa) than that which comes from New Grenada, and consequently are not so much valued. It forms a very digestible nutritious aliment, containing a peculiar azotized compound, *Theobromine*, analogous to that contained in tea and coffee. - J. W.]

39 Benson, W., 133 *Oxford Street*—Importer.

Samples of Flor de Cabanas, Martinez, and Havanna cigars. Samples of tobacco.

40 Lambert & Butler, 141 *and* 142 *Drury Lane*—Manufacturers.

Tobacco imported from America, Havanna, Holland, &c.; and specimens of the articles manufactured from it.

[The total quantities of tobacco retained for home consumption, in 1842, amounted to nearly seventeen million pounds. Professor Schleiden gives a singular illustration of the quantity of tobacco consumed. North America alone produces annually upwards of two hundred million pounds of tobacco. The combustion of this mass of vegetable material would yield about 340 million pounds of carbonic acid gas, so that the yearly produce of carbonic acid gas from tobacco-smoking alone cannot be estimated at less than 1,000 million pounds—a large contribution to the annual demand for this gas, made upon the atmosphere by the vegetation of the world.—R. E.]

41 Bremner & Till, 60 *Fenchurch Street*—Producers.

Samples of tobacco.

42 Jonas Brothers, 42 *and* 43 *Leman Street, Whitechapel*—Manufacturers.

Specimens of cigars of home manufacture; and of tobacco, imported from the Havanna; with samples of the raw material.

43 Jones, Ben., & Co., 39 *Brunswick Square*—Importers.

Chest of foreign cigars, and various smaller boxes of British manufactured cigars.

44 Lundy Foot & Co., *Dublin*—Inventors and Manufacturers.

Snuff: Lundy Foot's high toast, Scotch, and stalk snuff, made solely from the leaf and stalk of Virginia tobacco. Cavendish, negrohead, and other forms of tobacco manufactured in imitation of the foreign or American.

45 Taylor, Thomas George, *Grove Street, Hackney*—Grower and Manufacturer.

Tobacco of English growth and manufacture. Leaves of the plant prepared by exposure in a confined, dry, light, and warm place. Samples of manufactured tobacco dressed with treacle and oil. Cigars, free from dressing. Snuff, resembling high-dried Welsh, pure. The stem of the leaf roasted and ground.

[The botanical name of the tobacco plant is *Nicotiana tabacum*. Its cultivation in England is said by Mr. Loudon to be restricted to the extent of half a pole, and that only for botanical or medicinal purposes.—R. E.]

46 Hyams, M., 79 *Long Lane, City*—Manufacturer and Inventor.

Cigars solely of British manufacture. Samples of cigars made of Havannah leaf, Columbian and Cuba tobacco, &c. A sample of straw cigars, as made in London, up to the year 1837, to show the improvement in the make of cigars. An improved cutting-board for making cigars. A case of clay pipes, the large bowls made of clay from the river Thames. A nest of racks; a model used for drying cigars. Implements for bundling and pressing cigars. A table cigar-case. A specimen carrot of Cuba leaf tobacco. Small samples of leaf tobacco, the produce of Columbia, Giron, Havannah, Germany, Florida, Maryland, &c. Sample of tobacco in its original state, and after having been adulterated with a preparation for flavoring.

47 Sales, Pollard, & Co., 57 *Red Cross Street, Cripplegate*—Manufacturers.

Cigars manufactured from Yara tobacco. It is shipped from the port of Manzanilla.

48 Buckland & Topliss, *Barrington Crescent, Brixton*—Inventors and Manufacturers.

Specimens of "the aromatic cigarilla," for the use of smokers, being composed chiefly of British herbs, and diffusing an agreeable perfume. Other aromatic and medicinal cigars.

49 **COHEN & ORR**, 41 *St. James's Street*—Importers.

Raw tobacco, and tobacco made into cigars by hand-labour at Havanna.

50 **GOODES, GEORGE & SAMUEL**, 12 *Prince's Street, Spitalfields*—Manufacturers.

Samples of British manufactured cigars; also, an arranged series, showing the process of manufacture.

---

52 **RICHARDSON BROTHERS**, *Edinburgh*—Manufacturers.

Tobacco, imported from Virginia into Leith.

Specimens of the raw material, as imported with the stalk on it, known as "leaf," or "unstemmed," tobacco; of the stalk extracted; and of "strip," or "stemmed" tobacco, which, after being damped with water, is manufactured into "twist," and made up into rolls; a cord is then wrapped round each 150, and put into a press for about a month, under a pressure of nearly five tons. The article, then, is "roll" tobacco.

Leaf tobacco and stalk.

Snuffs: black rappee, Scotch, and brown rappee.

---

53 **THE LONDON SPICE TRADE**—Importers.

Samples of spices and the places of shipment:—

No. 1. Mace, from Penang.

No. 2—4. Nutmegs; brown, from Penang; luned, from Batavia; and wild, from Singapore.

Nos. 5—7. Cloves, from Penang, Amboyna (Dutch produce), and Zanzibar.

Nos. 8, 9. Cinnamon, from Ceylon.

Nos. 10, 11. Cassia, from Canton.

No. 12. Pimento, from Jamaica.

Nos. 13—17. Black pepper, from Bombay, Tellicherry, Singapore, and Batavia.

Nos. 18—21. White pepper, from Tellicherry, Penang, Singapore, and Batavia.

Nos. 22—27. Ginger, from Jamaica, Cochin China, Calcutta, Sierra Leone, and Bombay.

Nos. 28—30. Carraway seeds, from Holland and Mogadore, and English.

Nos. 31, 32. Coriander seeds, from Madras, and English.

---

54 **FAULKNER, RICHARD & CHARLES**, 44 *Jermyn Street, St. James'*—Manufacturers.

Specimens of English tart fruits, preserved in bottles, without sugar.

---

55 **FORTNUM, MASON, & Co.**, 182 *Piccadilly*—Importers.

Preserved and dried fruits, and edible seeds, from various countries. Varieties of honey.

---

56 **CLEMENS, JOHN**, 25 *Mincing Lane*, and *Malaga*—Producer.

Specimens of Jordan almonds and raisins.

58 **SPUR, GEORGE**, *Boston*—Manufacturer.

Specimens of linseed cake prepared from English linseed.

58A **GRACE, D**, *Brighton*—Patentee.

Specimens of patent mushroom spawn.

---

59 **RICHARDSON, TIMOTHY, & SONS**, 6 *Duke Street, Southwark*—Proprietors.

1. Golding hops, grown in the district called "The Hill," in Mid-Kent, used for the finest ales.

2. Golding hops, grown in East Kent, used for the same purpose as No. 1.

3. Golding hops, grown in the heart of Mid-Kent, and used for the best brown beers.

4. Jones's hops, grown in various parts both of Kent and Sussex.

5. Grape hops, also grown generally through the hop plantations.

6. Colegate hops, a hardy plant, but of inferior flavour; the cultivation of it has much increased of late years.

7—9. Hops grown in Essex, Suffolk, and Worcester.

[These hops are samples of the varieties in most estimation for the purposes of the brewer. The Goldings take their name from that of the grower who first introduced them; they are considered to be the finest, richest, and most valuable in the market, varying, however, according to the soil in which they are grown, and the treatment they receive. Jones's are of a shorter growth than the others, and are thus useful by enabling the grower to make use of the poles which would be too short for the Goldings or other varieties. Colegates are hardy, but backward at harvest, running much to vine, and capable of growing in comparatively poor soils. These qualities are, however, of advantage, as the inferior soils may thus be beneficially occupied by them, and their harvest takes place after the finer sorts are all in. The grape hop takes its name from its habit of growing in clusters like the grape. It is hardy, not so particular as to soil as the Goldings, and is generally very productive in yield.—J. W.]

---

60 **ASHBURNHAM, JULIANA**, The Dowager Lady, *Broomham, near Hastings*—Producer.

A bag of hops, grown within three miles of the sea, in the parish of Guestling, Sussex.

---

61 **ATTFIELD, CHARLES**, *Farnham*—Producer.

Pocket of Farnham hops.

---

62 **PAINE, J. M.**, *Farnham, Surrey*—Producer.

Samples of hops of the "Golding" and "Farnham white bine" varieties, grown at Farnham. Other specimens are exhibited in Class 1, in connection with the rich phosphoric fossils which abound in the neighbourhood where these hops are cultivated.

---

63 **GOLDING, ROBERT**, *Hunton, Maidstone*—Manufacturer.

Pocket of Mid-Kent hops.

---

64 **PLOMLEY, FRANCIS**, *Maidstone*—Designer.

Drawing of a magnified view of the formation and growth of the hop fungus, from its earliest to its latest

65 **MASTERS, ALGERNON**, *Tonbridge*—Proprietor.

Four branches of dried hops. Samples of the same.

---

66 **PETERSON, THOMAS**, *Trinity Chambers, Water Lane, Tower Street*—Agent.

Specimens of oilseed cakes. Vegetable oils and manures.

68 **BURN, ROBERT**, *North Merchiston House, Edinburgh*—Importer and Manufacturer.

Cotton seed, seed-cotton, with oil, and oil-cake imported from the colonies.

[Were the cotton with the seed to be imported, and the seed separated from it at home, it might be applied to agricultural purposes at a greater profit. The cost of seed, freight included, was 2*d.* per lb. from Charlestown to Port Glasgow. Cotton oil-cake is now ordered at the same price as linseed cake. The produce of oil-cake and oil from cotton-seed, is two gallons of oil to one cwt. of seed, leaving about 96 lbs. of cake; 8 lbs. is the daily allowance for cattle in England. The exhibitor has a machine at work at Port Glasgow for extracting or separating seed from cotton wool.]

---

70 **SHEPPARD, ALFRED**, *Ipswich*—Proprietor.

"Eggshell white" wheat, and "Chevalier" malting barley, grown in Suffolk. Malt manufactured at Ipswich.

Wheat 65 lbs. per bushel; chevalier barley 56 lbs. per bushel; and malt 43 lbs. per bushel.

---

71 The TRURO LOCAL COMMITTEE—Producers.

Specimens of Cornish agricultural grains:—Black barley, skinless barley, grown and supplied by J. D. Gilbert, Esq., of Trelissick, near Truro. Indian corn, grown and supplied by Colonel Scoble, of Nansalvern, near Penzance.

Cornish red wheat, grown on the granite soils, especially adapted to the exposed situations in the neighbourhood of Penzance, and Cornish white wheat: the best sort to be grown on the high and exposed land of Cornwall, supplied by Mr. John Michell, of Feock, near Truro. Cornish barley, grown and supplied by the same, adapted for malting and grinding purposes. Agricultural produce, grown and supplied by the Rev. R. M. N. Eusticke, of Penwarne, in Mawnan, adapted for feeding cattle and poultry; grown on the poor and exposed peat soils of Cornwall.

---

72 WEBB, RICHARD, *Calcot Farm, Reading*—Producer.

Mummy Talavera wheat. Three grains of this wheat are said to have been found in the hand of an Egyptian mummy, and sent to Mr. Dobree, President of the Agricultural Society in Guernsey, who planted the same in his garden, and forwarded the produce to Col. Blagrove the following year. This produce he has successfully grown as a spring crop, and from it the present sample, grown by the exhibitor, is a specimen, the quality and crop being alike good.

[Much doubt has been raised as to the origin of the mummy wheats. The Egyptian wheat (*Triticum compositum*) is very different from the variety of common wheat (*Tr. vulgare*), called "Talavera." The Egyptian wheat has a head composed of three spikes, one erect in the centre, similar to the common wheat, and on either side another, not quite so large, attached to the base of the centre, and standing out at a small angle from it. Our climate is not suited to its growth, as, in the course of one or two years, the side spikes entirely disappear, and a coarse, thick-skinned grain is produced.—J. W.]

Specimen of the Wellington apple.

---

73 RAYNBIRD, ROBERT, *Hengrave, near Bury St. Edmunds*—Producer.

Sack of Kessingland wheat, grown upon a light soil, at Hengrave, Suffolk; this is a productive and new variety of wheat.

Sack of Chevalier barley, grown at Hengrave.

Sack of tick beans with white eyes, grown at Hengrave; a variety, called "Manchester white eyes."

---

74 RAYNBIRD, HUGH, *Laverstoke, Andover Road, Hampshire*—Producer.

Specimens of wheat produced by hybridization.

Specimens of Hopetoun and Piper's thickset wheat—the variety from which the hybrids were obtained, by fertilizing its pistils with pollen from the stamens of the Hopetoun wheat. To effect this, the stamens of the flower of the thickset variety were removed before they had reached maturity, by opening each of the glumes and carefully picking out the stamens upon the point of a needle: the pistils of the flower being left perfect, were a few days afterwards fertilized by dusting them with the pollen from stamens brought from the Hopetoun variety of wheat; this produced a great number of varieties, partaking more or less of the parent stocks, and from these the four specimens exhibited were selected.

[In the hybridization of plants experiments are always of much interest, and often productive of very important results, as the good qualities of two varieties may be obtained, or their bad qualities be counteracted. Hybrids obtained by the judicious intermixture of species, frequently produce seeds capable of giving origin to plants combining the characters of the two different parents; but hybrids produced by species closely allied but really distinct gradually lapse into the one or the other of the originals, and thus become extinct.—J. W.]

---

75 KENDALL, JOHN, *Treverlin, Truro, Cornwall*—Producer.

Sheaf of white wheat, named "The giant straw wheat;" grown by the exhibitor in quantities of from 10 to 15 acres for the last 10 years. This wheat is stated to have produced, on an average, 60 bushels per acre. Its superiority consists in the length, size, and stiffness of the straw, and in its abundant produce.

77 TAYLOR, JOHN, & SON, *Bishop Stortford, Herts*—Manufacturers.

Varieties of malt, viz.:—

Amber, used in brewing ordinary ales and porter.

Coloured, used for same purpose.

White, used in brewing pale ales.

Brown, used in brewing porter to give it flavour and colour.

[The various colours described are given to the malt by the different temperatures to which it is submitted after the germination is stopped. The essential oil contained in the barley is acted upon by heat, and different flavours are also produced. In the brown malt the saccharine matter is partially carbonized, and a peculiar empyreumatic flavour obtained.—J. W.]

---

78 WELLSMAN, JOHN, *Moulton, near Newmarket*—Manufacturer.

Sample of pale malt, manufactured from Chevalier barley.

---

79 MAUND, BENJAMIN, F.L.S., *Bromsgrove*—Producer.

Specimens of wheat, artificially hybridized, showing that its exterior form, and probably its chemical properties, can be modified, and its productiveness improved.

80 WRENCH, R., & SON, *London Bridge*—Producers.

Specimens of various kinds of grain most familiar to the London market.

82 PAYNE, H., *Birdbrook Moat, near Halstead*—Producer.

Varieties of grain.

---

83 STRANGE, WILLIAM, *Banbury*—Producer.

Samples of beans grown, in 1850, on stiff clay soil, without phosphate of lime or magnesia, and in cultivation, with 22 per cent. of phosphate of lime and magnesia.

85 MILNE, WM., *Rhynie, Scotland*—Producer.

One quarter of Scotch barley oats.

---

86 WALKER, WILLIAM, *Mossat, near Aberdeen*—Producer.

Sample of Kildrummie oats.

88 COUSENS, S., *Great Bentley, near Colchester*—Producer.

White wheat, new variety; weight of imperial bushel, 64 lbs. net.

90 FOX, JOHN JAMES, *Devizes*—Proprietor.

Specimens of red straw-white Essex wheat, and of Nursery, Lammas, and Talavera red wheat, grown in Wiltshire.

0A CAHILL, M., *Ballyraggit, Kilkenny*—Producer.

Samples of wheat, oats, and barley, grown at Grove Kilkenny.

---

91 STEVENS, RICHARD, *Stamford*—Producer.

Sample of wheat, Collyweston white.

92 CROUGHTON, WILLIAM PEEL, *Tenterden, Kent*—Producer.

Hoary white wheat; produce stated to be over five quarters per acre.

Golden pod beans; produce, from which the sample is taken, stated at four quarters and six bushels per acre.

93 ASPREY, JAMES, *Sandleford, near Newbury, Berks*—Producer.

White trump wheat, grown on a very poor soil; weight, 67 lbs. per bushel.

94 FORDHAM, THOMAS, *Snelsmore Hill East, near Newbury*—Producer.

Samples of hybridized white wheat; weight stated to be 66¼ lbs. per bushel.

Prolific beans; weight stated to be 70 lbs. per bushel.

95 JUSON, W., *Red Hill, Shrewsbury*—Producer.

Samples of grain and fine flour.

98 KEENE, WILLIAM, 42 *Cornhill*—Proprietor.

Specimens of the "forty-day maize" grown in England, from new sorts cultivated by the exhibitor in the Pyrenees.

99 IRWIN, ELIZABETH, *Ballymore, Boyle, Roscommon*—Producer.

Black barley, grown at Ballymore, in the county of Roscommon, Ireland, from African seed.

[Black barley is a variety of the common two-rowed barley (*Hordeum distichum*). In the course of cultivation the dark colour gradually disappears. It is a heavy cropper, and requires care at harvest, as, when the grain is ripe, the straw below the ear becomes very brittle and apt to break off.—J. W.]

100 BEXLEY, Lord, *Footscray, Kent*—Producer.

Bushel of white chittim wheat.

102 GIBSON, CHARLES, *Pitlochry, Perth*—Producer.

Four bushels of English barley, grown by the exhibitor near Pitlochry, about 600 feet above the level of the sea.

Hand-spun and hand-woven shepherd check plaid, composed of natural black and white wool from black-faced Highland sheep.

Hand-spun and hand-woven shepherd check plaid, composed of blue dyed and white wool from black-faced Highland sheep.

103 GUILLEREZ, ACHILLE FRANÇOIS, 37 *Castle Street, Edinburgh*—Producer.

The lentil, or *Ervum lens* of botanists—known and extensively cultivated in the earliest ages, especially in the East, being probably similar to the "red pottage" of Esau.

The exhibitor has cultivated lentils at South Queensferry, near Edinburgh, for two years; he has successfully grown and ripened in soil manured by sea-weed, the small lentil and the large red (the common, or Egyptian).

[In Egypt, Syria, and Hindustan, lentils form at the present day a chief article of food among the labouring classes. They are also a common ingredient in French cookery.—J. L.]

103A SADLER, WILLIAM JAMES, *Swindon, Wilts*—Producer.

"Lawrance's prolixus," crystal white. This wheat has qualities which are considered to render it highly deserving of cultivation. The root is adapted to draw nourishment from an unusual depth in the soil, produces a strong straw, effectually resists the storm, affords a prolific yield; and its colour and weight are good. Yield of sample shown, stated at 66½ lbs. per bushel.

104 GIBBS, THOMAS, & CO., *Half-Moon St., Piccadilly*—Importers and Producers.

Collection of dried specimens of grasses used in laying down land for permanent pasture, with seeds of the same. Specimens of wheat, barley, &c.; collection of various agricultural, kitchen garden, and other seeds.

105 LAWSON, PETER, & SONS, *Edinburgh*—Producers.

Specimens of the vegetable productions of Scotland, comprehending all substances used for food in the chemical arts and medicine, in manufactures, and in house and ship building.

This collection is divided into six sections, as follows:—

1. Plants cultivated for their farinaceous seeds, together with their straw or haulm.
2. Plants cultivated for their herbage and forage.
3. Plants cultivated chiefly for their roots.
4. Plants cultivated for their uses in the arts, manufactures, and for various economical purposes.
5. Plants cultivated for their medicinal properties
6. Plants cultivated for their timber.

A detailed account of each specimen is contained in a catalogue printed by the exhibitors.

106 JONES, G., *Redland, Bristol*—Producer.

Specimen of wheat, grown by spade culture and dibbling.

107 H.R.H. PRINCE ALBERT—Producer.

Three samples of grain grown on the Royal Farm at Windsor, consisting of wheat, oats, and beans, one bushel of each.

107A WRIGHT, HENRY, *Antingham, near North Walsham*—Manufacturer.

Malt, manufactured from barley grown by the Rev. Cremer Cremer, of Beeston, near Cromer, Norfolk.

108 GENTILE, JOSEPH PASCAL, *Harbertonford Works, near Totness, Devon*—Manufacturer.

Macaroni and Italian pastes. Prepared flour.

[The hard wheats are best adapted for the manufacture of these substances. They contain more gluten than the soft wheats.]

Prepared flour and cocoa as a chocolate.

Vegeto-animal food; a compound of the nutritious principles of meat and wheat, &c.

110 WATT, GEORGE, *Upper Balfour, Banchory, Scotland*—Producer.

Sample of barley, grown after turnips, in a five-course rotation, turnips, barley, hay, pasture, oats, with the ordinary farm-yard manure. Exhibited for quality.

112 SUTTON, JOHN, & SONS, *Reading*—Producer.

Specimens of grain. Skinless Chevalier barley, a new variety. Purple-topped yellow hybrid turnip, valuable for late sowing, as a substitute for swedes. Lincolnshire red turnip, from the stock of Philip Pusey, Esq., M.P.

114 M'KILLICAN, JAMES, *Piperhill, Cawdor, Scotland*—Producer.

Sample of perennial rye-grass seeds (*Lolium perenne*), raised on the farm of Piperhill, Nairnshire. They are the produce of the third year's crop; weight 37 lb. 3 oz. per bushel.

Sample of white wheat, the produce of the first crop, from land formerly worthless, on the same farm, manured by 300 lbs. weight of Peruvian guano to the acre. Produce per imperial acre about five quarters; weight per bushel, 65 lbs. 1 oz.

115 ILLINGWORTH, ALEXANDER, *Banchory Ternan, Scotland*—Producer.

English barley, weighing 53½ lbs. per bushel. Scotch birley oats, weighing 44 lbs. per bushel. Perennial rye-grass seeds, weighing 30½ lbs. per bushel.

116 **Batty & Feast**, *15 and 16 Pavement, Finsbury Square*—Inventors and Manufacturers.

Vegetable productions preserved in distilled vinegar. A pine apple, with roots and leaves. An orange-tree, branches, and fruit, and branches of citron and fruit. Cucumbers, grown in England. A variety of preserved fruits and other comestibles.

117 **Colman, J. & J.**, 9 *College Hill, City*—Manufacturers.

Specimens of starch, from wheat and rice, mustard, British gum, indigo blue, &c.

The "satin glaze rice-starch" of the exhibitors possesses the following advantages:—From its extreme fluidity it is more economical than common starch; it is free from mucilaginous matter; it does not require boiling, and the clearness, colour, and glaze, which it imparts are permanent. It is particularly adapted for lace, and the finer fabrics of linen, cotton, &c.

["British Gum" consists in reality of torrefied starch. The granules of starch, in its ordinary form, are enveloped in a thin pellicle, insoluble in cold water. By roasting the starch, the membranous envelopes are burst open, and their granular contents are then readily soluble in cold water. It is used, among other purposes, for thickening the colours of calico printers.—R. E.]

118 **Noak, W. & John**, *Covercroft Salt Works, Droitwich*—Manufacturers.

Sample of the brine from the salt-works at Droitwich, obtained at the depth of 173 feet below the surface.

Specimen of rock salt: only a small quantity of this is obtained in the neighbourhood.

Specimen of bay salt; an article supplied to druggists.

Hopper or Maldon salt; used as a dessert with wine, instead of olives.

Coarse broad salt; exported for the fisheries.

Brisk salt; used for chemical purposes, fisheries, and exportation.

Lymington grained salt; used for curing bacon and butter and for exportation.

Best cooking salt, superfine table salt, and refined table salt; used for various domestic purposes.

Pickings, or cattle lickings, a valuable and useful article for sheep or cattle, which they eagerly seek after and enjoy.

[The salt manufacture of Droitwich, Worcestershire, existed at a very early period: it is mentioned as in operation at the time of the Roman invasion; then it was carried on in a primitive style, and at considerable expense. The brine springs here extend over a very limited space of land, and are comprised within a circle of about 200 yards in diameter. Formerly the brine was obtained by boring: this process made it rise to the surface and run to waste; for, ascending through and mixing with the fresh-water springs, it was very much lowered in strength, and the manufacture of the salt, which was conducted by evaporation, was attended with great expense, owing to the quantity of fuel required to vaporise the water.

Within the last 50 years an improvement was effected by casing the pit with wood, and thus partially preventing the fresh water mixing with the brine. More recently, the principle was introduced of sinking a shaft quite through the fresh-water springs, and then making the bottom and sides of the pit secure with iron cylinders, before boring down to the brine springs. By this means the brine is obtained at its full saturation, or about 42 parts of salt in the 100; whereas formerly it varied between 28 and 37 per cent.

The exhibitors recently obtained a patent for improvements in manufacturing salt; and, by using very large evaporating pans of an improved construction, they obtain larger quantities of salt, at a considerable saving of labour to the workmen, who obtain better wages and longer intervals of rest.

The source of the brine in Droitwich is inexhaustible, and exhibits no diminution of strength or quality: it lies at a depth of 173 feet from the surface, but as soon as it is reached by boring it rises up to the level. The salt manufactured here is exported largely from the ports of London, Gloucester, and Bristol. There are upwards of 70,000 tons per annum manufactured, of which 40,000 tons are used for domestic and agricultural purposes; the remainder is used chiefly for chemical decomposition and exportation. The Droitwich salt has always been celebrated for its strength and purity.]

119 **Dewar, Thomas**, *Newcastle-upon-Tyne*—Manufacturer.

Specimens of brown and white mustard seed, from which mustard for table use is made.

[The mustard of commerce belongs to the family of cruciferous plants. Its introduction as an article of extensive employment at the table, only dates from the beginning of the last century. It is principally cultivated in the North Riding of Yorkshire.—R. E.]

120 **Levy, Walter**, 2 *White Row, Spitalfields*—Manufacturer.

Specimen of Taganrog wheat; the same, granulated, with the flour and bran extracted.

Samples of maccaroni celery and vermicelli.

121 **Tucker, Richard Grant**, *Lenton, near Nottingham*—Manufacturer.

Starch, used by the lace-dressers in Nottingham.

Gum substitute, used by cotton, silk, woollen, and wall-paper printers, for giving consistence to colours.

Adhesive, or label gum, suitable for postage stamps.

The residue, or glutinous matter, remaining after starch is extracted from wheat.

[A large number of plants and vegetable substances contain starch. It is found in seeds, roots, tubers, and stems. It is often obtained from wheat which has become accidentally damaged. From its insolubility in cold water, it is easily washed out of any vegetable tissue which may contain it, and thus it may be partially separated from other substances present in the matter operated upon. But there are some from which it cannot be thus separated, and here, by an ingenious method, chemical decomposition is employed to get rid of them. The liquor in which some of the starchy particles are contained is allowed to ferment. By this means the gluten, albumen, &c., become, in a great measure, dissolved, and the starchy particles are left unaltered, and separate themselves by precipitation. The largest source of starch of late years has been the potato, from which it is obtained simply by rasping and washing.—R. E.]

122 **Tucker, Edward**, *Belfast*—Manufacturer.

Glue and starch, produced at Belfast.

[The manufacture of the common and useful substance, glue, forms an interesting branch of the industrial arts. It is procured from the parings of hides, parchment, and refuse leather of all kinds. Such matters, after a preparatory cleaning in alkaline water, are boiled in large vessels for some time. The liquid is then run off and is found to be charged with an impure solution of gelatine; on cooling, the sheets of glue are left in frames to dry. This part of the process is often singularly affected by atmospheric vicissitudes. The state of the air during thunder-storms produces a remarkable effect on the glue, and often spoils the manufactured product. The substance commercially called "gelatine" is a very pure description of glue obtained, like it, from animal substances carefully selected and purified, so as to be fitted for human consumption. It has been largely used of late as a substitute for isinglass.—R. E.]

123 **BROWN & POLSON**, *Thrushcraig, near Paisley*—Manufacturers.

Patent powder starch, manufactured from sago flour (the exhibitors being inventors of this article).

Patent soluble starch, granulated, manufactured from potato flour.

Patent wheat starch, manufactured from wheat.

Arrow-root, manufactured by the exhibitors.

124 **WOTHERSPOON, ROBERT**, *Glenfield Starch Works, Maxwellton, near Paisley*—Manufacturer.

Specimen of Glenfield patent powder starch, manufactured from sago; a new material, from which the starch is made.

125 **RECKITT, ISAAC, & SON**, *Hull*—Manufacturers.

Patent imperial wheaten starch, white and blue.

Patent soluble starch, blue and white, made from potato flour.

Patent sago starch.

Potato flour, used as a raw material in the manufacture of starch, and for stiffening Manchester calicos, muslins, &c.

Wheaten starch powder, used in perfumery and confectionery.

126 **SHAND & MUCKART**, *Montrose*—Producers.

Samples of starch.

127 **MILLER, DAVID & WILLIAM**, *Musselburgh, near Edinburgh*—Producers.

Starch: household white, bleachers' wheaten, Royal blue, and sago flour. Scotch farina, Nos. 1 and 2. Arrow-root.

128 **JONES, ORLANDO, & CO.**, *Battersea*—Inventors, Patentees, and Manufacturers.

Specimens of starch manufactured from rice, and of rough starch, hair powder, and gluten, obtained in the process of manufacture.

The process (patented in 1840) is the result of the discovery that a weak caustic alkaline solution has the property of separating starch from the gluten and fibrin with which it is combined in farinaceous substances. This process has enabled the patentee to substitute rice for wheat in the manufacture of starch: this substitution, besides other advantages, possesses that of preserving wheat for the more important purposes of human food. This starch requires no boiling—a point of great importance in its use; and, being less hygrometric than wheat starch, retains a more permanent stiffness and glaze. The rough starch obtained in the process is valuable for feeding purposes, and for stiffening coarse fabrics.

129 **PIESSE, SEPTIMUS**, 43 *Molyneux St., Marylebone*—Inventor and Manufacturer.

Lactine or artificial milk, composed of yolk of eggs, gum acacia, honey, and salad oil; manufactured by the exhibitor.

This material contains all the elements of natural milk from the cow:—Caseine, albumen, gum, grape sugar, and fatty matter. On gradually mixing it with water, it forms either cream or milk, according to the rate of its dilution. Chemically, it resembles milk in its action towards re-agents, and, as in milk, we have the true emulsion of fatty matter (butter) in water, without the intervention of any alkali.

Lactine keeps well for one or two years. On being mixed with water, it forms artificial milk for the use of sailors on a long voyage. With coffee, tea, and chocolate, it acts like ordinary milk, from which it can scarcely be distinguished.

Pistachio nuts (*Pistacia vera*) and pistachio-nut kernels, from the shores of the Mediterranean; imported by the exhibitor. The latter forms a cooling emulsion. The fecula, prepared like starch, is used as a cosmetic. It is very oily, sweeter than almonds, and is commonly eaten in the south of Europe and in India, at the dessert, and for confectionery.

Pistachio-nut powder (the fecula of pistachio kernels), manufactured by the exhibitor. This powder is used for whitening and enamelling the skin, for removing redness of the features, for drying the hands, and preventing perspiration—an advantageous substitute for the preparations of bismuth, largely used for the same purposes.

Patchouly plant (*Pogostemon patchouly*), a native of India and China; and essence of patchouly, a perfume distilled from it by the exhibitor.

Sulpho-nitro muriatic acid, or everlasting chlorine, for disinfecting purposes and deodorising the sick chamber; invented by the exhibitor. The materials, employed slowly generate chlorine, and continue in action for several months.

130 **BERGER, SAMUEL, & CO.**, *Bromley, Middlesex*—Manufacturers.

Specimen of rice starch, blue and white, made under the exhibitors' patent; also, samples of Madras and Bengal rice, from which this article is usually made.

131 **HALL, THOMAS**, *Lenton, near Nottingham*—Manufacturer.

Patent starch.

132 **M'GARRY & SONS**, *Palmerstown and Ashtown Mills, Dublin*—Manufacturers.

Specimens of linseed and refined rape oils. Linseed and rape cakes. Specimen of Irish mustard.

Specimens of copper plates and lead pipes.

133 **MCCULLUM, MALCOLM**, 12 *Cannon Street, Leith*—Discoverer and Producer.

Specimens of the rhizome, or creeping stem, of *Typha latifolia*, or "large red mace." The Gaelic name is 'morthan;" the central part is edible in its raw state; when dried and separated from the fibres, it affords a meal, or flour, of a sweet and agreeable taste, which can be made into bread or starch.

Sample of the meal. The fibres of the stem are a substitute for lint. This plant grows in abundance in lakes and marshy places, and is very prolific.

134 **EDWARDS, HENRY**, 32 *Great Windmill Street, Haymarket*—Inventor and Manufacturer.

A mass of "custard powder," capable of producing 896 quarts. Composed of flour and other ingredients.

138 **ST. ETIENNE, Madame DANIELE**, *Harberton Ford, Totness*—Agents, **TOOTAL and BROWNE**, 73 and 74 *Piccadilly*—Producer.

Specimens of wheat-gluten, mixed with wheat flour, or potato-flour. Used chiefly as food, especially for invalids, in the form of soups, puddings, biscuits, &c.

Specimens of vegeto-animal compounds for long voyages, &c.; prepared with wheat-gluten, and beef, veal, mutton, gelatine, poultry, fish, &c.; the same with fruits. Used in the preparation of soups, puddings, pies, and other dishes.

Specimens of chocolate, biscuits, &c., improved in nutritive power by the addition of wheat-gluten.

Specimens of starch and potato-flour, artificial sago, pioca, arrow-root, &c.

Specimens of gums. Potato-flour and starch gums, all soluble in cold water.

Inferior gum-arabic, cleaned and granulated, with improvement in the quality. All these gums used as substitutes for natural gum for printing, chemical, and general purposes.

139 **Moore, Edw. Duke**, *Ranton Abbey, Eccleshall, Stafford*—Patentee.

Essence of milk, requiring only the addition of water to produce perfectly fresh milk. Samples combined with chocolate, cocoa, and coffee.

[In specimens similar to that described, inconvenience is often occasioned by the crystallization of the sugar of the milk, which is but sparingly soluble.]

140 **Fadeuilhe, V. B.**, 19 *Newington Crescent, Surrey*—Patentee, Manufacturer, and Inventor.

Consolidated milk for long sea voyages, and for medicinal and domestic use. After being dissolved in boiling water and reproduced in the form of milk, the solution will keep perfectly pure for four or five days; it may be boiled as often as required without "breaking;" and is miscible with all kinds of spirits.

[The preservation of the substance in question is due to the entire expulsion, by evaporation, and various other processes, of the watery constituents of milk. In the absence of a certain quantity of water putrefactive changes cannot proceed.—R. E.]

141 **Glass, George Michael**, *Brandon Street, Walworth*—Inventor and Manufacturer.

Gelatine for culinary and manufacturing purposes.

142 **Gardner, John**, M.D., 51 *Mortimer Street*—Discoverer.

Leaves of a tree, said to contain a nutritive crystalline principle, identical with that of Chinese tea (*Theine*), showing the leaves in their natural state, simply dried, also in various forms after having undergone the necessary preparations for use.

143 **Assam Company**, 30 *Great Winchester Street, City*—Producer.

Samples of tea, the produce of Assam (*Thea Assamica*).

Assam became a British possession in 1826, at the conclusion of the Burmese war. The tea-plant was found to be indigenous there, but this fact was not generally known until the year 1834. In 1839, the Assam Company was formed. It is incorporated, and its object is the cultivation and manufacture of tea. Owing to impediments of various descriptions, its early operations were checked, and have been confined to the cultivation of about 1,000 acres. Until recently the results of the cultivation and manufacture of tea in a commercial point of view have not been ascertained. They are now fully established.

The tea realizes in England high prices, and is considered to be of fine qualities. It is entirely manufactured by natives of India.

144 **Saunders & Gatchill**, *Dublin*—Agents.

Chicory in all its stages, from the kiln-dried root to the ground dust, fit for use.

"Chicory" and endive greens, the root of which is used as a substitute for coffee. The leaves are also largely used in a manufactured state, as a dye-stuff, called "pastel," or imitation woad," of which they form the principal ingredient, for the purpose of rendering the colour permanent in woollen cloths.

[Chicory is the *Cichorium intybus*, a plant of the order Compositæ, indigenous in most parts of Europe.—E. F.]

146 **Poole, Sarah Rebecca**, *Kingston-on-Thames*—Producer.

Patent crystallized malt, used by porter brewers. Upon breaking a grain it will be seen that its substance has been converted into sugar; its properties consist in producing double the quantity of extract, and giving porter the desired flavour.

149 **Perkins, Henry**, *Hanworth Park, Middlesex*—Producer.

A loaf of sugar, made by W. J. Evans, M.D. in Mr. Perkins' kitchen at one operation, and without filtration through animal charcoal, from canes grown by Henry Perkins in his hothouse, Hanworth Park, Middlesex.

A bottle of rum which was also made at the same time, from the same canes, by Dr. Evans.

150 **Kidd & Podger**, *Isleworth, Middlesex*—Manufacturers.

Specimens of extra superfine flour dressed through Swiss silk machines, and manufactured from English wheat and Australian wheat.

152 **Marriage, E.**, *Colchester*—Producer.

Samples of flour.

153 **M'Cann, John**, *Beamond Mill, Drogheda*—Manufacturer.

Coarse cut oatmeal, used for making stirabout, or porridge, in Ireland.

154 **Stonehouse, Alexander**, *Farina Works, Dunning, Perth*, and 43 *Molyneux Street, Bryanston Square*—Producer.

Specimen of farina, used as food, and in manufactures.

157 **Styles, Thomas**, 148 *Upper Thames Street*—Manufacturer.

Ashby's prepared groats, barley, and pea-flour, for the production of pure gruel, barley-water, light puddings, and food for infants, pea-soup, &c.

159 **Chitty, Edward**, *Guildford*—Manufacturer.

Specimens of flour.

160 **Fitch, Fred. Chs.**, *Steeple Bumpstead, Essex*—Producer.

Sack of fine wheaten flour, manufactured from Essex wheat.

161 **Smith, J.**, *Hare Craig, Dundee*—Manufacturer. Agent in London, **J. Robertson**, 48 *Devonshire Street*, and 35 *Walbrook, City*.

Samples of patent oat flour.

162 **Buck, P., & Son**, *Danby Mills, near Middleham, Bradford*—Producers.

Double superfine flour; fine flour; wheat meal and oat meal. Exhibited for colour and quality.

163 **Hattersley, W.**, 136 and 137 *St. George's East*, and 15 *Lisle Street, Leicester Square*—Producer.

A preparation of tea.

SECT. I.

CLASS 4.

VEGETABLE AND ANIMAL SUBSTANCES USED IN MANUFACTURES.

INTRODUCTION.

THE present Class concludes the first section relating to Raw Materials and Produce. Within the limits of the present Class are included a great variety of substances employed in the arts and in manufactures. The Class is subdivided generally into substances of vegetable, and substances of animal origin. The former division comprises gums and resins, oils, acids, dyes and colours, tanning materials, fibrous and cellular substances, timbers, and miscellaneous articles applied to various economical purposes. The latter division includes materials for textile fabrics, for the production of chemical substances, and for pigments and dyes.

The objects included in this Class are placed in SOUTH GALLERY P, and succeed those belonging to the preceding Class in order of arrangement. The Class, although embracing a variety of substances, is not an extensive one, regard being had to the space occupied. Among the substances of vegetable origin of interest in the arts, are oils of various kinds, together with their solid and fluid principles; stearine and oleine, varnishes made by the solution of a variety of resinous substances in alcohol or wood spirit; specimens of wax, and of the same in a manufactured state. Interesting series of dyes and colours are also exhibited. The beautiful colours derived from various lichens by a curious chemical process, are shown with their application to textile fabrics, and gum. The splendid colours yielded by safflower, indigo, and other vegetable substances are also illustrated. This Class is particularly rich also in its illustrations of the fibrous materials used for cordage and clothing. Specimens are shown of China grass, a fibrous product from *Urtica nivea*; of New Zealand flax; of hemp of various growths—Indian, Egyptian, Belgian, American, and Russian; and of flax from various countries. The fibrous substance commercially known as jute, is also illustrated. The fibrous material obtained from the husk of the cocoa-nut is exhibited in its various stages of manufacture and in its applications to the production of fabrics. Specimens illustrative of the application of new processes to the preparation of flax for spinning have also a place in this Class, and appear to promise useful results in the employment of this material in textile manufactures. Corks of different kinds, and new fibrous substances applicable to textile purposes and for paper, are also shown. The specimens of different timbers used for construction and ornament have great technical interest. The botanical names, habitats, and uses of the trees producing these woods are attached to their description in the Catalogue. This will enable the merchant to supply himself with accurate information upon a variety of fancy woods hitherto only recognized under their commercial appellations. In the space allotted to the preceding Class will also be found illustrations of various useful timbers. The preservation of timber is illustrated by several series of specimens indicating the progress of decay, and its arrestation in wood equally exposed.

The substances derived from the animal kingdom include specimens of whalebone in different stages of manufacture; wools of various kinds in the raw state, and as cleansed from some impurities. Mohair, horse-hair, in various conditions of manufacture; down and feathers. Some interesting results of the attempt to breed the silkworm in England, are exhibited in raw silks obtained, and in manufactured specimens. Raw and thrown silks of their natural colour and variously dyed are also shown. Animal oils, gelatine, glues, and pigments and dyes of animal origin are also included in the objects contained within this Class.

The four Classes comprised within this section deserve and demand attentive study. The objects comprised by them form the materials out of which all that is beautiful and useful in this great collection has been created, and indicating in their various states the preliminary application of human industry to their preparation for further usefulness. The study of them is a valuable introduction to that of the other Classes, in which constructive industry is illustrated as contrasted with that preparative series of operations exhibited by the objects included within the first section. The consideration of results is more generally interesting than that of the processes leading to them; but the latter study is unquestionably the most instructive. To the philosophic inquirer into the objects of this Exhibition, this section will probably appear the most interesting of all, as the development of raw material in all the varied forms assumed in those sections is observed in Machinery, Manufactures, and Fine Arts.—R. E.

1 **Grigor, J., & Co.**, *Nurseries, Forres, Scotland*—Producers.

Native Scotch pine plants, of various sizes and ages, some of which are raised by a new method, which produces fibrous roots, and adapts them for bare and exposed situations. Larch plants of various sizes and ages. Weeping birch, one year old, from seed produced by native trees on the banks of the Findhorn, Morayshire; sown April 20, 1850.

2 **King, Emma**, *Church Street, Edmonton*—Producer.

Specimens of anatomised plants, arranged as an ornament.

2A **Cooke, E. W.**, *The Ferns, Victoria Road, Kensington*—Producer.

Preserved pitcher plants. These natural pitchers are appended to the leaves of a plant, a native of the East Indies, growing in stagnant, swampy places; it possesses the faculty of distilling the purest water. The pitcher during the period of its growth remains closed; but when quite expanded and full of water the lid opens. The pitcher of some species will contain nearly one quart. The case contains specimens (which were dried in hot sand to preserve their form) of the following species, viz.:—Nepenthes Rafflesiana (Singapore); N. ampullacea (Singapore); N. Loddigesii (Singapore); N. distillatoria (Ceylon).

Also a specimen of Sarracenia, and a species of Cephalotus; which both grow on the ground.

The palm and other seed-vessels are introduced merely for ornament.

3 **Stevens, William**, 1 *Rock Place, Tottenham Road, Kingsland*—Inventor.

Preserved flowers, retaining their natural form; intended to form cabinet illustrations of botany.

3A **Crowcher, C., jun.**, *Chapel Place, Liverpool Road*—Producer.

Specimen of calcined straw.

4 **Pursey, William Henry**, 14 *Spring Street, Sussex Gardens, Paddington*—Manufacturer.

Flowers used as ornaments for garnishing meats, &c.; cut out of vegetables, such as carrots, turnips, beet-roots, &c.

[This curious art gives exclusive employment to several persons in the Metropolis.]

5 **Rock, Mary**, 6 *Stratford Place, Hastings*—Producer.

Ornamental stand, formed chiefly of a species of grass which grows on the cliffs at Hastings, and is used for ladies' work-baskets, table-mats, &c. The stand contains specimens of Hastings pebbles.

[The Hastings pebbles are from the calciferous grit of the Tilgate beds which form the "White Rock" of Hastings, but are often elsewhere seen in more tabular masses, resting on a very compact conglomerate, enveloping large rolled pebbles of variously-coloured quartz, and jasper and smaller ones of pure white quartz and flinty slate.—D. T. A.]

5A **Tilley, Lieut., R.A.**, *Fivehead, Taunton, Somerset*—Designer.

A series of beautiful specimens of the leaves of various trees, anatomised, prepared, and arranged by the exhibitor.

Perfect skeletons of the leaves of the sycamore, poplar, aspen, ivy, lime, and wild or wood-medlar trees (or of the *Pseudo-platanus, Populus, Populus tremula, Hederahelix, Tilia*, and *Mespilus diffusa* of Linnæus), grouped, dyed black, and displayed on a white drawing-board, to show their contrast in kind, texture, shape, and shade.

Groupings of some of the above leaves, dyed and undyed, on a blue and white drawing-board, and placed in a glazed frame, divided into compartments, one of which contains a vegetable or leafy picture of the year, shown by twelve growing and fading changes of the elm leaf (*Ulmus campestris*). Also strawberry leaves (*Fragaria vesca*), displayed under the similitude of a snake, from their spotted resemblance to the skin of that reptile, overlaid by ferns brought from the island of Madeira by Mrs. Susan Farrent. In this specimen is exemplified one of the most difficult operations in vegetable anatomy. In a small circular gilt frame may be seen two anatomized pear leaves (*Pyrus*), having the appearance of *three*, the one being whole, the other divided from the tip to the leaf stalk or stem, and the two parts laid open right and left. The minutest threads in the texture of the one side having its counterpart in that of the other; a task of no small difficulty, when it is considered that they previously undergo the double process of anatomy and dying, added to the frail and delicate nature of the material operated on. Some of the arrangements are under-lettered with letters cut from the leaf in its different stages of growth and decay.

[The whole of these specimens owe their origin to the accidental circumstance of the operator's going to the pond-side for water to refresh his flowers in the dry summer of 1840, when the fragment of an elm leaf floating into the dipper in its skeleton state suggested the idea of effecting its anatomy by artificial means. He was then in his sixtieth year, and had never seen or attempted anything of the kind before.]

6 **Harrison, Richard & John**, *Hull*—Producers.

Specimens of English and Foreign Woods.

Alder, English.
Apple-tree, English.
Ash, English.
Ash, American.
Barwood, African.
Beech, English.
Beech, Dutch.
Birch, English.
Birch, American.
Birch, Russian.
Blackwood, East Indian.
Blackthorn, African.
Butternut, American.
Boxwood, Turkey.
Boxwood, Brazilian.
Boxwood, European.
Braziletto, Jamaica.
Brazilwood, Pernambuco.
Camphorwood, Brazils.
Camwood, African.
Canarywood, Brazils.
Canazuetta.
Cedar of Lebanon.
Cedar, Havannah.
Cedar (pencil), North America.
Cedar (red), New South Wales.
Cedar (white), New Brunswick.
Cherry-tree, English.
Chesnut (horse), English.
Cocus, West Indies.
Cocus (cut endwise), West Indies.
Coromandel, Ceylon.
Cotton-tree.
Cypress, Egypt.
Cypress, English.
Ebony (black), African.
Ebony (green), West Indies.
Ebony (marble), Ceylon.
Elm, English.
Elm Pollard, English.
Elm (rock), American.
Fir, Scotch.
Fustic, South American.
Giraffwood.
Greenheart, Demerara.
Gumwood (blue), New South Wales.
Gumwood (red), New South Wales.
Hackmatack, Canada.
Harewood, English.
Hemlock, New Brunswick.
Hickory, United States.
Holly (white), English.
Hornbeam, English.
Horseflesh-wood, Rio Janeiro.
Ironwood, Brazils.
Jakwood, East Indies.
Kiaboca, or Amboyna (trunk of), Singapore.
Kiaboca, or Amboyna (burr of) Singapore.
Kingwood, Brazils.
Kingwood, African.
Laburnum, English.
Lancewood (red), Cuba.
Lignum-vitæ, St. Domingo.
Lemon-tree, Sicily.
Lime-tree, English.
Locust-tree, North America.
Logwood, Bay of Campeachy.
Mahogany, Cuba.
Mahogany, St. Domingo.
Mahogany, Jamaica.
Mahogany, Honduras.
Mahogany, Bahama.
Mahogany, Panama.
Mahogany, African.
Mahogany, South Australian.
Maple, English.
Maple (Birds'-eye), American.
Maragaybo, Bay of.
Mosatahiba, Rio Janeiro.
Mulberry, Valparaiso.
Niagara-wood, from the Falls.
Oak, English.
Oak Pollard, English.
Oak, Memel.
Oak, Canada.
Oak (wainscot), Riga.
Oak, Dutch.
Oak, Botany Bay.
Oak, New Zealand.
Oak (live), North American.
Oak, African.
Oak, South American.
Olivewood, Leghorn.
Orange-tree.
Palm-tree, Palmetto, Palmyra, India.
Paraiboo.
Partridgewood, Brazils.
Pheasantwood, Brazils.
Pear-tree (plain), English.
Pear-tree (stained), English.
Pear-tree (figured), English.
Pine and Fir, American White.
Pine and Fir, American Red.
Pine and Fir, Baltic Red.
Pine and Fir, Baltic White.
Pine and Fir, American Spruce.
Pine, Swiss.
Pine and Fir.
Pine (Pitch), United States.

Larch, Scotch.
Pine.
Pine Fir.
Pine Cowdie, New Zealand.
Plane-tree Lacewood, Levant.
Plum-tree, English.
Poplar, English.
Quassiawood, West Indies.
Quassiawood, Brazils.
Red Saunders, or Rubywood, East Indies.
Rosetta, or Damsonwood, East Indies.
Rosewood, East Indian.
Rosewood, Mexican.
Rosewood, Brazils.
Rosewood, African.
Rosewood, Honduras.
Sabicû, Cuba.
Sandalwood.
Sapanwood, Siam.
Satinwood, St. Domingo.
Satinwood, East Indian.
Satinwood, Porto Rico.
Sassafraswood.
Saul, East Indies.
Snakewood, Surinam.
Sycamore, English.
Teak, Moulmein.
Teak, African.
Tambookie.
Totag'o.
Tulipwood, Brazils.
Tulipwood, Botany Bay.
Tulipwood, French.
Valparaiso wood.
Violetwood Brazils.
Walnut, English.
Walnut (black), Mexican.
Walnut (black), American.
Willow, English.
Yellow-wood, East Indies.
Yew, English.
Zebrawood, Brazils.
Several specimens of unknown wood.

7 **Burnett**, Sir W., M.D., K.C.B., F.R.S., 53 *King William Street, London Bridge*—Producer.

Specimens of Burnettized and un-Burnettized timber, canvas, cotton, and woollen cloth, and raw hides, tested to demonstrate the efficacy of the process. Specimens of antiseptic and disinfecting solutions, and a drawing of the hydraulic apparatus employed for the preparation of timber.

8 **Fitch**, F. C., *Steeple Bumpstead, Chelmsford*—Producer.

Specimens of English woods.

9 **Sanders**, W. **Wilson**, *Wandsworth*—Proprietor.

Collection of woods, amounting to upwards of 700 specimens, from various parts of the world, arranged geographically; with scientific name, native or local name, native country, weight per cubic foot, principal uses or peculiarities; with specimens of veneers of the more beautiful or interesting woods. The block specimens are without varnish of any kind. The veneers are varnished so as to show the beauty of the woods.

9a **Evans**, **William**, *Castle Street, Swansea*—Inventor.

Pieces of Welsh oak, prepared by a peculiar process, as a substitute for fancy wood, and useful for turners and cabinet makers: the process is both simple and cheap.

A cannon lock of peculiar construction, designed to fire a gun by percussion.

10 **Stowe**, **Henry**, *Buckingham*—Inventor.

Specimens of wood, stained without heat or moisture; the process being equally applicable to it when carved.

14 **Holtzapffel** & Co., 64 *Charing Cross*, and 127 *Long Acre*—Proprietors.

Specimens of woods commonly employed in England for turnery.

15 **Gillow** & Co., 176 *Oxford Street*, and *Lancaster*—Proprietors.

Specimens of St. Domingo mahogany.

16 **Enderson**, **Henry John**, 140 *Praed Street, Paddington*—Producer.

Grained imitation of bird's-eye maple and other fancy woods, on deal. Imitation of inlaid marbles and fancy woods, on slate.

19 **Scott**, E., & Co., 83 *Dean Street, Soho*—Manufacturers.

Walnut and rosewood veneers.

20 **Newton**, **Charles Henry**, *Plough Bridge, Rotherhithe, Surrey*—Manufacturer.

Specimens of English and Foreign woods, prepared on one side and rough on the other, to show the application of the patent desiccating process in the seasoning of woods. By this process, wood is seasoned and made fit for use in a few weeks. The moisture is evaporated by rapid currents of hot air, by which decay and dry rot are, in a great measure, prevented.

21 **Bethell**, **John**, 8 *Parliament Street, Westminster*—Inventor and Patentee.

Specimens of wood saturated with oil of tar, by the process called "creosoting."

Creosoted sleepers, which have been in use for years on the Northern and Eastern, and London and North Western Railways. A piece of unprepared wood, showing the ravages of the *teredo navalis*. A piece showing those of the *limnoria terebrans*, with a few holes bored by the teredo.

Two slices, cut from creosoted piles, which have been four years in the sea, at Lowestoft harbour.

Specimens of fish, prepared for manure, by the creosote oil.

[Several plans have been patented, having for their object the prevention of timber from decay by injecting certain fluid substances into its pores, and by chemical and mechanical action preventing the growth of fungi—viz., Mr. Kyan's patent, in 1832, for impregnation with corrosive sublimate; Sir W. Burnett's, in 1836, for injecting chloride of zinc; Mr. Bethell's, in 1838, for impregnation with oil of tar; and Mr. Payne's, in 1841, for impregnation with metallic oxides or alkalies.—S. C.]

21a **Samuels**, **David**, 71 *Lebon Street, West Ham, Essex*—Inventor and Manufacturer.

Picture frame of various English woods.

22 **Classon**, J., *Industrial Depôt, Northumberland Buildings, Dublin*—Manufacturer.

Denoters of time, exhibiting days, months, and dates, and made of bog-yew, bog-oak, and various fancy woods, the growth of Ireland. Letter racks. Chimney-piece what-nots. Book carriers. Inkstands. Paper and envelope cases. Ticket trays. Nests of boxes, and frames for different purposes: made of the same materials.

Packages of scouring powders.

[These powders are produced from a preparation of freestone and alkali, and possess both mechanical and chemical properties, which render them valuable for cleansing railway carriages covered with smoke and grease, and for purifying culinary utensils in general.]

Different qualities of peat or turf, and peat charcoal, adapted for manufacturing purposes, deodorizing and manure.

Specimens of fancy woods, the growth of Ireland; part of a mulberry-tree, perfectly sound, from the gardens of Trinity College, Dublin; known to be more than 400 years old, presented by the Rev. Dr. Luby.

23 **Brotherton**, **William**, & Co., *Hungerford Wharf*—Importers and Manufacturers.

Samples of rape seed, the produce of Holland and the East Indies. Rape seed bruised previous to extracting the oil. The oil as extracted, refined, and purified. Olive oil in its original state; and as refined for machinery. Almond oil as extracted; and as refined for the finer descriptions of mechanism.

24 **Barclay** & **Son**, 170 *Regent Street*—Manufacturers.

Specimens of bleached wax; wax candles, white and coloured; sperm candles, white and coloured; stearine candles; candles of mixed materials; wax and composition mortars, for night lights and for heating dishes; with sundry small articles.

25 **FREEMAN, Messrs.**, 3 *Wigmore Street, Cavendish Square*—Manufacturers.

Fine transparent wax and spermaceti lights, with plaited wicks, and other candles and night lights. Materials in the unmanufactured state. Refined oils, &c.

26 **BAUWENS, L. F.**, *Grease Works, Wakefield*—Manufacturer.

Products of various patent processes used in extracting pure oils and greases from the refuse soap-suds of woollen, silk, and other manufactories.

27 **ROSE, WILLIAM ANDERSON**, 66 *Upper Thames Street*—Manufacturer.

Palm-oil grease, for fast trains. White grease, for machinery, &c. Liquid grease, for mining purposes.

Clarified machinery oil, will not gum or clog. Clarified burning oil, to burn equal to sperm oil. Body, carriage, and oak varnishes.

Ironwork black, equal to black japan, dries in half-an-hour.

Red, blue, yellow, and purple paints supplied to Messrs. Fox, Henderson, & Co., for decorating the Exhibition Building.

White zinc antioxide paint for ironwork, stucco, &c.

28 **HILLAS, FLEMING**, 5 *Ordnance Row, Lewisham Road, Greenwich*—Inventor.

Purified animal, vegetable, and fish oils for lubrication and perfumery.

29 **MILLER, TAVERNER JOHN**, *Dorset Wharf, Westminster*—Importer and Manufacturer.

Spermaceti oil in its original state, as imported from the South Seas.

Rough spermaceti, when separated by filtration and pressure from the oil.

Filtered spermaceti oil, used for illuminating purposes and for lubricating machinery.

Block of refined spermaceti, the inside being hollow, to exhibit its natural crystallization.

Bust formed of refined spermaceti, a new application of the article.

[The sperm whale, *Physeter macrocephalus*, called also cachalot, is a carnivorous cetacean, living chiefly on cuttlefish, and having its mouth armed with teeth instead of whalebone. It is gregarious, and inhabits the open oceans of both eastern and western hemispheres, ranging between 60° N. L. and 60° S. L., but abundant and pursued chiefly in the region of the line-currents between 7° N. L. and 7° S. L. It grows to a large size, the male to 60 feet in length, the female to half that dimension. The former yields 70 to 90 barrels of sperm-oil, the latter 20 to 30. The spermaceti is contained in cellular cavities, occupying the anterior and upper parts of the unwieldy head; from 200 to 500 gallons of this "head-matter" are yielded by a whale. One-sixth of the entire produce is the usual proportion. This matter is placed in hair bags, submitted to strong pressure, melted, and boiled with a weak solution of potash and in alcohol, then cast into moulds, when it becomes the crystalline substance called spermaceti, which is itself a peculiar species of stearine. *Cetine* is its purified state.—E. F.]

30 **EWEN, JAMES**, 17 *Garlick Hill, City*—Manufacturer.

Samples of clarified fats.

31 **DURANT, RICHARD, jun.**, 11 *Copthall Court*—Proprietor.

Samples of raw silk, the produce of the various silk-producing countries, Italy, China, India, Turkey, &c.

32 **DODGE, Mrs. CATHERINE**, *Godalming, Surrey*—Producer.

Silk produced by the silkworm, fed upon the leaves of the white mulberry, at Godalming, it being a first production.

Specimens of the silk manufactured.

34 **HANDS & LEAVESLEY**, *Coventry*—Silk Dyers.

Specimens of dyed silks.

35 **DOXAT & Co.**, *Bishopsgate Street Without*—Importers.

Sample of Italian raw silk.

36 **HOWE, JOSEPH, & Co.**, *Coventry*—Dyers.

Specimens of self-colours dyed from thrown silk:—yellow gum; specimens of shade dyeing, showing permanency of colours for several years.

37 **JACQUEMOT, JOHN MARK**, 36 *Old Broad Street*—Importer.

Skeins of raw silk, the produce of a filature near Geneva, Switzerland.

39 **OLIVER, WILLIAM**, 89 *John Street, Fitzroy Square*—Producer.

A slab of bird's-eye maple.

40 **SECTIONAL COMMITTEE ON VEGETABLE KINGDOM**, *Exhibition Building*—Producers.

Samples of the ordinary flax and hemp of commerce.

French flax; Flemish flax; Dutch flax; Friesland flax; Archangel flax; Riga flax; English flax; Egyptian flax; New Zealand flax.

Petersburg clean hemp; Petersburg half-clean hemp; Riga Rein hemp; Riga Pass hemp; American hemp; Egyptian hemp; brown India hemp; India scum hemp; Manilla hemp; Italian hemp; Jute hemp.

41 **TRENT, EDWIN WARD**, *Park Hemp Works, Old Ford*—Manufacturer.

New Zealand flax as imported. New Zealand flax cleansed, from the same; cleansed by machinery, invented by the exhibitor.

Tow, made in the operation of cleansing the flax. Fishing-lines, made from the same, showing what can be made from the least valuable portion of the flax.

Samples illustrating the different modes of laying ropes or lines. Coil of rope made from yarn spun by the exhibitor's improved machinery, combining all the advantages of hand and machine spinning, without their defects.

42 **WRIGHT, LEMUEL WELLMAN, & Co.**, 75 *Cheapside*—Inventors and Manufacturers.

Specimens of China grass (*Urtica nivea*) as it comes from India (Assam) and China; and in various stages from the raw material, as manufactured in India and China.

Also flax and China grass as prepared in this country, for spinning into yarns for finer purposes. Specimens of broad cloth, in which it is mixed with wool in various proportions. Specimens of various kinds of paper made from wheat straw.

43 **DONLAN, M. J. J.**, 4 *St. Peter's Square, Hammersmith*—Inventor.

The seeds of flax and hemp chemically prepared, by which their germinating powers are said to be augmented.

Flax straw, produced from prepared seed, and flax straw produced from seed not prepared, sown on the same day, and on the same land; also samples of flax in different stages of preparation, produced from unsteeped flax straw.

Samples of the ligneous or woody particles from the flax straw; these, when mixed with other ingredients, are used for the feeding and fattening of cattle.

Samples of sail-cloth, produced from unsteeped flax straw. Sail-cloths produced by these processes are said to have been used during five years without being affected with mildew, heating, or premature decay.

Samples of the Phormium tenax, or New Zealand flax, in different stages of preparation, and sail-cloth manufactured from the same.

[The *Phormium tenax*, or New Zealand flax, is a plant of very different nature from the common flax (*Linum usitatissimum*). The former is an endogen, the latter an exogen. The New Zealand flax is a liliaceous plant.—E. F.]

Samples of fine textures, threads, &c., produced from unsteeped flax straw, brought into a similar state to cotton incorporated with German wool; and also specimens of similar manufacture, produced from the Phormium tenax, or New Zealand flax plant.

The above specimens are said to have been produced by new and peculiar processes.

44 GILLMAN, EDWARD, *Twickenham*, Agent for Tao Nui, a New Zealand Chief—Producer.

Specimens of the most useful of the New Zealand woods.

Gum of the Kawri tree (*Dammara australis*) called Tino; a good varnish can be made from this substance.

Bark of the Hinau tree (*Dicera dentata*); used by the New Zealanders to prepare the flax for dyeing.

Flax (*Phormium tenax*), prepared for dyeing by steeping in a strong decoction of the Hinau bark.

Flax dyed black, by kneading and rubbing in black mud from a freshwater river.

Shrimp net (*Kotutu*), made from shreds of flax, the pulp of the leaf not removed.

Flax partially disengaged from the leaf; also the shell (*Kuku*) used for the purpose.

Flax in the first stage of preparation (*Muka*).

Small cord made from the flax in the first stage of preparation.

Flax prepared for weaving, by soaking it for two days in water, then twisting it into hanks, and beating it with a mallet on a stone. Mantles wove from flax.

45 HIVES & ATKINSON, *Leeds*—Importers and Manufacturers.

Samples of flax grown in the Courtrai district, Belgium; line, sliver-roving, and yarn, from the flax.

Fine cloth, manufactured from 280 warp and 320 weft.

[The preparation of flax at Courtrai differs in no essential respect from the ordinary method adopted at home. But the bundles, instead of being steeped in stagnant pools, are sunk in the clear waters of the River Lys. It is said that the waters of this stream have a peculiar effect in producing flax fibre of extraordinary whiteness and purity. The bundles, after having been steeped, are untied and spread out on grass to be dried. On the completion of this process, the flax is again made up into bundles and undergoes its preparation for the market.—R. E.]

Samples of flax from the Lokeren district, Belgium; line, sliver-roving, and yarn, 50 leas to 200 leas, from the flax.

[The total annual production of flax in Belgium amounts, by a recent estimate, to about forty millions of pounds. Its total value is calculated at about two millions and a half sterling. This flax is of very superior quality, and is principally employed in the manufacture of the finest class of fabrics. Attempts are being now on a large scale to cultivate this important plant in England and Ireland. Belgium exports about five millions of pounds of flax to England. The flax grown in the Courtrai district is universally considered to be of the finest quality.—R. E.]

Samples of yellow flax, grown by John Warnes, Esq., Trimingham, Norfolk; of blue flax, grown in Yorkshire. Line, sliver-roving, and yarn, from 50 leas to 200 leas, from the flax.

Piece of brown cloth and piece of bleached cloth, 100 warp and 150 weft.

Specimen of Chinese reed.

Samples of China grass (a kind of nettle) in the raw state; softened; prepared for cutting and heckling; half-bleached and full-bleached line from this grass; sliver-roving from full-bleached line; tow; 250 leas spun from full-bleached line; 100 leas from tow; dyed line, yarn, and tow from the same.

Piece of cloth, 200 leas warp and 200 leas weft.

["China grass" is known botanically under the name, *Urtica nivea*. It is extensively imported into this country from Assam, and from China.—R. E.]

46 CATOR, NELSON, & Co., *Selby*—Manufacturers.

Line stumps, or the raw flax plant with the seed attached, as pulled and dried: grown in Yorkshire.

Flax manufactured from the line stumps, and prepared for the flax-spinners. The seed is taken off, the stumps then retted by an artificial process, and afterwards broken and scutched by machinery.

---

47 LONG, J., C.E., *Limerick*—Producer.

Specimens of Irish woods. Bog oak; bog yew; bog deal; oak; elm; ash; beech; copper beech; black oak; sycamore; cherry; apple; holly; poplar; maple; alder; spruce; Scotch fir; larch; walnut; arbutus; laburnum; and evergreen oak. These timbers are the growth of former ages, and are found embedded in the bogs of Ireland.

[These timbers represent ancient forests, the remains of which are now buried beneath accumulations of peat and water, but in which wandered not only species of existing British mammals, but extinct races, like that of the *Megaceros hibernicus*, "leading into the times when elephants, hyænas, and other extinct quadrupeds appear to have tenanted this country."—J. L.]

The black oak is used for fancy and ornamental work. The yew is a fine-grained timber of different shades. It appears to be a suitable timber for cabinet work, such as pianos, &c., being durable and capable of taking a high polish. The deal is useful for rough work.

These timbers are in general used in carpentry and joinery, ship-building, house-building, coach-building, cabinet-making, machinery, farming implements, &c. The ordinary timbers, such as oak, elm, ash, beech, larch, maple, &c., are considered of superior quality and large growth.

Specimen of Carrigeen moss; found in great abundance on the sea-shores in the counties of Clare and Kerry.

["Carrigeen," or "Irish moss," is a sea-weed. It is the *Chondrus crispus* of botanists, a fucus which grows abundantly on all the rocky shores of the British Isles. It is most plentiful at the edge of low-water mark. *Chondrus mammillosus* is another species often mixed with and used like the former. The plant is gathered from the rock, then washed and laid out to dry and bleach in the sunshine. It has emollient and demulcent properties.—E. F.]

Specimen of oak bark. This bark is supplied from the various counties around Limerick to the tanners of the city and neighbourhood.

---

49 ADAMS, —, *Ballyderritt, Coleraine*—Producer.

Sample of flax.

51 **ROBERTSON, HENRY**, 7 *Salisbury Street, Strand*—Producer.

A vegetable fibre, indigenous to the British Isles, applicable to the manufacture of fine thread and paper.

---

53 **PICCIOTTO, MOSES HAIM**, 3 *Dean Street, Finsbury Square*—Producer.

Specimens of fine flax, prepared in Italy by a peculiar process, applicable to all sorts of flax, steeped or unsteeped. By this process coarse produce may be brought to a great degree of fineness.

54 **MASON, GEORGE**, *Yately, Hartford Bridge, Hants*—Producer.

1. Flax grown, steeped, and prepared for market at Yately, North Hants. 2. Produced in South Hants. 3. Produced at Cobham, Surrey. 4. Flax grown and scutched at the Farnborough workhouse. 5. Flax scutched by prisoners in county gaol, Winchester. 6. Refuse tow and flax manufactured at Yately. 7. Coarse tow and flax. 8. Models of tools used.

55 **MARSHALL & Co.**, *Leeds*—Importers and Manufacturers.

Sample of Chinese grass, *Urtica nivea* (*Ma*, Chinese name), the white-leaved nettle of China, commonly called grass, in the state in which it is imported from the province of Canton, in China. Sample of heckled fibre from the same, ready for the spinning process, after it has undergone a steeping similar to that of flax, and also a chemical or mechanical treatment, by which it is cleansed and softened.

Samples of sewing thread, dyed and bleached, and of thread for lace, from No. 30 to 300 lea, made from this material, showing its capacity of taking a good colour, and producing an even wiry thread. Samples of fine drill, from the same material, bleached and coloured, showing the same qualities.

Samples of Courtrai flax and of dressed line, also of sewing thread dyed and bleached, No. 25 to 240 lea, from the same, exhibited for quality and finish.

---

56 **BARSHAM, JOHN**, *Kingston-on-Thames*—Inventor and Manufacturer.

The outer shell or husk of the cocoa nut (*Cocos nucifera*).

Fibre separated from the same by a patent process.

Brushes, manufactured from the fibre, instead of bristles.

Door mat manufactured from the fibre.

The fibre is cheap, and is preferable to bristles for durability.

---

57 **NIGHTINGALE, WM. & CHARLES**, 64 *Wardour Street, Soho*—Importers and Manufacturers.

Bed feathers and downs, mostly used in England: the produce of the country, of Ireland, and of the northern portions of Europe and America.

Horsehair and the hair of other animals, English and American, in various stages of manufacture for the purposes of weaving, stuffing, brush and sieve making, &c.

58 **MORRELL, HENRY**, 149 *Fleet Street*—Manufacturer.

Specimens illustrating the manufacture of lead pencils:

Black lead (*plumbago*), exported from Germany and other parts. Specimen of purified lead, and lead cut into plates. Cedar wood from North America, cut into veneer, and bottoms and tops for pencils.

1st stage.—Bottoms grooved and machine for grooving.

2nd stage.—Bottoms, showing the plate of lead inserted and tool used for cutting off.

3rd stage.—Tops, and tops glued on to bottoms.

4th stage.—Rounding machine and pencils in stages of rounding to completion.

Paring tool to finish the ends. Specimens of rough and finished ends.

Stamping machine and pencils stamped, &c.

Pencils in various packages and sorts.

Specimens illustrating the manufacture of sealing wax:

1.—The resins. Stick lac, a secretion from trees punctured by an insect (*Coccus lacca*), in the form of a reddish-brown resinous substance, having a crystalline fracture, enclosing the insect. Shellac produced from it. Lac dye, exported from the East Indies to England, and again exported into Germany, Russia, &c.

2. The colouring matter.—Mercury. Sulphur. Sulphuret of mercury or vermilion, the colouring matter used for red sealing wax.

Rough sealing wax. Stick of sealing wax moulded, partly polished, and finished and stamped. Sealing-wax in packages, and of various qualities.

Specimens illustrating the manufacture of wafers:

Wafer tongs. Sheets of wafer, as produced from tongs by the wafer composition being baked in them. Punches for cutting wafers of various sizes, with samples of the wafers cut.

Specimens of quills.

59 **HEAL & SON**, *Tottenham Court Road*—Importers and Dressers.

Specimens of bed feathers; Irish, English, Russian, Hudson's Bay, and Dantzic, in the raw state, and steamed and dressed.

Specimens of Russian down, in the raw state, and steamed and dressed.

Specimens of Greenland eider-down dressed.

An eider-down quilt, composed of a fine satin centre, and surmounted by a border of white satin, embroidered with flowers and ornaments. Executed by James Houldsworth and Co., of Manchester.

A quilt of fine Greenland eider down, covered with blue and gold brocaded silk, designed and adapted to lay across the foot of a bed.

60 **BLYTH, HAMILTON, & BLYTH**, 52 *Little Britain, London*, and *Henry Street, Liverpool*—Importers and Manufacturers.

English and Dantzic goose bed feathers, in a raw state, white and grey; and in a dressed and purified state.

English black horse-hair in a curled and manufactured state; and in the raw state.

61 **ENGLISH'S PATENT CAMPHINE COMPANY**, *Hull*—Manufacturer.

Oleaginous seeds, tar, and turpentine, and their products.

---

62 **BARKER, THOMAS, & Co.**, *Dreams Buildings, Chancery Lane*—Inventors and Manufacturers.

Spirits of turpentine, prepared by a new process, so as to render paint inodorous as soon as dry. Mastic varnish, for paintings, preventing bloom, &c.

British Eau-de-Cologne and a variety of other scents essential oils, manufactured and purified by the above process. Hair dyes, essences, extracts, and perfumes.

---

63 **MANNING, JAMES**, 18 *Coles Terrace, Barnsbury Road, Islington*—Manufacturer.

Varnish composed of various gums and pure spirits of wine: the materials are put into a glass barrel and made without the aid of heat. Portraits, &c., varnished to show its clearness.

64 **PENNEY, HENRY**, 4 *York Place, Baker Street*—Manufacturer.

Colourless linseed oil and copal varnish.

A door on which the varnish has been applied.

65 **SMITH, BEN. THOS. & CHAS.**, 12 *Church Street, Mile End New Town*—Manufacturers.

Emerald green.

Chrome yellow, three shades. Ultramarine, three qualities (imported from Nuremberg). Chinese red. Pure blue. Oxalic acid, two qualities. Oxalate of potash. Chromate of potash. Nitrate of lead. Oxymuriate of tin.

Colours of various kinds.

66 **JEWESBURY, H. W., & Co.**, 1 *and* 2 *Mincing Lane*—Brokers and Producers.

Varieties of cochineal from Honduras, Mexico, Teneriffe, Java, and the West Indies.

[Cochineal is an insect, the dried body of which yields the beautiful red dye for which it is valued in commerce and the arts. The insect is obtained in large quantities from Mexico, the British West Indies, the United States, and Guatemala. It is bred with great care, and feeds on the *Cactus cochinellifer*. Upwards of a million pounds were imported ten years since into the United Kingdom, and in every pound are contained not fewer than 70,000 insects! Cochineal, from its resemblance to seed, was formerly considered to be really a vegetable product. In the cactus stove at Kew the insect may be seen alive feeding upon the cactus of its native habitat.—R. E.]

Varieties of lac-dye from Calcutta.

["Lac-dye" is a term commercially applied to a colouring matter extracted from stick-lac. The latter is considered to be the resinous secretion of a tree on being punctured by an insect common in many districts of Eastern India. This insect is called *Coccus lacca*, and is found in enormous numbers in the forests of the mountains on the sides of the Ganges. The insect, when about to deposit its eggs, attaches itself to the branches of trees, and soon becomes enveloped in a layer of gummy matter which hardens on exposure. The insect dies, and her body shrivels into an oval bag containing a minute drop of red fluid. This is extracted from the lac, and, when formed into small masses, becomes the lac-dye of commerce. In 1848, 1,221,308 lbs. were imported into the United Kingdom.—R. E.]

68 **SMITH & SON**, 14 *Corbet Court, Spitalfields*—Producers.

Lichens from which archil and cudbear can be produced by steeping them in prepared ammoniacal solutions, so that the orcine they contain may, by combination with water, ammonia, and oxygen, develop colouring matter:—

No. 1. Angola Orchilla weed (*Roccella montagnei*), from Angola, coast of Africa. 2. Thick Lima Orchilla weed (*R. tinctoria*), from Lima, South America. 3. Lima Orchilla weed (*R. fuciformis*) from Lima, South America. 4. Canary Orchilla weed (*R. tinctoria*), from the Canary Islands. 5. Canary rock moss (*Parmelia perlata*), from the Canary Islands. Pustulatus moss (*Gyrophora pustulata*), from Norway.

Eight samples of archil and two of cudbear, all made from Angola lichen, and used for dyeing and printing woollen, silk, cotton, mixed fabrics, and leather, all shades of crimson, violet, blue, and chocolate; used also in making stone blue and lake pigments.

Samples Nos. 8, 9, and 10. Blue, violet, and red archil weed and liquor, as taken from steeping backs, used for dyeing leather and silk. 11 and 12. Red and purple archil liquor, for printers' use. 13. Extract of red archil, for printers' use. 14 and 15. Red and blue archil paste, for dyeing wool and silk. 16 and 17. Cudbear, of two qualities, for dyeing wool and silk.

Specimens of woollens, silks, velvets, cottons, mixed fabrics and leathers, dyed and printed with archil and cudbear, also of stone blue and lake made with archil.

[Lichens are flowerless plants of very low organization, living on air and growing usually on the ground, or on the surface of rocks and trees, in the form of crusts or branching leathery expansions. Many kinds of lichens are available for dyeing. The species of *Roccella* are most useful, but various kinds of *Lecanora* (as *L. perella*, which is the Perelle d'Auvergne, and *L. tartarea*, the cudbear), *Variolaria, Urceolaria, Isidium, Lepraria, Parmelia, Sticta, Solorina, Gyrophora, Usnea, Evernia, Alectoria, Ramalina*, and *Cenomyce*, many of which are not at present used, would produce colouring matter.—E. F.]

---

70 **COONEY, CHARLES**, 60 *Back Lane, Dublin*—Manufacturer.

Samples of Irish manufacture in starch, indigo blues, vegetable gums, and blacking.

71 **SAUNDERS & GATCHELL**, *Dublin*—Producers.

Pastel, or imitation woad, made from the leaves of the chicory plant, used in the dye-vat for fixing colours in woollen cloths.

---

72 **ROBINSON, JAMES, & Co.**, *Huddersfield*—Inventors and Manufacturers.

Archil paste and cudbear, patent process. Liquid archil for dyeing and printing.

Samples of worsted yarn dyed in best cudbear.

73 **HALLIDAY & Co.**, *Quay Street, Salford.*

Post-office label gums.

74 **BRUCE, G.**, 52 *Nelson Street, Liverpool*—Inventor.

Black varnish, for painting and preserving wood and iron-work, either for land or marine purposes. Blue-coloured composition for covering wood or iron, with or without a thin priming of paint. Red composition for the use of agriculturists, machinists, engineers, ship and steamboat builders. Green and stone-coloured composition, applicable to general purposes. Spirit varnish for wood-work.

---

75 **LONG & REYNOLDS**, *Hackney*—Manufacturers.

Carthamus tinctorius (*Indicus*), safflower. The colouring matter shown in the liquid and dry state. Used for the purposes of dyeing silk, cotton, &c. Specimens of its effects on those materials.

[The colouring matter yielded by this plant is obtained exclusively from the flowers. It is of a beautiful pink colour, and is employed by dyers to produce the peculiar colour called *ponceau*. It does not, however, bear exposure to light well. Safflower is also employed in the preparation of the most costly descriptions of rouge. About 6,000 cwt. are imported annually into Britain, the greater part from the East Indies.—R. E.]

76 **SADLER, J.**, 2 *Gloucester Terrace, Regent's Park*—Proprietor.

Mexican black and white cochineal, produce of the department of Oaxaca.

The imports of cochineal (*Cocus cacti*) from Mexico, were, in 1839, 194,903 lbs.; but, in 1841, they had diminished to 20,678 lbs. The cochineal of white silvery lustre is most esteemed.—R. E.]

---

77 **BURCH, WILLIAM**, *Sewardstone Mill, Woodford, Essex*—Manufacturer.

A series of substances and combinations used in the art of dyeing; showing, in various states, the woods, roots, flowers, metals, &c., from which dyeing colours are obtained, with aqueous decoctions and dried extracts. Various acids, and solutions of metals in acids; dyeing precipitates caused by the action of various metallic solutions on vegetable colouring matters; and samples of the general effect of the colouring matters on cotton, silk, and wool.

Samples of London skein silk, woollen, and cotton dyeing, in colours and shades.

Samples of cotton, dressed as hard silk, and of fast cotton dyeing for Lisle thread gloves. The woollen dyes by P. J. Chabot, of Spitalfields; the silk dyes, by Reynolds & Son, Temple Street, Hackney Road (for further specimens by the above dyers, see Class 18).

Opaque or precipitant colours used in oil painting and printing, and as water-colours on paper, book muslin, &c.

An illustration of the art of block printing.

Various gums and substances used in dyeing, printing, painting, dressing, &c., and in the preparation of colouring matters.

---

78 **Moore, John**, *Littlecott Farm, Pewsey, Wilts*—Proprietor.

Southdown ewe (stuffed), bred by the exhibitor, seven years old, but never shorn. Length of the wool 25 inches, weight 36lbs.

---

80 **Henderson, Richard**, *Wooler, Northumberland*—Producer.

Fleeces of Cheviot wool, grown at an elevation of 2,600 feet above the level of the sea.

81 **Dorrien, C.**, *Sennicots, near Chichester*—Producer.

Specimens of merino wool, produced from two-year old sheep, sufficiently long and fine for shawl manufacturers; average weight of the fleece of each sheep, nearly 8 lbs.

---

83 **Price's Patent Candle Company**, *Belmont, Vauxhall*—Manufacturer.

Specimens of candles, vegetable tallow, palm oil, &c.

84 **Rebow, J. G.**, *Wivenhoe Park, near Colchester*—Producer.

Southdown sheep's wool.

---

85 **Millner, Robert**, *Dublin*—Proprietor.

Fleeces, long wool, wether and ewe, and male and female hoggets; grown in the counties Meath and Galway. Fleeces, long and short wool, hogget, wether and ewe, mountain grown in the county Wicklow.

85a **Sectional Committee on Animal Kingdom**, *Exhibition Building*—Producers.

Various kinds of wool.

86 **Mannings, George**, *Wedhampton, near Devizes*—Manufacturer.

Diamond teg matching wool, for combing; and diamond clothing wool, from Southdown fleeces, the produce of the county of Wilts.

---

88 **Sands, Wm., & Co.**, *Mortimer Street, Leeds*—Producers.

Specimens of "burry" wool in the original state, with specimens of the same cleaned by machinery.

[By "burry" wool is meant, in the language of commerce, wool containing a quantity of "burrs" or thorny particles derived probably from the spinous and other thorn-bearing plants of Australia. These it is necessary to remove previous to the preparation of the wool for textile purposes, and by ingenious machinery this is successfully accomplished.—G. T.]

91 **Preller, C. A.**, 31 *Abchurch Lane*—Patentee and Manufacturer.

English wether and hog wool.

Mohair and fine Australian wool, in the raw state as imported; washed; and carded and balled.

Tops, being the long fibres in slivers, to be spun into yarn for the manufacture of worsted stuffs, shawls, and hosiery.

Noils, being the shorter fibres used by blanket and cloth manufacturers.

Yarn, No. 70, spun from the Australian wool (commonly called Botany) tops. The peculiar process of combing by which the above tops have been manufactured is patented.

[By the ordinary process the combs are heated to a high temperature, and oil is applied to the wool before being drawn out in the sliver. On the present plan the heat employed is not so great, but more equable, and the use of oil can be dispensed with. The tops are thus preserved clean and white, and better suited therefore for all fine fabrics. The specimens now exhibited are produced without oil.—G. T.]

91a **Cahill, M.**, *Ballyruggit, Kilkenny*—Producer.

Fleece of Leicester wool, from the flock bred by the exhibitor, at Grove, county Kilkenny.

94 **Irving, G. Vere**, *Newton by Leadhills, Lanarkshire*—Producer.

Fleece of an aged ewe of the black-faced Highland breed, unlaid.

---

95 **Good, Floodman, & Co.**, *Hull*—Importers.

Specimen of white Iceland wool.

95a **Breadalbane, Marquis of**, *Taymouth, Aberfeldy, Scotland*—Proprietor and Producer.

Specimens of woollen yarn, made from the wool of the bison.

---

97 **Lippert, David**, 66 *Albion Street, Leeds*—Importer.

Fleeces of German wool.

[Wool is a kind of hair, characterised by an imbricated scaly surface, when viewed under the microscope, on which depends its remarkable felting property and its consequent value in manufacture.

Most quadrupeds possess the woolly variety of hair as an under-clothing, but in a small proportion, and hidden by the smooth exterior coarser kind of hair. In the wild sheep (*Ovis ammon* and *Ovis musimon*), the woolly variety is developed in excess; and in the domesticated varieties the fleece has become improved by care and breeding until its original coarse character has disappeared.—R. O.]

101a **Smithson, T.**, *Bramley, Leeds*—Producer.

Samples of wool.

---

103 **Horan, H.**, 7 *Stud Street, Islington*—Manufacturer.

Prepared Greenland whalebone of different colours, for covering whip handles, walking sticks, and telescopes, and various other purposes, with portions of black and white whalebone as cut from the palate.

[The whalebone or *Baleen*, as it has been called, consists of numerous parallel laminæ, descending perpendicularly from the palate of the *Balæna mysticetus*. Its object, in the economy of the animal, is to form an efficient strainer for its food, which is taken in with the water; and the latter, when the mouth is partially closed, is expelled, leaving the small crustacea and other animals, which constitute the nourishment of the whales, entangled, as it were, in the laminæ of whalebone. Although all the species of *Balæna* possess this substance, it is furnished in the largest quantities and of the finest quality by the *Balæna mysticetus*, which is the object of incessant and eager pursuit, not only for the value of this substance, but for the immense supply of oil which is obtained from the thick layer of blubber or cutaneous fat in which the body is enveloped. The length of the largest pieces of baleen in a whale 60 feet long, is frequently as much as 12 feet; and the laminæ are ranged in two series, each containing about 300 in number.—T. B.]

---

104 **WESTALL & Co.**, 69 *Aldersgate Street*—Proprietors.

1. Fins of whalebone from Greenland (*Balæna mysticetus*).
2. Fins from the north-west coast of America.
3. Fins from the South Pacific Ocean.
4. White fins, from the western coast of Australia (*Balæna Australis*).
5. Finner, of the hump-backed whale (*Balænoptera Boops*).
6. Thirty-four specimens of whalebone.

[The fins or plates of "baleen," or whalebone, are of an inequilateral triangular form, the largest, which are of most value in commerce, being arranged in a single longitudinal series on each side of the upper jaw of the "whalebone whales" (*Balænidæ*), descending vertically, and ending in a fringe of bristles: the smaller plates are arranged in oblique series, internal to the marginal ones. The base of each plate is hollow and is fixed upon a pulp developed from a vascular germ, which is attached to a broad and shallow depression occupying the whole of the palatal surface of the maxillary bones. The plates are so disposed as that their fringed terminations are directed downwards, and inclining towards the back part of the mouth, and they prevent the escape of the small marine animals which constitute the food of the great whales (*Balæna*). and for the prehension of which this singular substitute for the teeth is adapted. The baleen plates are smallest at the two extremities of the series; the large intermediate ones sometimes attain the length of 15 feet, being above a foot broad at their base. There are about 200 plates in the outer row on each side of the mouth in the "true whale" (*Balæna mysticetus*). Each plate consists of a central coarse fibrous substance and an exterior compact fibrous layer: but this reaches to a certain extent only, beyond which the central part projects in the form of a fringe of bristles. The chemical basin of baleen is albumen, hardened by a small proportion of phosphate of lime. The baleen plates of the finners or hump-backed whales (*Balænoptera*) are smaller, and of less value than those from the true whales (*Balæna mysticetus*).—R. O.]

---

105 **CLAUSSEN, PETER**, 26 *Gresham Street, London*—Inventor and Patentee.

Samples of flax prepared by the exhibitor's process, intended to show the universal applicability of flax fibre to the purposes of textile manufactures.

The first set of samples are intended to show the various processes resorted to in the preparation of flax into a material capable of being spun alone, or mixed with various proportions of cotton upon any of the ordinary cotton-spinning machines. The samples show, 1st, the flax in the straw as pulled from the ground, cut into appropriate lengths by suitable machinery. 2nd. As it appears after having undergone the first process of saturation in a solution of soda required to remove the glutinous substance adhering to the fibres. 3rd. The fibres as seen after the removal of the "shove," or woody part of the plant. 4th. The flax transformed into a cotton-like substance by the expansive force of carbonic acid gas produced by the action of an acid upon the soda, taken up by the fibres in the previous stage. The 5th, 6th, and 7th shows the same bleached, dried, carded, and ready for spinning. The remaining articles in this series are samples of mule and throstle yarn of various numbers, some of which are composed entirely of flax, and others of various proportions of flax and cotton. Both these descriptions of yarn are exhibited, bleached and dyed in various colours for the purpose of showing that flax, prepared upon this process, is capable of receiving the same opaque dye as cotton, and, in the mixed yarns, no difference can be distinguished in point of colour or of shade between the two materials. Samples of grey and bleached, dyed and printed cloth woven from the yarns, prepared as above, are also exhibited. The yarns formed of a mixture of flax and cotton are termed "flax-cotton" yarns.

The second series of samples consists of yarns formed of various proportions of flax and wool called "flax-wool yarns," the flax being prepared, in many respects, in the same manner as when required for spinning on cotton machinery. The mixed woollen and flax yarns were spun on the ordinary woollen machinery. Samples of flannel and of woollen cloths, milled and dyed, woven from these mixed yarns, of various colours.

The third series contains samples of flax prepared for spinning alone or combined with short silk upon the ordinary silk machinery. The flax so prepared is shown, dyed various colours, and possessing, unlike the samples prepared for the cotton machinery, the brilliancy of colour which is peculiar to silk. The yarns formed of equal or other proportions of flax and silk, which are termed "flax-silk yarns," are shown dyed; and, as in the case of the "flax-cotton," no difference of shade or colour is perceptible in the two materials. A quantity of silk, woven from "flax-silk" yarns, is also shown in this series.

In the fourth series, samples illustrative of the exhibitor's mode of preparing flax for spinning upon the ordinary flax machinery, and for its manufacture into linen fabrics.

A fifth series consists of various samples of hemp, jute, and the fibrous substances prepared, either in whole or in part, as above; and samples of cloth woven upon the Chevalier Claussen's circular loom for the purpose of showing the applicability of the invention to articles of hosiery.

The advantages claimed as arising from the process, illustrated in the fourth series for preparing flax for the linen manufactures, are its simplicity, rapidity, certainty, and cheapness. By this process a fibre nearly free from colour is procured, so that the after process of bleaching is greatly facilitated: the fibre is also pure when produced, so that the same weight, or nearly so, of yarn, can be spun from a given weight of fibre; and the loss in bleaching is very small, as it consists only of the removal of accidental impurities received in the process of manufacture.

The three first series of samples are intended to show the applicability of the flax fibre for textile manufactures, other than linen or cambrics. It can also be spun alone, on cotton machinery, by the ordinary cotton process.

It has long been a desideratum with woollen manufacturers of all classes to obtain a material cheaper than wool, possessing the same felting or "milling" properties. Cotton and China grass have not this property. The flax fibre is said to be stronger than the wool, and to mill equally with it. The sample shown was milled from 54 inches wide (as it fell from the loom) to 28, its present width. To prove its felting properties fully, hats have been made from the fibre mixed with an insignificant portion of rabbits' hair.

1. Flax-seed and flowers (in wax).
2. Flax-straw with the seed-bolls on.
3. Flax-straw rippled or deprived of the seed-bolls.
4. Flax-straw as prepared by the farmer (by the exhibitor's machine). By this operation the straw is freed from the greater portion of the wood, and is reduced to one-third of its original bulk and weight, and the fibre is left uninjured, and in a fitter state for the next process.

5. Flax straw, as above, after having undergone the alkaline part of the process.

6. Flax-straw, as above, after having undergone the acid part of the process.

7. The fibre, as above, unbleached, scutched.

8. Flax-straw prepared, unbleached, and scutched.

9. Flax-straw prepared whole by processes 5 and 6, or not having undergone the breaking process described in No. 4.

10. Flax-straw, prepared and bleached as above, in the straw.

11. Flax, prepared, bleached, and scutched in the straw whole.

12. Flax-straw, prepared, broken by the exhibitor's machine (No. 4) and bleached in the bulk.

13. The same scutched.

14. Flax split according to the exhibitor's natural colour.

15. The same, bleached.

16. Linen yarns spun from fibre prepared by the above processes, *i. e.*, from fibre, natural colour, whole; from the same, split; from fibre, bleached in the straw, whole from the same split.

17. Linen cloths woven from each of the above described yarns.

Short Fibre.

18. Flax-straw cut into lengths for producing fibre to spin on cotton machinery, wool or silk, whole.

19. The same, having been partially deprived of its refuse (process No. 4), cut into short lengths.

20. The same, after the alkaline process.

21. The same, after the acid process.

22. The same, fibre split.

23. Flax-fibre, separated from the refuse, unbleached.

24. The same, separated from the refuse, bleached in the straw.

25. The same, unbleached and carded, fit for spinning on cotton machinery.

26. The same, bleached and carded for cotton machinery.

27. The same, in slivers.

28. The same, in rovings.

29. The same, in yarn.

Flax Cotton.

30. Flax-cotton—half cotton and half flax in wool,—as above.

31. The same, slivers.

32. The same, rovings.

33. The same, yarns, mule, and throstle.

34. Cloths, all flax, spun and woven on cotton machinery.

35. The same, flax and cotton, spun and woven on cotton machinery.

36. Flax-cotton yarns, dyed by the ordinary cotton processes, showing that flax fibre takes colour exactly in the same manner as cotton.

37. Flax cloths, dyed and printed.

38. Flax-cotton cloths, dyed and printed.

Flax Silk.

39. Fibre prepared for spinning on silk machinery.

40. Slivers of flax and short silk, mixed in various proportions.

41. Rovings made from such slivers.

42. Yarns made from such rovings.

43. Cloths made from such yarns.

44. Flax fibre (pure) dyed by the ordinary process for dyeing silk, showing the greater brilliancy of the flax when prepared by the patent process.

45. Flax-silk cloths dyed and printed.

Flax Wool.

46. Flax fibre for mixing with wool (carded).

47. Flax and wool mixed together in equal parts.

48. Slubbings from the same.

49. Yarns from such slubbings.

50. Cloths produced from such yarns, woven on the exhibitor's circular loom.

51. Flax and wool mixed for flannels.

52. Yarns produced from the same.

53. Cloth produced from the same.

54. The same dyed.

55. Various samples of cloths produced from flax, flax-cotton, flax-silk, flax-wool, woven on Chevalier Claussen's circular loom, and intended to show the applicability of the invention to hosiery, &c.

56. Various samples of hemp, and other fibrous plants, prepared either in whole, or in part, as above.

106 ROYAL BELFAST FLAX IMPROVEMENT SOCIETY—Producer.

Specimens of flax.

---

107 ROYLE, J. FORBES, M.D., F.R.S., *Acton Green*—Collector.

Specimens of cotton.

---

108 PUCKRIDGE, FREDERICK, 5 *and* 6 *Kingsland Place, Kingsland*—Patentee and Manufacturer.

Goldbeater's skin. The raw material, or skin of the gut of oxen. The material in its various conditions, as used for other purposes. The raw material manufactured into goldbeater's skin. Mould of skins, as used in France and Belgium, in which leaf gold is beaten out for gilding.

Flexible fine gold, silver, and other metals, for ornamental purposes, in sheets of any length.

[Goldbeater's skin is a membrane separated from animal intestine, attenuated by beating with a hammer, and subsequently prepared so as to resist putrefaction.]

109 STAIGHT, THOMAS, 12 *Walbrook*—Manufacturer.

Specimens of turning and carving in ivory, viz., vase, pedestal and flowers; carved ivory candelabra; pedestal thermometers; ivory paper knives.

Graydon's registered ivory chessmen, carved, the Crusaders.

Specimens of carving in pearl, viz., card cases, work boxes, watch cases, paper knives, and tablets.

111 TEBBITT, W., 4 *North Crescent, Bedford Square*—Manufacturer.

Ornamented box, calculated to contain four packs of playing cards, manufactured entirely from the two shells known in commerce as the mother-of-pearl and the New Zealand green-ear; surrounded by an elegant specimen of pierced work, intended as a border for the cover of a drawing-room table book; the cover to be of blue velvet.

[The mother-of-pearl shell is a bivalve of the genus *Avicula*. Several species are used in commerce. The "New Zealand green-ear" is a univalve of the genus *Haliotis*, of which a kind lives in the seas of the Channel Islands, and is used also for the purposes of inlaying.—E. F.]

Lady's visiting card-case; subject, Belisarius.

Taper candlestick; shoe-slip; door-handle; paper-knives; umbrella-hooks; and a ten-inch rule.

The whole made by hand, and wrought exclusively by English workmen.

---

114 MARKWICK, MARK, 32 *King William Street*—Manufacturer.

Specimens of Markwick's patent "epithems" for medical, surgical, and veterinary purposes.

"Impermeable spongio-piline," for applying heated fluids to the surface of the body, in lieu of poultices and fomentations. A spongio-piline sock; knee-cap; finger-stall; and breast-poultice.

Impermeable water-dressing. This material is intended for the application of lotions, either simple or medicated, ulcerated surfaces.

Impermeable "piline," for affording protection against cold and wet, &c.; in various forms, fitted in various parts of the person, and applicable to different uses.

[The material here described consists of a soft and absorbent layer of sponge, or similar material, placed upon a sheet of thin caoutchouc. The impermeability of the latter prevents the evaporation of the liquid, and the combined material becomes a convenient substitute for an ordinary poultice.—R. E.]

115 GRANVILLE & Co., 9 Gresham St. West—Proprietor; BURKE, WM. H., *Tottenham*—Manufacturers.

India-rubber waterproof silk and cotton garments, seamen's coats, and hats. Silk, satin, and cotton-covered air-proof cushions. Cotton air-proof pillow and swimming belt. Different makes of India-rubber webs. Mohair and genappe braids. India-rubber thread for weaving into webs. Patent mineralized rubber, unaffected by heat, cold, or grease, and without any of the efflorescence or smell of sulphurized or vulcanized rubber.

[In addition to its combination with sulphur, caoutchouc has been mechanically united, by mastication, with other substances, such as antimony, &c. It is difficult to determine whether a true chemical union takes place in such combinations. But the caoutchouc undergoes considerable alteration in its properties, and acquires some new ones.—R. E.]

116 REA, EDWARD, 117 *Wardour Street*—Manufacturer.

Lac insects, or *coccus lacca*; lac stick, Siam and Bengal. Products—Seed lac, orange and ruby; shell lac, orange and ruby, lump and button. Lac lake and lac dye, shell lac, lacquers, &c. Polish, varnishes, sealing wax; &c.; white lac, lac wax, yellow and white. Gum elemi, thus, or frankincense; sandrac; mastic, and varnishes. Dragon's blood, grass-tree gum, gum kauri, or Australian copal, gum animi; copal; damur; rosin, rough turpentine, Canada balsam, varnish resin, oil varnish, colourless paper varnish, resin varnish, &c.; purified rough turpentine, and spirits of turpentine, varnish, &c.

[Gum elemi and frankincense are furnished by plants of the order *Amyrideæ*, a family allied to the orange tribe; they are tropical.

Gum sandrac, or sandarack, is the product of a North African tree allied to the juniper, probably the *Calitris quadrivalvis*.

Mastich is derived from species of pistachia, natives of the Mediterranean region; they belong to the cashew-nut tribe (*Anacardiaceæ*), a family furnishing many varnishes.

Dragon's blood is produced by the *Dracæna draco*, a liliaceous plant; the *Callitris draco*, a palm; and the *Pterocarpus Draco*, a sandal-wood tree, of the pea tribe; from the wood of the first and last named, and from the fruit of the second; they are all tropical.

Grass-tree gum is from *Xanthorrhæ*, an Australian plant of the lily tribe. Gum animi is from the *Hymenæa courbaril*, and copal from other tropical species of the same genus, belonging to the pea tribe.

The balsams and turpentines are resinous secretions from trees of the pine tribe. Canada balsam is from the *Abies balsamea*, or balm of Gilead fir. Damur is from *Dammara*, a New Zealand pine.—E. F.]

117 SIMPSON, HUMPHREY, & VICKERS, 23 *Little Britain*—Importers and Manufacturers.

Various specimens of isinglass, cut and uncut.

[Isinglass is the swimming bladder of sturgeons caught in the Caspian and Aral seas, and in all large rivers in [illegible], an [illegible] the rivers of South America, in the Demerara and Berbice rivers, and in the East Indies. Formerly isinglass was torn up by hand, or cut with scissors; it is now rolled and cut by machinery.]

118 DAWSON & MORRIS, 96 *Fenchurch Street*—Importers and Manufacturers.

Specimens of Russian and Brazil isinglass.

119 SWINBORNE, T. C. & G., & Co., *Coggeshall*, and 1 *Great Tower Street, London*—Manufacturers.

Refined isinglass and gelatines.
Clarifying isinglass and gelatines.
Glues, and manufacturer's gelatines.

120 WATT, W., & SON, *Dumfries, Scotland*—Manufacturers.

Glue made from pieces of hides and skins, principally used by cabinet-makers and joiners.

121 ABBOTT & WRIGHT, *Needham Market, Suffolk*—Manufacturers.

Two cakes of crown glue, manufactured from the hides and feet of cattle.

122 NIMMO, THOMAS, & Co., *Linlithgow, Scotland*—Manufacturers.

Specimens of glue:—Strong, for the use of joiners, &c.; refined, for paper-makers, &c.; and extra-refined gelatine.

124 TUCKER, E., *Belfast*—Manufacturer.

Specimens of glue.

125 DUFAVILLE, W., *Broughton House, Islington*—Manufacturer.

Culinary articles: fish, crystal, brilliant, and various other gelatines; British isinglass, &c.; loose and in gelatine wrappers.

125A MULLER, F., 2 *Hill Street, Hackney Road*—Manufacturer.

Specimens of gelatine and glue, adapted for general use; but especially delicate cabinet-work.

126 CURTIS BROTHERS & Co., 19 *Coleman Street*—Factors.

Substances used for tanning leather: oak bark (*Quercus pedunculata* and *sessiliflora?*), English tree, in the rough, cleaned, chopped, and ground; coppice, in the rough, chopped, and ground; Flemish tree and coppice, cleaned and chopped; Dutch tree, cleaned and chopped. Larch bark (*Abies larix*), Scotch, in the rough, and ground. Mimosa bark (*Acacia*), New South Wales, in the rough and ground. Babool bark (*Acacia Arabica*), Calcutta. Cork-tree bark (*Quercus suber*), Larache and Rabat. Hemlock spruce (*Abies Canadensis*), United States, in the rough and ground. Sumach (*Rhus coriaria*), Sicily. Valonia (*Quercus ægilops*), Smyrna. Valonia (*Camuta*), Dragomestra, Morea. Divi-divi (*Cæsalpinia coriaria*), Maracaibo, Rio de la Hache, Savanilla. Myrobalans (*Terminalia*), Calcutta. Terra Japonica (*Nauclea Gambia*), Singapore, in import package, and loose. Cutch (*Acacia catechu*), Pegu, in import package, and loose.

[The active principle for which all these articles are valued in the process of tanning leather is *tannin*, or *tannic acid*. It exists in greater or smaller proportions in each vegetable product named, being found principally in the bark. Except for the purposes of chemistry and medicine, tannin is not extracted from these substances, which are consequently employed, in a more or less comminuted state, in the conversion of the gelatine of the hides, &c., into tannate of gelatine, or leather.—R. E.]

126A **KITCHIN, J.**, 42 *Commercial Sale Rooms, Mincing Lane*—Producer.

Shumac, in the leaf, and ground, from Palermo, used in tanning sheep and calf skins, moroccos, &c.

---

127 **FRENCH, BEAL**, 51 *Crutched Friars*—Importer and Manufacturer.

Cork, raw material; cork, manufactured by hand.

[Cork is the exterior bark of *Quercus suber*, a species of oak native, cultivated in Spain, Portugal, and the south of France. A tree is ready for barking when it reaches 15 years in age, and between that and 30 years may be barked several times.—E. F.]

---

128 **HOLT, EDWARD**, 24 *White Rock Place, Hastings*—Inventor and Manufacturer.

Mosses, collected from various places in East Sussex, arranged in the form of a vase, and placed in an oak frame, with a description of the uses of the plants.

Sea-weeds, zoophytes, corallines, &c., found on the rocks and coast of Hastings and St. Leonards, ornamentally displayed in the form of a wreath, and placed in a carved gilt frame; with the various uses of the plants, for medicinal and other purposes, briefly described.

Collection of sea-weeds, called the "treasures of the deep," with shells and specimens of Hastings' pebbles, under a glass shade, collected and dried by Mary Ann Holt.

---

130 **FIELD, J. C. & J.**, 12 *Wigmore Street, Cavendish Sq.*, and 36 *Upper Marsh, Lambeth*—Manufacturers.

Specimens of stearine, produced entirely from tallow; exhibited for hardness, whiteness, and transparency. A combination of stearic and margaric acids for candle-making and several other purposes of minor importance.

---

131 **GROVES, NICHOLAS**, 58 *Watling Street, Dublin*—Manufacturer.

Specimens of parchment and glue of Irish manufacture

---

132 **PEET, THOMAS**, 6 *Frederick Street, Regent's Park*—Manufacturer.

Corks, solely of British manufacture; cut by hand.

---

134 **BREADALBANE**, Marquis of, *Taymouth, Aberfeldy, Perth*—Producer.

Four squares of flooring, showing specimens of some of the woods grown in Perthshire and Argyllshire.

Table, chair, and chest of drawers, veneered with roots of the natural Scotch fir, dug from peat bog in the forest of Glenorchy, Argyllshire.

---

135 **FAUNTLEROY, ROBERT, & SONS**, *Potters Fields, Tooley Street*—Producers.
GROUND FLOOR. S. 11, 12, 13, and 14.

An extensive collection of foreign, hard, and fancy woods.
An elephant's head, with tusks and grinders.
A variety of teeth of elephants, hippopotamus, and walrus. Horns of the sea unicorn.
Mother-of-pearl shells. Corozo nuts, or vegetable ivory. Coquilla nuts, &c.

Names.	*Places of Produce.*	*Purposes.*
1. Amboyna, or Kiabooka (*Pterospermum indicum*).	East Indies, Borneo, Amboyna	Cabinet-work.
2. African black wood (Cocobolo prieto)	Africa, Madagascar, &c.	Turning.
3. Angica	The Brazils	Cabinet-work and turning.
4. Barwood (*Baphia nitida*)	Africa (West Coast)	Dyeing and turning.
5. Beefwood, or Bully tree (*Robinia panacoco*).	Guiana (Demerara)	Machinery and turning.
6. Botany Bay Oak (*Casuarina stricta*)	New South Wales	Turning and brush-making.
7. Boxwood (*Buxus balearica*)	Turkey	Turning, machinery, and wood engraving, &c.
Boxwood (*Buxus sempervirens*)	England, Spain, &c.	Turning.
Boxwood		
Boxwood	East Indies	
8. Brazil wood (*Cæsalpinia Braziliensis*)	The Brazils	
9. Braziletto (*Cæsalpinia Bahamensis*)	Jamaica and the Bahamas	Dyeing and turning.
10. Cam wood (*Baphia nitida*)	Africa (West Coast)	
11. Camphor wood (*Camphora officinalis*)	China, Borneo, &c.	Cabinet-work.
12. Canary wood (*Laurus indica*)	The Brazils, &c.	Cabinet-work and turning.
13. Cedar (pencil) (*Juniperus virginiana*)	The United States	Pencils and cabinet-work.
14. Cedar (Cuba) (*Cedrela odorata*)	West Indies, Havana	Cabinet-work.
15. Cocus wood (*Amerimnum ebenus*)	Jamaica	Turning, &c.
Cocus wood	Cuba	
16. Coromandel or Calamander (*Diospyros hirsuta*).	East Indies (Ceylon, Manilla, &c.)	Cabinet-work and turning.
17. Ebony (black) (*Diospyros melanoxylon*)	Africa, West Coast	Turning and cabinet-work.
Ebony (black) (*Diospyros ebenum*)	Mauritius and Madagascar	
Ebony (black) (*Diospyros ebenaster*)	Ceylon	
Ebony (black) (*Diospyros melanoxylon*)	Bombay, &c.; Sumatra, &c.	
18. Ebony (green) (*Amerimnum ebenus*)	Jamaica and the Bahamas	Dyeing and turning.
19. Fustic (*Maclura tinctoria*)	West Indies (Cuba, also Savanilla)	
Fustic (*Rhus Cotinus*)	Ionian Islands (Zante)	Dyeing.
20. Hickory (billets) (*Carya alba*)	The United States	Handspikes, fishing-rods, &c.
21. Ironwood (*Sideroxylon, &c.*)	East Indies	Machinery and turning.
22. Jackwood (*Artocarpus integrifolia*)		Cabinet-work and turning.
23. Kingwood	The Brazils	Turning and cabinet-work.
24. Lancewood spars (*Guatteria virgata*)	West Indies (Cuba, Jamaica)	Gig shafts, archery bows, &c.
25. Letterwood or Snakewood (*Brosimum aubletii*).	Guiana and the Brazils	Turnery and archery bows.
26. Lignum vitæ (*Guaiacum officinale*)	West Indies (St. Domingo, Jamaica, Porto Rico, Cuba, Honduras, the Bahamas).	Sheaves for ships' blocks, turning, and machinery.
Lignum vitæ (*Guaiacum officinale*)	Australia	Turning.
27. Logwood (*Hæmatoxylon campechianum*)	West Indies, also Central America	Dyeing.
28. Madagascar red wood	Madagascar	Turning and cabinet-work.
29. Maple (bird's-eye and Rock) (*Acer saccharinum*).	North America	Cabinet-work.
Maple (Russian) (*Acer tataricum*)	Siberia, &c.	
Maple (English) (*Acer campestre*)	England	

Names.	*Places of Produce.*	*Purposes.*
30. Nicaragua wood (*Cæsalpinia hæmatoxylon, &c.*).	Central America, &c.	Dyeing.
31. Nutmeg wood (*Areca catechu*)	The Brazils (Para)	Turning and cabinet-work, umbrella and parasol sticks, &c.
32. Palm-tree (black) (*Cocos nicpere*)	East and West Indies	
Palm-tree (red and brown)		
Palm-tree (prickly brown) (*Cocos guianensis*).		
33. Partridge wood (brown and red) (*Heisteria coccinea*).	The Brazils and West Indies	
34. Pheasant wood (*Heisteria coccinea*)		
35. Princes wood (*Cordia gerascanthus*)	West Indies (Jamaica)	
36. Purple wood (*Copaifera rubiflora*)	The Brazils and West Indies	Turning and cabinet-work, umbrella and parasol sticks, &c.
37. Queen wood, or Jugeca wood (*Laurus chloroxylon*).		
38. Red sanders wood (*Pterocarpus santalinus*).	East Indies (Calcutta, &c.)	Dyeing and turning.
39. Rosewood (*Trioptolomea*)	Brazils (Rio de Janeiro and Bahia)	Cabinet-work, turning, and brush-making.
Rosewood (*Amyris balsamifera*)	Honduras, &c.	
Rosewood (*Dalbergia latifolia*)	East Indies	
40. Rosetta wood		
41. Sabicu	Cuba	Ship-building and furniture.
42. Sandalwood (*Santalum album*)	East Indies	Perfumery and cabinet work.
43. Sapanwood (*Cæsalpinia sapan*)		Dyeing.
44. Sapodilla (*Fugara pterota*)	Honduras	Machinery and turning.
45. Satin wood	East Indies	Brush-making, cabinet work, and turning.
Satin wood (*Chloranthus, &c.*)	West Indies, (St. Domingo, Porto Rico, and the Bahamas)	
46. Tulip wood	The Brazils	Cabinet-work and turning.
47. Walnut wood (*Juglans regia*)	Italy and Belgium	Cabinet-work and gun-stocks.
48. Yew tree (*Taxus baccata*)	England and Spain	Archery bows and turning.
49. Zebra wood (*Omphalobium Lamberti*)	The Brazils	Cabinet-work and turning.
An elephant's head, with tusks and grinders complete.	Africa (West Coast)	
Elephants' tusks	Africa—Camaroon, Gold Coast, Angola, and the Cape	Cutlery, turning, carving, &c.
Elephants' tusks	Calcutta, East Indies, & Alexandria	
Elephants' grinders	Africa	
Sea-horse, or hippopotamus, teeth (curved and straight)	East Indies and Africa	Dentists and turning.
Sea-cow, or walrus, teeth	Hudson's Bay	
Sea-unicorns' horns		
Mother-of-Pearl shells (white edge)	Sincapore	Button-making, turning, and fancy work.
Mother-of-Pearl shells (yellow)	Manilla	
Mother-of-Pearl shells (black)	Tahiti	
Mother-of-Pearl shells (Bombay)	Bombay	
Mother-of-Pearl shells (Buffalo)	South America	
Coquillo nuts (*Attalea funifera*), a kind of palm-tree, which yields the fibres now in use for coarse brooms, &c.	Brazils	Turning.
Corozo, or Corusco, nuts (*Phytelephas macrocorpa*).	Colombia	

IN THE NAVE.—A circular slab of Honduras mahogany, 7 ft. 6 in. in diameter.

136 CROSS, SAMUEL, 57 *Bunhill Row*—Proprietor.

English-grown woods, with their botanical names and some of their various uses.

FOREST AND PARK WOODS.

No.	*Botanical Name.*	*Popular Name.*	*Habitat—Uses.*
1	Robinia Pseudacacia	Acacia Locust-tree	Chair-making; cricket-stumps and turnery; posts, &c.
2	Thuja occidentalis, or T. orientalis.	American Arbor Vitæ or Chinese.	*Asia and America* (scarce).—Fancy cabinet-work, inlaying, &c.
3	Fraxinus excelsior	Ash	*Europe and North of Asia.*—Every description of carriage building, agricultural implements, and felloes for wheels; handles of every kind; various turnery; bent for hoops and measures, &c.
4	Pyrus aucuparia	Ash, Mountain	
5	Pyrus	Ash, Drooping	
6	Alnus glutinosa	Alder	*Europe and Asia.*—Pattens, clogs, hat-blocks, broomsticks, brush-boards, rollers for silk goods, and various toys and turnery; makes the best charcoal for coppersmiths and gunpowder; the bark used in light tanning.
7	Populus tremula	Aspen, see Poplar	
8	Fagus sylvatica	Beech	*Europe.*—Foundations of large edifices, and building in general; oil-mill stampers, cabinet, chair, and bedstead-making; saddle-tree and last-making; cut for screws; plane-making, and tool-handles; wheelers' work, and felloes for wheels; large letters for printing, brush-boards, and bottoms of ships and barges; turnery, firewood for pastrycooks, and glass-bending.

FOREST AND PARK WOODS—*continued.*

No.	*Botanical Name.*	*Popular Name.*	*Habitat—Uses.*
9	Fagus sylvatica	Beech, White	*North America.*—The same purposes.
10	Betula alba	Birch	Bottoms of pattens and clogs, turnery, reels, and toys.
11	Buxus sempervirens	Box	*European and Turkey.*—Wood engraving, turnery, fancy work, &c.
12	Abies cedrus	Cedar of Lebanon	Valuable as an ornamental tree; available for fancy box-making, cabinet and other fancy work.
13	Æsculus hippocastanum	Chestnut, Horse	Inlaying cabinet work, Tonbridge ware, brush boards, stained ornamental work, and common buildings.
14	Castanea vesca	Chestnut, Spanish	*Europe.*—Carving, interior of ecclesiastical and other buildings, cabinet-work, &c.
15	Pyrus malus	Crab	(Very hard).—Engineering purposes, turnery, &c.
16	Cornus sanguinea	Dogwood	Chiefly for skewers (small).
17	Ulmus	Elm	*Europe.*—For bottoms of ships and barges, ships' blocks, gun-carriages, mast caps, piles for foundations, railway sleepers, wheelwrights' and millwrights' purposes; bored for pipes and pumps; large turnery and culinary purposes; naves for wheels; coffins, bellows, scale-board making, &c.
18	Ulmus	Elm, Dutch, or Sand	Press-making, &c.
19	Ulmus montana	Elm Wych	Boat-building, and some of the above-mentioned uses.
20	Abies larix	Larch Fir	Cabinet-work, building purposes, railway sleepers, fencing, posts, gates, &c.; the bark used for tanning.
21	Pinus sylvestris	Scotch Fir	Chiefly used for building purposes, railway sleepers, fencing, &c.
22	Abies picea	Silver Fir	
23	Abies excelsior	Spruce Fir	
24		Pine Fir	
25	Corylus avellana	Hazel	Hoop handles, small turnery, fishing-rods, cotton-reels, pea-sticks, &c.
26	Carpinus betulus	Hornbeam	Cogs for mill-wheels, mallets, skittles, and hard-turnery.
27	Ilex aquifolium	Holly	Engraving blocks for silk and calico printing, fancy cabinet-work, whip-sticks, small turnery.
28	Cytisus laburnum	Laburnum	Used for turnery.
29	Tilia europæa	Lime	Carving purposes, musical instruments, pianoforte keys, cutting boards, &c.
30	Syringa vulgaris	Lilac	
31	Acer campestre	Maple	Fancy cabinet-work, veneering; chair, musical instrument, and frame-making.
32	Cerasus avium	Merry, or Wild Cherry	Chair-making, &c.
33	Quercus pedunculata	Oak	Ship-building timbers, as futtocks, knees, stem and stern posts, top-timbers, floors, and planks for covering the frame; barge and boat-building, dock-gates, and large buildings generally; railway-carriage building, liquor-back making, and engineers', wheelwrights', and carpenters' purposes; railway sleepers, piles, coffins, and furniture generally; stocks and spokes for wheels, posts, rails, and cleft-pales for fencing, &c.; the red for fancy cabinet-work; the bark the principal ingredient in tanning leather.
34	Quercus cerris	Turkey Oak	(Scarce.)
35	Quercus ilex	Evergreen Oak	(Scarce.) Used by millwrights, &c., for cogs for water-wheels.
36	Platanus	Plane Tree	Rough buildings, brush-boards, and many purposes for which beech is used.
37	Populus canescens	Poplar, or Abele	Breaks of railway carriages, and used in paper-mills; leather-cutters' boards, and rough buildings, and sometimes for life-boats.
38	Populus nigra	English Poplar	
39	Populus fastigiata	Lombardy Poplar	
40	Acer pseudo-platanus	Sycamore	Musical instruments, churns, turnery, bread plates, carving, chair-making, brush-boards, &c.
41	Salix caprea	Sallow, see Willow.	
42	Pyrus domestica	Service	(Scarce.) Used as lime-tree.
43	Liriodendron tulipifera	Tulip-wood	(Very scarce.) Fancy cabinet and box-making.
44	Cratægus oxyacantha	Whitethorn	(Hard.) Used by millwrights for cogs.
45	Prunus spinosa	Blackthorn	(Small) Whip-stocks and walking-sticks.
46	Rhamnus catharticus	Buckthorn	(Scarce and small.)
47	Salix	Willow	Cricket-bats and small turnery; split and wove for ladies' bonnets, foundations of hats, &c.
48	Salix	Willow, Weeping	
49	Taxus baccata	Yew	Fancy cabinet-work and inlaying; bows for archery; rustic chairs, whipstocks, &c.

ORCHARD WOODS.

50	Amygdalus communis	Almond	
51	Pyrus malus	Apple	Chair-making, turnery, &c.
52	Cerasus	Cherry	Fancy chair, furniture, and turnery.
53	Cerasus	Damson	
54	Sambucus nigra	Elder	Shoemakers' pegs, &c.
55	Juniperus communis	Juniper	
56	Mespilus germanica	Medlar	(Scarce.)
57	Mespilus	Mulberry	Fancy work and turnery.
58	Pyrus communis	Pear	Blocks for engraving on silk, cotton, &c., paper-staining, chair-making, &c.

ORCHARD WOODS—*continued.*

No.	*Botanical Name.*	*Popular Name.*	*Habitat—Uses.*
59	Prunus domestica	Plum	Fancy cabinet-work.
60	Juglans regia	Walnut	Furniture and fancy cabinet work; gun and pistol stocks.
61	Juglans nigra	Black Walnut	The same purposes.
62	Cydonia vulgaris	Quince	
63		Wild Pear	Best wood for receiving a black stain.

NOTE.—The woods not marked with their uses are valuable for their fruit-bearing or ornamental properties.

137 MURRAY, Sir WM. KEITH, Bart., *Dunnottar, Stonehaven*—Proprietor.

Plank of Scotch fir (*Pinus sylvestris*).
Section of Scotch elm (*Ulmus montana*).

138 DILLON, Viscount C. H., *Loughlyn House, Loughlyn, Ireland*, and *Dytchley, Oxfordshire*—Proprietor.

Slabs of yew, oak, and fir, from trees found in the bogs.

139 PAYNE'S PATENT TIMBER PRESERVING COMPANY, *Whitehall Wharf, Cannon Row, Westminster*—Producer.

Specimens of English woods subjected to Payne's patent preserving process.

140 LAXTON, W., 19 *Arundel Street, Strand*—Producer.

Bituminous black candle, and an embossed ornament from the Binney quarries, near Edinburgh, formed by the natural bitumen found in the joints of the stone quarry.

Sect. II. Class 5.

MACHINES FOR DIRECT USE, INCLUDING CARRIAGES, RAILWAY AND MARINE MECHANISM.

INTRODUCTION.

The objects contemplated by this Class form the most important series exhibited. They develop the application of a source or sources of power, either derived by man from simple combinations of elementary things, or supplied to him in the active forces of nature—in the winds, tides and rivers—or obtained by him from adaptations of dynamical laws. They represent also the means employed in effecting change of place, whether of inanimate matter or of man himself. The Class is a very large one, occupies a considerable amount of space, and, as the most direct representation of one of the principal sources of the industrial success and prosperity of Great Britain, it must receive a large amount of study and attention.

The Class is subdivided into machines for direct use, including Carriages, Railway and Naval Mechanism, and Carriages generally, not including Railway Carriages, or similar vehicles. The first of these divisions is the most important, and comprehends—A. Steam-engines and Boilers, Water and Wind Mills, and various other prime movers; B. the separate parts of Machines, specimens of Workmanship, &c; C. Pneumatic Machines such as Air-pumps; D. Hydraulic Machines; E. Locomotives and Railway Carriages; F. Railway Machinery and Permanent Way; and G. Weighing, Measuring, and Registering Machines for commercial purposes. The several divisions include—A. Carriages for Town use; B. Travelling Carriages; C. Carriages for general use; D. Public Carriages; and E. Carts and Waggons—not agricultural.

The arrangement of the objects included in this Class, within the Building, extends over a large area. Commencing at Avenues C. D. Prime Movers in action will be found scattered in different positions down those avenues, and on entering Avenues A. B. C. lower down, they are still found as low as Areas 30. Avenues D. E. and F. from Areas 19 to 30, contain some highly interesting Engines and Machines comprehended within this Class. Avenues F. G. are occupied by Locomotives, Railway Carriages, and Railroad Apparatus generally. Avenues G. to I., from Area 1 to 14, are filled with Carriages of every description. In Areas G. H. and I., from 19 to 22, are found the largest specimens of Prime Movers exhibited, representing that peculiar form of steam-engine applied to the purposes of marine propulsion. The Prime Movers being employed in communicating motion to machines belonging to the next Class, are necessarily distributed among those machines; but the other objects regarded by the Class have, as far as possible, been grouped in immediate proximity to each other. A number of Models, illustrative of Class 5, are found at the eastern end of that part of the Building containing machinery in motion.

Steam-engines are so directly in relation with the prosecution of manufactures and locomotion, that they must always demand a certain degree of superior interest. A great variety is exhibited: these belong chiefly to the high-pressure class; and motion is communicated to them by steam conveyed in pipes clothed with hair-felt running under the flooring. These pipes derive their supply from five boilers, arranged in the boiler-house, at a little distance from the north-west corner of the Building. The system adopted of clothing the pipes with thick hair-felt, and over that with a casing of painted canvas, has rendered it possible to carry high-pressure steam to a distance before thought to be impracticable. The pipes are supplied at intervals with globular water-traps, in which the water resulting from the condensation of the steam is collected, and whence it can be readily removed. The system of non-conduction is so complete, that no perceptible heat is experienced rising through the open flooring.

The beam engines of a former period appear to be becoming replaced, in high-pressure engines, by those forms in which a direct communication of power is made from the piston to the crank, either mediately through connecting arrangements, or immediately by the attachment of the piston rod to the crank itself. To the latter class belong the steam-engines with vibrating or oscillating cylinders; to the former, those in which the cylinder is fixed, and in which the rectilinear movement of the piston rod is converted into the curvilinear one of the crank and shafting, through the medium of vibrating mechanism attached to it. Several varieties of both these kinds of steam-engine are exhibited in motion driving cotton-spinning, weaving, and other machines. Rotatory steam-engines of different kinds are also exhibited: in most of these the curvilinear motion necessary for driving machinery is obtained without the intervention of the crank, and power is led off by bands from the shafting directly operated upon by the engine. Some of these machines present the most singular and anomalous forms. There are some examples of new methods of converting rectilinear into curvilinear motion.

The Marine Engines, which are not in motion, form an extremely interesting study. The ponderous engines from the Soho Works, of the collective power of 700 horses, for driving the screw propeller by direct action, form a remarkable illustration of the revolution effected by progressive science, not only in the form, but also in the application, of the steam-engine. The time existed when the great improver of the steam-engine questioned the probable application of steam to ocean navigation; and it is remarkable to find these immense engines, exclusively adapted to steam navigation, proceeding from the works founded by James Watt himself. Upon these engines are wooden models of an attempt at steam locomotion made as early as 1785.

Separate parts of machines and specimens of workmanship are also exhibited. Among the former will be recognised the enormous connecting rod, adapted to marine steam-engines, of the collective power of 800 horses. Some beautiful specimens of straight edges and flat surfaces are also shown. Hydraulic presses of various kinds are exhibited, and among them the vast machine which was employed to lift the Britannia tube into its place. The application of the same powers is also shown in other directions. Cranes of various kinds are found in this class—the peculiar form of the tubular iron crane, of the Derrick, and other cranes, will attract attention. The Derrick crane was employed in the construction of the building, and in placing the heavy machinery *in situ*.

The high reputation enjoyed by the locomotive engine-makers of England is adequately sustained by the magnificent and costly engines found in this department. The stupendous wide-gauge engine—the "Lord of the Isles"—illustrates the peculiar features of construction introduced on that system, and conveys an overwhelming impression of speed and power. In contrast are the beautiful engines for express travelling—the Cornwall, and another, built on Crampton's patent: the driving wheels of the latter are eight feet in diameter. These engines are calculated for a high degree of speed, with great power. Corrugated iron carriages, carriages built of Moulmein teak, breaks, trucks, turn-tables, signals, specimens of permanent way, and all that relates to the railroad system, are therein abundantly represented.

Carriages of every description are found in their proper place. Some of these are of new form and design, others combine new mechanical adjustments or adaptations, and others exhibit improvements instituted for particular purposes, as for convenience in travelling or for the removal of invalids. Public carriages, of new forms, are also found among others.

This Class, viewed as a whole, indicates in what direction the current of industrial activity has been most successfully conducted in Great Britain. The workmanship employed in the reduction of ponderous masses of material into forms capable of exercising movement and developing force, is of necessity of the highest order; for an error of adjustment were fatal to the operation of these mighty engines, and the difficulty of accurate adjustment presents itself, at a rough estimate, proportionately to the size of the objects concerned. But specimens of the successful application of mechanical skill in every direction, and to objects great and small, are found, and appear in forms which indicate that compactness and completeness of execution are not less regarded than perfection of adaptation. As the practical display of the sources of power at the command of this country, whether in their application to production or to locomotion, Class 5 is complete, and offers a wide field of fruitful investigation to the inquirer.—R. E.

1 **ATHERTON, CHARLES**, *Dockyard, Devonport*—Inventor.

Pair of marine steam-engines of 25-horse power, constructed with a view to apply the sway-beam principle in driving the submerged screw propeller.

Drawing, to show the mode of applying the same principle to large engines for ships of war, which require the engines to be below the water-line of the ship. The air-pump valves are adapted for being worked with great speed, and the eccentrics and slides are arranged for being easily managed so that the engines may be quickly reversed. The patent expansion gear is intended to be made one of the principal means of registering the variations of expansion during the working of the engine, in order that the indicated working power and the corresponding consumption of fuel may be duly recorded; thus applying to marine engines a system of inquiry which has been attended with great advantage in the case of mining engines.

Model of the expansion slide.

2 **POWELL, EDWARD JAMES**, 11 *Hartland Terrace, Camden Town*—Designer.

Drawing illustrative of the various forms of patent screw propellers.

3 **SMITH, Captain. F. P.**, *Greenwich*.

Various screw propellers.

4 **STOTHERT, SLAUGHTER, & Co.**, *Avonside Iron Works, Bristol*—Inventors and Manufacturers.

Patent combined propeller engine, patented by Edward Slaughter. This system which has reference only to condensing propeller engines, purports to combine the advantages of a direct action, quick working engine, with those of the indirect slow working engine. In the latter, the speed requisite for the propeller is obtained by means of accelerating gearing driving on to a second-motion shaft. The new engine claims to avoid the disadvantages of both. It is assumed that, to attain the best possible form and angle of screw, it is in all cases desirable to give a speed to the propeller shaft unsuited to the vacuum, supply, and bilge pumps, but especially to the former; and that whereas the required number of revolutions presents no practical difficulty in those portions of the engine where the passage of steam only is in question, very great difficulty, and an undue amount of wear and tear, as well as loss of power, attach to the rapid opening, closing, and constantly repeated shocks of large and numerous valves, required for the passage of water through the vacuum pumps for the process of condensation. So greatly is this difficulty estimated by some of the first naval engineers of the day, that the indirect engine, with its cumbersome and costly gearing, is preferred to the light, simple, and inexpensive direct-action engine; and this preference obtains in spite of the very strong prejudice entertained against the employment of gearing in any form on shipboard. Under the present system, direct-action to the screw shaft from the steam pistons is obtained, in connection with a reduced speed of the vacuum apparatus, by means of gearing of a lightness proportioned to the fraction of power required, say $\frac{1}{10}$ part of the entire power of the engine. It may be said that direct-action engines are in successful operation, in which the vacuum apparatus is made to work, without difficulty, at the same speed as the steam pistons. Now, if this cannot be denied, it is submitted that the speed, and therefore the angle of the propeller, must be lowered to the speed suitable for the vacuum apparatus; that they do so work at a considerable loss of power, by reason of the unduly large relative capacity of the air pumps, at a much increased ratio of wear and tear of machinery, and, as it can scarcely

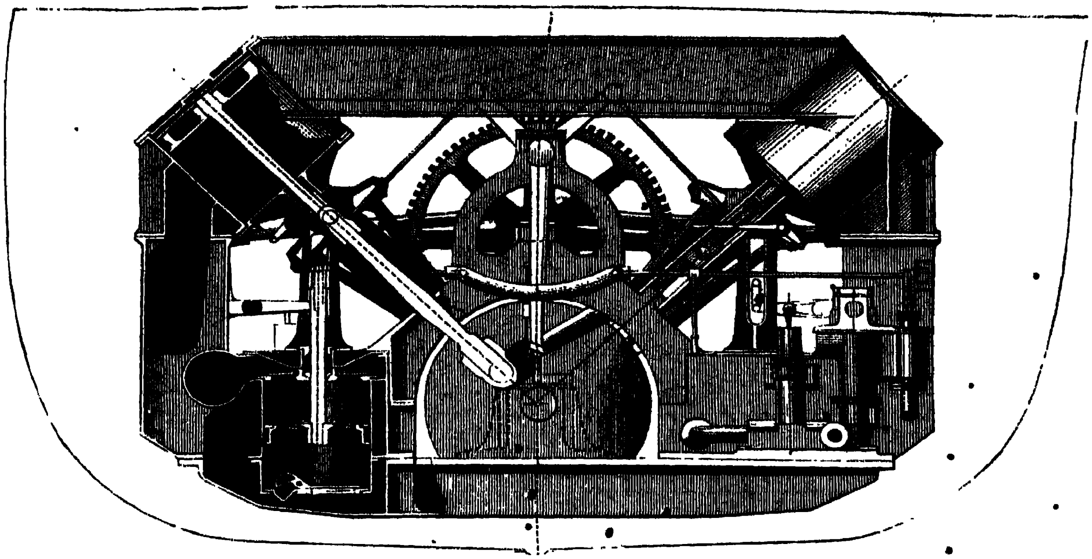


Fig. 1. Partly Sectional Elevation of Combined Marine Propeller Engine.

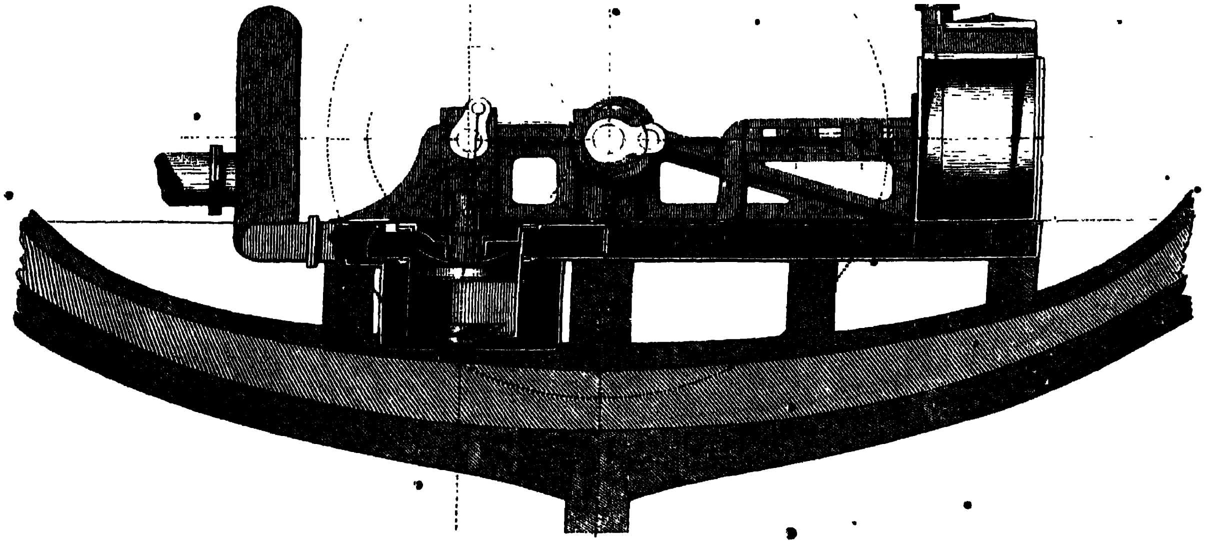

Fig. 2 Represents the same Engine, adapted to War Steamers.

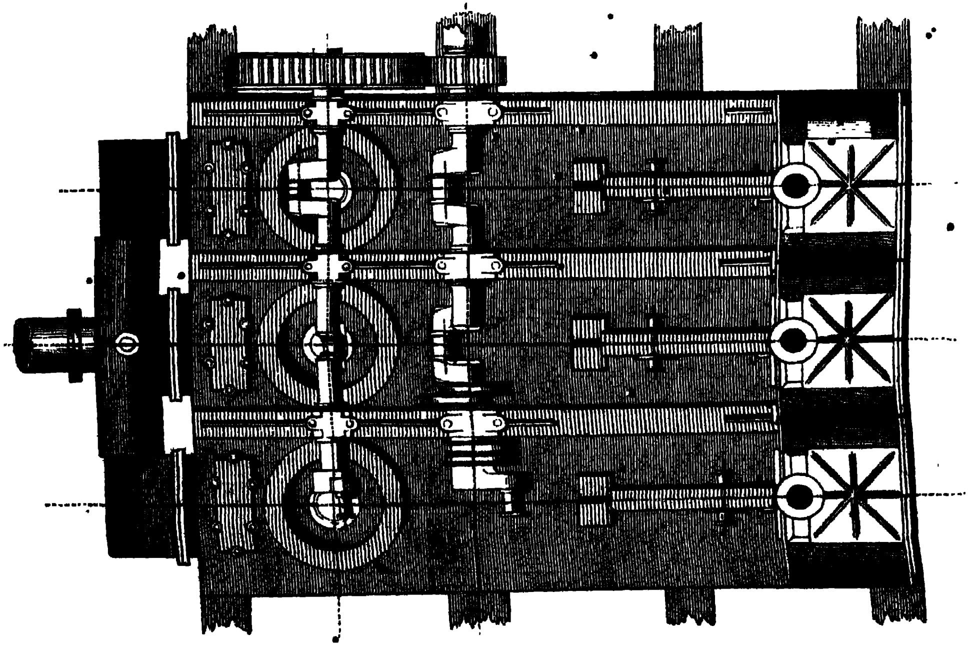

Fig. 3. Plan of the same.

be doubted, with much greater risk of accident. It will be readily understood that the system must be considered irrespective of the particular arrangement exhibited which had in view to economise space in the vessel longitudinally; and that cylinders, disposed horizontally or otherwise, are equally applicable, and the horizontal disposition would be adopted for war steamers. In illustration of the above, the marine condensing engine exhibited (100 horses power), may be regarded as divided into two parts comparatively distinct one from the other, the steam portion working directly on to the screw shaft with all the simplicity of a high-pressure engine, at a speed of 120 revolutions per minute; the vacuum apparatus, as well as the supply and bilge pump, being made to work at the reduced speed of 40 reciprocations, or about the approved speed of paddle-wheel engines of same power. It may here be well to state that the relative capacity of the vacuum pumps and the steam cylinders must be calculated in reference to the difference of speed; and that, in practice, the vacuum produced in the condensers, is found to be as perfect as that in any existing engines, viz., 28 and upwards. A pair of engines, identical with these, is at work in the Bristol Channel. The system has been proved with equal success in a small experimental vessel, in which the speed of vacuum apparatus is only ¼ instead of ⅓ of that of the steam pistons. The following advantages are claimed:—High speed upon the screw shaft, in connection with slow speed of vacuum apparatus, in the same machine. No reasonable limit to the high speed required for screw shaft, giving facility for securing the best form and angle for propeller. No reasonable limit to the reduction of speed required for vacuum apparatus, with diminished risk of accident resulting therefrom. Saving of power by reason of relatively reduced proportion of vacuum pump, and consequent saving of fuel. The Plate represents elevations and a plan of these engines as applied to river steamers.

5 **Taplin, R.**, 7 *Upper Woodland Terrace, Woolwich*—Inventor.

Model of a telescopic funnel or chimney for marine boilers. This telescopic funnel or chimney is on the compound principle, and not simply telescopic. It is designed to accomplish the desideratum of striking the funnel of any steam vessel below the upper deck; and the principle may be applied in a variety of ways. To paddle-wheel vessels it affords the power of working the sail nearest the funnel; and while under sail, the vessel is not hindered by its resistance to the air. To the screw vessel, in particular, it offers more advantages, as by relieving the deck of the cumbersome and unsightly appearance, as well as inconvenience of the funnel, it enables the vessel to chase or approach an object almost unobserved; and if the masts, rigging, &c., be dispensed with, which is also possible, nothing but the hull might be seen, when steaming to effect some special purpose, as a secret expedition, &c.

6 **Watt, James, & Co.** (late **Boulton & Watt**), 18 *London Street*, and *Soho, Birmingham*—Designers and Manufacturers.

Marine engines, of the collective power of 700 horses, with four cylinders, 52 inches diameter, and 3 feet stroke, designed for driving the screw propeller by direct action at 65 revolutions per minute.

The object of the inventor has been to combine lightness and compactness relatively to the power, with simplicity of arrangement. These engines can be placed in the ship entirely below the water-line, whereby they are protected from the effects of shot in vessels of war; and in the mercantile marine the decks are left clear for passengers or cargo.

Two working models, made in the year 1785, by Mr. William Murdoch of Soho, who was at that period connected with the firm of Messrs. Boulton, Watt, & Co. The first is of a "locomotive," showing the original application of steam for the purposes of travelling; and tried upon the common road in Cornwall, in 1785 and 1786. The second is a model of an oscillating engine, constructed at that early period for the purpose of illustrating Mr. Watt's patent of 1784, for making the cylinder work on its axis.

7 **Roughton, R.**, *Dockyard, Woolwich*—Inventor.

Improved slide-valve.

8 **Penn, John, & Son**, *Greenwich*—Manufacturers.

Pair of marine oscillating engines. One paddle-wheel is fitted on the patent feathering principle; and the other on the ordinary plan. Collective power, 24 horses.

Pair of patent marine engines on the trunk principle, arranged and adapted for the driving of the screw-propeller direct. Collective power, 60 horses.

Fig. 1 represents a section of the patent marine trunk engines, the piston being at half stroke.

Fig. 2 (p. 212) shows a section of the marine oscillating engines at the air-pump.

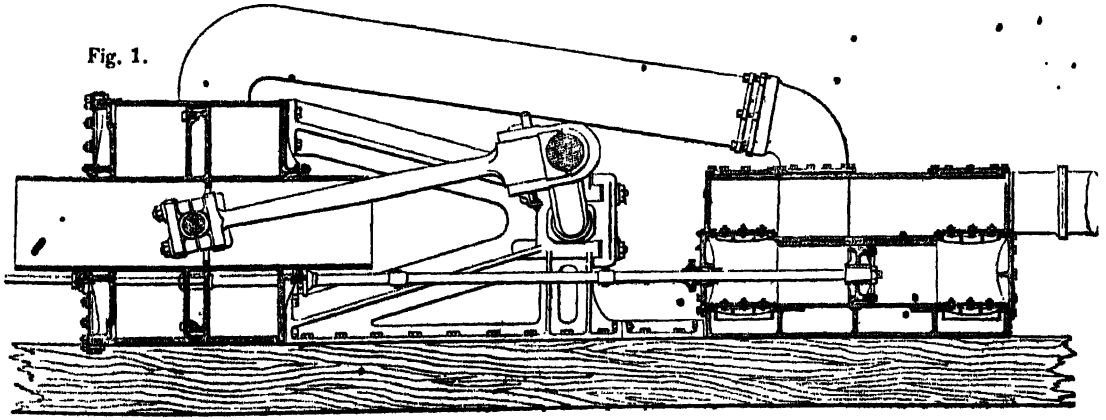
Working model of a pair of marine oscillating engines, as made and fitted on board H.M. steam-frigate "Sphynx." Collective power, 500 horses.

Working model of a pair of oscillating engines, used in river vessels.

Working model of a pair of patent trunk engines, as fitted on board H.M. steam-frigate "Arrogant," 46 guns, and H.M. steam-sloop "Encounter," 12 guns. Collective power, 360 horses.

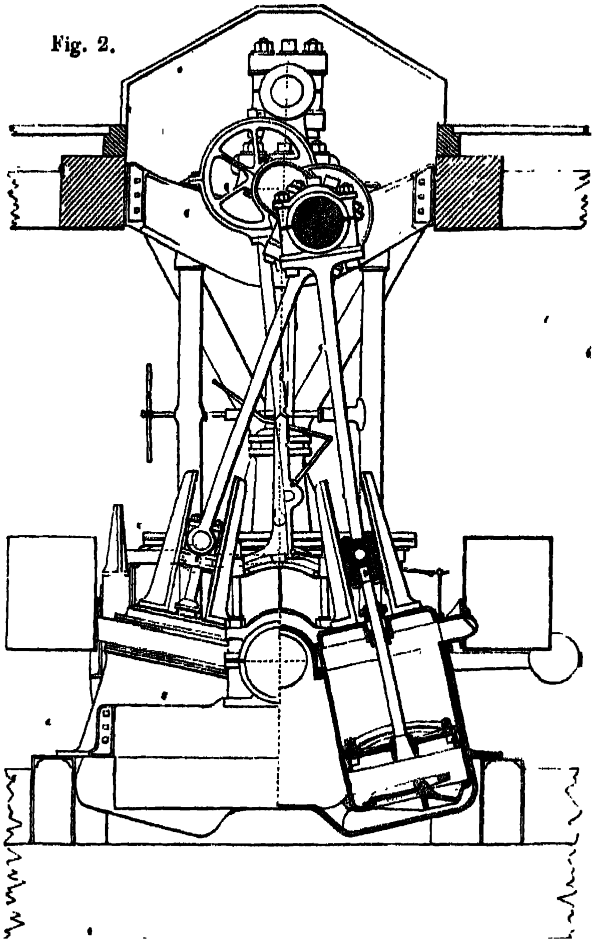
An auxiliary or "donkey" engine for pumping water into marine boilers when the larger engine is not at work.

Fig. 1.



Penn & Son's Patent Marine Trunk Engines.

Fig. 2.



Penn & Son's Marine Oscillating Engines.

10 **FOSSICK & HACKWORTH**, *Stockton-on-Tees*—Manufacturers and Inventors.

High-pressure steam-engine boiler, with improvements. Locomotive and carriage, buffer and draw spring.

11 **HAWTHORN & CO.**, *Leith*—Manufacturers.

High-pressure oscillating steam-engine, of simple construction, without slide-valves, eccentrics, or gearing.

12 **EDWARDS, THOMAS**, *Islington Foundry, Birmingham*—Manufacturer.

A five-horse-power patent direct-action high-pressure steam-engine, applicable for all purposes where steam power is required.

The advantages of this engine are stated to be simplicity of construction, few bearings, its occcupying little room, and less liability to derangement than the ordinary beam-engine.

13 **HICK, B., & SON**, *Bolton*—Manufacturers.

The steam-engine which drives Hibbert and Platt's cotton machinery in the Exhibition Building.

14 **SIMPSON & SKIPTON**, *Trafford Street, Manchester*—Manufacturers.

The improved short-stroke reciprocating high-pressure steam-engine, which drives Parr, Curtis, and Madely's cotton machinery in the Exhibition.

The advantages claimed for this invention are as follow:—The piston, receiving a reciprocative action from the steam, by reason of its mechanical arrangement, gives out a revolving motion, thus reducing the impetus at each return stroke; and from the fact of its containing the properties of the piston and crank combined, it is not subject to the same straining of parts. Although the piston of the ordinary engine at all times receives the full effective pressure of the steam (when the valve is open), there are positions of the stroke when this is useless, as when the crank is "on the centre," consequently the shock is sustained on the several cottars and parts, which is much felt in overloaded engines; but by the arrangements submitted, the crank shaft, which is the piston shaft, receives this shock, which is somewhat diminished on account of the piston itself gliding gradually out of equilibrium into full effect (the same as the common crank, though divested of the intermediate parts). An advantage is also obtained by working a short stroke with a large effective area of piston, and, consequently, a great speed, with slow velocity of the piston through space, is obtained, compared with the ordinary engine,—thus the first motion can be attached direct to the main shaft, thereby not only dispensing with all intervention of wheel-work, and its necessary appendages, but also producing a steadier motion, consequent upon the engine not having multiplying gear, which must only increase any inequalities in the stroke. This arrangement of engine requires but slight foundations, compared with others, from the peculiar manner in which the power and resistance are compounded together, and from the fact of the capability of these engines to run at high speed, a large power can be concentrated into a small space; hence if such results be obtained, and the multiplying gear be dispensed with, and the number and weight of the parts be reduced, not only economy in first cost will be gained from its close approximation to the ordinary reciprocating engine, but also economy in fuel.

16 **DAVIES, JONAH & GEORGE,** *Albion Foundry, Tipton, Staffordshire*—Inventors.

Pair of patent elliptic revolving steam-engines.

Self-acting steam-regulating damper, for high and low pressure steam.

Feed nozzle for boilers.

Patent sluice valve, for air, steam, or water.

Equilibrium valve.

Double beat for nozzles.

Patent revolving blowing apparatus.

20 **JOYCE, WILLIAM,** *Greenwich*—Manufacturer.

Steam-engine, high pressure, four-horse power, called the pendulous steam-engine.

The principal advantages of this engine are:—1st. Its great economy of fuel, the average consumption being 3lbs. of coals per horse power per hour; 2nd. Its great simplicity; 3rd. It effects a saving of about one-half the space, usually occupied by engines of similar power. Fig. 1 represents a side, and Fig. 2 a front, elevation of this steam-engine.

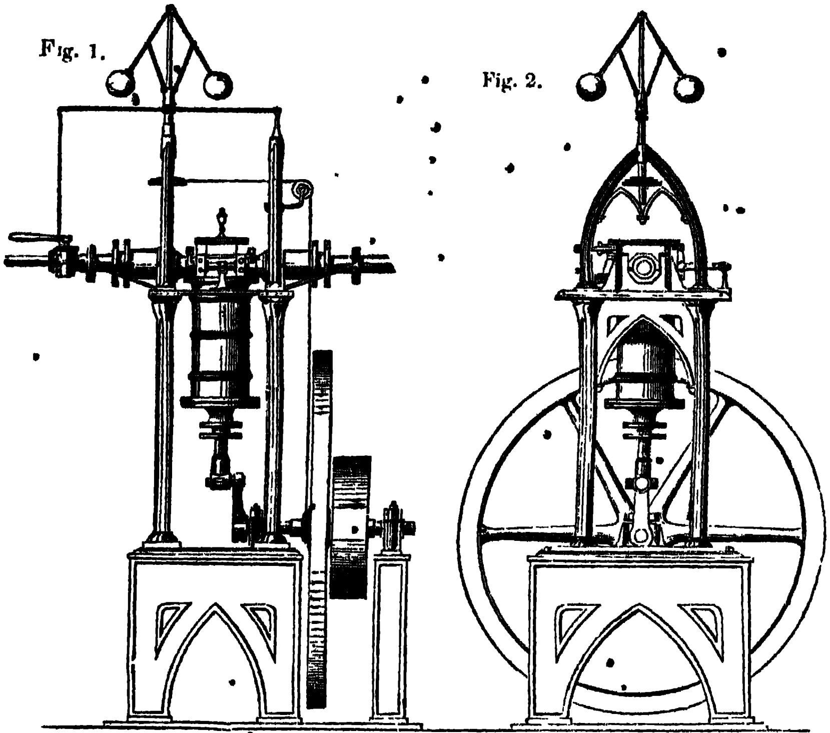


Fig. 1.
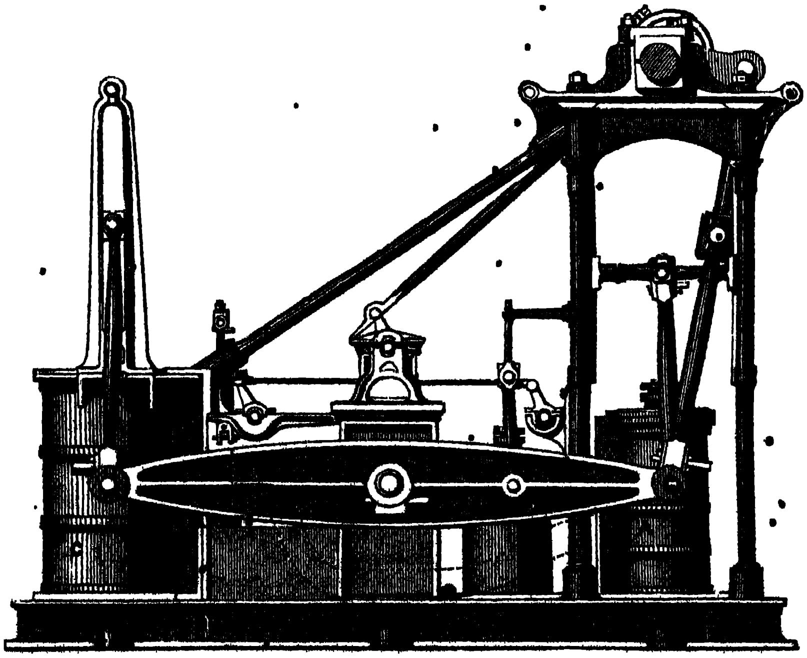
Fig. 2.

Joyce's Pendulous High-pressure Engine.

22 **McNAUGHT, WILLIAM,** 26 *Robertson Street, Glasgow*—Inventor.

Patent double-cylinder steam-engine; a modification of "Woolf's double-cylinder engine," in which steam is admitted at a high-pressure into a small cylinder, from which it passes into a larger one, where it expands, and



McNaught's Patent Double Cylinder Steam-engine.

whence it finally escapes into the condenser. The present arrangement is designed to admit of the application of high-pressure steam, and the expansive principle, to engines originally constructed for working low-pressure steam. This is effected by placing the high-pressure cylinder at one end of the beam, and the low-pressure cylinder at the other. Power being thus applied at the two ends of the beam neutralizes the strain upon the main centre, and removes the cause of the shaking of the machinery and building, experienced in ordinary beam engines when heavily loaded. In the example exhibited, the arrangement is adapted for marine-engines, and offers the means of obtaining increased power in a limited space, with equable motion and strain.

Montgomery's self-acting break for railway carriages. To the axle of each carriage is attached a break, acted on by a spring; the shackle of each carriage is fixed to this spring, so that when the tractive power is withdrawn, the pressure of the breaks is applied.

24 **LYNCH & INGLIS**, *Garratt Road, Manchester*—Manufacturers and Designers.

One-horse portable steam-engine, for driving agricultural or other machinery.

25 **CROSSKILL, WILLIAM**, *Iron Works, Beverley*—Patentee and Manufacturer.

A steam-engine.

26 **FAIRBAIRN, W., & SONS**, *Manchester*—Inventors and Manufacturers.

Six-horse steam-engine.

28 **MACINTOSH, JOHN**, 5 *Gray's Inn Square*—Inventor.

1. Patent rotatory steam-engine. The novelty consists principally in the use of the flexible outside belt, whereby the friction is greatly diminished, and unequal wear obviated.

2. Patent rotatory steam-engine. Applicable where a great speed is required direct from the shaft.

3. Patent rotatory steam-engine. Applicable to the same purpose as the preceding. The peculiarity of this engine is in the construction of the piston.

29 **HODGE & BATLEY**, 9 *Adam Street, Adelphi*—Manufacturers.

Steam-engine.

30 **RANSOMES & MAY**, *Ipswich*—Inventors and Manufacturers.

A five-horse-power steam-engine.

34 **BUTTERLEY CO.**, *Alfreton, near Derby*—Producer.

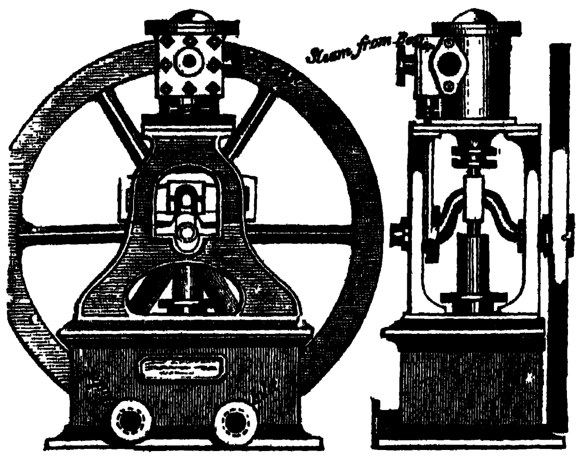
Oscillating steam-engine, of 10-horse power, without a slide valve, the steam being admitted and exhausted through the trunnions by the motion of the cylinder.

35 **CARRETT, WILLIAM ELLIOT**, 13 *Rockingham Street, Leeds*—Inventor and Patentee.

A steam-pump, combining a high-pressure engine, and an improved suction and force pump, designed and constructed for filling low or high pressure locomotive, stationary, or marine steam-boilers, and for fetching or forcing water any distance or height; it may, by disconnecting the pump, be used as a steam-engine for driving portable machinery for engineering works, the household or farm-yard, for working hydraulic presses, water-cranes, &c.

A portable steam-pump, for lifting or forcing water. Applicable to the supply of steam boilers—locomotive, marine, and stationary. Also as a water-lift to work hydraulic presses, water cranes, &c. Fig. 1 shows a front, and Fig. 2 an end, elevation of the steam-pump.

Fig. 1. Fig. 2.



Carrett's Steam-pump.

This apparatus is a simple form of high-pressure engine, with a lifting and a force pump combined; is portable and complete in itself, requiring no other fixing than the attachment of the steam and water pipes.—Invented by W. E. Carrett, engineer, Leeds, and registered Aug. 31, 1850. It is constructed to fetch or force water any required distance in *one continuous stream*, without shock or injury to the pipes or machinery; and at an effective velocity. The pump can also be disconnected, when the engine is to be used singly for driving small machinery of the household or the farm-yard.

[This patent steam-pump, which was adopted by the Royal Commissioners, in the Boiler-house, at the Exhibition Building, is an example of the application of steam-power for lifting or forcing water under any pressure, and for every variety of purpose. It supplies an important want frequently experienced in engineering, agricultural, and manufacturing works, of a ready means of lifting and conveying water supplies, without involving the trouble and expense of fixed machinery of complicated construction. It can be adjusted to work under all varieties of pressure at a uniform speed, and is capable of fetching or forcing water, at a maximum velocity, any required distance, without shock or concussion to the pipes. Size No. 1 of this apparatus is constructed to deliver 10 gallons per minute, at a pressure of 50 lbs. per inch, or 100 feet high. It will be obvious that, by increasing the size of the pump-ram, twice this amount of water can be raised one-half the height, or in any other quantity or proportion. For pumps from 2-horse power and upwards, side-rods and slide-bars are substituted in place of the cross-head movement, shown in the cut; the size of the whole apparatus, in both cases, being little more than that of the diameter of its own fly-wheel. The engine is complete and perfect in itself, and can, by its simple disconnection from the pump-ram, be used as a rotative power to work suitable machinery, &c. A peculiar feature of improvement in this pump, may be said to consist in the introduction of two accumulating vessels in connection with the influx and efflux passages, these, by their action, producing a continuous stream of water throughout the whole length of the pipes.

Without a provision of this nature, the barrel of the common pump is only partially filled at each stroke, and the ram is consequently driven against the surface of the water with a serious shock at each down-stroke. In this pump, the lower valve, at each ascent of the plunger, drains its water-supply from the bottom of the induction air-vessel; which again is fully replenished by the suctional power from the reservoir. When the plunger descends, the water in the barrel is driven through the upper valve into the discharge air-chamber, and makes its escape thence in a continuous stream, under the pressure of the contained air. Thus the pump has a noiseless and perfectly smooth action, with a uniform delivery. Hence its capability to fetch or force water any required distance, at a much more effective velocity than has hitherto been accomplished, without the usual and expensive resort of a trio of lesser pumps in neutral connection, driven by a three-throw crank.

The peculiar advantages of this continuous stream will be obvious; for, since the water is always in motion in one direction throughout the pipes, it has not to be stopped and started at every return-stroke, and is therefore better able instantly to follow the pump-ram the moment it changes the direction of its motion.]

A portable high-pressure boiler of two-horse power, weighing 6 cwt. Complete in itself, and independent of all fixings and foundations. Constructed for working the steam-pump, and for several other engineering, agricultural, and domestic uses. The funnel is capable of being unshipped and stowed away, thus rendering the whole easy of removal from place to place.—Provisionally registered.

A portable high-pressure boiler, so constructed as to be convenient for removal from place to place.

37 EVANS, JOHN, & SON, 104 *Wardour Street, Oxford Street*—Manufacturers.

Six-horse power high-pressure oscillating steam-engine. Exhibited for simplicity of construction, economy in working, and portability. Patentees, Richard Want and George Vernum, Enfield Lock, Middlesex.

38 MAUDSLAY, SONS, & FIELD, *Lambeth*—Designers, Manufacturers, and Proprietors.

A small double cylinder direct-acting high-pressure steam-engine, for working a coining-press.—*See* No. 228, Class 6.

A model of a gun-metal screw-propeller, so constructed that the blades can be turned fore and aft from their proper position for propelling, and thus assume a line with the keel of the ship, so that, when steam-power is not used, and the vessel is put under canvas alone, no necessity exists for taking the propeller out of the water, as the blades will not offer any resistance to the progress of the ship. The exhibitors have fitted 23 vessels with screw machinery (some of the screw propellers being on this plan) of the collective nominal power of 4,380 horses.—Patented by Joseph Maudslay.

Fig. 1 represents this screw-propeller when in use. Fig. 2 shows it when the vessel is under canvas alone.

A connecting rod, fitted with its bolts and brasses; the latter lined with soft metal, and adapted to a pair of patent double cylinder marine steam-engines, of the collective nominal power of 800 horses.

A model of a pair of direct-acting double cylinder marine steam-engines, fitted with paddle-wheels and improved feathering floats. On this plan the exhibitors have constructed marine machinery, since the patent was taken out, of the aggregate power of 19,130 horses, and some of them of 800 horses collective nominal power.—Joseph Maudslay & Joshua Field, patentees.

Figs. 3 and 4 represent these engines.

A model of a pair of direct-acting marine steam-engines, with oscillating cylinders; on which principle the exhibitors have constructed engines of the aggregate nominal power of 2,100 horses.—Joseph Maudslay, patentee.

Figs. 5 and 6 represent these engines.

A model of a pair of direct-acting double piston-rod marine steam-engines, peculiarly adapted to shallow river navigation. The exhibitors have made engines on this plan for the Rhone, Indus, and Sutlej, of the aggregate nominal power of 545 horses.—Joseph Maudslay & Joshua Field, patentees.

Figs. 7 and 8 represent these engines.

A model of a pair of marine beam steam-engines, on which plan the exhibitors have completed 103 pairs, of the aggregate nominal power of 11,358 horses.

Figs. 9 and 10 represent an end and side elevation of these engines.

A model of a pair of direct-acting annular cylinder marine steam-engines, fitted with paddle-wheels and improved feathering floats. These engines have been fitted to some of the fastest packets in the Channel, and on this principle the exhibitors have manufactured 23 pairs, of the aggregate nominal power of 2,250 horses.—Joseph Maudslay, patentee.

Figs. 11 and 12 represent these engines.

A model of a pair of horizontal cylinder direct-acting marine steam-engines for driving a screw-propeller; so constructed as to occupy little space, and to be altogether below the water line.

Figs. 13 and 14 represent an end and side elevation of these direct-acting engines.

[These models are extremely interesting as illustrations of the various forms of the steam-engine applied in modern times to navigation. Propulsion by the paddle and by the screw, each require a peculiar adaptation of prime movers; and those forms exhibited appear to combine the features of construction deemed best adapted for these purposes. The connecting rod gives a forcible impression of the power of these stupendous engines.]

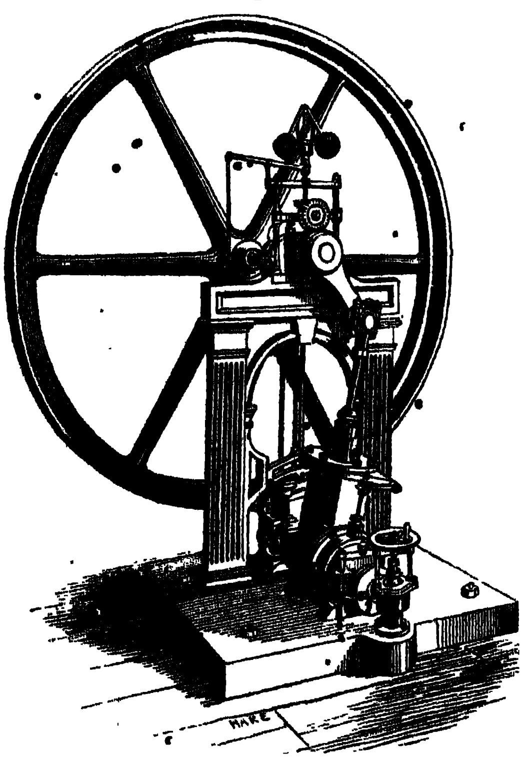
39 **CLAYTON, SHUTTLEWORTH, & Co.**, *Lincoln*—Manufacturers.

Eight-horse power fixed steam-engine of an improved construction. This engine is of the description known as having an oscillating cylinder, which reduces the number of working parts, rendering it very simple and less liable to get out of repair. It is well adapted for working fixed barn machinery, saw-mills, corn-mills, &c. The following cut represents the steam-engine fixed and ready for work. The power may be communicated by a leather band over the fly-wheel, or through the medium of a spur-wheel and pinion.



Clayton, Shuttleworth, & Co.'s Oscillating Engine.

40 **POPE, WILLIAM, & SON**, 81 *Edgware Road*, and *Grove Foundry, Lisson Grove*—Manufacturers and Designers.

Improved oscillating cylinder steam-engine of four-horse power, with parallel valve gear acted on by an eccentric; its object is to effect economy of space, and efficiency in action.

41 **NASMYTH, J.**, *Manchester*—Inventor.

A steam-engine.

42 **DONKIN, BRYAN, & Co.**, *Bermondsey*—Manufacturers and part Inventors.

Patent disc water-meter. Patent improved disc engine, intended to effect rotary action, with high speed, and in little space; it is free from dead points. Disc pump, with a rotatory instead of an alternating motion, and producing a continued stream of water without air-vessels or valves.

44 **ARMSTRONG, W. G.**, *Newcastle-upon-Tyne*—Inventor.

Model hydraulic crane, for railway stations, docks, or quays. The power may be supplied either from the water pipes of a town, where the pressure is considerable, or from the action of a steam-engine with an accumulating reservoir.

Model steam-engine, with plunger pumps, especially adapted to the working of hydraulic lifting machinery.

Model of accumulator, for equalizing the working of the engine.

Model corn-lift, worked by hydraulic power, for corn warehouses.

Model of machine for unshipping coals by hydraulic power.

45 **LLOYD, EDWARD**, *Glyndwrdu, near Corwen, Wales*—Inventor.

Patent steam-engine, on the double-cylinder expansion principle.

46 **SIEMENS, CHARLES W.**, *Summerfield Cottage, Birmingham Heath, Birmingham*—Inventor.

Chronometric governor for a fifty-horse power engine. It consists of a conical pendulum, which is maintained in motion by a permanent power, independently of the velocity of the engine. This power is obtained by simply attaching a weight to the throttle-valve lever. A uniform angle of rotation is insured by means of a break, which is acted upon by the pendulum on reaching its desired inclination, and absorbs any excess of driving power which the weight may supply. A differential motion between the conical pendulum and the engine at once adjusts the valve to the altered condition of load or power.

In Watt's centrifugal, and other governors, the power necessary to move the valve is only gradually accumulated by an actual change in velocity, and the valve is maintained in its altered position on condition of an altered speed of the engine.

The action of the chronometric governor is, on the contrary, immediate, and the regulation of speed absolute, however great the variation of load may be.

This governor has been applied successfully to steam-engines, Barker's mills, and by the astronomer royal to give smooth and accurate motion to astronomical instruments.

Model of simplified chronometric governor, in which an expanding fly-wheel has been substituted for the more delicate conical pendulum. The action of this governor is illustrated by preventing a fly-wheel from being turned above a certain speed.

Model of a variable expansion valve, consisting of a revolving cylinder divided in two in a helical curve corresponding with a helical aperture in the outer shell. The governor moves one portion of the revolving cylinder endways, and thereby varies the time for the admission of steam to the engine. This valve should be applied in connexion with the improved chronometric governor, which has sufficient power to work it with certainty.

Model of a surface condenser, showing an effective and simple arrangement of condensing surface.

Water-meter, in action, working under pressure. The novelty consists in the water impinging, in its passage, on two sets of helical blades which travel in opposite directions (being right and left handed), whereby deflection of the current and the effect of local currents are compensated. Its advantages are simplicity and efficiency of action.

Model of regenerative condenser, which possesses the new and useful property of returning the condensing and condensed water at the initial temperature of the steam, 212° Fah., previous to its release from the working cylinder, producing nevertheless an effective vacuum. When applied to high pressure-engines it allows a large proportion of the waste steam to escape, and condenses the remainder with a minimum of condensing water.

It has been applied to engines of different sizes, where it has been found to effect a considerable saving of fuel.

If applied to high pressure-engines, it produces an additional atmosphere's effective pressure upon the working piston, with a quantity of injection water little exceeding the quantity of feed-water for the boiler. A portion of the steam escapes uncondensed, and may be used to produce draught (in the case of the locomotive engine), or other purposes. The power required to work the air-pump of a common condenser is saved. The boiler is supplied with boiling-hot feed-water, &c.

Working model of a regenerative evaporator, applicable to the evaporation of brine, cane-juice, and other solutions, and to the distillation of sea-water (converting it into fresh water), spirits of wine, &c.

A circulating current of air is passed along the surface of the evaporating liquid, and absorbs vapour at first from the cooler and, by degrees, from the hotter end thereof. It then passes under the metallic bottom of the pan, and in proceeding toward the cooler end, the vapour which it contains is condensed, and yields its latent heat again to the evaporating liquid. Heat is continually supplied at the hotter end, and is abstracted at the cooler end, where the cold liquid enters the apparatus. The circulating current is divided into the principal current, which traverses the whole length of the apparatus, and into secondary currents, which return at intermediate points, and are essential to the economical working of the system. The fire burns under a boiler, which supplies a steam chamber at the hottest end of the apparatus, and proceeds through flues traversing the evaporating current in its progress towards the chimney. By this means the evaporating current is superheated throughout its course to a temperature exceeding that of the liquid by about 15 per cent., and its evaporating power is greatly increased.

The regenerative evaporater has been found to save about three-fourths of the fuel usually required to evaporate liquids. It has been applied on a large scale to the evaporation of brine, producing six tons of salt for every ton of fuel from a concentrated solution, instead of 1½ tons, which are usually obtained from a ton of fuel.

48 **BUNNETT, JOSEPH, & Co.**, 26 *Lombard Street, City,* and *Deptford, Kent*—Inventors, Patentees, and Manufacturers.

Patent concentric reciprocating steam-engine for high or low pressure. The steam is worked expansively without gear or tappets. This direct-acting engine requires neither guides nor parallel motion; it is compact, and adapted for stationary, locomotive, or marine purposes.

49 **COLLINGE, CHARLES, & Co.**, 65 *Bridge Road, Lambeth*—Designers and Manufacturers.

Improved portable direct-acting high-pressure steam-engine of 5-horse power.

52 **RENNIE, GEORGE, & Sir JOHN**, 6 *Holland Street, Blackfriars*—Manufacturers & Licensees.

Working model of Bishopp's patent disc engine of 40-horse power, fitted as auxiliary power to drive a screw propeller, in a model of part of the hull of a merchant vessel of 300 tons. One-fifth the full size. Engine 2-horse power.

Disc engines have been used in factories, mills, &c., for several years past, and they may be employed to drive the screw-propeller in steam-vessels by direct action. The disc engine acts with a uniform force in a direction tangential to the crank throughout the revolution, without any rotary motion taking place within the cylinder; although such an engine be only half the bulk and weight of the engines at present applied to the screw-propeller, yet at the same velocity of the piston it makes three times as many revolutions in a given time as other engines. The disc engines on this construction are said to be equal to the best engines in economy of fuel; and are, on this account, better adapted to vessels, as expansion can be carried to a great extent without straining either the frames or the vessel.

Model of H.M. Steamer "Samson's" engines.—Power of engines, 467-horse power; burthen in tons, 1,299; direct action weight of engines, 12 cwt. per horse-power.

Model of H.M. Steamer "Bull-dog's" engines.—Power of engines, 500-horse power; weight of engines, 12 cwt. per horse-power.

Model of a pair of marine engines, with four cylinders of the joint power of 800 horses, proposed for trans-atlantic steamers.

Models of paddle-wheels.—Common paddle-wheel. Modifications of the common paddle-wheel on Mr. Rennie's patent principle.

Model of a vessel fitted with patent paddle-wheels.

[In the direct-action marine-engine, circular motion is communicated to the paddle-shaft immediately from the piston-rod, without the intervention of side levers, &c. This arrangement saves space, weight, and friction.—S. C.]

53 **GREEN, E.**, *Phœnix Foundry, Wakefield*—Inventor and Manufacturer.

Patent fuel economiser, applicable to steam-boilers, for heating the feed-water with the spare heat from the boiler flues.

An apparatus for supplying rooms and buildings with pure warm air.

56 **WATKINS & HILL**, 5 *Charing Cross*—Manufacturers.

1. Sectional model, to illustrate the construction of a condensing steam-engine. One face showing the whole of the valves and pumps moving at their exact times, and the other presenting an outside view of the engine.
2. Sectional model of a condensing steam-engine, with section of the boiler and furnace. These models are constructed in metal for use in tropical climates.
3. Sectional model to illustrate the construction of the locomotive steam-engine. One face showing the formation of the tubular boiler, and the action of the various working portions, and the other presenting the exterior appearance of the engine.
4. Improved mercurial barometric steam vacuum gauge, combined on the same metal frame and scale, with an atmospheric barometer, to give an accurate comparison of the vacuum and atmospheric pressure.
5. Sectional model to illustrate the construction of the marine steam-engine, without the boiler. One face showing the action of the pumps and valves, the other presenting the exterior appearance of the engine.

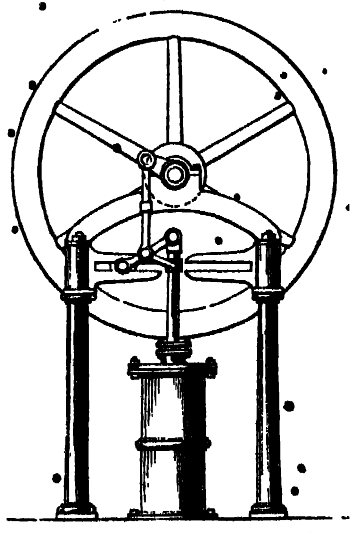
57 **FITZ MAURICE, The Hon. WM. ED.**, *Hamilton Lodge, Prince's Gate*—Inventor.

Patent rotatory steam-engine; stated to be light, simple, and cheap in construction, and not liable to get out of order: for driving the screw or other power it acts without requiring gearing of any kind. It is free from vibration, being its own fly-wheel.

[The superiority of one piece of mechanism over another, designed to produce the same effect, depends not on any saving of power, or on any increased mechanical advantage, but on the adaptation of the construction to lessen friction, to prevent straining, to preserve the elasticity of some parts, and to secure the rigidity of others; as also on the economy of space and material.—J. B.]

Model of a patent steam-engine, illustrating a new method of converting rectilinear into rotatory motion, by the Rev. J. Booth, F.R.S. Constructed by J. Aspinall, London.

Fig. 1.



This model (fig. 1) illustrates a new method of converting rectilinear into rotatory motion. It is a practical application of the geometrical principle, that if the extremities of a given straight line in motion *always* rest upon two *fixed* straight lines, at right angles to each other, the middle point of the moving line will describe a circle. The distance between the top of the cylinder and the axis of the shaft need not to be more than half the length of the stroke. This permits the machinery to be comprised in a very small compass. The friction on the slides is inconsiderable, and vanishes altogether when the engine is producing its maximum effect. The motion is produced by a combination of levers, identical in principle with the common crank. This crank, called the *sliding crank*, is equivalent in power to a common crank of the same radius, having an infinite connecting rod, and the parallel motion of the connecting rod is exact.

58 **Whitelaw, James**, *Johnstone, Renfrewshire, Scotland*—Inventor.

Improved steam-engine, for driving the screw-propeller direct, without wheels or other intermediate gearing, and for all kinds of machinery which work at a considerable speed.—(Drawing.)

Centrifugal atmospheric churn.—(Model.)

Centrifugal pump, for short lifts.—(Model.)

60 **Wilding, William Henry**, 2 *Chesterfield Street, King's Cross*—Inventor.

Patent steam-engine, exhibiting a new method of converting reciprocating rectilinear motion into rotatory motion. Model, illustrating a modification of the same.

Model of a patent submerged paddle wheel, combining the power of the ordinary feathering wheel, with the advantages of the screw, in being wholly under water.

61 **Leigh, Evan**, *Miles Platting, Manchester*—Inventor.

Patent steam-engine.

63 **Williams, D.**, *Thornhill, Llandilo, Wales*—Inventor.

A furnace, for burning anthracite or smokeless coal, in marine, locomotive, and other steam-engines.

64 **Dodds & Son**, *Rotherham*—Inventors & Manufacturers.

Four-horse portable steam-engine; for all purposes to which portable engines are usually applied, but more especially for thrashing, &c. The particular features are, the direct motion given to the slide-valve by a return crank, and the arrangement of the cylinder face and valve, without the intervention of other machinery than the valve connecting-rod, no weigh-bar or cross-shaft being required; it is also easily accessible to repair.

Model of locomotive engine, without boiler, fitted with the exhibitors' patent wedge expansive (cam) motion. Its simplicity consists in having only two eccentrics, instead of four, for working the valves, the strokes of which are adjusted or reversed by means of wedges or inclines; the motion to the valve is direct (without weigh-bars or other intermediate machinery, except the valve connecting-rod).

A piece of Jessop's patent steeled tire-bar, for railway wheels. The wearing surfaces of the tire are converted into steel (either in the bar or after being welded into a hoop), but only so far as is necessary to maintain the working surface, by which all the toughness and ductility of the iron are retained, while the steel parts may be hardened and ground up.

A piece of railway bar, with the wearing surfaces converted into steel by Jessop's patent process. Being steeled, the bar is of greater strength and durability; it does not laminate or splinter, and it presents a uniform hard-wearing surface. The process is believed to increase the strength of wrought-iron, and consequently allows rails to be made much lighter.

Model of a railway bar straightening press, on truck. The straightening press does not indent the surface of the rail, as the hammer does, and will straighten much quicker.

65 **Surmon, Henry, & Co.**, *New North Road, Hoxton*—Manufacturers.

Jukes's patent smoke-consuming furnaces.

66 **Redmond, Amedee François**, *Birmingham*—Importer and Inventor.

Working model of a steam-engine, showing three different constructions of slide-valves: short slide, and long D valve; and the exhibitor's patent double independent slide valve, to prevent back pressure from the exhausted steam. This model is worked by steam, and is furnished with an indicator, to show the comparative effect of different slide-valves.

67 **Ebbw Vale Company**, 83 *Upper Thames Street*, and *Abergavenny*—Producer.

An improved double-cylinder steam-engine, one-horse power. Invented and designed by Evan William, a blind man.

68 **Clay, John**, *Edgeley, Stockport*—Inventor.

Smoke-consuming furnace.

69 **Whitney, James**, *Calver Hill, Hereford*—Inventor.

Apparatus for preventing the bursting of steam-engine boilers, and other steam apparatus, by an improvement in the composition and adaptation of fusible metallic plates.

70 **Constable, William**, *Photographic Institution, 57 Marine Parade, Brighton*—Inventor.

Model of the "Compensating Fly-wheel," an invention for converting a fluctuating into a constant force.

The fly-wheel, as ordinarily applied to steam engines, effects two purposes—it carries the engine through the dead points of the crank revolution, and it does this effectually; it also, in a measure, corrects the variations inseparable from a power communicated through a crank; this latter service, however, it performs only approximately, and being *fixed* upon the main shaft, it transmits all its uncorrected irregularity through any train of machinery connected with it, in many cases to the great detriment of the manufacturing work it has to perform, and often occasioning the rapid destruction of the gear-work through which the power is transmitted. This defect is incurable under the existing method of using the fly-wheel; for although every augmentation of its weight will bring its oscillatory movements within a more limited range, yet no weight of metal will ever entirely correct them. In the scheme involved in the model, the hopeless task of compelling the fly-wheel to steadiness is abandoned, it being permitted to take up its oscillatory motion according to the force applied, while all the subsequent machinery is secured from partaking, in the slightest degree, of these oscillations.

The means for effecting this, consists in releasing the fly-wheel from its *rigid* connection with the main shaft, and substituting for it a spring or springs, through which the force is conveyed, and then, by a further device, correcting the small remaining irregularity that results from the reaction of the springs when under different degrees of enforcement. It will be apparent to every mechanic that constructive arrangements comprehending these principles of action may assume a great variety of forms and combinations. The following is that adopted in the model, the essential parts of which are shown in its accompanying diagrams. It consists of a fly-wheel 3 feet in diameter, having six arms, hanging *loose* upon a cylindrical end of the main shaft; immediately behind the fly-wheel are three other arms, issuing from a boss which is *fixed* on the same main shaft. On the face of each alternate one of the fly wheel arms there lies a spiral spring, which is partially compressed between two studs which are fixed to the arms of the wheel; a bolt passes freely through the springs and studs, which being drawn upwards (towards the rim of the wheel), forces the spring, by means of a collar at the lower stud, into closer compression. The bolt is connected with a roller on the rim, by a leather strap; the spindle of this roller passes through a hole in the rim, and carries, on the other side, a second roller, which, in like manner, is fastened by a second strap to a pin at the upper end of an arm of the boss.

The fly-wheel, during the part of its revolution in which the steam has a power superior to the resisting force, will advance by acceleration, but the fixed arm not partaking of the increased speed, the space between the second roller and the arm of the boss will be increased, and by the action of the rollers the spring will be compressed; that period being passed, and the impelling power falling below the resisting power, the latter will prevail, and bring back the wheel again to the place, with respect to the mean place, from which it started. Now, when the fly-wheel advances, by its oscillating movements, it will leave the arm of the boss behind, and the strap connecting it with the second roller will occasion the roller to move on its axis, which will result in the drawing up of the bolt, and compressing the spring; and the reverse will happen when, through its oscillations, the fly-wheel loses speed; and thus the fly-wheel will go on oscillating twice in every revolution, the oscillations playing smoothly and harmlessly upon the spring.

Now, if both the rollers be cylinders of the same diameter, the reactive force of the compressed spring, and the force dragging the led arm and main shaft, will be equal; and as constant variations will take place in the compression of the spring, an equal variation will occur in the force leading the arm; and although, to a great extent, an equalization will have been effected, the problem of the conversion of a fluctuating force into a constant force has, as yet, received no solution.

But the rollers are not both cylinders; the second roller is bounded by an irregular curve, a part of which—called the isodynamic curve—is so formed that, in its rotary motion, the lever of resistance within it, through which, and the second strap, the fixed arm acts against the force of the spring, shall become lengthened as that force increases, the curve offering in every position a lever of resistance proportional to the force of the spring. With this final appliance, a perfect uniformity of force is obtained, and the problem proposed is solved.

In order to explain the actual working of a specific steam engine with these appliances, suppose the model extended, in all its parts, linearly in the ratio of 3 to 10: the fly-wheel will then be of 10 feet diameter, and will have 1,500 pounds weight in its rim. The engine to be of 10-horse power, clear of all loss by friction or otherwise, in its own parts; strokes, 40 per minute. The steam may be applied to the piston at any amount of pressure, and be worked expansively, or not. The springs, as in the model, to be 3: coiled of steel wire, ¼ inch in diameter; the coils to measure 2¼ inches in diameter to the middle of the wires; the space between the coils, when the spring is relaxed, to be equal to the diameter of the wires; the number of coils, 70; its whole length, when uncompressed, consequently, will be 35 inches. Such a spring will suffer compression of 1·17 inch for every 10 pounds of compressive force. It is proposed that each spring shall be confined between the studs, with a force of 40 pounds, by which the length will be reduced to 30·32 inches: this compression is not necessary to its proper action, but it keeps the length of the spring within convenient compass. The breadth of the rim to be 7 inches; therefore, the circumference of a circle, at the middle of the rim, will be 29·6 feet; and the speed, at this place, will be 1,184 feet per minute. The mean force communicated, at any point in this circumference, will be equal to 279 pounds. Let this force be transmitted, through 3 springs to the arms, then we shall have a force of 93 pounds applied to each arm.

A wheel thus circumstanced will have an oscillating motion of 1·26 inch from its mean place, and the measure, between the extremes of its oscillations, will be 2·52 inches; and as the axis of the rollers is placed in this circle, the variations in the compression of each spring will be of the same measure (2·52 inches).

Now, since the compression of the spring is 1·17 inches, with a force of 10 pounds, a compression of 2·52 inches will be the exponent of a force of 21·54 pounds, and 21·54 pounds will be the variation of force communicated from the fly-wheel to the fixed arm; and since the mean force, applied to one arm, is 93 pounds, the maximum force, when the fly-wheel is at the extreme of its advance, will be 103·77 pounds, and the minimum, in the contrary position, 82·23 pounds; and this variation is so moderate, that, for most of the purposes to which steam-engines are applied, it would scarcely have any appreciable disturbing effect.

For the final correction of this remainder, the isodynamic curve must have a length equal to the extent of the action or the springs, or the wheel's oscillations, 2·52 inches; and the radius of resistance of the minimum force must be to that of the maximum, as the smallest force of the spring is to the greatest, that is, as 82·23 to 103·77.

With respect to the minimum weight of fly-wheel that may suffice in a given engine, under these arrangements, it must depend upon the range of action that can be obtained in practicable springs. In the case assumed, the wheel is supposed to have a rim of 1,500 pounds; if half that weight had been taken, the length of the arc of oscillation would have been doubled; and if we could employ springs in which the range of compression would be twice as great as in those proposed, when acted on by the same force, we should have a regulating power of the same efficiency; and if we desire to perfect the uniformity of force, we might do so by employing an isodynamic curve of twice the length, keeping the radii which constitute the levers of resistance of the length proposed in the first case, and the action of the engine would be the same.

This invention claims not only to improve, but to *perfect* the action of the Reciprocating Steam Engine; it is simple, of easy and inexpensive construction, and but little liable to go out of repair. A proper method of trying the action of the model is, to stand at the right-hand side, holding one of the arms of the fly-wheel in the left hand; then applying the palm of the right hand to the fixed arm in advance, and forcing the arms apart. It will require a force of about 40 pounds to bring the springs into action.

76 **CRADDOCK, THOMAS,** *Ranelagh Works, Pimlico*—Inventor and Manufacturer.

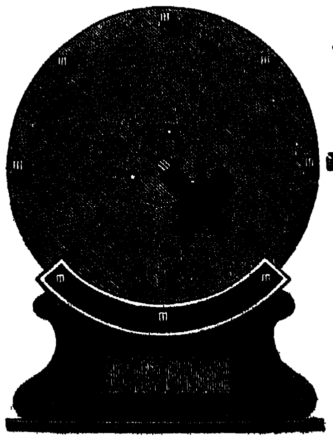
Patent high-pressure, expansive, and condensing steam-engine, with tubular boiler and regulating damper. The novelty consists in the mode of condensing the steam and obtaining the vacuum without cold water, in the mode of fixing the cylinders of the engine at an angle, so that the two connecting-rods take hold of the same crank-pin, and in the construction of the valves, the expansive gear, and the regulating damper.

78 **FERGUSON, DANIEL,** *Kilkenny, Ireland*—Inventor.

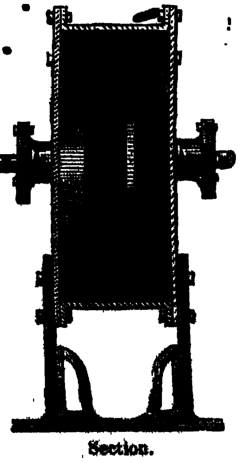
Registered boat-propeller and water-wheel.

82 **MORRELL, G.,** 149 *Fleet Street*—Inventor.

Patent rotatory engine, fitted as a steam-engine. It may also be used as a pumping and forcing-engine, or as a blowing apparatus for blast-furnaces. The following cut represents the front elevation of the engine, and



Front Elevation.



Section.

section, or side elevation, with part of the side removed to show the internal construction.

88 **Jenkins, George**, 4 *Nassau Street, Soho*—
Inventor and Patentee.

New hydro-pneumatic engine. The object of which is to employ water pressure to drive the piston of the engine in one direction, and a vacuum being produced, to make use of atmospheric pressure to drive it in an opposite direction.

90 **Read, Stephen King**, 50 *Paradise Street, Rotherhithe*
—Inventor and Maker.

Double-action metallic pump, for domestic purposes; by fixing a hose on the nozzle, it will act as a powerful fire-engine.

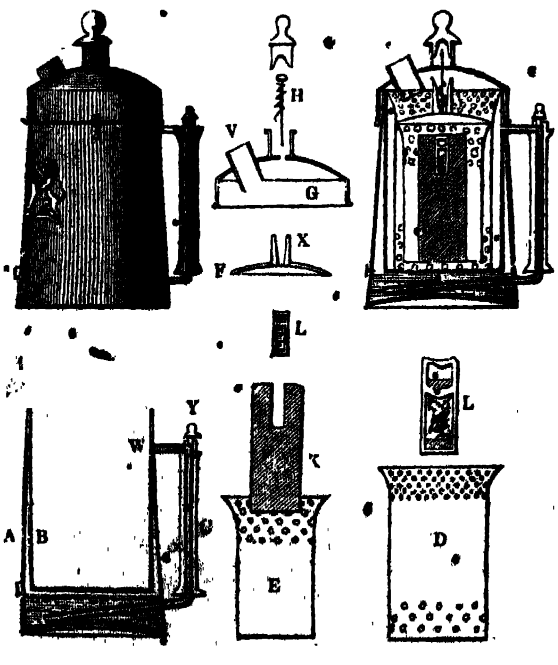
91 **Reed, Joseph Haythorne**, *Westbourne Lodge, Harrow Road*—Inventor.

Model of a new patent propeller, attached to a boat.

92 **Phillips, William Henry**, 16 *York Terrace, Camberwell New Road, Kennington*—Inv. and Pat.

The fire annihilator, a portable machine, for extinguishing fire. This apparatus will, when occasion requires, instantaneously discharge, with the power of steam, an atmosphere of gases and vapour, possessing the property of suddenly subduing and rapidly extinguishing fire, without saturating the unburnt property. The vapour emitted from the machine, by its expansive force, intermixes with the fire, whether in a confined space or in the open air, while the air about the fire is rendered innocuous. The property the vapour has of circulating in the flames, and permeating amongst the burning goods, gives it the power to extinguish fires that may be unapproachable and inextinguishable by water. The machines and the chemical charges are not liable to get out of order by time or change of climate, and the management is so simple and easy that any one may use and recharge them.

Directions for Use.—With the knob of the stopper strike down the pin beneath it. A dense cloud of vapour instantaneously rushes forth, which being cast upon the burning materials extinguishes the fire.



Description of the Apparatus.—A and B, cases forming a close chamber to contain water up to the level of the screw vent-plug Z, and the air in the annular space above.

C, a pipe forming the handle, and a screw-cap, Y; this pipe may be stopped with a plug of soap at W.

D, a perforated cylinder.

E, the charge-case, also perforated.

F, the inner lid, having a neck, X, to keep it down in its place.

G, the cover, having a discharge-pipe, V.

H, an iron-pin supported by a special spring.

I, the stopper.

K, the charge: composition of nitre and gypsum.

L, the igniter, being a glass sheath, containing a bottle of mixture a chlorate of potass and sugar, and a small bottle of sulphuric acid.

The action is as follows:—the pin being forced down breaks the igniter bottles; the sulphuric acid, falling on the chlorate of potass and sugar, ignition takes place; the flame of the ignition mixture spreading over the upper surface of the charge, the charge instantaneously ignites, and evolves heated gases, which, in their passage through the perforated cylinder, impinge against cylinder B, expand the contained air, and produce steam between A and B, by which the water is forced up through the tubular passage. The vapour of the water, mixing with the hot gases, escape together from the discharge tube, in a dense expansive cloud, and are continuously delivered until the charge and the water are expended.

93 **Fire Annihilator Company**, *Office and Depôt* 105 *Leadenhall Street, City*—Producer.

Patent machine for extinguishing fire in buildings, in ships, and in mines, invented by W. H. Phillips, Esq.

94 **Hill, William**, *Blackheath Road, Greenwich*—
Inventor and Manufacturer.

Registered flue-boiler and furnace for hot-water apparatus, as applied for warming buildings.

96 **Simons, W. Vazie**, *South Shields*—Inventor.

Electro-magnetic machine.

97 **Rhone, Edw.**, 7 *Cooper's Gardens, Hackney Road*—
Inventor.

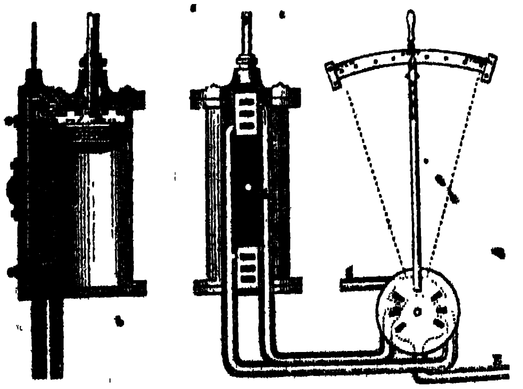
Models of two revolving blade paddle wheels fixed on a skeleton hull, for propelling steam vessels. Their submersion in the water obviates the lifting of back water and the creation of a great swell; the action of the wheels can be reversed on deck or below without altering the speed or reversing the engine; and the motion of the wheels being uniform, they can be fixed either horizontally or perpendicularly.

98 **Scott, Michael**, 6 *John Street, Adelphi*—
Inventor.

Hydraulic machine for raising water or producing a vacuum in any situation where there is a fall of water or a running stream.

100 **Erskine, Daniel**, *Clerk Street, Edinburgh*—
Inventor and Manufacturer.

New land beam engine, having balance valves, with a new method of reversing, and other improvements for



Erskine's Balance Valves, &c., in Section.

working the pit apparatus, and shutting off the steam at the pit's head. The figure represents the balance valves, and shows their method of action.

New self-reversing beam engine, for planing machines and other purposes.

Silver locomotive and railway, with a new method of reversing and of disconnecting locomotives and carriages when falling from the perpendicular.

Circulating steam boiler for generating steam at experimental lectures.

New hydraulic locomotive for propulsion.

Horizontal water-wheel for large rivers, from 3 to 6 feet fall.

Self-acting valve cock without ground surfaces.

Gas water-meter, having a direct spindle which dispenses with meter wheels; index and stop-cock.

Highland shield.

101 Whytehead, W. K., *Cornhill*—Proprietor.

1. McNaught's steam-engine indicators, for measuring and recording pressures; used principally for ascertaining the power and working order of steam-engines, for which purpose a communication is made between the cylinder of the engine and the cylinder of the indicator. The varying pressure of the steam acting on the piston of the indicator, raises or depresses the pencil in opposition to the internal spiral spring, and registers itself on the paper.

[To ascertain by this apparatus the pressure at various points of the stroke of the engine, the paper is moved by a string attached to some working part of the engine, so that its motion may coincide with that of the engine piston. By the shape of the diagram thus traced, the exact power given out by the engine (as distinguished from "nominal power"), the most advantageous adjustment of the valves, the friction of the engine, the power required by any portion of the machinery, the neglect or attention of the engine-driver, and the friction of the machinery when using different oils, can be ascertained. The instrument is fitted with two springs and a double scale, one for high-pressure steam divided to a small scale, and one for low pressure, to a scale of twice the size. The importance of an indicator may be estimated from the enormous amount of fuel consumed in this country for steam-power, a large quantity of which would be saved were the value of the indicator better understood by the proprietors of steam-engines.]

2. Drawing of section of large indicator, showing the construction.

3. Indicator diagrams to an enlarged scale.

4. McNaught's oil-testing machines. In spinning, weaving, &c., a large number of small spindles are kept in rapid motion, and if lubricated with an inferior oil, their friction, and, consequently, the non-productive load on the engine, is materially increased. A small quantity of the oil to be tested is poured into the cup, a plate is then placed on the top of the oil, and the cup set in rapid motion. The plate is dragged round also, by the tenacity of the oil, and raises the weight on the steel-yard; by adjusting which, until an equilibrium is established, the friction of the oil can be read off on the scale. Invented by W. McNaught, C.E., of Glasgow.

5. Design for the application of McNaught's patent expansive principle to a 30-horse engine. By this plan, high-pressure steam can be applied with safety to engines which have been designed originally for low-pressure steam only. A small cylinder is applied at the crank end of the beam, at about half-stroke, and the steam from it passes into the existing cylinder, where it expands, and whence it finally escapes into the condenser, in the usual way. By this means, a saving of from 30 to 40 per cent. of fuel is effected, and the power of the engine may be increased, if desired, to the same extent.

102 Potts, J., *Stockton-on-Tees*—Manufacturer.

Complete working model of the high-pressure steam-engine, with several parts made of glass, as the cylinder and steam chest, showing the working of the piston and steam slides, and the internal structure of the engine.

[This may be called the transparent high-pressure steam-engine, the invisibility of the steam being a cause of wonder to many observers. Such a model is of the greatest utility to lecturers and others engaged in teaching the principles of practical science.]

103 Hodges, B. J., *Grove House Lodge, Outer Circle, Regent's Park*—Inventor.

Working sectional model of a marine condensing steam-engine, for the use of schools and institutions.

104 Sharp, William Douglas, *Swindon, Wilts*—Inventor.

Steam-engine, with improved valves, valve-gear, &c.

The valves may be described as an elongation of the cylinder at each end in which the valves work; they are formed similar to, and of the same diameter as the piston, only that they are made hollow, with openings left in them large enough for the exhaustion. The ports form narrow openings extending quite round the circumference of the cylinder. The advantage of this description of valve is, that it gives a free inlet and outlet to the steam, which cannot be obtained with the slide-valve, especially at high velocities, as in the locomotive-engine, where the loss arising from this cause ranges from 30 to 50 per cent. Another advantage which this valve also possesses is, that the pressure on the back of the valve, which is so detrimental to the working of the slide-valve in locomotives and other high-pressure engines, is avoided.

Although the eccentric is quite applicable for working this description of valve, a motion is substituted which has many advantages; which, with the reversing motion, will be understood from inspection. One valve-shaft is sufficient for a pair of engines, care being taken to make the angle between the point of contact of the cams with the valve-rods the same as that formed by the cranks.

The mode of working expansively is only indicated by the cross-rod and the double joint on valve-rod.

105 Bevan, Hopkin, *Llanelly*—Inventor.

Plan of a locomotive steam-carriage for common roads.

106 Beckett, E. G., 3 *Joynson Street, Strangeways, Manchester*—Manufacturer.

High-pressure steam-engine, suitable where small power is required.

108 Webster, Benjamin, 5 *Stracey Street, Stepney, near Commercial Road East*—Maker.

Working model of a pair of oscillating engines, of 300-horse power, on a scale of ½ inch to the foot, with eccentric paddle-wheels connected, showing the working of the engines, and the feathering of the floats.

112 Perry, Henry, *Bromley, Bow*—Manufacturer.

Model of a condensing engine and boiler, complete and constructed to scale.

113 Shaw, B. L., *Newhouse, Huddersfield*—Inventor.

Model of Whitham's patent hydraulic engine, designed as a substitute for the steam-engine in certain localities. This engine is said to have opened a great extent of mining ground in Swaledale, Stonesdale and Coverdale in Yorkshire, and in Weardale in Durham.

116 Linton, John, *Selby, Yorkshire*—Inventor and Manufacturer.

Model of an improved engine working high-pressure steam expansively, with power to cut off the steam at any part of the stroke, and finally condensing it, so as to effect a saving of fuel.

118 **Fitt, William,** *Ponder's End*—Designer.

Working models of wind, water, and steam engines. Exhibited for economy and improved construction; the steam-engine is on the high-pressure principle, and has a peculiar arrangement for working the fly-wheel shaft with a single crank. The correcting machinery is so arranged as to admit of any one of the three engines to work separately.

---

119 **Firth, T. & J.,** *Eliza Street, Belfast*—Inventors.

Improved hollow furnace-bars.

Fig. 1.

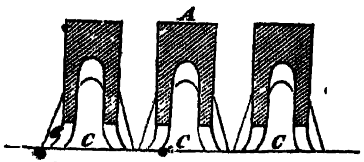


Fig. 2.

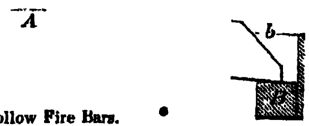


Firth's Hollow Fire Bars.

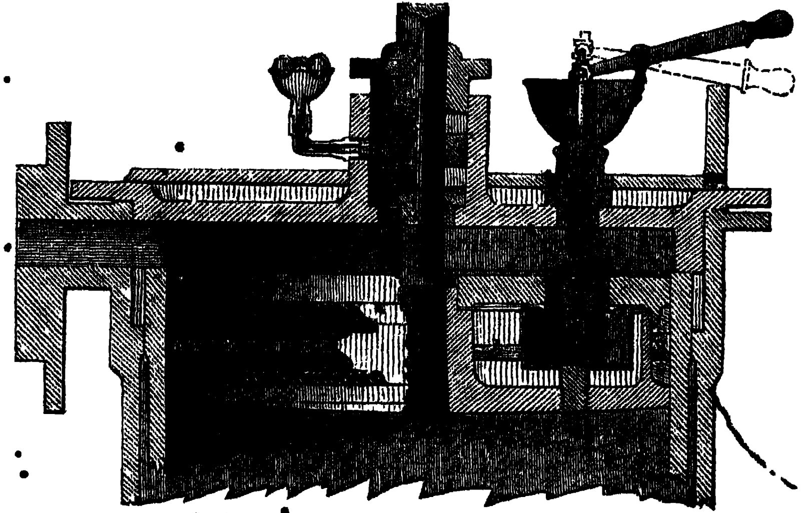
Fig. 1 of the drawings is an elevation of this furnace-bar; Fig. 2, a cross section of three of these bars; *A A* are the bars, *B B* the bearers upon which they rest. The bars are slightly arched, so that they may, with a given amount of material, be stronger than if straight. The lower edge has a channel, *C*, cut in it from end to end, as shown in the cross section. The air rushing along these channels keeps the bars partially cool, and escapes in a heated state into the furnace at each end of the bars through the openings at *a a*, formed by cutting off the top corners, *b b*, of the bars.

---

122 **Hurry, H. C.,** 81 *King Street, Manchester*—Inventor.

A model, showing improvements in lubricating. Patent dated May, 1850. The novelty consists in forming a chamber for the oil within or about the part to be lubricated. The advantage assumed is, that perfect lubrication is thus obtainable without waste of oil. The annexed illustration represents, in section, a portion of the cylinder and piston of a stationary steam-engine, showing the improvements exemplified by the model, as applied to stuffing-boxes, and to fibrously packed pistons; *a a* is a perforated hoop placed in the middle of the packing, to form a chamber for the reception of oil about the part to be lubricated; *c c* is a reservoir for containing the supply; *b b* are tubes of communication between the reservoir (*c*) and the hoop (*a*); *e f g*, is an apparatus for charging the reservoir (*c*) periodically; this is also, in some cases, effected by a hole drilled down the piston-rod, or by a plug-hole in the cylinder cover, and an independent funnel of peculiar form.

[In order to render the lubrication of machines effectual, the surfaces should be supplied with a fine stream continually flowing. The apparatus in question is intended to effect this result with a smaller amount of loss of material than usual.—S. C.]



Section showing Hurry's Lubricating Improvements.

124 **Galloway, William & John,** *Manchester*—Manufacturers.

Patent lifting jacks, for raising, moving, or turning over heavy bodies; made of wrought-iron, and case-hardened.

Patent steam-engine boilers, with new internal flues, by which the gases from two additional fires within the boiler are united and brought into admixture in a chamber, or throat, immediately beyond the fire-bars of the grates, so that by alternate ignition, the smoke of the newly-made fire is effectually consumed. The vertical water-cones, in the back portion of the flue, being acted upon by the flame, are active agents in the generation of steam, and keep up a constant circulation of the water. One of these land-boilers of thirty-horse power is in operation in the Exhibition.

---

125 **Flynn, W. P.,** 16 *Summer Hill South, Cork*—Inventor.

Improved paddle-wheel, combining the action of the screw with that of the wheel. Provisionally registered.

126 **Terrett, Richard,** 2 *Homer Street, Lambeth*—Inventor.

Feathering paddle-wheel, and feathering windmill—constructed on an improved principle. Intended to save power, and prevent strain and friction.

---

127 **Vallance, P.,** 1 *Davies Street, Berkeley Square*—Producer.

Horizontal wind-mill.

128 **Willison, Robert,** *Alloa, Scotland*—Manufacturer and Inventor.

Model of double-acting force and vacuum pump, adapted for mines.

---

129 ——

Model copper boiler.

130 **Judge, Thomas,** *Hampstead*—Inventor and Manufacturer.

Crank to pass the centres without the use of a fly-wheel or second steam-engine. Two cranks, intended as a substitute for four bevel wheels used in turret clocks, to show the time on the dial.

Gas consumer, which receives the soot that passes through the burner, and destroys it by effect of the same light.

Carriage steps. Self-adjusting spirit level.

---

131 **Bickle, William,** 18 *Reading Street, Swindon*—Designer and Manufacturer.

Working model of a pair of non-condensing steam-engines, which stands within the compass of a shilling, and weighs three drachms; made, with the exception of the piston rods, of a fine white metal.

---

132 **Eccleshall, Thomas,** 2 *Great Ruston Street North, Birmingham*—Inventor.

Submarine propeller for steam vessels. Its purpose is to supersede the present means of producing motion by the paddle-wheel or the screw, more especially the paddle-wheel.

An atmospheric propeller for the purposes of navigation. Its object is to increase the speed of navigable vessels, and to avoid the expense of the mast and rigging of sailing vessels; the delays arising from contrary winds, so that a vessel may take her course direct; and to diminish many of the present causes of shipwreck from shoals, &c., when driven by stress of weather, as well as the risk of human life attendant upon rough weather.

---

133 **Day, Henry James,** 27 *Lower Northampton Street, Clerkenwell*—Manufacturer.

Oscillating-cylinder marine-engine, exhibited for workmanship. Diameter of cylinders, one-fifth of an inch; length of stroke, one-fourth of an inch.

---

134 **Hemming, George,** 44 *Lucas Street, Commercial Road East*—Designer.

Bird's-eye view of a 145-horse power marine engine, shown at an angle, and drawn to a scale from working drawings; illustrative of a method of laying down machinery or buildings, so as to avoid the expense of a model.

Bird's-eye view of a 280-horse power direct action marine steam-engine, shown perpendicularly.

---

136 **Stevens, John Lee,** 3 *Copthall Buildings*—Inventor.

Models of a surface-propeller for steamers, &c.; of a water-wheel; of a registered omnibus ventilator; and of Robinson's registered safety-plug for boats, &c.

Drawings of registered improvements in umbrellas, fire-tongs, and shovel.

---

138 **Richards, Thomas,** 2 *Kidd Street, Woolwich*—Manufacturer and Designer.

Model of an apparatus for connecting and disconnecting the engines from the paddle wheels, by a new method, intended to dispense with the friction strap.

Models of propellers now in use, made to scale.

---

140 **Keasley, W. H.,** 7 *Smithfield Bars*—Inventor.

A new application of the Archimedean screw, for propelling small vessels by hand. Applicable to canals, the screw creating no swell.

---

141 **Smith, George,** 49 *Lime Street*—Inventor.

Improved method of feathering the floats of paddle-wheels. The novelty is in the simplicity of its action, increased speed, and less straining of the vessel.

---

143 **Hodgson, Robert,** *Ewell, near Epsom*—Inventor.

Patent parabolic submarine propeller, for steam-ships. The novelty consists in the application of the hollow paraboloid, as the form of the machine to operate on the water. By this means, its resistance, acting in parallel straight lines, is concentrated to the focus, which forms a momentary fulcrum for propulsion. The water is then thrown off in the direction of the axis or plane of the vessel's course.

---

148 **Paterson, Thomas,** 15 *Rupert Street, Haymarket*—Inventor.

Model of a rotatory steam-engine. The invention consists in having each piston alternately fixed as a point of resistance to the steam, and revolving as a moving power. —Provisionally registered.

---

151 **Haycraft, William Tutin,** *Greenwich*—Patentee.

Model of the "anhydrous" steam-engine; designed to work with "dry" steam, by means of a "separator" of new construction, and a "siccator;" to which is added an expansion valve; this valve is specially applicable to locomotive engines, from its readiness of action. The object of this engine is to prevent boiler explosions. The cylinder is provided with a steam jacket, which is essential to its operation.

[The object of this invention is to separate the steam from the water which generated it, and to apply it, in its separated state, to the working of the engine. For this purpose an apparatus called a "separator" is employed; another called a "siccator" is also used to keep up the heat of the steam in its separate state, otherwise it would condense and lose its power.]

---

152 **Elder, D.,** *Royal Adelaide Steamer, Leith*—Inventor.

Model of an oscillating marine steam-engine, so arranged as to dispense with the ordinary slide valves, eccentrics, &c.

---

154 **Scott, G.,** 22a *Winchester Street, City*—Inventor.

Boiler cleanser.

---

156 **Jones, William,** 4 *Tabernacle Square, Finsbury*—Inventor.

Model of an improved paddle-wheel, in which the paddles rise vertically from the water, which prevents back water, and the consequent loss of power. The floats may be formed of sheet-iron, in one or more pieces, to slide into iron framework, and to move in plummer blocks fixed to the arms of the wheel, but not represented in the model.

---

158 **Deane, C. A.,** 7 *Henry Street, Hampstead Road*—Manufacturer.

Working model of a high-pressure pedestal steam-engine.

---

160 **Pym, John,** 52 *Threadneedle Street*—Inventor.

Model of a submerged paddle-wheel, for propelling vessels, to work wholly or partially under water. The wheel has two shafts, one within the other: the inner one is a screw, the arms of the wheel have blades at their extremities, for a double-bladed paddle. On the arm or centre of each paddle (within the main shaft) is a pinion worked by the screw shaft, giving to the paddle a rotatory or propelling position at one part of the revolution of the wheel, and in a vertical or feathered position during another part of the revolution.

---

162 **Colegrave, Francis Edw.,** *Round Hill, Brighton*—Inventor.

Model of a cylinder, fitted with patent slide valve, for diminishing friction.

---

200 **Tuck, Joseph Henry,** 22 *Pall Mall*—Manufacturer.

Larivière's patent pneumatic governor for regulating the speed of steam-engines.

---

201 **Carnell & Hosking,** *Perran Foundry and Engine Works, near Truro*—Inventors and Manufacturers.

Treble-beat hydraulic valves and seats, particularly adapted for water-works, where large pumps are required.

The improvement in these treble-beat hydraulic valves consists in making the outer beats as near as possible of one size, and allowing the water to act against the middle plate to lift the valve, which will give a third beat, and a third discharge of water, and consequently reduce the lift, prevent concussion, and increase the durability not only of the valve, but other parts of the machinery.—Registered 1851.

202 **ASHBY, JONATHAN**, *Croydon Common*—Inventor.

Screw friction clutch, for engaging and disengaging machinery, while the moving power is in motion.

204 **LEES, T.**, *Stockport*—Inventor.

Water-gauge, alarm valve, &c.

205 **NEWCOMB, THOMAS**, 12 *Norfolk Place, East Lane, Walworth*—Inventor and Maker.

Brass model of machine, for rolling tanned hides. Its objects are, increased speed in drying hides, less power in working, and a finer finish in the leather. The pressure on the hides may be varied from 1 cwt. to 2 tons.

Brass model of patent furnace for marine or stationary steam engines; it supplies itself with fuel, consumes its own smoke, and burns small coal.

206 **HASKETH, —**, *Redruth*—Inventor.

A lubricator for machinery.

208 **GADD & BIRD**, *Manchester*—Inventors.

An expansive piston.

300 **LLOYD, GEORGE**, 70 *Gt. Guildford Street, Southwark*—Inventor and Manufacturer.

Patent centrifugal disc blowing machine.

The centrifugal exhauster differs from the ordinary blower in requiring no outside case; the air or gas is drawn through the pipes, and discharged through the opening in the periphery, into the atmosphere.

301 **NAPIER, J. R.**, *Vulcan Foundry, Glasgow*—Inventor.

Portable rivet-heater, for iron ship builders or boiler makers.

304 **KENNEDY, M.**, 3 *George Street, Camden Town*—Designer and Manufacturer.

Improved blast-fan, for blowing smiths' forges, and founders' furnaces, applicable also for ventilating and fumigating.

305 **WHEELER, EDMUND**, 2 *North Buildings, Finsbury Circus*—Inventor and Patentee.

Equilibrium slide valves for steam engines, to relieve the valve from the pressure due to the elastic force of the steam.

400 **DALY, JOHN**, *Brass and Lead Works, Limerick, Ireland*—Manufacturer.

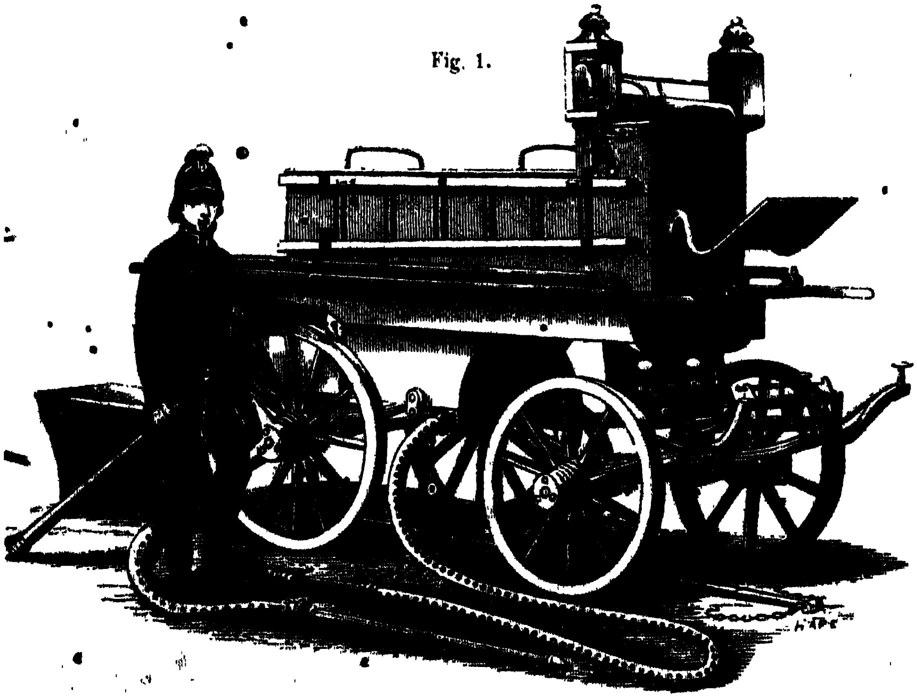
Bronze bell, mounted between two brass pillars, with the bust of Shakspeare on the top.

Improved brass pump, for supplying kitchens, water-closets, cisterns, stable-yards, &c.

401 **MERRYWEATHER, MOSES**, 63 *Long Acre*—Manufacturer.

Carriage fire-engine to be drawn by two or four horses, London Fire Brigade pattern (Simpkins' patent), with 7-inch gun-metal cylinders, and spherical copper air-vessel; gun-metal pistons and valves in separate valve chambers; handles for 30 men, to fold up fore and aft; improved wrought-iron fire carriage, patent axles and springs; double delivery screws for attaching two lines of hose. Fully equipped with hose, suction-pipes, nose-pipes, jet-spreader, &c. Fig. 1 represents this engine, and the peculiar dress of the fire brigade.

Fig. 1.



Merryweather's Carriage Fire-engine.

Light carriage fire-engine, Simpkins' patent; country pattern for post-horses, with handles for 20 men. Equipped and furnished like the preceding.

metallic fire-engine, for tropical countries, to by hand.

ine for six men; on the ipes, delivery-hose, branc

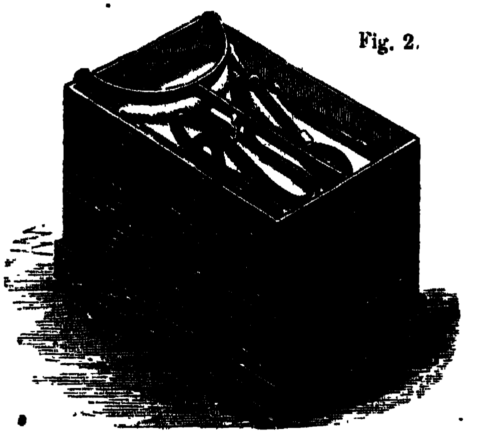
Cabinet fire-engine (fig. 2, p. 227), for mansions, picture galleries, &c.

Two portable conservatory engines.

A coil of best leather-hose, copper-riveted, with gun-metal union screws—London Fire Brigade pattern.

A coil of patent seamless canvas hose, screw, &c., as before.

Fig. 2.



Merryweather's Cabinet Fire-engine.

An improved short branch-pipe and nozzle fitted with Baddeley's jet-spreader.—Registered 1842.

An improved metal breeching for connecting two separate lines of hose into one, or for dividing one line into two.—Invented by Lord Thurlow; registered 1844.

Improved preventor (or fire-hook), capable of being lengthened indefinitely.—W. Baddeley, inventor.

Six improved japanned leather helmets, and leather belts and axes, for firemen.

Leather and canvas fire-buckets.

Set of seven portable fire-escape ladders on hand carriage, with guide wheels, safety-belt and rope, as supplied to the City police, &c.

Domestic family fire-escape, simple and easily applied.

Fireman's leather morion, as made at the establishment of the exhibitor in the early part of the 18th century.

Old English leather black-jack, of the same period.

Old English leather plate-basket, of the same period.

402 **SHALDERS, WILLIAM**, jun., *Bank Place, Norwich*—Designer and Manufacturer.

Patent fountain pumps, engines, and hydraulic working parts, in various metals, for beer, &c., and for house or garden cisterns.

The advantages claimed consist in their reciprocating and rolling action, which is effected without leakage, friction, or liability of choking from such particles as are not easily prevented from entering without blocking up the entrance to their suction-pipes, as small stones, shingle, &c., or from cargoes of grain, pepper, rice, beans, &c., the evolutions of the connector quickly expelling such matters, without receiving material injury, but which with the valve leathers are the only parts that suffer at all; they will pump up even from the bottom of deep wells, and drive up to a higher level any puddled soil or half sand and half water, and that more economically than by other means. Fountain pumps admit of more economical and simpler construction than the common piston and cylinder pumps, and by their admitting of either quick or slow motion without leakage or loss of power, they are easily applied to any motive force; they are cheap, simple, and durable, and, with common smiths' tools, the most complex are readily examined or repaired.

403 **STOTHERT, RAYNO, & PITT**, *Newark Foundry, Bath*—Improvers and Manufacturers.

Iron crane for a dock or wharf, with improvements in the gib, and in the general arrangement and proportion of the parts.

403A **STOTHERT, H.**, *Bath*—Inventor.

Model of a plan for removing the sewage of London without disturbing the present arrangement of drains.

404 **FOX, HENDERSON, & CO.**, *London Works, Birmingham*—Inventors.

Derrick crane and model. Proving press and patent pipes.

[This crane was put into actual service in lifting the heavy machinery around it into their present places, and is equally applicable for their removal at any future time. It was also employed in the construction of the building, and particularly in unloading and testing the cast-iron girders.]

405 **BERRIEDALE, Lord**, 17 *Hill Street, Berkeley Square*—Inventor.

Double-acting fire-engine, for privte houses; exhibited for power and ease of working.

406 **FOURDRINIER, E. N.**, 38 *Barclay Street, Sunderland*—Inventor.

Patent safety apparatus, for preventing loss of life and property when a rope or chain breaks in shafts of mines and collieries.

407 **BEGG, W. G.**, 20 *Market Street, Edinburgh*—Inventor and Manufacturer.

Safety cages, for mine shafts, to prevent the loss of life and destruction of property in mine shafts, when the rope or chain snaps.

408 **EASTON & AMOS**, *Grove, Southwark*—Part Inventors and Manufacturers.

Improved patent hydraulic ram, originally invented by Montgolfier, in France, and patented by him in 1797: the English patent has passed into the hands of the exhibitors.

[This machine, which is self-acting, is composed of an air vessel and three valves, two for the water, and one for keeping up the supply of air. Upon pressing down the valve in the conducting tube, which opens downwards, the water escapes from it, until its momentum is sufficient to overcome the weight, when the valve immediately rises and closes the aperture. The water having then no other outlet than the inner valve, rushes through it, by its generated force, compressing the air in the air vessel until equilibrium takes place, when the air reacts by its expansive force, closing the inner valve, which retains the water above it, and driving it up the ascending tube. By this reaction, the water is forced back along the conducting pipe, producing a partial vacuum beneath the outer valve, which immediately falls by its own weight. The water then escapes until it has acquired sufficient force to close this, when the action proceeds as before. It is best adapted for the raising of moderate quantities of water, as for household or farming purposes.]

409 **BADDELEY, WILLIAM**, 29 *Alfred Street, Islington*—Inventor and Manufacturer.

A portable, and simple farmers' fire-engine. It is also applicable as an agricultural force-pump.

A portable fire-engine; two sizes.

410 **SHAND & MASON** (late **TILLEY**), 245 *Blackfriars Road*—Manufacturers.

Improved brigade fire-engine, with complete set of tools and implements, worked by 28 men; is drawn by horses, and carries the firemen; has improvements in suction or inlet cock, air-vessel, and exit pipe; by means of the latter two, right angles are avoided in the passage of the water. This engine is represented in the accompanying Plate.

Mansion or factory fire-engine, for 20 men.

Metallic fire-engine, for 14 men, suitable for any climate.

Ship's fire-engine, for 6 men, mounted on wheels.

The above are each fitted with metallic valves, draw water through suction-pipe or from cistern, and are mounted on four wheels, with locking-carriage and drag-handle.

Hall fire-engine, for the interior of public buildings and mansions.

Galvanised iron garden-engine, with improved lever.

Improved portable fire-pump, introduced by the London Fire Brigade, and found of great utility at the commencement of a fire. The same with pail, into which it can be instantly fixed.

Hose-reel, with implements complete. Hose and suction-pipes of various sorts, also various descriptions of fire-cocks. A series of experimental jet-pipes, used in determining the best form. Fire-buckets, fire-axes, London Brigade firemen's helmet, &c. Branch and jet-pipes, as used in floating fire-engines, for 120 men.

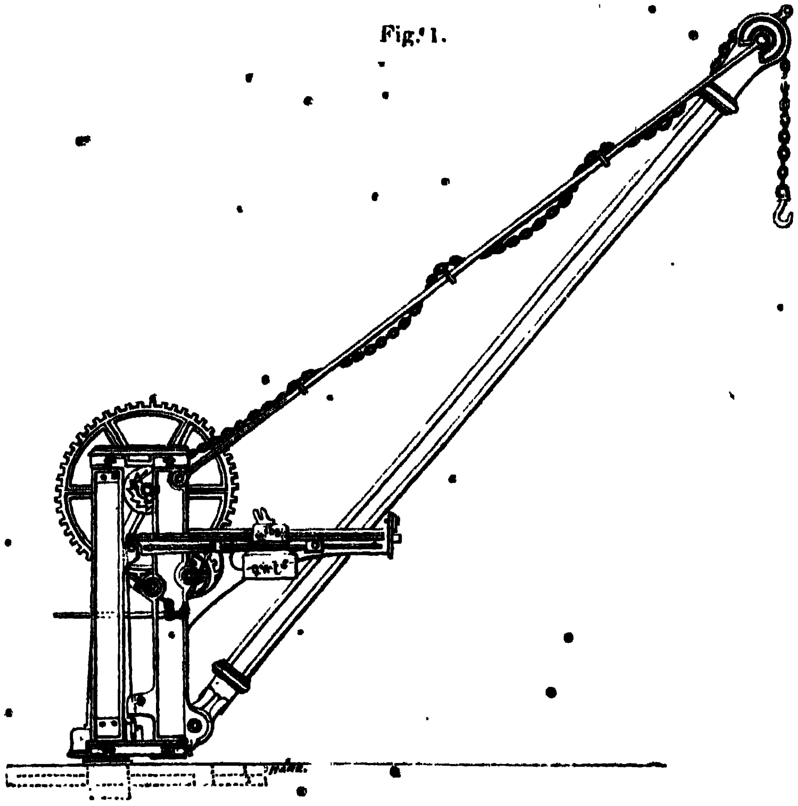
The improved brigade fire-engine, several hose-reels, and 18 portable fire-pumps, have, at the request of the Executive Committee, been placed at their disposal, to be used in the event of fire. They will be found in various parts of the Building, under the care of firemen of the London Establishment.

---

411 **JAMES, JOHN, & Co.**, 24 *Leadenhall Street*—Manufacturers.

A patent weighing crane (fig. 1). This crane is adapted for raising heavy goods, and, at the same time, obtaining their weight by an adaptation of the principle of the steelyard.

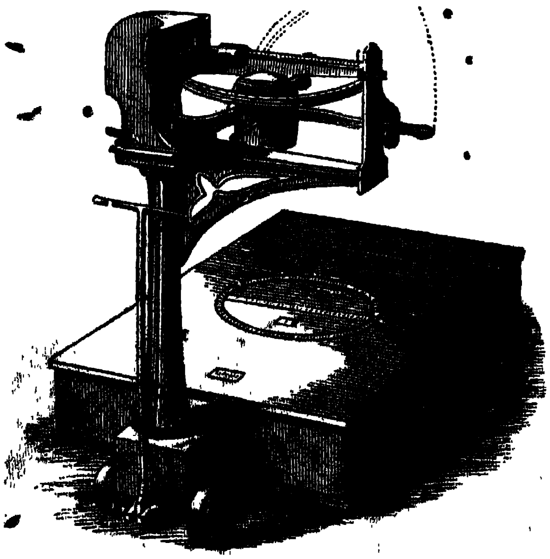
Fig. 1.



James & Co.'s Patent Weighing Crane.

A small weighing machine for warehouse purposes (fig. 2). This machine is intended to weigh any description of merchandize from 1 lb. up to 21 cwt., and the principle upon which it is constructed is applied to weighing machines of all sizes. Its novelty is comprised in the absence of all loose weights, in the counterpoise, being so arranged as to admit of the free oscillation of the beam, and in the weights by which the goods are weighed being attached to, and forming part of, the machine itself. The large weight moves on a circular scale, and the small weight along a straight scale, the one indicating cwts., the other lbs.—Patented.

Fig. 2.



James & Co.'s Small Patent Weighing Machine.

---

412 The **BANK QUAY FOUNDRY COMPANY**, *Warrington*—Manufacturer and Proprietor.

Large hydraulic press, used for raising the Britannia Tubular Bridge.

Explanation of the engravings (Plates 18, 19, 20) of the hydraulic press used for raising the tubes of the Britannia Bridge; executed by the Bank Quay Foundry Company, Warrington.

A—Wrought-iron Sandwich girders, weighing 12 tons each.

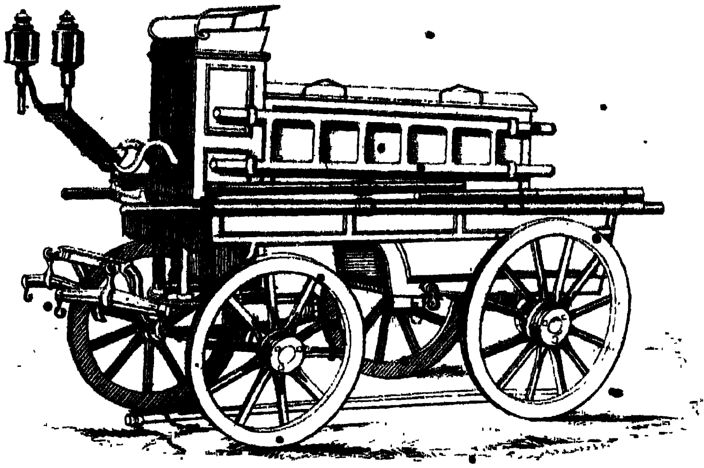
B B—Cast-iron beams, 5 tons each.

C—Jacket of cast and wrought iron, weight 3 tons.

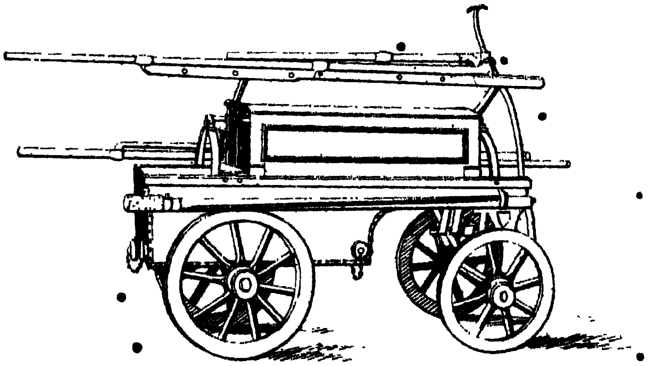
D D—Cylinder, cast-iron, weight 15 tons.

E—Ram, 3 tons 13 cwt.

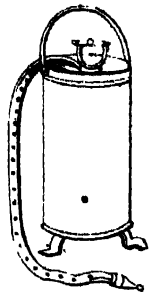
F—Crosshead, cast-iron, 13 tons.



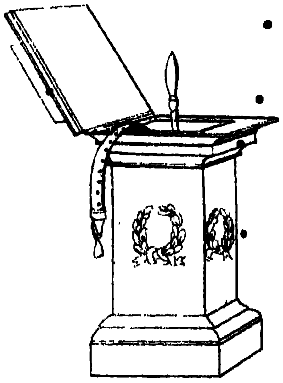
IMPROVED BRIGADE FIRE ENGINE.



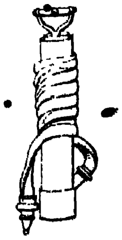
METALLIC FIRE ENGINE.



PORTABLE
FIRE PUMP
WITH PAIL.



HALL FIRE ENGINE.



PORTABLE FIRE PUMP
AS USED BY
THE LONDON FIRE BRIGADE.

MESSRS. SHAND & MASON'S FIRE ENGINES & APPARATUS.

[illegible]

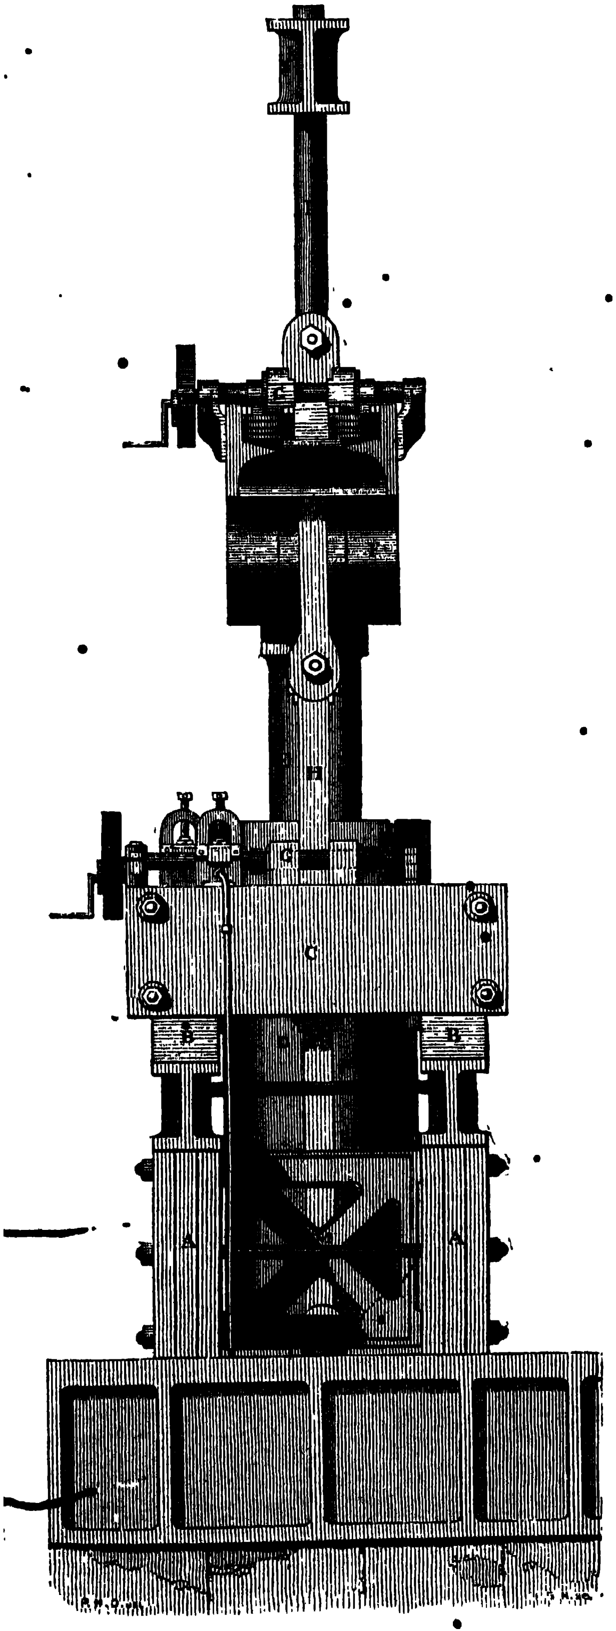
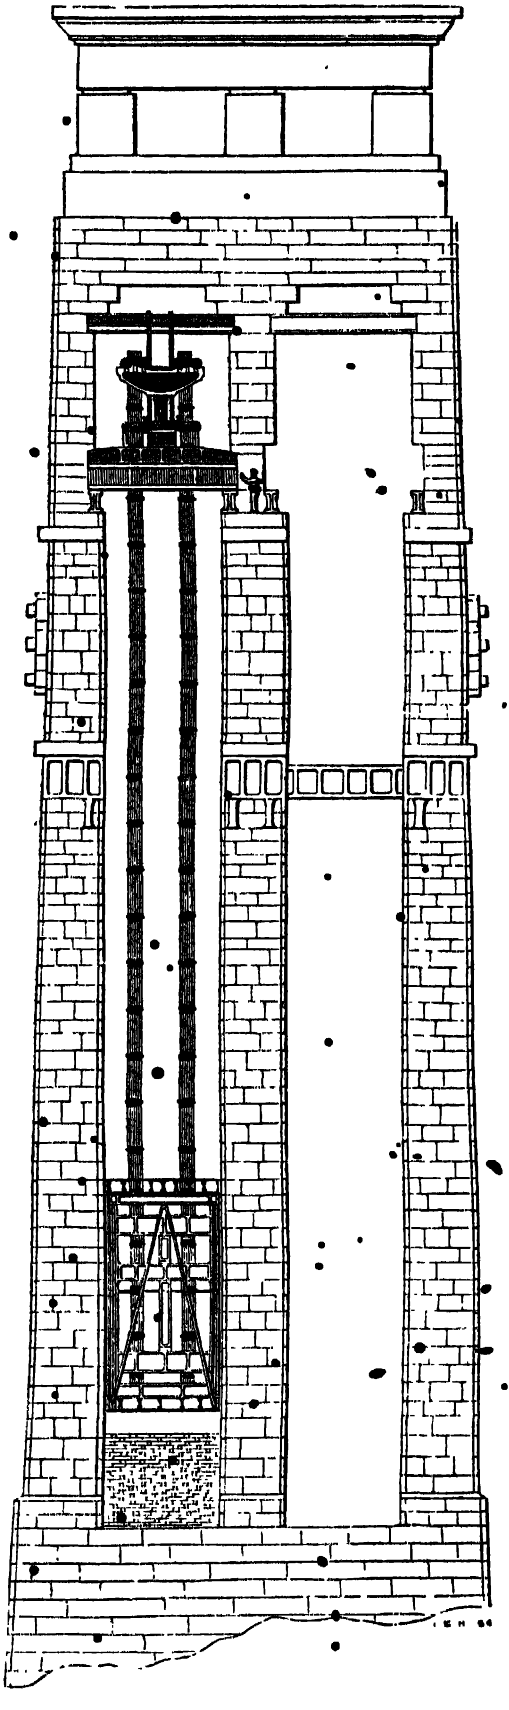
I. GREAT HYDRAULIC PRESS EMPLOYED IN RAISING THE BRITANNIA TUBULAR BRIDGE.



II. THE PRESS SHOWN IN OPERATION—THE TUBE PARTLY LIFTED.

19.



III. END ELEVATION.

20.

G G G G—Clamps.
H—Chains.
I I—Guide rods, wrought iron.
K—Guide rod beam.
L L—Valves.
M—Distance pieces between wrought-iron Sandwich girders.

Plate 18 represents a front elevation of the press; Plate 19 an end elevation; and Plate 20 shows its application in raising the Britannia tube, with the latter partly lifted.

The internal diameter of the cylinder is 22 inches, the diameter of the ram is 20 inches, the external diameter of the cylinder is 42 inches, external length 9 feet 1½ inch; thickness of metal 10 inches; the water is forced into the cylinder through a pipe and valve L, the press is placed in the jacket C, and rests upon the cast-iron beams B B, which again are supported by the wrought-iron beams A A; the cast-iron crosshead F has wrought-iron links let in at the top, for the purpose of strengthening the part subject to tensile strain; the sides of the jacket also are strengthened with wrought-iron slabs, weighing 30 cwt. each, expanded first by heat and then fitted-on hot, and allowed to contract. To cast the cylinder, it required 22 tons of fluid metal, the additional quantity beyond its finished weight being required for the head, or git, which weighed 2½ tons. This head, or git, was kept in a fluid state for six hours after the run, by replacing the material after it became stiff, with metal fresh from the furnace, and of the highest attainable temperature, for the purpose of supplying the space in this immense body of metal below, consequent upon the contraction. In three days afterwards the cylinder was partly denuded of its outer coat of sand, when it was found red hot: in seven days it was lifted from the pit in which it was cast, and in ten days, or 240 hours, it was sufficiently cool to be approached by men well inured to heat, for the purpose of dressing the remaining sand off it.

The A A beams, for supporting the press, consisted of six vertical ribs of boiler plates, $\frac{5}{16}$ths thick, united by vertical strips, to preserve them in form; the $2\frac{3}{8}$ inch spaces between ribs were filled with American elm, so that the vertical rib was a sandwich of elm and iron. The top and bottom flanges were each formed by twelve wrought-iron bars, extending the whole length of beam. The top bars 7 inches wide, and the bottom bars 9 inches by $1\frac{1}{8}$ inch; the whole riveted together. The weight of each girder was 12 tons. In order to prevent the crushing at the ends, cast-iron plates were inserted instead of the wood.

The weight actually supported by one pair of beams was 1,177 tons, but they were capable of sustaining 2,000 tons. The length between the bearing was 17 feet 4 inches. The ram was cast hollow and turned to bed truly, beneath the crosshead, which was bored to receive it. The crosshead was guided by two wrought-iron rods, 6 inches diameter, fitted in sockets on the top of the press, and keyed above into a cast-iron girder, K, built in the masonry.

There were two sets of clamps: the one placed on the crosshead and rising with it, was immediately used for lifting the chain and tube, the under set was fixed on the cast-iron girders which support the press, and was used for securing the chain at the end of each lift, while the press was lowered, and the upper set of links removed; they are in all respects similar to each other. The wrought-iron clamping cheeks are slotted to fit closely beneath the slotted shoulder in the head of the links; they are withdrawn or closed by right and left handed screws, on turning which the cheeks recede from each other, or are drawn into close contact with the chain. To insure a parallel action, the screws are moved simultaneously by a winch and gearing; they are thus easily worked by one man. Thus at each stroke of the press the tube was raised 6 feet, the time occupied in one lift being usually from 30 to 45 minutes.

The lifting chains were manufactured by Messrs. Howard & Ravenhill; the clamps and valves by Messrs. Easton & Amos. The superintendence of the designs and construction of this machinery were entrusted by Mr. Robert Stephenson, the engineer, to Mr. Edwin Clark.

The greatest weight lifted by the press at the Britannia bridge was 1,144 tons; the quantity of water used for each 6 feet lift 81½ gallons. "The pressure at 3 tons per circular inch equals 3·819 tons per square inch, which would raise a column of water 5·41 miles in height; this pressure would, therefore, be sufficient to throw water over the highest mountains on the globe." This extraordinary fact is derived from Mr. Edwin Clark's work on the Britannia and Conway bridges. The following additional extract shows indirectly the vast power of this machine:—

"If it were required that 1 lb. should raise the tube, or 2,000 tons, then one arm of the lever must be 448,000 times as long as the other; but if the 1 lb. move through a space of 1 inch, the tube will be only lifted $\frac{1}{448000}$th part of an inch; and in order to raise the tube 100 feet the pressure of 1 lb. must be continued through a space of 83,522 miles; and, conversely, a pressure of 2,000 tons through a space of 100 feet, would raise 1 lb. 83,522 miles; thus the descent of a clock-weight through a space of 6 feet overcomes the friction of the machine, and moves the extremity of an ordinary seconds-hand through a space of two miles in a week, and the descent of the tube to the water would maintain the going of an ordinary clock for 240,000 years," or the power expended by the press in lifting the tube 100 feet, if applied to an ordinary clock, would work it for a period of 240,000 years.

After the first tube was raised, the cylinder met with an accident, described in the following terms by Mr. Clark:—

"In a little more than a fortnight after this operation the presses were removed ready for raising the next tube. They were lowered and raised again by means of capstans, with an 8-inch rope; and in this operation another accident occurred with the unlucky press. The cylinder was lowered from a cat-head at the top of the tower; the rope from the blocks led to a capstan on the beach, on which three turns only were taken; while the cylinder, weighing 15 tons, was suspended at an elevation of 140 feet above the water, the rope unexpectedly surged on the capstan, and was dragged out of the hands of the men who were holding it; the cylinder descended with fearful velocity, dragging the rope through the block tackle and round the capstan, which fortunately became palled by the jerk. As the velocity increased, the cat-head in the tower gave way, and the cylinder fell on the stone shelf below, fracturing the masonry, and gliding off 50 or 60 feet into the Straits. Several men were injured, and a sailor who was serving out the coil of rope was dragged round the capstan and killed. None of the tackle was broken, and the press was easily raised by the ropes attached to it, and was found to be uninjured by the fall."

[The weight raised by this single press at the Britannia bridge was 1,144 tons, and this was effected with ease by the hydraulic press exhibited. A popular error prevails on the subject of gaining power by the application of machinery, and particularly with relation to the hydraulic press, in which it appears that a small applied force produces immense results. In this case, however, as in all others, the power is only transferred and distributed. Water, and indeed all fluids, possess the property of pressing equally in all directions. If water is enclosed in an iron box, and the force of one pound is applied to but one square inch of its surface, this pressure is at once communicated to every square inch of the surface of the box. Bramah rendered this force available by applying a packing around the moving pistons, which made them perfectly water-tight under any pressure. By the force pump, pressure is applied to the water in the small cylinder of the pump, and this fluid being connected with that in the large cylinder of the press, whatever force is applied to the water in the first, is increased according to difference of the capacity between it and the last, which was in this case as 1 to 354·3.

Four such cylinders have been cast at Bank Quay Foundry, and they are, perhaps, the most powerful machines ever constructed.—R. H.]

---

413 **HOWARD, RAVENHILL, & CO.,** *King and Queen Iron Works, Rotherhithe*—Inventors, Patentees, and Manufacturers.

Link of a suspension bridge chain, formed of eleven bars, to illustrate the method for rolling bars for suspension bridges, and similar purposes.

This process produces the bars of the form required at one heat, and is intended to supersede the uncertain and insecure method of welding on the heads; and to carry the fibre of the iron in the proper direction around the eye to resist the strain of the coupling pins. The bars exhibited form a link of the chains in all respects similar to those manufactured for the suspension bridge over the Danube at Pesth. The tubes of the Conway and Britannia bridges, the latter weighing 2,000 tons, and lifted 100 feet, were safely raised by chains made on this principle.

[With a force of about 10 tons per square inch of sectional area, the elasticity of wrought iron is wholly excited, and in some cases surpassed. Engineers, therefore, do not subject it to this strain, even when the iron is perfect in the texture of all its parts; but as in the case of chains with welded heads, the texture can never be perfect, a still larger margin must be left; probably the strain permanently acting on it should not much exceed 5 tons per square inch. If by any process of manufacture these defects can be certainly removed, greater safety may be gained by a less expenditure of metal.—S. C.]

---

414 **GOSSAGE, J.,** *71 Florence Road, Deptford*—Inventor.

Improved portable engine-pump, designed for the use of ships, particularly for men-of-war. It may be used for a fire-engine, watering-engine, and wash-deck pump. It is available for all the purposes of a lift or force-pump; also, as an auxiliary to, or substitute for, any fixed pump in use on board ships, in case of need, and can be used to wet the ship's sails, or worked in a boat to wash the ship's side, and extinguish fire.

The principal peculiarities are, its portability and capacity of working in less space, greater durability under action of sea-water, and its not being so liable to be injured from accident, nor to get out of order; metallic valves are used in lieu of leather, with vulcanized India-rubber discs between the piston caps, and its general construction is suited for all climates. It is not rendered inefficient by not being in constant use, or by being kept free from water.

---

415 **GREATOREX, DAN.,** *9 Desborough Terrace, Harrow Road, Paddington*—Inventor and Manufacturer.

Model (scale 1½ inch to a foot) of an improved hoisting machine, for raising or lowering goods; the machine can be worked by hand or steam, and its whole operation requires but one man. The principle is applicable to dinner-lifts for hotels and mansions.

---

416 **BELLHOUSE, E. T., & CO.,** *Eagle Foundry, Manchester*—Inventors.

Hydraulic press for packing cotton, or other material in bales; worked by two hand-pumps; with illustrative drawings.

Model of the exhibitors' fire-proof hoist for mills and warehouses. This plan prevents the rapid communication of fire from one story to another, by the interposition of fire-proof doors between each story; an arrangement is introduced which causes the doors to shut by their own gravity, when the cradle is removed.

Model of the iron shell of a cottage.

Brick-pressing machine, with W. Percy's self-lubricating piston.

Small hydraulic press, adapted for making experiments in the compression of material.

---

417 **FAIRBAIRN, W., & SONS,** *Manchester*—Inventors and Manufacturers.

Patent tubular crane, manufactured by the exhibitors.

[The following observations on this crane are extracted from a paper contained in the Reports of the British Association, communicated by Sir David Brewster:—

"These structures indicate some additional examples of the extension of the tubular system, and the many advantages which may yet be derived from a judicious combination of wrought-iron plates, and a careful distribution of the material in all those constructions which require security, rigidity, and strength.

"The projection or radius of the jib of these cranes is 32 feet 6 inches from the centre of the stem, and its height 30 feet above the ground. It is entirely composed of wrought-iron plates, firmly riveted together on the principle of the upper side being calculated to resist tension, and the under, or concave side, which embodies the cellular construction, to resist compression. The form is correctly that of the prolonged vertebræ of the bird from which this machine for raising weights takes its name; it is truly the neck of the crane tapering from the point of the jib, where it is 2 feet deep by 18 inches wide to the level of the ground, where it is 5 feet deep and 3 feet 6 inches wide. From this point it again tapers to a depth of 18 feet under the surface, where it terminates in a cast-iron on which it revolves. The lower or concave side, which is calculated to resist compression, consists of plates forming three cells, and varying in thickness in the ratio of the strain; as also the convex top, which is formed of long plates chain-riveted with covers; but the sides are of uniform thickness, riveted with T iron, and covering plates 4½ inches wide over each joint. This arrangement of the parts and distribution of the materials constitute the principal elements of strength in the crane. The form of the jib, and the point at which the load is suspended, is probably not the most favourable for resisting pressure. It nevertheless exhibits great powers of resistance; and its form, as well as the position, may safely be considered as a curved hollow beam having one end immoveably fixed at A, and the other end, C, the part to which the force is applied. Viewing it in this light, the strengths are easily determined, and taking the experiments herein recorded, we have by the formula $W = \frac{A\,d\,C'}{e}$ a load of 63 tons, the weight it would require to break the crane. With 20 tons the ultimate deflection was 3·97—·64 of a permanent set = 3·33 inches, the deflection of the jib due to a load of 20 tons. The following constitute the experiments made at Keyham Docks:—

"Experiments made to ascertain the resisting powers of a new wrought-iron tubular crane, erected at Keyham Dockyard, Devonport, November 8, 1850.

Weight of Cargo in Tons.	Deflection at the point of the Jib in Inches.	
2	·32	
3	·50	
4	·65	
5	90	
	1·05	With 5 tons suspended the crane was turned completely round, without any alteration in the deflection.
7	1·20	
8	1·35	
9	1·50	
10	1·70	

With this weight the crane was again turned round; the deflection in eight minutes increased to 1·85 inches, when it became permanent after sustaining the load during the whole of the night, a period of about 16 hours.

"On 9th November the experiments were resumed as follows:—

Weight of Cargo in Tons.	Deflection at the point of the Jib in Inches.	Weight of Cargo in Tons.	Deflection at the point of the Jib in Inches.
11	2·05	16	3·00
12	2·22	17	3·20
13	2·40	18	3·50
14	2·60	19	3·73
15	2·80	20	3·97

On again turning the crane round with a load of 20 tons there was no perceptible alteration in the deflection, and the permanent set, after removing the load, was ·64 inches.

"From the above experiments, it appears that the ultimate strength of the crane is much greater than is requisite either in theory or practice, and, although tested with nearly a double load, it is still far short of its ultimate powers of resistance, which it will be observed are five times greater than the weight it is intended to bear.

"The advantages claimed for this construction are its great security, and the facility with which bulky and heavy bodies can be raised to the very top of the jib, without failure. It moreover exhibits, when heavily loaded, the same restorative principle of elasticity strikingly exemplified in the wrought-iron tubular girder. These constructions, although different in form, are nevertheless the same in principle, and undoubtedly follow the same law as regards elasticity and their powers of resistance to fracture."]

Description of the annexed engraving of the Keyham tubular crane:—

Fig. 1 is a side view of the crane, with a portion of the side removed to the foot, in order to show the cast-iron cylinders built in the masonry, the rollers which encircle the body of the crane and support the stem vertically, with its rollers and bearings acting against the interior recess of the large circular plate *a a*, between the plate and the frame, which embraces the crane in a ring which contains the rollers, giving a rotatory motion to the crane in any direction. Immediately above the rollers, is a platform of 12 feet in diameter attached to the stem, on which the men stand to work the crane. This platform also enables a man, by turning a handle, to move the crane round in any direction at pleasure.

Fig. 2 is a section of the body of the crane taken above the quay wall. The cells are carried along the concave side of the jib, where they terminate in two cells near the top, and also in two cells near the bottom, where the stem enters the cast-iron shoe already described.

Fig. 1.

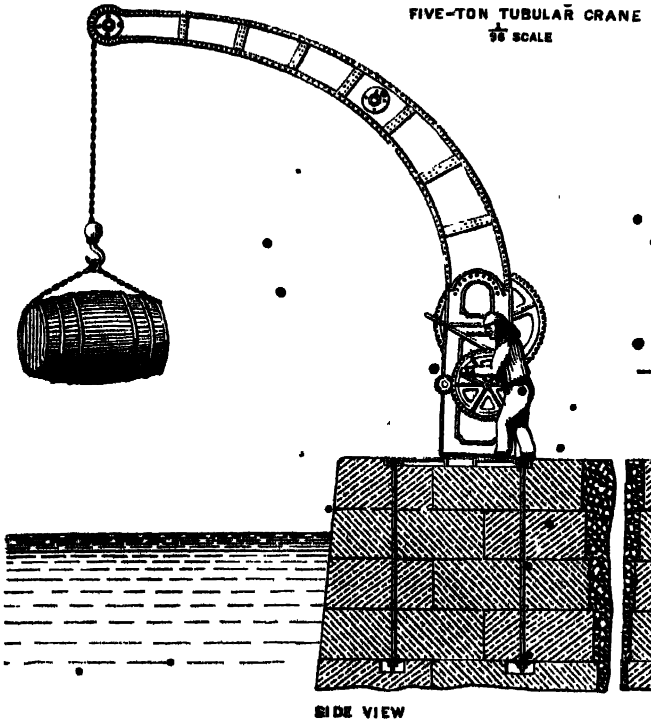


Fig. 2.

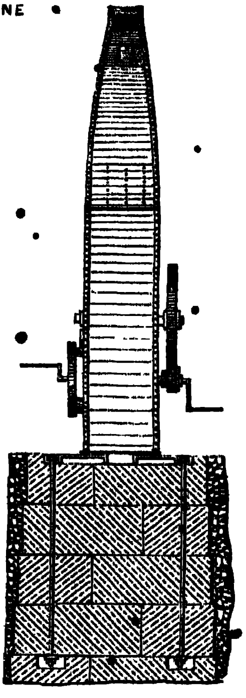

418 The DEVONSHIRE GREAT CONSOLIDATED COPPER MINING COMPANY, 17 *Barge Yard Chambers*—Producer.

Models of two water-wheels, of 140-horse power each, erected at the mines of the above Company, for the purpose of pumping water from the one shaft by a plunger, and from the other by a drawing lift. Scale 1 inch to the foot.

1. Model of a wheel, 40 feet in diameter, by 12 feet in breast, pumping from the depth of 115 fathoms, or 690 feet, with 14-inch pumps, 7 feet 6 inches stroke, discharging 60 gallons of water per stroke, and lifting at each stroke 69,000 lbs., the average velocity being 4½ strokes per minute.

This wheel works a line of 3½ inch round iron rods, 390 fathoms or 2,340 feet; not exhibited on the scale of the model of the wheel, for the want of space, over pulleys, ascending a hill, at an elevation from the wheel to the shaft of 384 feet above the wheel.

This wheel pumps the water from the mine called "Wheal Josiah."

2. Model of a wheel of 40 feet in diameter, by 12 feet in breast, pumping water from a depth of 80 fathoms; 60 fathoms, or 360 feet, with 12-inch pumps; and 20 fathoms, or 120 feet, with 20-inch pumps, of 6 feet stroke, discharging 98 gallons of water per stroke; it lifts at each stroke 40,600 lbs.

This wheel works a line of rods of 3¼ inch round iron, 520 fathoms, or 3,120 feet, over pulleys; in connection with the shaft at the mine, called "Wheal Anna Maria."

The water supplying these wheels is derived from the river Tamar, by the means of a leat two miles long, and by the water collected from the dressing floors on the various mines.

The mines belonging to the Company, exhibiting the above-mentioned models, are situated about four miles west of Tavistock, in the county of Devon, on the banks of the river Tamar, which here forms the boundary of the counties of Devon and Cornwall. They are inlands, the property of his Grace the Duke of Bedford, who granted a lease of the mining set, from March 1844, for 21 years, at one-twelfth dues.

The mining set, which is about 1¾ miles in length, by 1½ in breadth, containing 1500 square acres, consists of the mines called "Wheal Maria," "Wheal Fanny," "Wheal Anna Maria," "Wheal Josiah," and "Wheal Emma," on the principal or champion lode, running east and west; "Wheal Frementor" on the southern part, where an adit has been driven from the surface, near the Tamar, to intersect parallel lodes; and "Wheal Thomas," also near the southern boundary, where a shaft has been sunk to the depth of 40 fathoms, and an adit driven with a view of proving the ground in that direction. The ore is found in the killas, or clay slate, of the country, and consists of black, grey, and yellow copper ore, the latter predominating. Operations at the mines were commenced in August, 1844, and the great lode, from which the following large quantities of ore have been extracted, was cut in November following, at a depth of 17½ fathoms from the surface. The first sale of ore took place in February, 1845; since which date, monthly sales have been regularly made, and the returns to the end of March, 1851, with the amount realized, and dividends paid, are as follow:—

	Returns of Ore.			Amount Realized.			Dividends Paid.
	Tons.	cwts.	qrs.	£	s.	d.	£
To Dec. 31, 1845	13,674	12	0	120,382	14	5	55,296
1846	14,398	9	0	94,626	17	10	37,888
1847	14,413	6	3	102,889	12	3	15,360
1848	16,580	17	2	100,761	14	5	30,720
1849	15,431	18	0	104,624	1	7	34,304
1850	17,290	15	3	117,364	12	2	40,960

Tons	96,343	17	8	£667,510	6	2	£229,888

Engineer and designer of the models, Mr. Nathaniel Smith, Mary Tavy, near Tavistock.

420 APPOLD, J. GEORGE, 23 *Wilson Street, Finsbury* —Inventor.

Centrifugal pump for draining marshes, contains one gallon; it discharges its contents 1,400 times in a minute, and does 73 per cent. duty. This pump is adapted for a large quantity of water, with a low lift; has no valves in action; and is adapted for a tide pump. Manufactured by Easton & Amos, Grove, Southwark.

421 BESSEMER, HENRY, *Baxter House, St. Pancras Road*— Patentee and Manufacturer.

1. A centrifugal disc pump for land and sewer drainage, which is said to be capable of discharging 20 tons of water per minute, and will drain one acre of land per hour, if covered with one foot depth of water. The distinguishing features of this apparatus are, its combination with the steam-engine (the disc and shaft of the pump serving also the purpose of fly-wheel and shaft to the engine); and the absence of all intermediate gearing, or any form of piston, slider, valve, stuffing-box, or rubbing surface of any kind whatever in the pump; its great power in proportion to its weight, the small space it occupies, and the cheap rate at which, from its simplicity, it can be manufactured in comparison with other descriptions of pump.

2. Model of a pump for steam-ships, being a precise copy of the exhibitor's original patent for the centrifugal disc, dated 5th December, 1845. The model will lift one ton per minute 20 feet high. The pump-case is divided into two compartments, in one of which is a centrifugal disc, and in the other a pair of emissive steam-arms, fixed on the axis of the pump, whereby a rotary motion is given to the disc, whenever steam is admitted to the arms. It therefore contains its own steam power, and may be used at any time to pump the ship, even though her engines may be disabled.

The full-sized pump, with a case of 3 feet 6 inches in diameter and 20 inches wide, will discharge from the ship 10 tons of water per minute.

3. A centrifugal disc pump for locomotive engines; it is self-acting, and will therefore supply water to the boiler while the engine is at rest. It consists of only one moving piece; has no valve, piston, slider, or stuffing-box; therefore neither steam nor water can leak from it. It is intended to run the vertical axis on a mineral bearing, which requires no oil or lubricating matter: all heat from friction of the axis is prevented, by the axis being situated in the cold water supply-pipe; the action of the stone upon the axis gives it brilliant polish, but does not wear it away; and as there are no other rubbing surfaces, its stoppage or derangement is almost impossible, particularly as there are moving parts exterior to the case. The only material used is an alloy of copper, tin, and nickel. This pump is applicable to marine and stationary boilers, as it will supply them with water when the ordinary pump may be out of repair, or when the engine is stopping. The one exhibited will supply 900 gallons per hour, equal to a boiler of 130 horse-power.

4. A small model worked by hand to illustrate the principle of the centrifugal disc.

422 STOCKER, SAMUEL & GEORGE, 4 *Arthur Street, New Oxford Street*—Manufacturers.

Patent pillar beer machines of various designs, and pump. Recess counters, having separate compartments for spirits and beer, designed by Samuel Stocker, jun. Patent seven-motion and other beer machines. New design for a spirit tap. Patent lift pumps for spirit warehouses, &c. Newly invented patent jar or bottle, intended to dispense with corking and uncorking; may be opened or closed instantaneously; is air-tight, and capable of being locked and secured without waxing, capsule, wire, or spring. Patent new pewter pot which cannot be melted. Decanter and water bottle, with self-acting stoppers. Tapping cocks which cannot be injured by being driven into the cask; and anti-corrosive tap, made of oak and pewter. Apparatus for icing or warming ale and other liquids.

423 SLACK, JAMES, 46 *Commercial Road, Lambeth* —Inventor.

Polished slate cistern, with an improved patent rapid purifier, 5 ft. long, 4 ft. deep, and 3 ft. wide; calculated to produce 3,000 gallons per day of pure soft water.

Portable stone-ware rapid purifier, to be fixed upon the floor.

424 WARNER, JOHN, & SONS, 8 *Crescent, Jewin Street*— Manufacturers.

1. Overshot water-wheel, with three pumps, in iron frame, for raising water to gentlemen's houses from a river, pond, or spring. This wheel is represented in the following cut (page 233).

2. Horsewheel and improved pumps for raising water from deep wells.

3. Double barrel pumps and air vessel, in iron frame, for raising water from shallow wells.

4. Double barrel pumps, in iron frame, for raising water out of shallow wells.

5. Treble barrel brewers' pumps, in iron frame, to be worked by steam, horse, or water power.

6. Patent vibrating standard pump on plank, for the supply of water to closets and all house purposes.

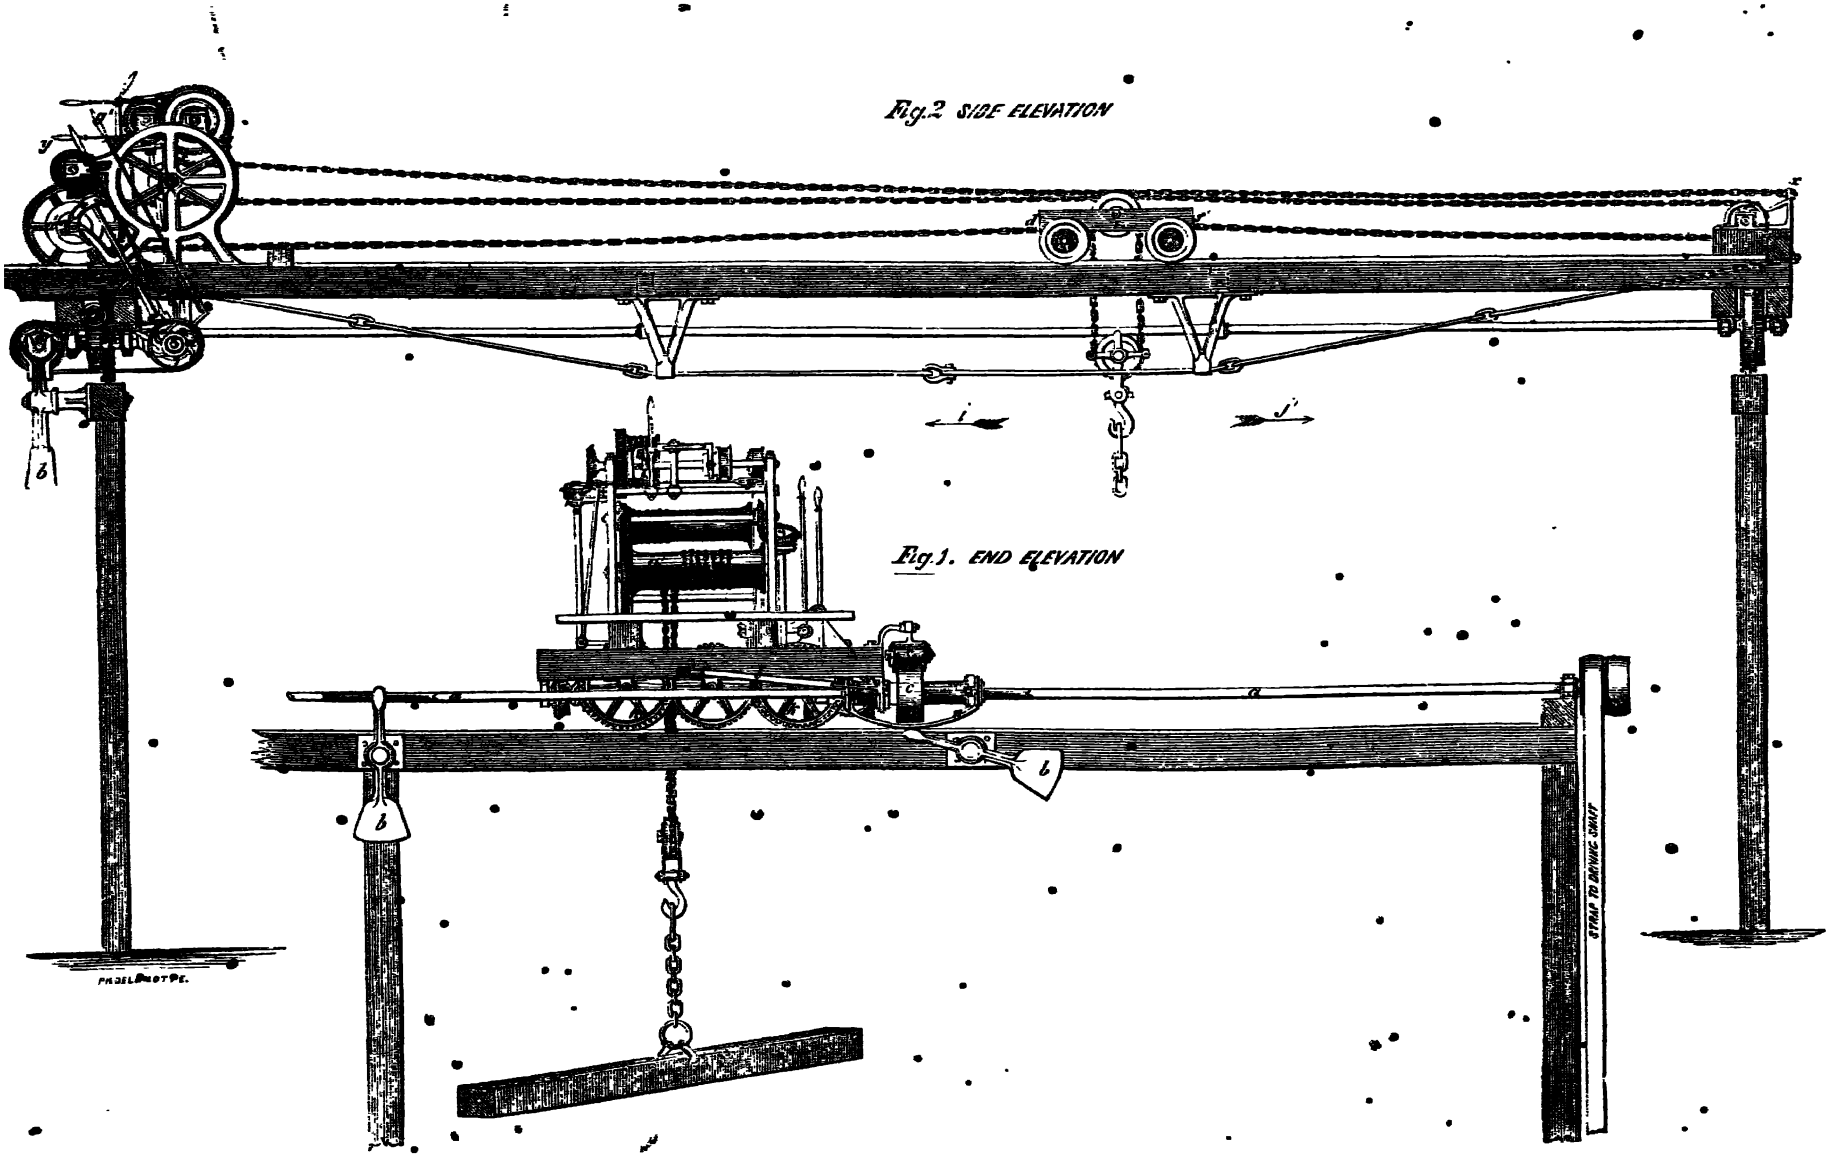

Fig. 2 SIDE ELEVATION

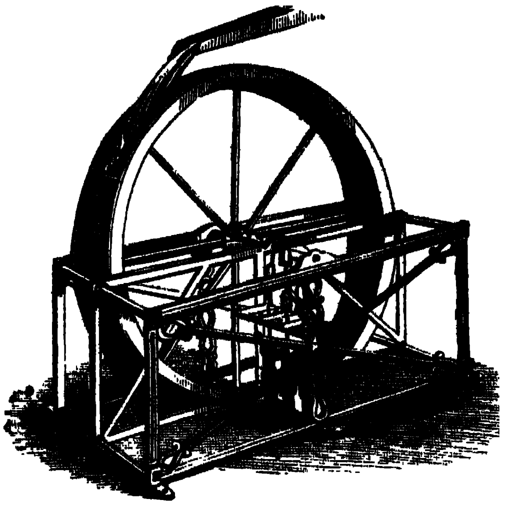
Fig. 1. END ELEVATION

3. PATENT STEAM TRAVELLING-CRANE. MESSRS. M'NICOL AND CO. LIVERPOOL.



Warner and Sons' Overshot Water-wheel.

7. Patent vibrating standard iron pump, for ponds or manure tanks.

8. Patent vibrating standard iron lift pump on plank.

9. Patent garden engine, with registered spreader.

10. Fire engine, with folding handles, for the use of mansions and small parishes.

The articles numbered 6, 7, 8, and 9, are patented by the exhibitors.

425 **CLARK, GEORGE DELIANSON**, 12 *London Street, Greenwich*—Inventor's Agent.

Water-filter, a model in action, exhibiting a new mode, on the principle of natural filtration, self-acting, economical, and applicable on a large scale for the supply of pure water to towns and districts. Model of same attached to a house-cistern, filtering the water as delivered from the main; connected with a self-acting regulator or water-meter, which governs and registers the supply with accuracy; and also connected with an apparatus for cleansing sewers with waste water.

426 **DEANE, JOHN**, 1 *Cross Wall, Dover*—Designer and Inventor.

A working model of a diver in his diving apparatus, consisting of a helmet, submarine dress, &c., in a reservoir of plate glass, containing about sixty gallons of water, the bottom of which represents the bed of the sea, with rocks, wreckage, &c., and the top a fortification, mounting ten brass guns, formed from metal recovered from the wreck of the Royal George by the constructor.

A glass model of a diving bell, representing two men supplied with air by a three-cylinder brass rotatory condensing engine. Model diving helmet, submarine waterproof dress, &c.

427 **BYWATER, WITHAM M.**, 99 *Piccadilly*—Designer and Manufacturer.

Water-meter, suitable to any pressure.

428 **TURNER, E. W. K.**, 31 *Praed Street, Paddington*—Inventor.

Model of an invention for improving the water supply.

429 **BOTTEN, CHARLES**, *Clerkenwell*—Manufacturer.

Appold's self-regulating friction-break. The resistance of this machine when loaded to any fixed strain on the handle will not vary, whether it be well oiled and working freely, or dry and with considerable friction. It is adapted for measuring labour in prisons, or ascertaining the amount of work performed by steam engines and other machines. Patented by J. G. Appold, Esq., Wilson Street, Finsbury Square.

430 **UNDERHAY, F. G.**, 13 *Wells Street, Grays Inn Road.*

A variety of patent cocks and valves.

434 **M'NICHOLL & VERNON**, *Brunswick Steam Saw Mills, Liverpool*—Proprietors. (**JOHN MCNICHOLL**, Inventor and Patentee.)

Working model of patent steam travelling crane, for lifting and removing heavy weights at the goods-depôt of railways, in timber-yards, foundries and other manufactories, and for the loading and discharging the cargoes of vessels. The three motions—the horizontal, the transverse, and the hoisting—may be worked simultaneously, or independently, or any two in combination.—(See Plate 23.)

1. This machine is adapted for the purpose of lifting and removing heavy weights at the goods-depôts of railways, in timber-yards, foundries, and other manufactories, and for the loading and discharging the cargoes of vessels.

2. This is the first instance of the threefold motions of a travelling crane being worked from a stationary engine. The three motions, the horizontal, the transverse, and the hoisting motions, may be worked simultaneously, or either of them may be worked independently, or any two of them may be worked in combination. The model will exhibit the mechanical arrangements by which these effects are produced.

3. The efficiency of these machines may be judged from the circumstance that one of them, with a 50-foot span, will travel 100 feet in a horizontal direction, with a load of three or four tons attached to it, in 45 seconds; and during the time the whole platform with the load is so moving, the load may be moving across the platform at right angles with the motion of the platform itself; at the same time, also, the weight may be raised or lowered as required. Cranes, on this principle, are being erected where the span is 53 feet, and the length of the tramway on which the platform travels is 266 feet, so that with one of these machines, the steam power is enabled to command an area of 14,098 feet.

4. In addition to the immense saving in time that is effected by these machines, the saving in the wages of labour is very great: one youth, at ten shillings per week, who travels on the machine (for the purpose of moving the handles in and out of gear), displacing the labour of six men, at the same time doing the work more efficiently. At a recent experiment, this machine removed 13 logs of timber, containing 1,050 cubic feet, and weighing 19½ tons, a distance of 100 feet (one log at a time), and piled them in 27½ minutes, at an expense in wages of about threepence. The machine had thus travelled 2,600 feet, and made 26 stoppages in the time named, with an average load of 30 cwt. for half the distance.

Steam power can, by this plan, be readily applied to the ordinary hand-travelling cranes.

The following are the particular features, to which attention is directed:—

Its novelty, see paragraph 2, above.

Its cheapness, inasmuch as one of these machines will displace two or three cranes of the most approved principles, hitherto in use.

The great annual saving it effects in wages, as seen in paragraph 4, above.

The rapidity and precision of its operations: see paragraph 3, above.

Its freedom from liability to derangement. Several of these machines have been in use for upwards of six months, working daily from morning to night, without stopping one hour for repairs.

This machine, like the ordinary hand-travelling crane, moves upon a tram-road laid upon longitudinal beams, raised from 15 to 20 feet above the level of the ground, the beams being supported at intervals by uprights. A square shaft, *a* (2¼ inch diameter), runs the entire length of the tram-road, and is attached to the longitudinal beams by moveable supports *b*, *b*, *b*. This shaft is connected at one extremity to the engine. Upon it and revolving with it, is placed a drum, *c*, which works, by means of a leather belt, the pulley *d* attached to the moving platform; the pulley *d* is fixed on the shaft *e*, upon which are placed the bevil-wheels, which impart the threefold motion to the crane. The bevil-wheels *f f*, which revolve on the shaft, are made so as to turn the bevil-wheel *g*, by means of the clutch-box *h*, which is attached to the shaft; so that by withdrawing the clutch-box from one of the bevil-wheels, and putting it in gear with the other, the motion of the bevil-wheel, *g*, is reversed, and when the clutch-box is out of gear, the bevil-wheel *g* is stationary. The bevil-wheel *g* is fastened upon the small shaft *i*, to the other end of which is attached the pinion *i*, which works the spur-wheel fixed to the roller-wheel *k*, and imparts the longitudinal motion to the whole platform. As the platform would otherwise move away from the drum *c*, which communicates the motion, it is made to slide freely upon the shaft, and being attached to the moving platform by means of the rod *l*, it always preserves its relative position with regard to the pulley *d*. The difficulty of making the drum pass over the numerous brackets that a long shaft must necessarily have to support it, is overcome by making the brackets swing on a centre, so that when the drum *c*, protected by the guard *n*, comes in contact with one of the brackets *b b*, it yields, as shown in fig. 1, and allows the drum to pass over it. Immediately it has so passed, the weight of the lower extremity of the bracket causes it to resume its position, and the machine passes on to the next bracket, where the operation is repeated. In order to prevent the shock that would be felt in putting in motion so heavy a body as a travelling crane of 50-feet span, carrying in addition to its own weight a load of three or four tons, a friction-roller, *o*, is made to press upon the leather belt that passes round the drum *c* and the pulley *d*, so that before putting the machine in gear the friction-roller is raised; the machine is then put in gear, and the friction-roller gradually lowered. The momentary slipping of the belt round the pulley *d*, when the weight of the friction-roller is only partially resting upon it, causes the machine to move forward with an easy motion; and, directly it is under way, the friction-roller is allowed to bear with the whole of its weight, and the crane then moves forward with its load at its usual speed of 100 feet in 45 seconds. The hoisting motion is obtained by communicating the power through the bevil-wheels *q q*, and the shaft *r*, to the barrel *s*, round which the chain revolves. In order to render the hoisting motion independent of the transverse motion, the hoisting chain passes from the barrel round which it is coiled to the truck *t*, and after passing over the pulley *u*, under the snatch-block *v*, and over the pulley *w*, it is finally attached to the point *x*, at the extreme end of the platform. To hoist a weight, therefore, it is merely necessary that the handle *y*, which communicates with the clutch-box *z*, should be moved a few inches.

The transverse motion is imparted to the load by means of the barrel *'a*, which is worked from the shaft *e*, by the bevil-wheels *'b b'*, and clutch-box *'c*, in the same manner as the longitudinal and the hoisting motions. Two chains are attached to the barrel, in such a way that one winds when the other unwinds. One of these chains is attached to the small truck *t*, at *'d*, and the other is carried round the pulley *'e*, and fastened to the truck at *'f*, so that by alternately putting the clutch-box *'c* in gear with one or other of the bevil-wheels *'b 'b*, by means of the handle *'g*, the truck, and with it the load, is moved backwards and forwards along the platform at right angles with the motion of the platform itself.

Each of the above, the longitudinal, the transverse, and the hoisting motions, can be used independently of either of the others; or any two of the motions may be used in combination; or the whole three may be used simultaneously. For instance, at the same time that a weight attached to the hook *h'* is being raised from the ground by the barrel *s*, the truck *t*, and consequently the load suspended on the chain, may be moved in the direction *'i* or *'j*, at the same time that the whole platform may be moving in a longitudinal direction.

A waggon of heavy merchandize taken to a crane, can be unloaded and placed in a road-waggon by three men in one hour: without the crane, double the number of men working a whole day would be required to do the same work. Cranes that can be moved to the waggons are often advantageous.—S. C.]

436 Teray, J., *Aldine Chambers, Paternoster Row*—Inventor and Manufacturer.

Patent water-meter.

438 Fell, Richard, 33 *Nicholas Lane*—Inventor.

Sea-water regenerator, to supply pure fresh water from salt or sea water, in whatever situation it may be required. For shipping purposes it supersedes the necessity of embarking water. The expense is comparatively trifling.

Patent self-cleansing filter; a peculiar feature consists in its being applicable either for a large reservoir or for a portable or house filter.

New motive power, intended to supersede the use of all steam locomotives, by introducing compressed air to propel carriages upon railways, by maintaining a uniform pressure or force throughout the line, and having at all times a perfect command of the engine or carriages.

Preservator; for obviating the necessity of bottling all kinds of liquors, requiring preservation from the atmosphere. By this machine, wines, spirits, stout, &c., can be kept on draught, and not only retain their full flavour, but they can also be removed from one vessel to another without being exposed to the atmosphere.

440 Siebe, A., 5 *Denmark Street, Soho*—Inventor.

Improved self-pressure cock for steam boilers.

444 Fletcher, Thomas, 161 *Westgate Street, Gloucester*—Inventor and Manufacturer.

Improved slide-tap apparatus for supplying fire-engines with water from the street plugs. It opens a two-inch waterway through the slide, and having a curved neck, it offers no obstruction to the passage of the water when in use. Double connecting branch for the supply of two engines. Improved slide tap to be attached to hose and swan's neck at the engine, so as to enable the fireman in attendance at the engine to shut off the water when desired.

445 Sumpton, J., 14 *Ebury Square, Pimlico*—Inventor.

Plug or cock-box, on a new principle, for water-works or gas-works.

447 Broughton, R. H., *Park Street, Brighouse*—Inventor and Manufacturer.

Self-acting machine, for regulating the supply of water in steam boilers.

448 Cheavin, Squier, *Spalding*—Inventor.

A floating filtering pump.

Specimens of metallic paste or cement, intended to prevent damp in walls, and to keep out wet.

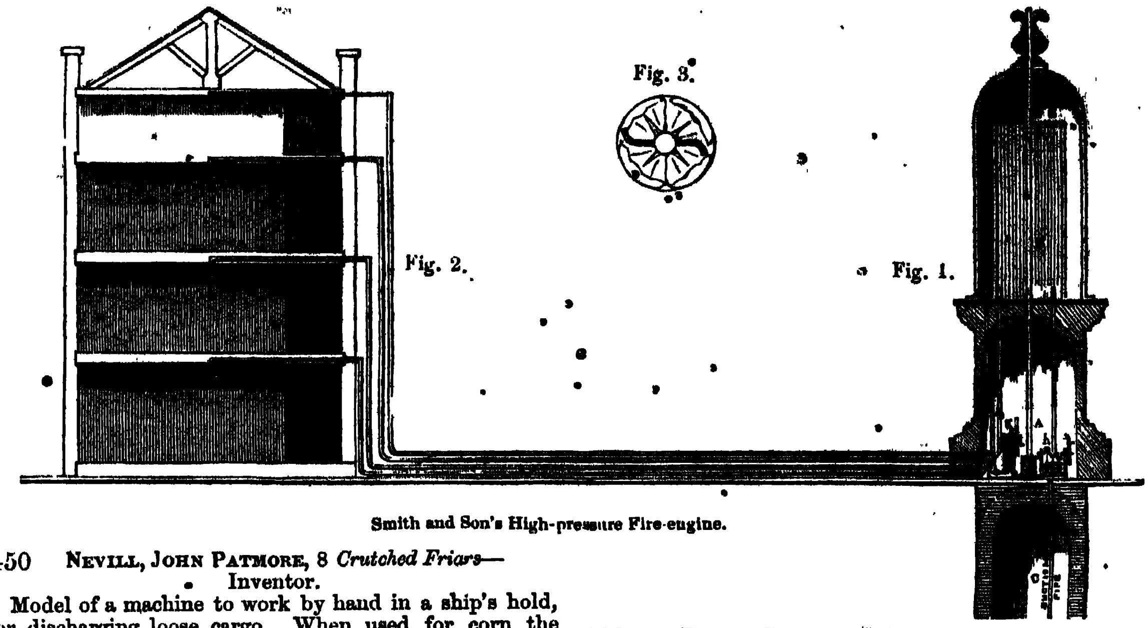
449 Smith R., & Son, *St. Mary Cray, Kent*—Inventors.

New high-pressure fire-engine, for large public buildings, docks, warehouses, and ships.

Model of a newly-invented double-motion pump, with transparent glass tubes, showing the moveable parts of the inside of the pump.

Figs. 1, 2. These figures represent the application of the fire-extinguishing apparatus to a private dwelling. The water-spreader, Fig. 3, *e*, being placed under the ornament in the centre of the ceiling at *e*, Fig. 2.

Fig. 1 shows the mechanical arrangements for obtaining the requisite supply and pressure of water: A is the water-pump; B the reservoir for water; C the suction-e; *g* is the air-pump; and E the air-vessel. The sup- pipes are represented by the letters *p p p*.



Smith and Son's High-pressure Fire-engine.

450 **NEVILL, JOHN PATMORE**, 8 *Crutched Friars*—Inventor.

Model of a machine to work by hand in a ship's hold, for discharging loose cargo. When used for corn the buckets serve as measures.

452 **SELFE, HENRY**, *Kingston, Surrey*—Manufacturer and Inventor.

Common pump with reserve chamber; improved valves, and bucket of new construction. Models of several useful machines on improved principles.

462 **ROE, FREEMAN**, 70 *Strand*—Manufacturer.

Hydraulic ram for raising water to the tops of houses, where a fall can be obtained.

[The hydraulic ram is a simple machine, containing a pulse-valve; a valve between the air-vessel and the body of the ram; and by a falling column of water acting on the pulse-valve closes it, thus letting a portion of water into the air-vessel. By a continuation of this action the air becomes compressed, and a portion of water finds its way to the top of the column; it is beautifully adapted for the supply of small towns, mansions, farms, &c.]

Fountain basins of iron, for pleasure grounds, with all kinds of ornamental jets. (*North Transept.*)

One of these fountains is shown in the cut.

Freeman Roe's Ornamental Fountain.

466 **KEITH, GEORGE**, 36 *Piccadilly*—Inventor.

Liquid meter.

467 **BEERE, GEORGE**, *Gallaway House, Bath*—Manufacturer.

Archimedean screw for raising fluids; constructed with square canals.

---

468 **BILLINTON, WILLIAM**, C.E., 31 *Regent Street*—Proprietor.

Patent improved water-meter.

---

471 **BURGESS, D.**, *Glasgow*—Manufacturer.

Hydrostatic press.

---

472 **FIRTH, THOMAS**, *Huddersfield*—Manufacturer.

Plates of machines in gilt frames. Working model of improved hydraulic press, with indicator and check. Hydrostatic press.

474 **DOWNTON, J.**, 4 *Conant Place, Commercial Road, Limehouse*—Patentee and Manufacturer.

Patent engine-pump, used in the Navy; the principle of which consists in its having three boxes working in the same cylinder, with a three-throw crank, by which means a continued stream of water is kept up.

---

475 **CLUNES, T.**, 100 *Lock Street, Aberdeen*—Inventor and Manufacturer.

Registered rotatory pump, that will act either as a common lift or force pump, and may be applied with advantage for a portable fire-engine, &c.

476 **LITTLE, Major ROBERT J.**, 4 *Queen's Terrace, Woolwich Common*—Inventor.

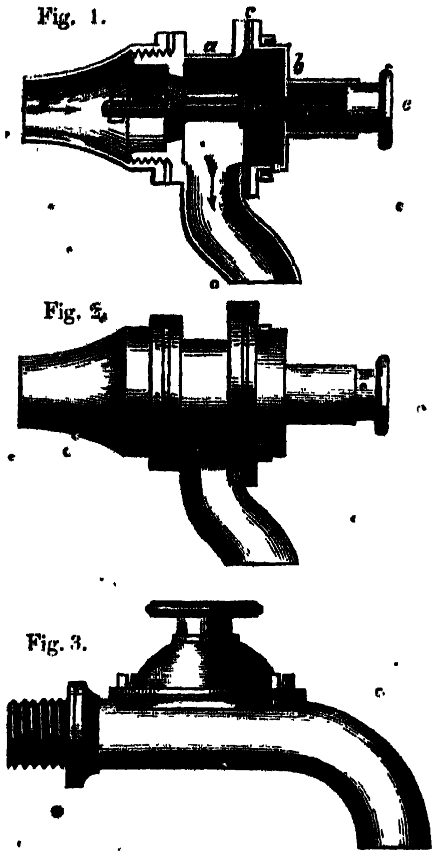
An improved watercock, with double plug, for connecting pipes without breaking joints, with sectional drawings of the same. Designed by the exhibitor, and manufactured by Frost, Noakes, and Vincent, 195 Brick Lane, Whitechapel.

---

478 **LAMBERT & SON**, *Short Street, Lambeth*—Manufacturers.

Union joints and water-taps, with a new application of vulcanized caoutchouc. Locomotive and steam fittings.

Description of the patent vulcanized India-rubber water taps: *a* is the body of the valve; *b* is the cover; *c* is the flexible diaphragm, confined at its edges, serving the purpose of a stuffing-box; *d* is the valve, which is held to its seating by the pressure of the water; *e* is the handle or knob, by means of which the valve is opened; by this arrangement it cannot be left open: there are other methods for opening and closing the same; the arrows denote the waterway when open.



Lambert and Son's Patent Vulcanized India-rubber Water Taps.

480 **WIGHT, JAMES**, 95 *Nelson Street, Tradeston, Glasgow*—Inventor.

Water-wheel and small cistern for regulating the water. The latenary water-wheel is intended to give more effect than can be obtained from the same quantity of water applied upon an overshot wheel of the best construction. The power is at once applied at the greatest extent of the leverage, without any increase in the diameter of the wheel.

---

482 **COLLINGE & Co.**, 65 *Bridge Road, Lambeth*—Manufacturers.

Specimens of screw-lifting jacks.

484 **ENGLAND, G.**, *Hatcham Iron Works, New Cross*—Inventor and Manufacturer.

Patent traversing screw-jack, for raising and moving heavy bodies, both vertically and laterally. It is particularly applicable to railway purposes, as in case of an engine being off the line of rails, two men, with this simple machine, can reinstate the engine upon the rails in less than half the time that 50 men could without it, although they may have all other known means at command to assist them.

485 **BAYMAN, HENRY**, 35 *Old Gravel Lane, Ratcliffe*—Inventor and Manufacturer.

Double and single purchase improved screw lifting jacks. The principal feature in these jacks is, that one man can raise twice as much as by the common jack, without fear of accident, as they will not run down while taking up or lowering a weight. The single purchase is equal to the ordinary double, and is lighter. Adapted for railways, engineers, storing wool on board ships, &c.

---

486 **HALEY, —**, *Frome Street, Somerset*—Producer.

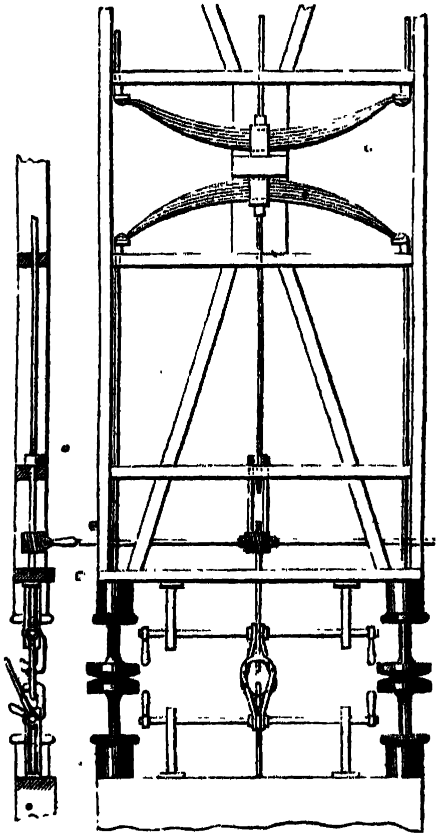
Specimens of lifting jacks.

488 **GLADSTONE, JOHN, Jun., & Co.**, *Liverpool*—Manufacturers.

Railway screw jack of simple construction, easily carried about by one man, and capable of lifting heavy weights. A jack is necessary in case of accident, such as collisions, carriages running off the rails, or in the event of either wheels or axles giving way, and as an aid in the removal of obstructions.

490 **THORNTON, J., & SONS**, *Birmingham*—Manufacturers.

1. Patent coupling for railway waggons and carriages. Thornton and McConnell's patent. The carriages are secured together by means of hooks and links with cross bars, which are moved from the outsides of the carriages, and prevent the dangerous practice of going underneath and between the carriages for the purpose of coupling and uncoupling them. See figure annexed.



Thornton's Patent Coupling for Railway Waggons.

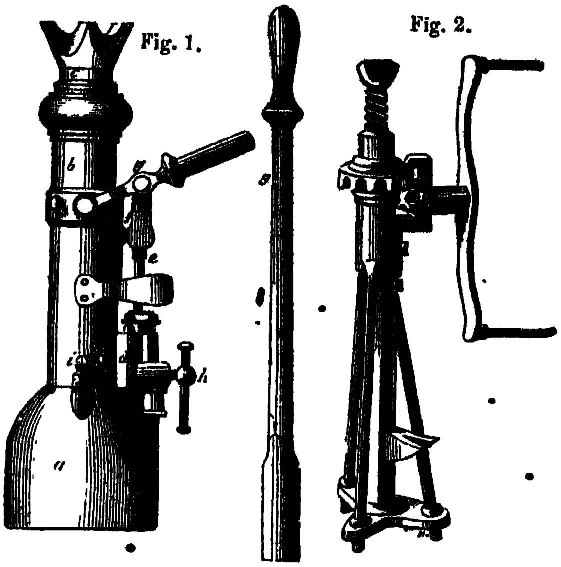
2. Patent steam-engine piston. Exhibitors' patent. The packing rings of this piston are adjusted by means of two conical surfaces, acted on by a spring and elastic discs.

3. Improved carriage axles, exhibiting different constructions, manufactured from the Patent Shaft and Axle-tree Company's iron, each axle being composed of at least nine different bars of iron welded together, prepared for this purpose, and insuring greater safety.

4. Hydraulic lifting jack for railway engines and carriages. Its advantages are, the ease and steadiness with which a great weight can be raised by one person, the facility with which the lowering of the weight can be regulated without labour, and its economy, since one man with this jack may lift 15 to 20 tons.

Fig. 1 represents the hydraulic lifting jack. *a* is a hollow vessel forming the base of the jack, and also a reservoir for the water; *b*, the cylinder; *c*, the ram; *d*, the pump; *e*, the plunger; *f*, the slide; *g*, the pump-lever; *h*, conical pointed pin; *i*, a small air-tap.

5. Improved crown-head lifting screw jack; powerful, portable, and quick in its action. (See fig. 2.)



Thornton's Lifting Jack.

6. Improved double bar wrench with solid handle for locomotive purposes; manufactured for the exhibitors, by Thewlis & Griffith of Warrington.

7. Railway shovels for engine stokers, coke, and soughing; of improved shapes.

501 & 506 **GREAT WESTERN RAILWAY COMPANY**, 16 *Lawrence Lane, Cheapside*—Producer.

Locomotive engine and tender, constructed at the Company's works at Swindon.

One of the ordinary class of engines constructed by this Company for passenger traffic since 1847. It is capable of taking a passenger-train, of 120 tons, at an average speed of 60 miles per hour, upon easy gradients. The evaporation of the boiler, when in full work, is equal to 1000-horse power, of 33,000 lbs. per horse—the effective power, as measured by a dynamometer, is equal to 743 horse power.

The weight of the engine, empty, is 31 tons; coke and water, 4 tons—engine in working order, 35 tons.

Tender empty, 9 tons; water, 1,600 gallons, 7 tons 3 cwt.; coke, 1 ton 10 cwt.—total 17 tons 13 cwt.

The heating surfaces are, fire-box 156 feet; 305 tubes 1,759 feet.

Diameter of cylinder, 18 inches; length of stroke, 24 inches; diameter of driving-wheel, 8 feet; maximum pressure of steam, 120 lbs.

The actual consumption of fuel in practice, with an average load of 90 tons, and an average speed of 29 miles, including stoppages (ordinary mail train), has averaged 20·8 lbs. of coke per mile.

A traversing-frame as used upon the Great Western Railway, manufactured by Mr. G. Hennett, Bridgewater, for transferring railway carriages from one line of rails to any other parallel line. Short inclined planes are attached to each end, up which the carriage is run upon the flanges of the wheels, and which are there raised clear of the rails by means of a pedal. The main lines of rails are usually lowered about an inch at the place where the frame is placed, so as to diminish by about half the amount what the carriage has to be raised.

A model of a safety stop or switch for a siding, worked together with the signal by the same lever as the switch of the siding; also of double signals for a junction line worked by the switchman. Manufactured by Mr. Richard Brotherhood, Great Western Railway, Chippenham, Wilts.

The engine and traversing frame are placed upon a portion of permanent way of the construction adopted upon the Great Western Railway.

502 **BROTHERHOOD, RICHARD**, *Chippenham*—Inventor.

Railway signal and stops, and patent tilt waggon.

503 **BECKERS, GUSTAVUS EDWARD**, *Great Western Railway, Paddington*—Inventor.

Registered self-acting railway siding stop.

The object of this contrivance is to prevent accidents on railways caused by carriages or trucks getting accidentally out of sidings, and thereby occasioning collisions with passing trains. Any carriage or truck can be pushed into a siding, but cannot come out again without being purposely removed.

507 **LEE, JOHN**, 103 *Long Acre*—Inventor and Patentee.

Full-sized under carriage, with Lee's patent railway breaks and axle-box. These breaks act directly from the axle and box of the wheels with a wedge-power shoe, which bears against the wheels and rails. The shoe has a long surface bearing on the rail of 18 inches of compound adhesive metal. The inefficient breaks commonly in use produce only five-eighths, or at most one inch, of bearing or friction from the wheel on the rail, which greatly destroys the wheel tyre and rails, and is insufficient as a stopping power. The friction on the rail of the exhibitor's break has the advantage of 18 to 1 over other breaks, by securing a certainty of biting the rails in wet, foggy, and slippery weather. This break being independent of the frame of the carriage, is free from the unpleasant tilting motion and mephitic smell of the old breaks. It is brought into action by one revolution of a powerful screw; another half turn of the screw throws the whole weight of the carriage upon the wedge block-bearing of the break against the wheel and rail, thus freeing the tyre of the wheels from friction, and raising the wheels clear of the rails one-sixteenth of an inch, further rise being prevented; thereby saving the expensive wear and tear of the wheels' tyre and rails—a matter of great consideration in the current cost of the stock of railway companies. These breaks can be brought into action on inclines, and relieved again without stopping the train.

Full-sized pair of Lee's patent carriage-wheels, with axletrees and axle-box. This patent invention is designed to prevent accidents when the axletree breaks—a circumstance not of unfrequent occurrence with public conveyances and railway trains, and is applicable to all kinds of carriages and machinery. When the axletree breaks the wheel will still retain its position, revolve, and carry on the carriage with safety to any distance. The bearings are more than triple the strength and utility of the solid axle. The draught of the horse is greatly reduced by it, and the bearing is proof against the heating or setting fast of the wheel: it carries a large supply of oil to last more than twelve months, and is protected from grit, &c. These wheels can be readily detached and replaced again. It very greatly obviates the sudden unpleasant jerk caused by the wheels coming in contact with projecting substances.

508 **CRAMPTON, THOMAS R.**, *South Eastern Railway Company*, 15 *Buckingham Street, Adelphi*—Inventor and Patentee.

South Eastern Railway Company's London and Paris express locomotive engine, the "Folkstone," Crampton's patent.

[This engine is suspended from three points at the ends of the machine, the object being to insure the weights on the wheels being at all times the same, and thus producing the greatest amount of steadiness. Attention is also called to the fact that the whole of the machinery is independent of the road: it is thus similar in its action to a fixed engine, and the risk of breaking the crank axle, which frequently occurs in inside cylinder engines, is considered to be thus avoided.]

509 **ENGLAND, GEORGE**, *Hatcham Iron Works, New Cross*—Inventor and Manufacturer.

An improved locomotive engine.

This class of engine is intended to reduce the locomotive expenses in proportion to the amount of traffic. The principal dimensions are the following:—Cylinders, 9 inches in diameter; stroke, 12 inches; driving-wheels, 4 feet 6 inches; and weight, in full working order, 13 tons. It has been proved that this engine is capable of working express trains, of six first-class carriages, at a speed of 60 miles per hour, consuming only 8 lbs. of coke per mile; while, from the centre of gravity being very low, and from the consequent steadiness of working at the highest velocities, an increased degree of safety is obtained, besides doing little injury to the permanent way. It carries coke and water for stages of 50 miles, and is capable of ascending an incline with a greater load than any other engine, in proportion to the size of cylinders or expenditure of fuel.

---

510 **Adams, W. Bridges**, 1 *Adam Street, Adelphi*—
Patentee and Designer.

Light locomotive engine for railways, named "Ariel's Girdle," on four wheels, coupled to a four-wheeled composite tender; it makes a steady eight-wheeled machine, capable of lateral flexure for sharp curves. The tender contains water beneath the floor, and has a sledge break of peculiar construction, acting with friction on the rails to save the wheels; its handle being within reach of the driver.

Eight-wheeled double railway carriage for first and second-class passengers. The wheels are left free to move laterally by means of swinging links and shackles, which enable the carriage to run round curves of 250 feet radius. A sledge break of peculiar construction is suspended from this carriage. The locomotive engine produced at the Airedale Foundry, Leeds, by Kitson, Thompson, and Hewitson; the carriage portion produced at Birmingham by Brown and Marshall.

A spring for the locomotive engine, formed of patent ribbed steel; the rib, working in a corresponding hollow of the adjoining plate, reduces the friction and preserves the parallelism of the plates.

Patent grease-tight axle-box.

Model of a patent fish-jointed rail, bedded to the upper lip in longitudinal timber sleepers. Drawings illustrating the mode of forming this railway. Drawings of patent carriages, &c., low-hung for agricultural railways. A non-recoiling patent atmospheric railway buffer for terminal stations.

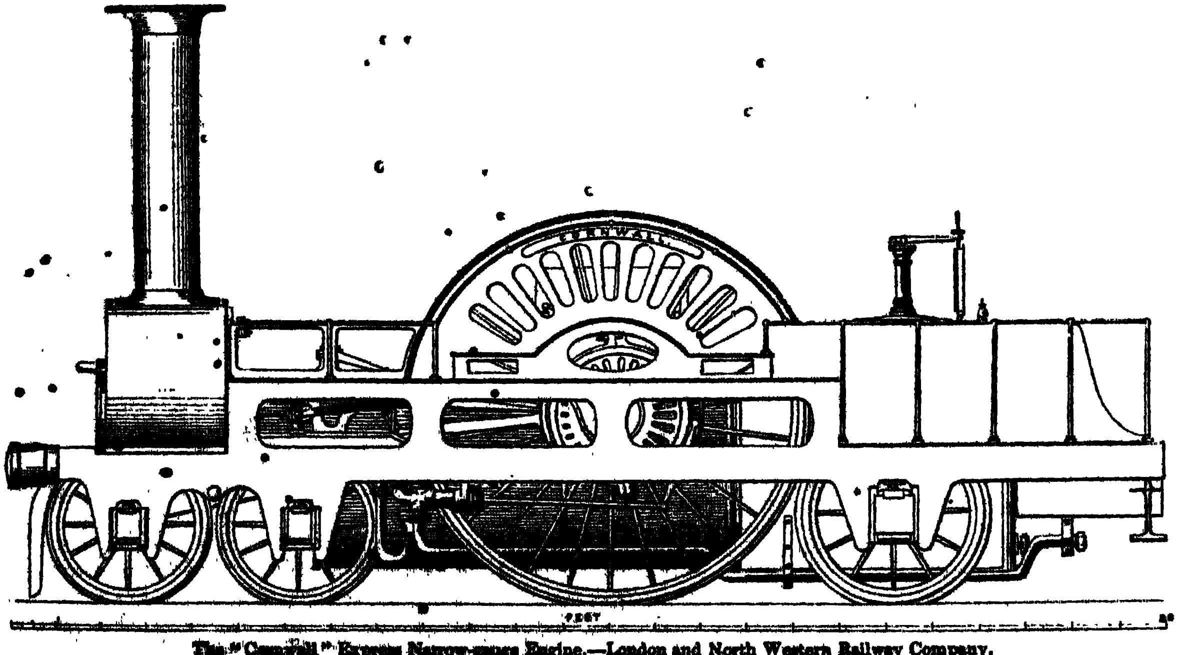
512 **London and North Western Railway Company**—
Stewart, C. E., *Euston Square Station*—Secretary.

Patent express locomotive engine, "Liverpool,"—diameter of cylinders, 18 inches; length of stroke, 24 inches; diameter of driving wheels, 8 feet; heating surface in tubes, 2136 feet; and in fire-box, 154 feet; weight in working order, 32 tons; coke and water, 4 tons. The evaporation of the boiler at full work is equal to 1,140-horse power. Pressure of steam 120 lbs. per square inch. The engine has a very low boiler, and the greatest weight is on the extreme wheels, which insures steadiness. Exhibited for the great amount of heating surface, and the general construction. Made by Messrs. Bury, Curtis, and Kennedy, of Liverpool. The patentee, T. R. Crampton, 15 Buckingham Street, Adelphi, London. (See Plate 50.)

---

513 **London and North Western Railway Company**—
Stewart, C. E., *Euston Square Station*—Secretary.

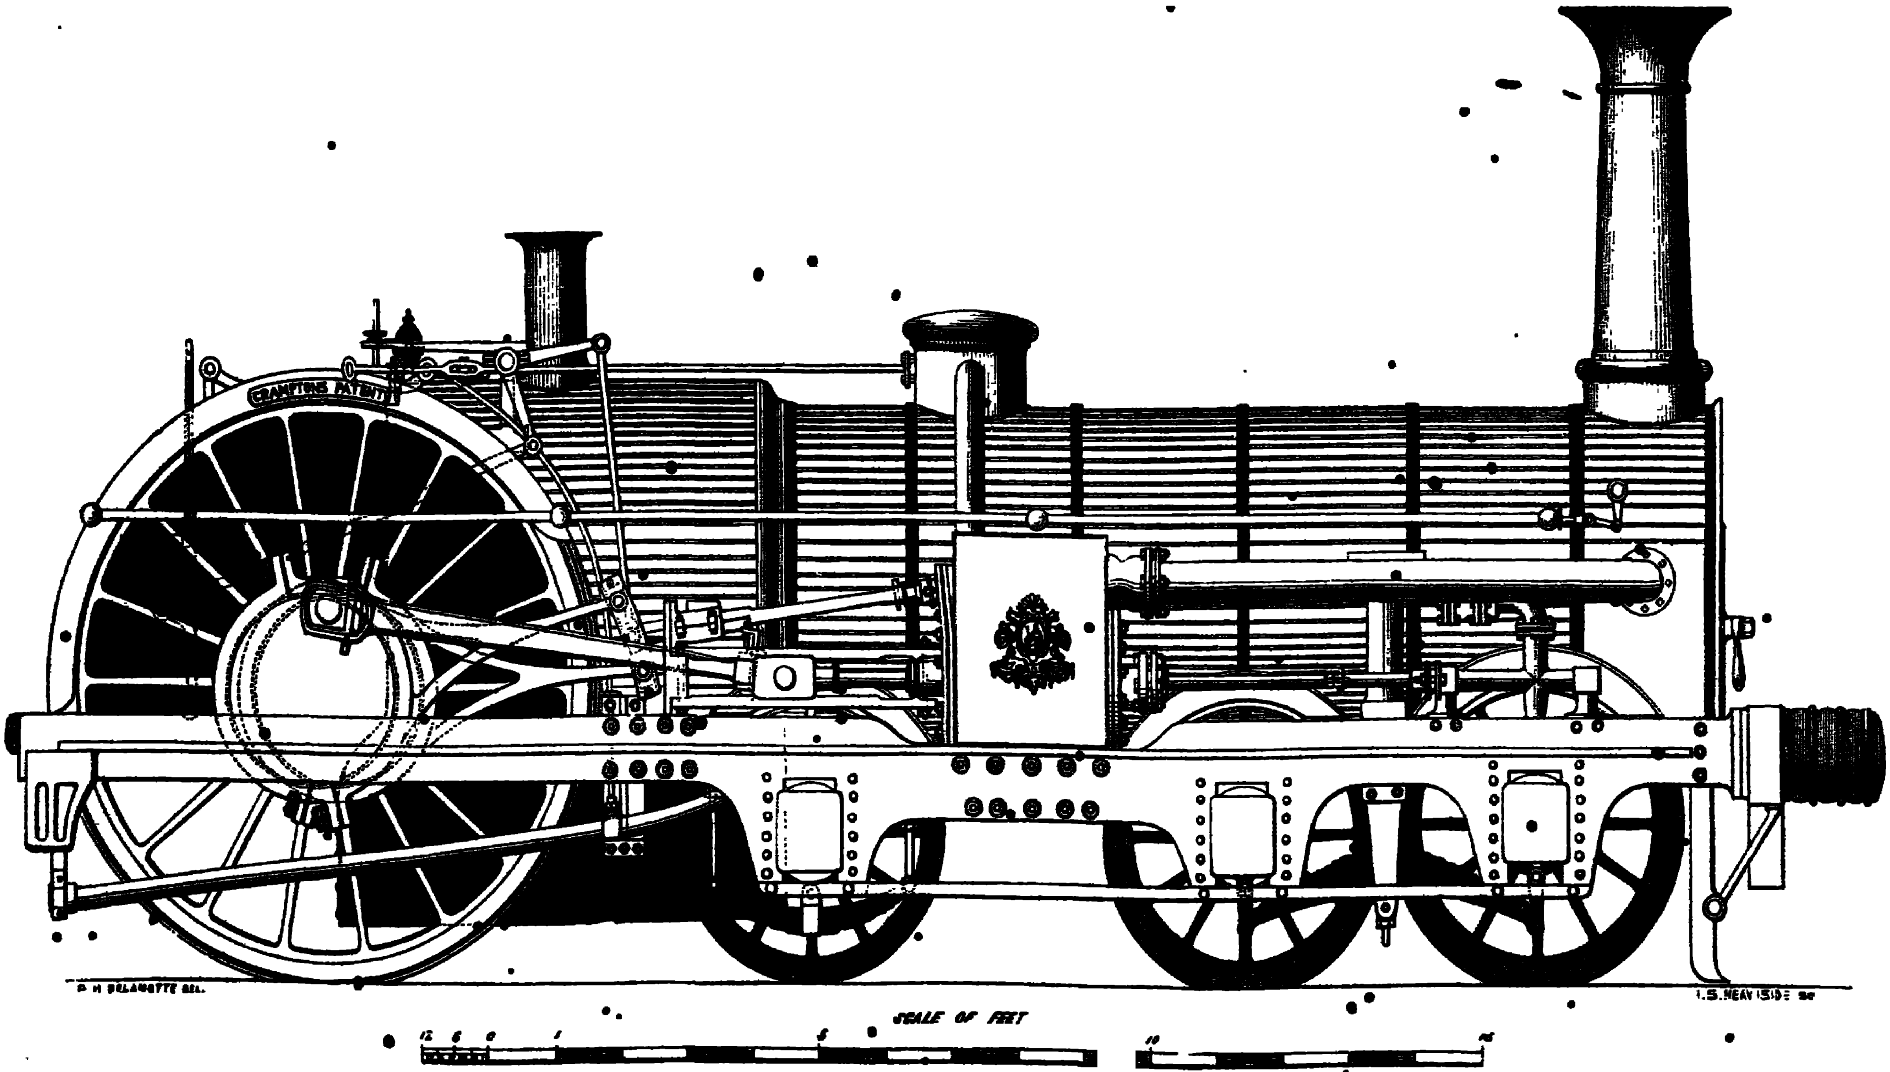
Narrow-gauge express engine, the "Cornwall" (see the following engraving), designed by Mr. Trevithick, one of the locomotive superintendents of the London and North Western Railway. Cylinders, 17½ inches in diameter; length of stroke, 2 feet; diameter of driving wheels, 8 feet 6 inches; weight, 27 tons. Exhibited for improved construction, in the form and position of the boiler, the size of wheels, &c. Made at the Locomotive Works of the London and North Western Railway at Crewe.



The "Cornwall" Express Narrow-gauge Engine.—London and North Western Railway Company.

[The amount of power obtainable in a locomotive steam-engine is to be measured by the diameter of the cylinder, or rather by the area of the piston working in the cylinder, and the pressure of the steam; and the effect with which this power can be applied to produce speed as a result is dependent upon the rapidity with which steam can be produced in the boiler; whilst the economy with which power can be obtained and effect given to it are estimated by the fuel consumed and by the absorption of power by the machinery, and the demand which the engine itself and its tender make upon the otherwise available power.

The high pressure which yields power, and the rapid evaporation which gives the means of applying the power directly to obtain speed, are dependent upon the effect with which heat can be applied to the water in the boiler; and hence the amount of surface exposed by a boiler in any



50. CRAMPTON'S PATENT EXPRESS ENGINE. LONDON AND NORTH WESTERN RAILWAY COMPANY.

manner to the action of the fire in the furnace or fire-box, or to heat arising from it—that is to say, whether by means of tubes running through the boiler and forming flues to the heat from the fire, or by a casing about the fire in the furnace—is the measure of the capability of the engine in respect of both power and speed.

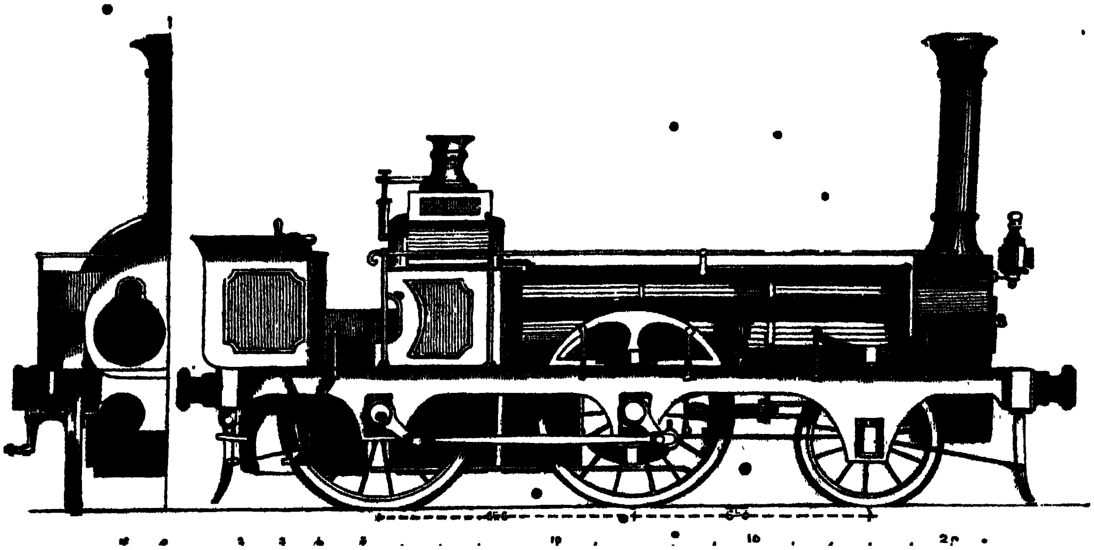
The diameter of the cylinder, the length of the stroke, and the diameter of the driving-wheel of a locomotive engine, act and react upon one another. Increase in the diameter of the cylinder increasing the area of the piston, and thereby its means of applying the power generated in the boiler, is an advantage checked in a slight degree only by the consequent increase of the friction of the piston in the cylinder: increase in the diameter of the driving-wheel requires increased power to put and keep the wheel in motion, but it gives increased speed to the locomotive as a body with the same speed of the piston in the cylinder; but increase in the diameter of the driving-wheel requires increased strength in the cranks of its axle, and thereby greater length of stroke, whilst greater length of stroke increases the time of the stroke, and consequently the time of a revolution of the driving-wheel.—W. H.]

514 KNOX, G., *Tottenhall, near Wolverhampton*—Inventor.
Model of railway break carriage.

522 FAIRBAIRN, W., *Manchester*—Manufacturer.
Locomotive tank engine.

526 WILSON, E. B., & Co., *Leeds*; and 2 *Poets' Corner, Westminster*—Manufacturers.

A locomotive double boiler tank engine and screw-moorings. The peculiar features of this engine are, its having two separate fire-boxes and boilers, so arranged that the stoking can be performed at alternate intervals in each box. The class of engines is six-wheeled, having four wheels coupled by outside rods with inside cylinders and crank axle; the centre of gravity is low, and the greater portion of the weight is carried by the coupled wheels securing a large amount of adhesion. The figure represents a side and half-end elevation of the engines.



Wilson & Co.'s Locomotive Tank Engine.

530 WILLIAMS, CHARLES CAVE, *Glasshouse Yard, Goswell Street*—Inventor and Manufacturer.

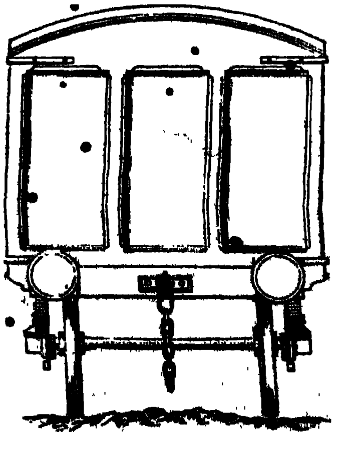
Railway carriage constructed entirely of East India Moulmein teak, unpainted, the object being economy. As varnish only is used instead of paint, a carriage can be repaired and got ready for work in a few days.

[East Indian teak is perhaps one of the most valuable timbers for all purposes where lightness and strength are required. It is extremely durable, and resists to a considerable extent the invasions of fungi and insects. Its native habitat is the mountains of Malabar and other districts, where it grows to an enormous size. Its botanical name is *Tectona grandis*.—R. E.]

532 HENSON, HENRY H., *Pinner, near Watford*—Inventor.

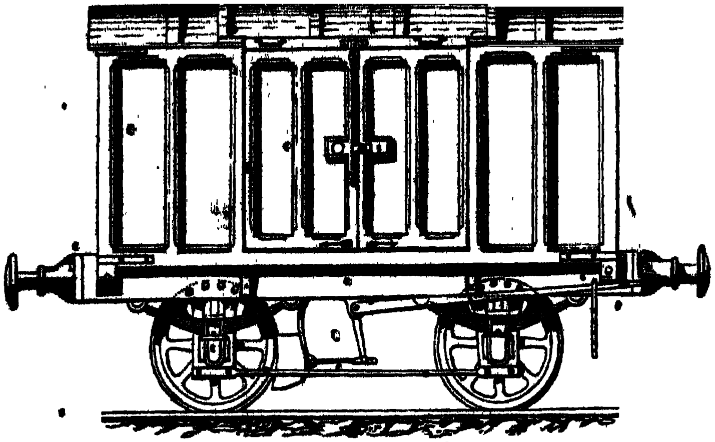
Patent improved covered waggon for the conveyance of merchandise by railway, constructed of wood and iron on a new principle. When closed, this vehicle is fireproof and waterproof, and any portion of the side or roof may be easily opened to load or unload. Fig. 1 shows an end, and Fig. 2 a side, elevation of this waggon.

g. 1.



Henson's Covered Waggon. End Elevation.

Fig. 2.

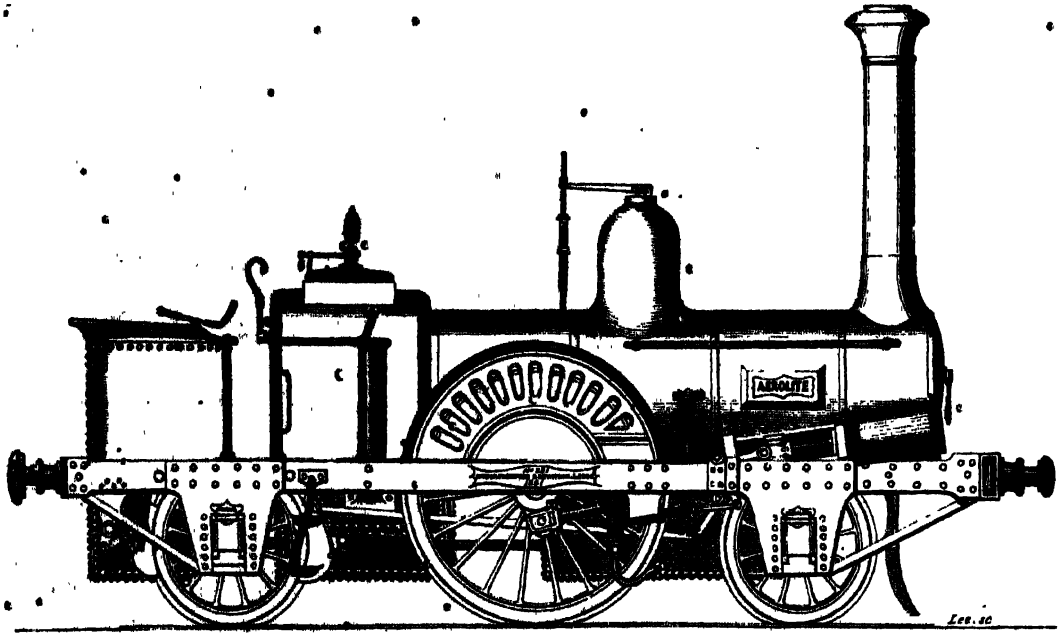


Henson's Covered Waggon. Side Elevation.

534 **KITSON, THOMPSON, & HEWITSON,** *Leeds*—Manufacturers.

Locomotive tank-engine. Its dimensions are, cylinders, 11 inches diameter, with 22 inch stroke. Is carried on six solid wrought-iron wheels. The pair of driving wheels is 6 feet diameter, and two pairs of carrying wheels, 3 feet 6 inches diameter. Constructed to run light express trains: will run without tender; having two water tanks beneath the boiler, and foot-plate to carry 500 gallons of water, and sufficient coke space upon the foot-plate to run for a journey of 50 miles.

The figure represents a side elevation of this engine.



Kitson, Thompson, and Hewitson's Locomotive Tank Engine.

536 **HAWTHORN, R. & W.,** *Newcastle-upon-Tyne*—Manufacturers.

First-class patent passenger locomotive engine. The weight of the engine is distributed more uniformly than usual upon the wheels and axles, by their double compensating beam springs *bb*. The slide-valves are relieved from the extreme pressure of steam; and the link motion, together with the action of the slide-valves, much improved; all of which, with the steam-pipe (*a*), are patented by R. and W. Hawthorn.

The fulcrum of the compensating beams, although here represented in the centre, may be varied to give any required weight upon the respective wheels and axles.

MCCONNELL, I. E., *Wolverton*—Inventor.
l of railway passenger carriage.

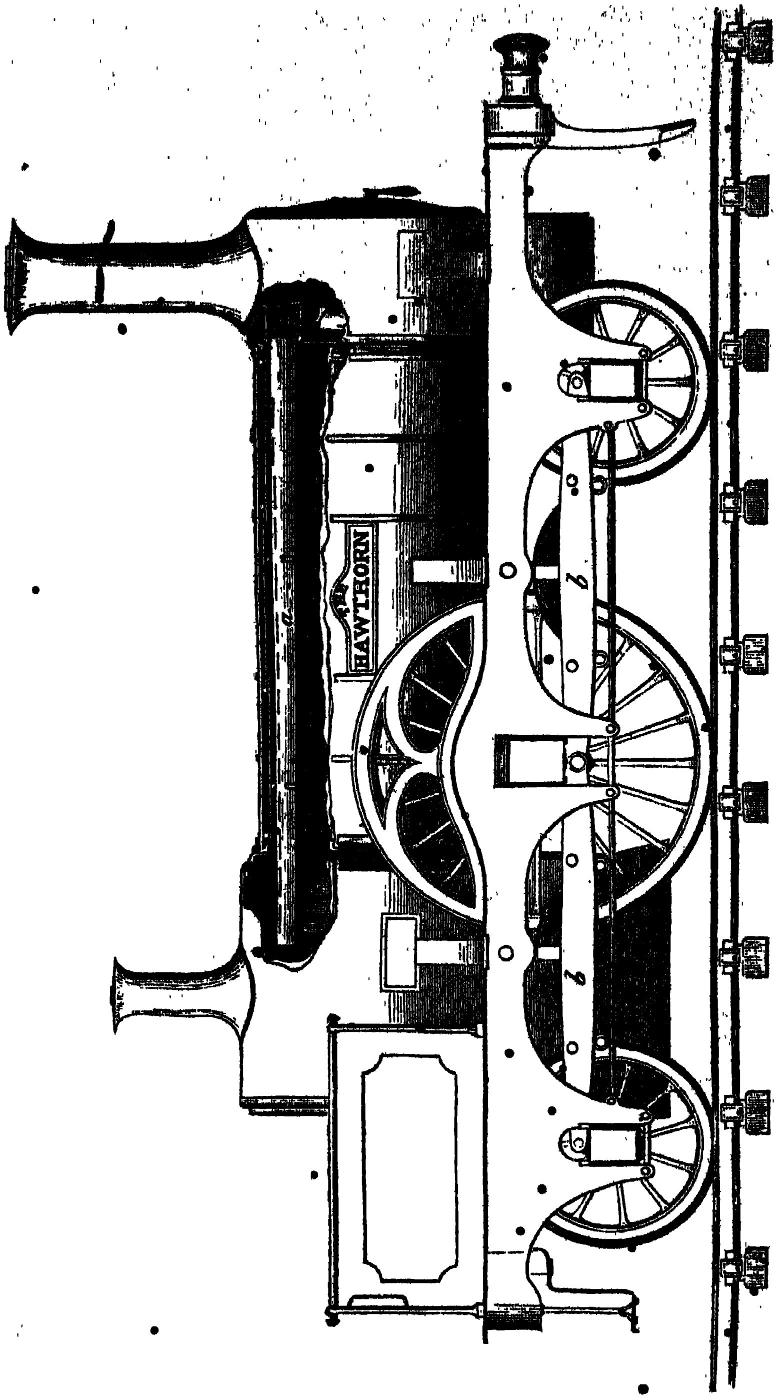
541 **HADDAN, JOHN COOPE,** 29 *Bloomsbury Square*—Inventor.

Specimens of patent papier maché for the exterior of railway carriages.

Patent railway carriage—the wooden panels grooved or rebated in the framing, show the ordinary and the painted part, the improved construction, which consists of a covering of papier maché in large pieces, laid over and against flush framework. Exhibited for cheapness and durability; the paper panels will not shrink, and there are no grooves to retain wet, which rots the framing.

Patent railway wheel, formed with wooden wedges to check vibration, and with wrought-iron nave, with tires not liable to burst from being in a state of tension.

Railway wheel formed of plain bars and filling-up pieces; the bars are so bent, and the filling-up pieces so shaped, that the heat requisite for welding on the cheeks of the nave does not burn or injure the bars, while at the same



time the spokes better resist torsion: vibration is checked by curving the spokes.

Another, constructed of plain bars, one end of each being bent so as to overlap or lie round the one next to it, and form a wrought-iron nave; parts of the wheels before being welded together.

543 **PATENT SHAFT and AXLETREE COMPANY**, *Brunswick Iron Works, Wednesbury, Birmingham*—Manufacturer.

Patent railway-carriage axle, as finished by the forge hammer.

Patent fagot, previous to its being welded and shaped into a patent axle.

Central bar, used in the formation of the patent fagot radial bar, fractured to indicate the quality.

Axle end, showing the perfect union of the radial and central bars in the welded fagot.

Patent axle (broad gauge), four and a half inches diameter, bent and twisted, without fracture, in consequence of receiving the shock of a heavy train, going at the rate of sixty miles an hour.

The patent mode of manufacture makes the axles equally strong throughout; the fagot is made in a cylindrical form by the external bars being rolled so as to fit accurately around a central bar. Such a fagot, however large, is perfectly welded throughout its whole length at one heat.

Patent link for suspension bridges, rolled into form at one heat; by avoiding the necessity of welding, and by the arrangement of the fibres of the iron in the same direction, throughout its whole length, a greater and more uniform strength is obtained.

---

550 ROBERTS, J. E., *Holywell, Wales*—Inventor.

Electric railway whistle.

---

552 DE BERGUE, CHARLES, 9 *Dowgate Hill*—Inventor and Manufacturer.

Specimens of patent vulcanized India-rubber buffers for railway carriages; they consist of alternate rings or blocks of vulcanized India-rubber and metal plates with a rod passing through both rings and plates; intended to be lighter, more compact, more easily applied, and less liable to injury than steel or other springs. When acted upon, these buffers offer a gradual and greatly increasing resistance.

Patent station buffer, which acts by friction; the resistance being given by a tapering hulk of timber passing between plates of metal acted on by India rubber; its power of resistance is progressive, like the former.

[In these springs the peculiar elastic properties of vulcanized India-rubber are made use of. Experiments have shown that by separating the elastic rings by non-elastic plates of metal, the *effective* elasticity is greatly increased. In action, their ratio of resistance increases with the amount of pressure; thus rendering them equally sensible to light as well as to heavy concussions.—J. W.]

---

554 SANDFORD, OWEN, & WATSON, *Phœnix Iron Works, Rotherham*—Inventors, Designers, and Manufacturers.

Patent railway wheels, three feet in diameter, made of wrought-iron, and welded into one piece. The manufacture is effected by machinery, and is scarcely more expensive than that of the common wheel, while it is much more secure, from its construction.

Wheel, 3¼ feet in diameter, made by the patented process, and similar to the former, excepting that the spokes are welded to an inner rim, which is turned, and the tire shrunk on and secured in the ordinary manner.

---

555 SPENCER & SON, *Newcastle-on-Tyne*—Manufacturers.

Baillie's patent volute springs for railway and other purposes, applied in various forms.

555A SPENCER, THOMAS, *Tividale, Tipton, Staffordshire*—Manufacturer.

Chambers' patent wrought-iron wheel.

556 LACY, H. C., M.P., *Richmond*—Producer.

Patent railway sleepers.

---

557 CRESTADORO, Professor ANDREW, 22 *Peel Street, Salford*—Inventor.

Model of a machine for applying animal power to the working of railways, consisting of a carriage, on which animals are placed to work the driving-wheels; with illustrated drawings, showing the recent improvements by the exhibitor.

---

558 WARREN, PETER, *Foley Fenton, Staffordshire Potteries*—Inventor.

Model of a driving wheel for railway engines, devised to prevent slipping when going up inclines. By the use of this wheel the engine may be reduced in weight, and the wheel rendered stronger, whilst it takes no more room than that now in use.

[The power of a locomotive railway engine is available for onward motion only by the *bite* or *grip* of the surface of the driving-wheel on the rail, and as the grip is created by the weight upon the wheel, the surfaces in contact being practically smooth, as the weight of [illegible] is reduced the *bite* becomes less tenacious, and the power of the engine may be expended in making the driving-wheel revolve without corresponding onward motion of the train. The method exhibited appears to promise to obtain the requisite *bite* or *grip* of the driving wheel, or to prevent the wheel from slipping, or from turning round without onward progress, by means independent of weight upon the wheel.—W. H.]

Two pair of couplings for railway carriages, one for luggage and the other for passenger carriages, to prevent the breaking away; they may be used with or without springs, and may be connected to any other carriage or waggon.

Model of a weighing and lifting crane that will weigh and wind in two inches square, without drum or wheels. By this crane it is stated that a man can lift and weigh one ton with more ease than he can half a ton with the common lifting crane.

---

559 PIZZIE, W., *Albourne Mills, Marlborough*—Inventor.

Railway break, which can be instantly applied to every wheel in the train.

---

560 DILLON, JAMES, 28 *Upper Buckingham Street, Dublin*—Inventor.

Railway break. The friction-slides are attached to the support beams, which rest on the axles of the wheels by means of six iron lifters, which are moveable on pivots, but equally distant and equal in length, so as to lift the wheels of the carriage one-third of an inch off the rail, when brought into a vertical position, by means of the guard turning a screw, which gives motion to the friction-slides; it would be made simpler if the lifters were fitted to the axle of the wheels, and the friction-slides made equal to the distance between the axle of the wheels.

---

561 COOLEY, JAMES, *Spalding*—Inventor.

Model of self-acting apparatus for making signals on railways. The arrival of a train, or the removal of carriages from sidings on to or over the main line, is immediately denoted by the action of the carriages themselves.

562 PERRY, HENRY JAMES, 3 *Greenwich Road, Greenwich*—Inventor.

An atmospheric railway vacuum, obtained by gutta percha tubing, in connection with an engine. Can either be worked by compression or exhaustion.

564 TENNANT, M. B., *Trafalgar House, Brighton*—Inventor.

Brass models of five patent railway carriages linked together, with auxiliary safety-wheels, and traverse bolts and socket buffers.

The models are provided with apparatus showing that railway trains may be prevented from going off the rails either from the effects of collision or dangerous obstructions, and from the danger of delay or stoppage occasioned by the slippery state of the rails, as in the case of Clay Cross Tunnel.

1st. The auxiliary safety wheels are intended to be applied to every fourth or fifth carriage, midway between the front and hind-wheels; they turn each on its own axis or pivot, *i. e.*, without an axle arm; they rise up and fall down, on passing over obstructions, to the extent of 10 or 12 inches, enabling the train to surmount the obstacles, hitherto so fatal, without verging off the rails; they may be set to a greater or less height, and made to drop down 10 or 12 inches below the level of the other wheels when they are forced up by accident, always retaining possession of the rails, and to turn acute curves with great speed and safety.

2nd. The bolt and socket buffers are placed transversely instead of longitudinally; they rise and fall simultaneously on a bolt or pivot at each side of the chain link, and are kept within each other by means of spiral springs introduced into the necks, having been closely wound up by the shackle, which tends to prevent oscillation of the carriages.

3rd. To guard against delay or stoppage of the train occasioned by the slippery state of the rails in snowy or bad weather, a leading carriage precedes the engine, loaded with sand, and has a seat for a look-out-man, who has the command of a handle to let sand out on the rails when required. The carriage is pointed in front to cut through the air, and has a grated fender in front to remove all obstructions. As no great quantity of sand is at all times required, heavy goods could be substituted to give sufficient gravity and tenacity of the wheels to the rails; and as the seat for the look-out man would necessarily be much exposed, glass shields could be formed.

In proof of the efficacy of the above plan, the models have been tested on a circular railway 60 feet in circumference, by a train which was propelled at the rate of 40 miles per hour, over obstructions adequate to 12 inches in height, with unerring certainty, but which, without the apparatus, would fly instantly off in a tangent; and it is to be remarked that as the safety wheels bear no part of the weight of the carriages to which they are attached, old wheels, on the score of economy, can be employed; and on the other hand, the adoption of the principle would not be attended with great expense, and railroad travelling would be rendered comparatively safe on the only transit now left open to the public.

Model showing the four processes of permanent flat roofing, impervious to rain. This species of roofing has been adopted at Queen's Road Colonnade Hotel, near the terminus at Brighton.

566 **Murray, W.**, 20 *University Street, Bedford Square*—Manufacturer and Licensee.

Eccentric coupling for railway carriages. Loop coupling, for taking up "the slack" between two carriages without recourse to the screw.

568 **Clarkson, T. C.**, 111 *Strand*—Inventor.

Railway buffers.

570 **Sanderson, C.**, *Baker Street, Reading*—Inventor.

Instrument for setting out railway curves.

572 **Stevens, J.**, *St. Leonard Station, Edinburgh*—Inventor.

Railway signal.

574 **Hemmingway, A.**, *Halton, near Leeds*, and 12 *Denham Street, Vauxhall*—Inventor.

Model locomotive.

576 **Cripps, W. Norris**, 352 *BellBarn Road, Birmingham*—Inventor.

Model locomotive tender and carriage for reducing the danger of collision on railways, and for affording refuge to the engine-driver and stoker. The novelty of the invention consists in the construction of a carriage with longitudinal tubular beams and rods, in lieu of the solid timber or iron beams at present used, and in the arrangement of elliptical springs, forming together a perfectly expanding and collapsing carriage, capable of sustaining an immense shock without receiving injury. Any description of body may be placed on the carriage; and a portion of the arrangement of springs is so designed as to be capable of being adapted to the form of every carriage in present use. It is considered that a train so fitted would suffer but little injury from shocks from front or rear.

580 **Dodds & Son**, *Rotherham*—Manufacturers.

Model locomotive.

581 **Fourness, William**, *St. James's Street, Leeds*—Inventor and Designer.

Alarum for locomotive engines, steam-packets, or other useful purposes. The sound is produced by the action of steam upon metallic reeds.

582 **Lockyer, Joseph Hooley**, *Leicester*—Inventor.

Model of a patent self-acting railway signal, for locomotive engines, &c., to signal the arrival of a train at any fixed spot, applicable for signalling trains in the rear, in a rapid curve, or approaching a station.

586 **Macbay, William**, *Royal Artillery Barracks, Woolwich*—Inventor.

Train of railway carriages, with break or luggage-van; containing self-acting collision-breaks, and other apparatus connected with the carriages, intended to prevent the destruction of the carriages and injury to the passengers.

Design for connecting the various railway termini of the metropolis, and affording suitable railway communication to all metropolitan large towns.

A section of a street, with improved kerb, for keeping the pavement clean; furnished also with a fire-annihilator and life-preserver.

588 **Snowden, William Francis**, *St. Thomas Street, Weymouth*, and *King's Cross, Gray's-Inn Road*—Inventor.

Working model of a new mode of assisting engines with carriages up and down hills on railways; it requires no alteration to be made on the engines, carriages, or rails in common use, and is chiefly intended to save the expense of deep cuttings, tunnels, &c.

Model of a new method of reducing the labour of horses, with carriages going up and down hills on common roads or streets.

Two models of mangles, showing a new application of a roller attached to the centre of the frames of such machines, and acting on the top of the mangle-box. The roller being made of galvanized iron, prevents rust; and being heated by one or more heaters, or otherwise, it improves the gloss and removes the damp of mangled articles.

591 **Parsey, A.**, 455 *Oxford Street*—Inventor and Patentee.

Compressed air-engine, for locomotive and stationary purposes.

600 **Young, Charles, & Co.**, *Edinburgh*—Inventors and Manufacturers.

Simultaneous-acting level-crossing gates for railways, for the prevention of accidents; consisting of four gates or levers, all of which act together, on one being moved by the gate-keeper.

These gates are placed outside the building, at the west end.

601 **Barlow, Peter William**, *Blackheath*—Inventor.

Model of cast-iron permanent way, as constructed on a portion of the South Eastern Railway. Also, models of sleepers for points and crossings for railways. The novelty consists in casting the chairs upon a cast-iron plate, which takes the place of a wooden sleeper or a stone block.

The advantages over the ordinary constructions are stated to be, greater durability, and an increased number of chairs or points of supports, which, being planed true as to line and level, afford the means of obtaining greater accuracy in railroad construction.

602 **Barlow, W. H.**, *Derby*—Inventor and Patentee.

Wrought-iron permanent way for railways. The rail is made to form its own bearing-surface in the ballast, without the aid of sleepers, chairs, &c. In use on the Midland Railway.

609 **Stevens & Son**, *Darlington Works, Southwark Bridge Road*—Manufacturers, Proprietors, and Patentees.

Model of railway junction semaphore signals. The platform is raised from the ground from four to eight feet, to afford the signal-man a good view of the line. The two signal-posts represent the meeting lines of railway. The arms and lamps are worked by the foot of the signal-man, leaving his hands at full liberty to pull over the switches or shifting rails; on the removal of his foot from the stirrup and his hand from the switch lever, the signals re-adjust themselves, the arms standing out at right angles, and the lamps "red," stopping both lines.

Model of a double station signal, provided with an arm and lamp working simultaneously on each side of the post, to command both lines by moving either of the hand levers.

---

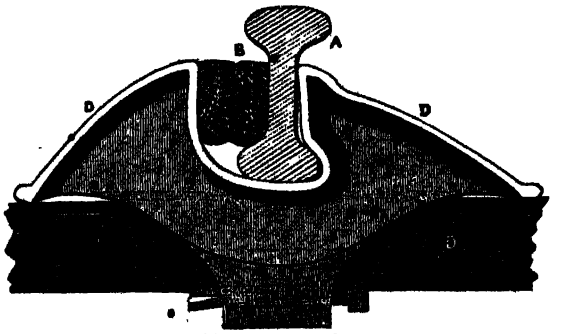
610 **De Fontaine Moreau, Peter A.**, 4 *South Street, Finsbury*—Importer and Proprietor.

Vidie's patent warner, an apparatus intended to be placed above carriages, from which metallic plates descend into the carriages, indicating the name of the place or station towards which they are proceeding, or are stopping. On one side of the carriage an apparatus is intended to be placed, which can be put in action from the inside of the carriage, and serves to give an order or warning to the guard. At the time of starting all the metallic plates of a train can be reversed by turning a crank arm for that purpose; and the apparatus closes simultaneously with the door of the carriage.

---

614 **Hoby, James Ward**, *Renfrew, near Glasgow*—Inventor and Manufacturer.

Patent system of permanent way for railways, comprising a length of 18 feet of single line, with double-headed rails, cast-iron longitudinal sleepers, folding keys, and cross ties. The following cut represents a cross section of this permanent way.



Cross section of Hoby's patent Permanent Way.

A is the rail, and B the folding-key. The part C is a cast-iron piece, with a stirrup, or recess, cast through it, which holds the wrought-iron bearer, and receives in the stirrup a wrought-iron cross-bar, D, set on edge, for the purpose of securing the gauge and the tilt of the rails.

Two cast-iron longitudinal sleepers reversed, to show the mode of securing the tie-bar.

Specimen of the folding keys applied to an ordinary chair and double-headed rail.

Specimen of a wrought-iron sleeper, with cast-iron folding keys, applied to a double-headed rail.

---

615 **Greaves, H.**, 4 *Ordsall Terrace, Manchester*—Inventor.

Iron surface-packed railway sleepers, with rails; a substitute for wood-sleepers.

[The decay to which the timber substructure of railways is subject renders the substitution of some indestructible material advisable, even presuming the first cost to be greater.—S. C.]

---

616 **Samuel, James**, C. E., 3 *Duke Street, Adelphi*—Inventor.

Patent cast-iron, timber-bedded, wedge-trough permanent way for railways.

Patent fish-chair, or improved joint-chair, applicable to existing railways without removing the present sleepers; and giving continuity to the rails.

[There are two kinds of rail-bearings, the chair bearings, and continuous bearings for rails.

With chair bearings the rails are supported at fixed points, from 3 feet to 4½ feet apart, the rail bridging near the intervals.

With continuous bearings the rails are laid or bedded upon timbers, termed sleepers, which are in their turn bedded upon the ground, or rather, upon that preparation of the railroad for the permanent way, ballasting. The connection between the rail and the sleeper is made so that the two act together, and are borne in every part alike by the ballast.

A transverse tie is required to keep the rails in gauge, or immoveably at the same distance apart; as the conical form given to the face of the tire of the bearing wheels of railway carriages, to enable them to run upon curves without dragging, induces a constant effort to force rails. At low speeds, this tendency is not felt; but at high speed, this derangement is very manifest. The sleeper commonly used is of timber in the log, cut into two halves, so as to present its section uppermost, and its round hard surface to the earth. The joint chair is intended to secure the abutting ends of the rails.—W. H.]

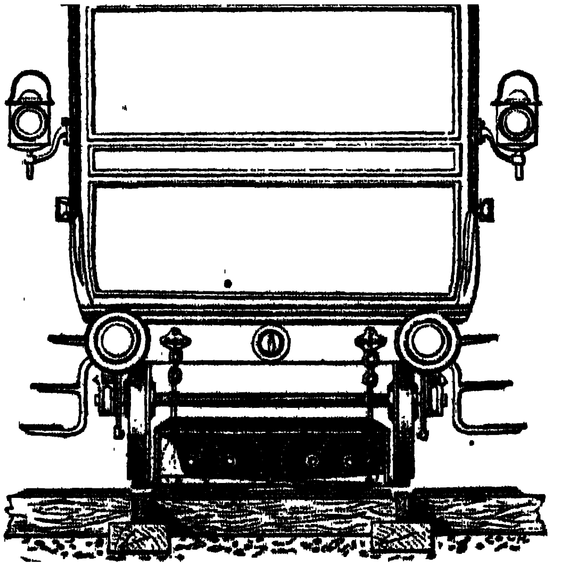
Patent improved "donkey-engine," for pumping water into steam boilers, to be used in locomotives instead of the present "feed-pumps."

Sectional model of patent double-cylinder "continuous expansion" steam-engine, in which the steam is made to exhaust from the first to the second cylinder, the cranks being set at right angles.

---

618 **Dunn, T.**, *Windsor Bridge, near Manchester*—Inventor and Manufacturer.

Apparatus for removing carriages from one line of rails to another. The following cut represents an end view of a traversing machine, patented by the exhibitor, and is shown in the act of removing a carriage from one line of rails to another. The principal feature in the invention is the rail or shelving at the lower edge of the machine. In the engraving the carriages are mounted thereon by easy inclined planes, A A, attached to the end of the traverser, and working inwards and upwards at the same time on spiral joints.



Dunn's Patent Traversing Machine.

Models, to scale, of traversing machine, being modifications of the same; with drawings.

Drawings of patent skeleton rail, or turn-table; of an improved chain-cable testing machine; of a hydraulic machine, for forcing railway wheels on and off their axles, with improved regulating and revolving carriage; and of a patent improved portable copying press.

---

624 **Ormerod, R., & Son,** *St. George's Foundry, Manchester*—Patentees and Manufacturers.

Patent traversing machine. The improvement consists in applying an oscillating frame, forming an inclined plane, up which the carriage is run, and which, when brought to a horizontal position, can pass over the rails. Its claim to superior efficiency arises from its not in any way interfering with the fixedness of the permanent line of rails. Figs. 1 and 2 represent a side elevation and plan of this traversing machine.

Dunn's patent turn-table—the rails of the platform are supported throughout their entire length by inclined planes or wedges, which are brought into action when required, and render the table perfectly rigid whilst a train is passing over. Figs. 3, 4, and 5, represent a section and plan of the patent turn-table.

Fig. 1.

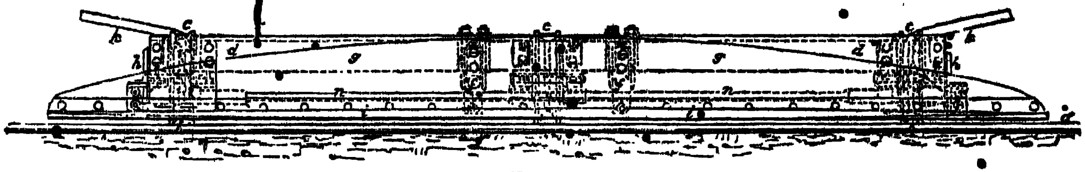


Fig. 2.

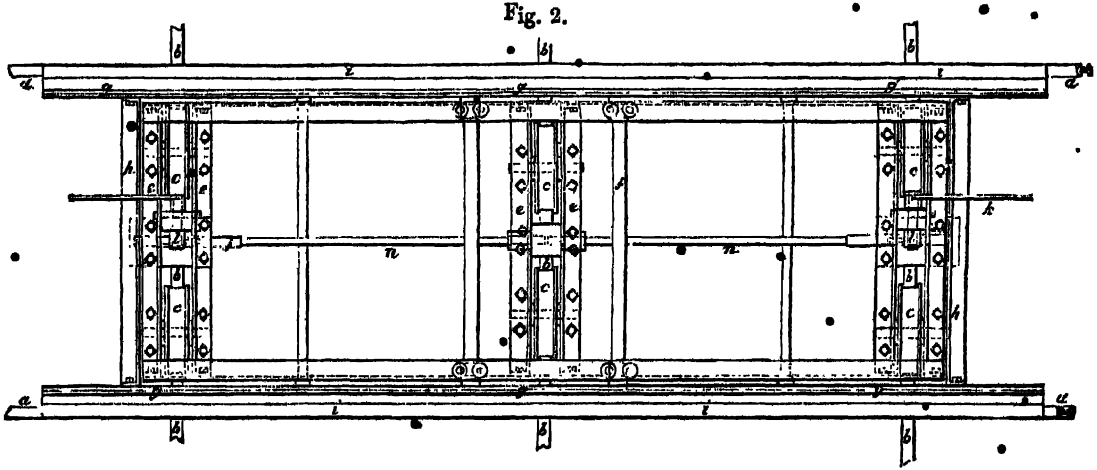

Ormerod and Son's Patent Traversing Machine.

Fig. 3.

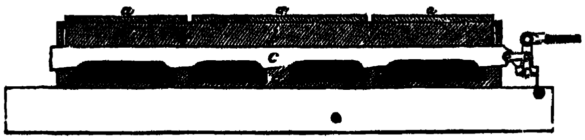

Fig. 4.

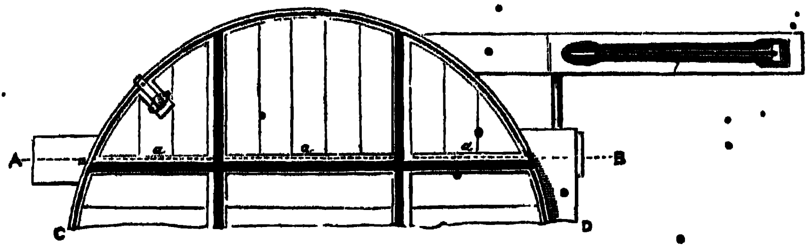

Fig. 5.

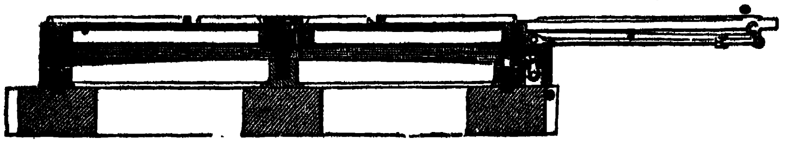

Plan and Sections of Dunn's Patent Turn-table.

The advantages claimed are, that the carriage to be removed may be received, sustained during the traverse, and discharged, by means of one and the same pair of rails, laid continuously, or without break, on an oscillating frame, and the carriage may be thereby transferred from one line of rails to another, without disturbing the fixedness of the permanent rails.

In figs. 1 and 2, *a a* are the permanent rails of the line. *b b* are the traverse rails, fixed at such a level as to allow the flanches of the wheels (*c c*) of the truck to pass over the permanent rails of the line.

d d and *e e* are the sides and ends or framing of the truck, supported by six wheels (*c c*) running upon the traverse rails already described.

By the sides (*d d*) of the truck is supported the axes (*f*), upon the extremities of which axes are secured the two sides (*g g*) of the oscillating frame. *h h* are two transverse pieces, connecting the ends of the two sides (*g g*) of the oscillating frame together. To the sides (*g g*) of the oscillating frame are attached the rails (*i i*) upon which the carriage is supported during its removal from one line of rails to another.

The raising or lowering of the oscillating frame, together with its rails (*i i*), is effected by the wedges (*j j*) acting upon the transverse connecting pieces (*h h*); and through the medium of the levers (*k* and *l*) and rods (*n*) either end of the rails (*i i*) may be depressed, and made to meet and rest upon the permanent rails (*a a*) of the line.

On the carriage being received upon the rails (*i i*) of the oscillating frame, the oscillating frame must be brought into the horizontal position by means of the wedges, and after the truck and its load are removed to the desired line of rail, the carriage may then, by the same means, be allowed to descend upon those rails in either direction, as required.

In figs. 3 & 4, *a, a, a* is a section of rail on the main line of way; *b*, is the girder upon which the rail is fixed; *c*, is a sliding beam, the top surface of which is planed, so that by the lever (*l*) and the wedge-shaped bearings (*d*), this sliding beam may be raised in contact with the under and planed side of the girders (*b*), whereby the platform is made rigid. When the platform is required to be turned, the sliding beam is lowered by the lever (*l*), and the platform is left to turn upon the friction pulleys (*e e*), two of which are shown in fig. 5.

---

628 **CUBITT, J.**, *Great George Street*—Producer.

Permanent way of the Great Northern Railway, with Ransomes' and May's patent chairs, treenails, and wedges.

---

636 **THORNEYCROFT, G. B., & Co.**, *Wolverhampton*—
Inventors and Manufacturers.

Specimens of Briggs' patent compound railway axle. Piece of the pile from which the axle is made.

Patent axle. Patent charcoal tire for railway wheels and rails, showing the arrangement of the charcoal and fibrous iron; the same after it has been subjected to the action of acid, showing the physical construction of the part upon which the friction more particularly bears.

The figures 1, 2, and 3 show the arrangement of the charcoal and fibrous iron in this metal.

Fig. 2.

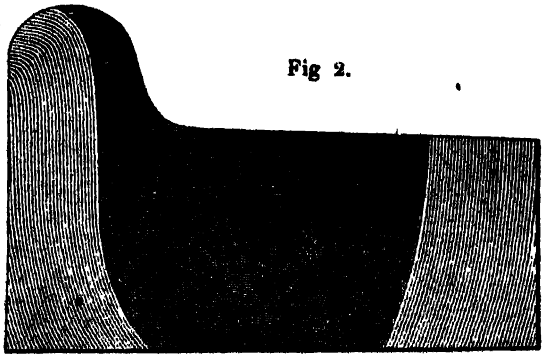

Fig. 1.

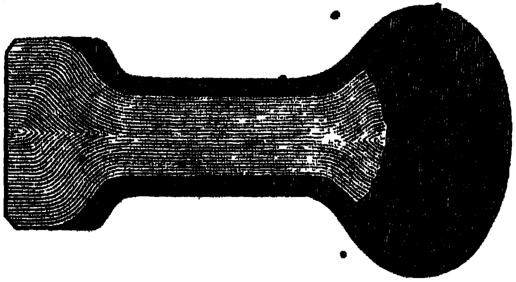

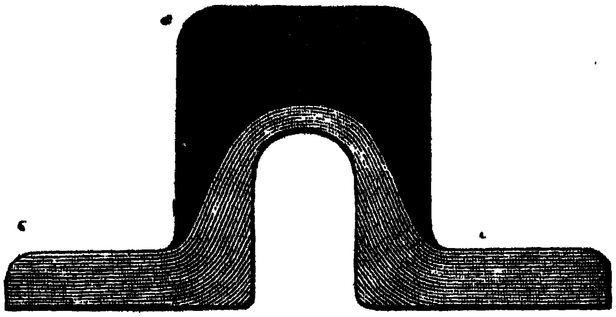

Fig. 3.

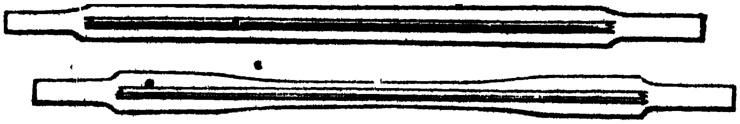


Thorneycroft's Patent Axles.

637 **WORSDELL, GEORGE, & Co.**, *Warrington*—
Manufacturers.

Railway axle-forge, hammered, showing process of manufacture; bent cold, and having borne a pressure of 84 tons.

Railway wheel-tire, forged and hammered: showing process of manufacture. Patent railway axle-box.

---

638 **EBBW VALE COMPANY**, 83 *Upper Thames Street, London*, and *Abergavenny*—Manufacturer.

Section of every description of railway bars used on different railways.

---

639 **POTIER, WILLIAM**, 33 *Green Street, Wellington Street, Blackfriars Road*—Manufacturer.

Gut wheel-bands used for all kinds of machinery, manufactured from the [illegible] this band can be split into three in its entire length, and worked as fine as the finest cotton. It is used by watchmakers and others for the drilling-bow.

640 **RANSOMES & MAY**, *Ipswich*—Manufacturers.

Barlow and Heald's patent machines:—Railway turn-table for turning engines or carriages.

Wild's railway switch or turn-out rail.

Barlow's iron sleeper, as in use on a portion of the South Eastern Railway.

Permanent way of the Great Northern Railway; with chairs, treenails, and wedges, on the exhibitors' patent.

Registered water crane, for supplying the tenders of locomotive engines with water.

Patent railway chairs, with patent compressed treenails and wedges.

Compressed wooden treenails and keys, for railway chairs, and previous to compression.

Patent compressed ship treenails, in various stages.

Chilled cast-iron pedestal, or axle bearing. Broken pedestal, showing the depth to which the chilling has penetrated.

---

641 **COALBROOK DALE COMPANY**, *Shropshire*—Manufacturer.

Square, round, flat, half-round and oval, bar iron; angle T and girder iron; sash bar and moulding iron; tire iron; engine-floor, and foot-plate iron.

---

642 **PARSONS, PERCIVAL M.**, C.E., 6 *Duke Street, Adelphi*—Patentee and Designer.

Patent switches adapted to the ordinary double T rail.

Single patent switch, adapted to Barlow's patent broad flange rail.

Patent crossing for railways, adapted to the ordinary double T rail.

Normanville's patent axle-box. The lower chamber of the axle-box, which contains the journal and bearing, is cast in one piece, and closed by means of an apparatus fitted to it, for the purpose of excluding grit or dirt, and preventing the waste of grease.

Patent machine for dressing mill-stones, with a mill-stone to illustrate its action. With the aid of this machine, it is stated that a boy can dress a pair of stones in less time and with greater ease than a millwright on the old plan.

---

643 **BAINES, WILLIAM**, *Birmingham*—Inventor.

An improved railway switch. The mode of forming the tongue of this switch gives it stiffness and a broad base to slide upon; when closed, it is locked under the main rail, and the point prevented from rising. The tongues clear their own track, by driving the dirt under the main rail, and not against it, as in the old switch. The cost of construction is less than in the ordinary mode of forming the tongue, which prevents them shutting close, obviating the necessity of personal attendance to keep them in working order, and also the liability of accident if neglected.

An improved joint chair, the object of which is to support more firmly the joints of the rail.

An improved intermediate chair. The two jaws of the chairs are made exactly alike, and are oblique, instead of opposite to each other. The chairs are slipped on diagonally, and when brought to right angles support the rail without any key or wedge.

---

644 **KENNARD, R. W.**, *Falkirk Iron Works, Scotland*, and 67 *Upper Thames Street, London*—Manufacturer.

Specimens of various switches.

---

645 **BIDDULPH, JOHN**, *Cwm Avon Works, Taibach, South Wales*—Manufacturer.

One large flanch rail, 63 feet long, 56 lbs. per yard.

One small flanch rail, 4 lbs. per yard.

---

646 **BEECROFT, BUTLER, & CO.**, *Kirkstall Forge, Leeds*, and 8 *Pancras Lane, London*—Manufacturers.

Specimens of railway wheels and axles, particularly adapted for express and fast trains, viz., entire wrought-iron wheels, with solid wrought-iron bosses, forged in one piece, with single and double spokes respectively.

Specimens of the same, with wrought-iron disc centres and wrought-iron bosses; the tires of the latter being dovetailed to the discs to supersede rivets and insure greater safety.

Specimens of wrought-iron wheels, with wrought-iron spokes, and cast-iron centres, for ordinary and other trains.

All the above wheels have tires, combining hardness of surface with toughness of texture, and double-faggoted axles of improved Kirkstall manufacture.

Specimens of tires and axles of above manufacture, bent cold, in a variety of forms, to show toughness and superior quality.

Specimens of 28 different kinds of improved patent axletrees, for carriages, phaetons, omnibusses, cabs, drays, and other vehicles, manufactured upon the newest and most approved principles, from best double-faggoted Kirkstall iron.

A self-acting regulating damper for high-pressure boilers.

A registered improved moveable eccentric tumbler, for the valves of steam-engines.

---

647 **DERWENT IRON COMPANY**, *Shotley Bridge, Newcastle*—Manufacturer.

A rolled malleable iron-beam plate, used in the construction of marine engines, 17 feet 1¼ inch long, 4 feet 6 inches broad, and 1¼ inch thick, weighing 1 ton 5 cwt.

A rolled malleable iron plate, used in the building of iron ships, 20 feet long, 3 feet 6 inches broad, 5-8ths of an inch thick.

A piece of rolled keel iron, used in building iron ships.

A railway bar, measuring 66 feet 9 inches in length, 88 lbs. to the yard, and weighing 17 cwt. 1 qr. 26 lbs.

A railway bar, 65 feet 9 inches long, 12 lbs. per yard.

---

648 **RICHARDSON, J.**, 9 *Woburn Buildings, Tavistock Square, St. Pancras*—Designer.

Table of the weights of wrought iron in ounces and decimals, from ¼ of an inch square to six inches by three inches, extending to 1,058 different sizes, advancing successively by 1-8th of an inch in each dimension of breadth and thickness. Also the weights of round iron of all the sizes usually manufactured, to six inches diameter. And the weight of hoop iron to six inches wide, advancing by one-sixteenth in thickness.

649 **MERSEY IRON COMPANY**, *Liverpool*—Manufacturer.

Samples of patent rolled iron.

650 **LEADBETTER, JAMES G.**, *Gordon Street, Glasgow*—Inventor and Patentee.

Patent inventions:—Canal-lift, or hydro-pneumatic elevator, a substitute for canal-locks. The same principle applied to a ship-lift, a substitute for slip-docks and grid-irons; and to a wreck-lift, for raising sunken ships. Railway turn-table, or weighing-machine. Swivel-bridge elevator. Furnace-lift. Crane. Tippling-machine. Air-pump.

---

651 **RICHARDSON, ROBERT**, 39 *Moorgate Street*—Inventor and Patentee.

Patent "fish joint" for rails.

Wrought and cast iron "fishing pieces."

652 **GOMPERTZ, LEWIS**, *Kennington Oval*—Inventor.

Railway trains constructed to prevent collision, by means of a lever curved two ways, which acts on all the wheels and projects beyond the carriage, which is met by a roller on the reverse side of the opposing carriage, so as to turn the one out of the other's way.

Square carriage wheels, termed *soapers*, intended to prevent the obstacles and friction of the road, and to travel with great facility and diminution of labour. Their object is to advance by steps as in walking, without jolting the carriage.

654 **CUNNINGHAM & CARTER**, *Addison Road, Kensington, and at Sydenham*—Inventors and Patentees.

Model of an atmospheric railway on a new principle, and models of carriages.

655 **HARLOW & YOUNG**, *Paradise Street, Rotherhithe*—Inventors and Patentees.

Model of patent atmospheric railway, with metal valves and discs.

656 **JONES, THOMAS MORETON**, *Southampton Chambers, 53 Chancery Lane*—Inventor.

Model of a railway train and breaks. The invention is intended to stop railway trains within a short distance by means of breaks fixed to the carriages, of such a form as to take the wheels off the rails with ease and safety. The breaks are successively brought into action with a rapidity proportionate to the velocity of the train, so as to avoid the danger of sudden jerking. They only require the application of a lever near the engine, to set in motion a rod, which passes underneath the carriages and communicates with the separate breaks. By moving the train backwards, the wheels immediately become free of the breaks. A simple spring buffer is substituted for those at present in

659 **CRUTWELL & Co.**, *Newport*—Inventors.

Model of permanent way for railroads.

660 **BOYDELL, JAMES**, 54 *Threadneedle Street*—Inventor and Manufacturer.

Pair of wheels placed under a truck, for facilitating the draught of heavily-laden carriages, especially on soft grounds. Applicable to the wheels of railway carriages, in certain circumstances.

661 **STANTON, ROBERT**, 73 *Shoe Lane*—Inventor and Manufacturer.

Electro-magnetic engine.
Locomotive steam-engine.

662 **LONG, CHARLES ALBERT**, 1 *King St., Portman Square*—Inventor.

Railway signal, worked by the agency of electricity; intended to obviate the danger of one train overtaking another. By the use of this signal, trains may always be kept at a given distance apart: a train on passing the signal-post causes a red board to be exposed in daytime, and a red light at night, which signals remain until the train has proceeded a certain distance in advance. The changing of the signal depending on the distance passed over, and not on the time which may elapse after passing the post.

666 **BANKS & CHAMBERS**, *German Street, Manchester*—Manufacturers.

Railway-carriage wheel, upon Banks' patented invention for inserting steel segments in that part of the tire which is most exposed to friction by running upon the rail.

Another, with part of one of the steel segments left out, so as to show the shape of the dove-tailed groove in the tire.

The improvement consists in turning a dove-tailed groove in the hollowed or worn part of the tire, and inserting solid steel of a particular kind, instead of turning away the surface of the tire to the level of the worn part, or re-tiring the wheel. It is stated that the steel segments do not cost half as much as new iron tires, and that the wheel wears twice as long by this method.

[The surface of the tire of a wheel running upon edge-rails—and all railways of recent construction, for travelling at least, are laid with edge-rails—bears upon a very narrow breadth of the rail, whilst the whole of the breadth of the rail is small compared with the requisite breadth of the bearing-surface of the tire. As the swerving of the wheel, and of its tire, is in practice very small, that part of the tire which bears upon the rail becomes worn and rendered concave, while the flange and the remaining surface of the tire remain unworn. In this condition the wheel no longer runs freely and smoothly over the rail, and it becomes necessary to put it into the lathe, and then reduce the uneven part of the tire to obtain a new and even face at the depth of the concave groove, or to put a new tire on the wheel, unless the groove can be filled in and the worn part be restored without subjecting the wheel to either of the two processes.—W. H.]

668 **COPLING, J., jun.**, *The Grove, Hackney*—Inventor.

Railway signal, for instant communication between the guards, passengers, and engine-driver.

670 **LIPSCOMBE, FREDERICK**, 233 *Strand*—Inventor and Manufacturer.

Contrivance for preventing vibration in railway wheels, and making them run without noise.

Portable fountains, for drawing-room tables, conservatories, &c.

---

672 **EASTWOOD & FROST**, *Morledge Iron Works, Derby*—Manufacturers.

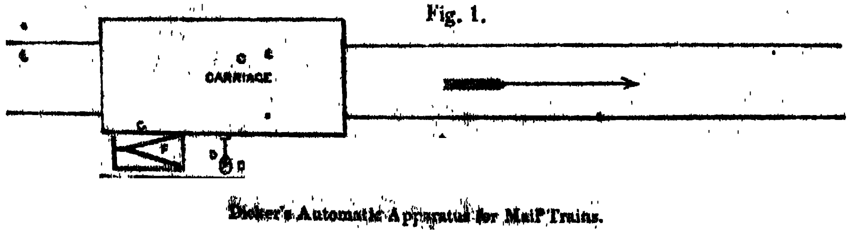
Rolled bar, forming when bent a segment of a wheel; bar, forming the centre of a wheel, viz., the boss, arms, and rim. Wheel-centre, complete, for carriages; and for engines. The wheel is made of wrought-iron, from rolled bars, so as to give strength and lightness to the arms and rim, and so secure uniformity of weight throughout.

674 **DICKER, JOHN**, *Clarence Terrace, 2 Rotherfield Street, Islington*—Inventor.

Improved automatic apparatus for transferring mail bags or parcels, on railways, at any speed, and capable of receiving and delivering them, from the weight of a single letter to that of 70lbs.

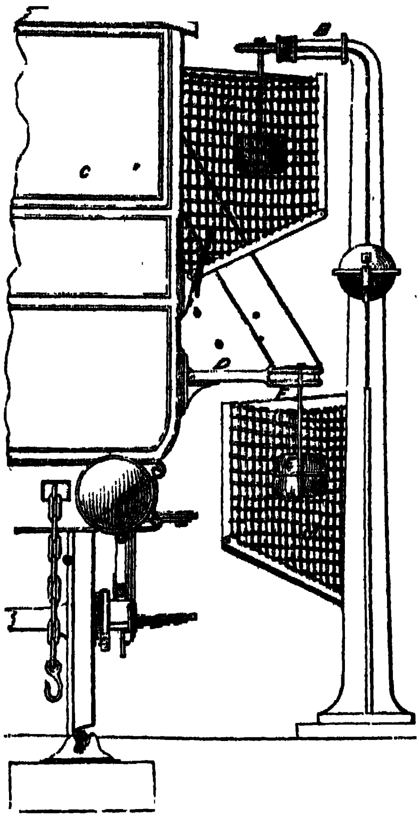
This apparatus consists of a wooden frame and net attached, shown in plan A; and an iron post B, fixed in the ground at the side of the railway in a direct line with each other; and a corresponding apparatus affixed to the side of the carriage C, viz., a projecting arm D, to support and deliver the envelope E (with bags or parcels enclosed), into the net A, which is fitted with conveying guide-lines F, to receive them. These lines are of great importance, the acute angle being the part in which the envelope is griped to detach it from the locks; it also prevents the possibility of escaping. G is a folding-net attached to the side of carriage to receive the envelope from the standard B. This apparatus has been long employed with uniform success on the South Eastern Railway. Fig. 1 is a ground plan, and Fig. 2 an elevation of this apparatus.

Fig. 1.



Dicker's Automatic Apparatus for Mail Trains.

Fig. 2.



Dicker's Automatic Apparatus for Mail Trains.

681 **Tabor, J. A.**, *Colchester*—Inventor.

Improved application of the whistle to locomotive steam-engines. The advantages are said to be as follows:—

The steam cannot be turned on the engine without first sounding the whistle.

The signal is uniformly given at suitable intervals of time and space, without the agency of the engine-driver.

It distinguishes an "up" from a "down" train, and also branch from trunk lines.

The whistle is placed at the front, instead of the back of the engine, thereby throwing the sound farther upon the line, and removing the vapour from the eyes of the driver, and the noise from the driver and the passengers.

682 **Jackson, P. R.**, *Salford Rolling Mills, Manchester*—Manufacturer.

Locomotive and carriage tires: manufactured by a patent process.

Spur-wheel, moulded by a patent machine, which moulds wheels or pulleys of any size, form, or number of cogs.

Registered stench-trap.

Model of the patent powerful hydraulic press, capable of lifting upwards of 3,000 tons. The cylinder is very light and strong, and the press has been at work for years.

684 **Chabot, Charles**, 9a *Skinner Street, Snow Hill*—Improver.

Models of three railway carriages, exhibiting the following improvements:—A rotary and self-acting break, by means of which a train in motion can be stopped without shock, and without wear and tear of the wheels or rails. The breaking power is communicated to each carriage in succession throughout the train. Locked buffers, by means of which oscillation is diminished, and the concussion occasioned by collision received upon the line of buffer-rods, instead of the carriage frames, by which the separation of the carriages and their liability to be thrown off the rails is prevented. An economical form of spring, applicable to the buffer and draw-rods, and other purposes.

686 **McNaught, W.**, 26 *Robertson Street, Glasgow*—Producer.

Montgomery's self-acting railway-break.

690 **Handley, William**, 26 *Great Earl Street, Seven Dials*—Inventor.

Patent break for railway trains, designed to obviate the serious defects of the common railway break. The first advantage it presents is an improvement as to the permanent way, which is effected by the use of the long shoe; this, by having 18 inches of bearing surface upon the rails, will slide over the soft or bad places hitherto made worse by the application of the ordinary break, the wheels having only about one inch of surface. The ends of the rails will not be jumped up or flattened by the wheels coming in contact with them, which is now the case, as the wheels resting upon the shoe will in fact press such irregularities down.

The second advantage is that, in the locomotive department, the wheel tires are always preserved perfectly circular; and the shoe, by bearing up the wheel when the break is applied, prevents the flat places being formed, and also torsion upon the axles. The wheels, whether of wood or iron, are saved from being strained, and the tires, rivets, bolts, &c. are not so liable to get loose, an evil which is caused by their becoming heated. The carriage frame is also saved from being racked and twisted, as the patent break is suspended upon the axle only. This will cause a great saving in the repair of break carriages. By the adoption of this break, a power is gained when applied to two wheels only, fully equal to the usual breaks applied to six, a feature of no slight importance in cases of danger. This power in retarding a train is also always the same, which is not the case with the common break. The different weights with which the carriages are loaded are continually altering the position of the blocks, which varies the number of turns of the screw necessary to apply the ordinary break; while in wet, greasy weather, it is almost impossible to skid the wheels. The patent break can be applied in less time, and with two or three turns only of the screw, whereas six or seven turns are required with that hitherto in use. It is also free from the usual unpleasant noise, smell, and sensation from friction.

Lastly, considerable saving is effected, both in the amount of stock required and in the wear and tear of railway apparatus.

The necessity for the introduction of an improved railway break is universally admitted by all engineers and practical men. The breaks in common use are very injurious, both with regard to the durability of the wheels and rails. Timber blocks of poplar wood are made to bear hard upon the peripheries of the wheels, so as to stop their revolution. The result is the grinding of many flat places on the tire of the wheels and the abrasion of the rails, occasioning frequent renewal.

691 **Chesshire, Edwin**, *Birmingham*—Inventor.

Model, showing the principle of an invention for lessening the danger of collisions on railways. This object is proposed to be attained by suspending in bearing sockets, under the centre of the framework of every carriage of the train, a strong iron rod or tube with an expanding head at each end, to be called a "safety buffer," and moving, when acted upon, in a longitudinal direction; and also by attaching at the hinder end of the train a strong van with a low centre of gravity, for the purpose of receiving the first shock of a collision, should it take place from behind; the engine tender being made to answer a similar purpose should the collision occur at the front. The force of the shock will throw the "safety buffers" into one continuous inflexible rod, by means of which its force will be transmitted to the opposite end, so as to protect the intermediate carriages. In the case of one train overtaking another, the latter, it is conceived, would be completely protected by this apparatus.

692 **HARVEY, D.**, 3 *Cumming Place, Pentonville Hill*—Inventor.

Models of a locomotive tender and carriage, on a scale of one inch to the foot; fitted with Harvey's patent safety machine, for railway carriages, to disconnect the locomotive from the passengers' carriages in the event of the former starting off the line of rail.

693 **WALKER, WILLIAM**, *Shrewsbury*—Inventor.

Railway break.

[The "break" is to the railway train what the shoe, skid, or lock is to an ordinary road-carriage, a means of checking its speed, by pressure upon the wheels of some of the carriages, so that they may revolve less freely, and thus destroy the momentum of the machine when it is desired to stop it. The master-break of a train is applied to the wheels of the tender, and is worked by the stoker, under the direction of the driver, whilst the guards act in aid only upon the carriage-breaks as occasion arises.—W. H.]

694 **GRAY, GEORGE**, 42 *Woodcock Street, Birmingham*—Inventor and Manufacturer.

Model of a four-wheeled railway carriage or guards' van, fitted with a new and improved "break," of great power and instantanous effect; it forms a direct "communication between the guard and driver," and acts on the rails only. Amount of rail friction obtained, 15 feet; ordinary breaks have only four inches: its object is to effect a great saving in wear and tear both to wheels and "permanent way," by rendering the "locking or skidding" the wheels unnecessary, and to prevent collisions, by stopping the train at one quarter of the distance required at present. A lamp in the centre lights the interior of the van, and it can be also made, by moving a snag, to exhibit a signal to the driver and guard to stop. The space under the guard's seat is for dogs, extra lamps, and tools, &c. Adapted to run either first or last in a train, and requires no "turning." The "blocks" of this break are composed of alternate plates of metal and blocks of wood placed the cross way of the grain.

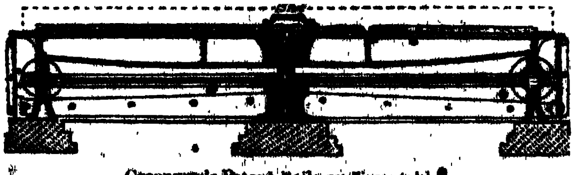
A six-wheeled model of a similar van and break: a portion of the roof is removed, showing the internal arrangements. The "blocks" of this break are of one piece of wood, "shod" with metal plates. It has rather less friction than the former. Scale of both—two inches to a foot. Provisionally registered.

697 **WILSON, CHARLES**, Engine-driver on the Leeds and Thirsk Railway—Inventor.

Small locomotive engine.

698 **GREENWAY, CHARLES**, *Southport*—Inventor.

Patent turn-table for railways, consisting of a "cradle" or frame divided into compartments, in which are placed spheres or balls on which the table top rests, the whole revolving round a common centre.



Greenway's Patent Railway Turn-table.

Patent anti-friction axle. The novelty consists in a "cradle" or frame, by which rollers are kept in their proper position.

Patent castor, for furniture. The novelty consists in the spindle being surrounded by friction rollers.

699 **COWPER, EDWARD ALFRED**, 9 *Kensington Park Road, Notting Hill*—Inventor.

Detonating fog and accident signal for railways. It consists of a small flat tin box about two inches in diameter, with a slip of lead soldered to it to fasten it to the rail. It is filled with gunpowder, and contains a match which takes fire when crushed.

700 **LESTER, THOMAS, C.E.**, 15 *Ure Place, Glasgow*—Inventor.

Elevation of an outside cylinder passenger tank engine, and first-class carriage, for the Glasgow, Paisley, and Greenock Railway. Among some of the advantages of this engine are its lightness, being only about 13 tons, with its complement of water; the fact of engine and tender being combined and placed on one frame; the extreme lowness of the centre of gravity, giving an angle of stability of 75°; and its large heating surface. The carriage is constructed with great regard to the comfort of passengers, and will hold about three times the number of the ordinary carriages. The engine and carriage constructed at Greenock by Robert Sinclair.

701 **HATTERSLEY, WILLIAM**, 136 and 137 *St. George's Street, East*, and 15 *Lisle Street*—Inventor.

Passengers' signal for railway and other carriages; for ready communication with drivers, guards, &c. It consists of a cylindrical tube or casing to be affixed to the top of each carriage, or at the side in an elevated position; within the casing is placed a lamp which is secured by a spring lock, and remains hidden until, wishing to give the signal, a bell-pull conveyed to each compartment is pulled, the spring lock is withdrawn, the lamp is forced up, and the signal is made. It is equally available by day and by night.—Registered.

702 **ELLIOTT, THOMAS**, *Queen Street, Stockton-on-Tees*—Inventor and Manufacturer.

Working model of a rotatory locomotive steam engine: intended to save 25 per cent. in steam.

703 **JACKSON, JOHN**, 5 *Victoria Grove, Bayswater*—Inventor.

Model of a railroad, with stationary engine for propelling carriages by compressed air.

704 **GREEN, WILLIAM**, 28 *Frederick Street, Hampstead Road*—Maker.

Model of a first-class railway carriage, on an inch scale, without trimming, showing the framing complete.

705 **STOY, HUGH**, 22 *Ann Street, Lambeth*—Inventor.

Model of an invention intended to stop, almost instantly, the engines and carriages on railways. It is under the command of the stoker or guard; it acts on the wheels of every carriage, and can be put in action or relieved in a moment.

[Power in the hands of the stoker or of the guard of a train, if acting with instant and certain effect upon the wheels of every carriage of the train, to break the speed and bring the whole body to rest as quickly as may be consistent with safety, having regard to the speed to be broken, is a desideratum.—W. H.]

706 **SQUIRE, JOHN, & Co.**, 5 *Barge Yard, City*—Manufacturers.

Specimens of the following articles, all manufactured of Dewrance's patent metal:—Locomotive axle and connecting rod. Rocking shaft bearings. Locomotive slide blocks. Bushes for levers. Carriage axle bearings.

Carriage axle bearings, and various other machinery bearings, of Babbitt's patent metal.

Improved carriage axle-boxes.

Meads' patent reciprocating gas-meter.

Model of direct-acting steam-engine, and sugar-mill with latest improvements.

Sample of patent metal machinery for cotton weft.

Crank shaft bearings, of Babbitt's patent lined metal, for a 300-horse engine.

707 **TIDMARSH, RICH.**, 3 *Jamaica Row, Bermondsey*—Manufacturer and part Proprietor.

Working model of James Smith Torrop's patent passengers' railway and steam-boat time signal; a simple instrument by which passengers are informed at one view of the exact number of minutes that are to elapse before the starting of a train or steam-boat; and which provides a mode of notification to passengers as they are on their way to the station.

708 **MELLING, R., jun.**, 5 *Coupland Street, Green Heys*—Manufacturer.

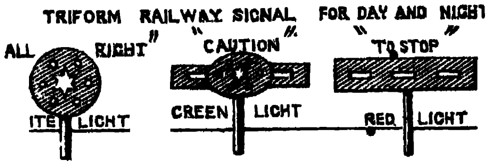
Model of a royal state railway carriage, 1½ inch to the foot (broad gauge), with promenade round the outside.

709 **PEARCE, T. B.**, 93 *Newman Street, Oxford Street*—Inventor.

A railway revolving fog signal-light. A red or green light is produced by triggers being struck by a stop placed at the side of the tram-road.

710 **HOY, JOSEPH**, 6 *Pickering Place, Paddington*—Inventor and Manufacturer.

Railway signal (for day and night); to indicate "all right," "caution," "danger" or "obstruction," or "order to stop;" by one and the same movement, or action of a small lever. It can be elevated to any convenient height. This signal is shown in the annexed cut.



Hoy's Triform Railway Signal.

711 **ALLAN, A.**, *Crewe, Cheshire*—Inventor.

Model of hydrostatic or floating turn-table, for turning engines and carriages on railways, &c., on the floating principle; made entirely of wrought iron.

Model of an improved crane, for lifting and moving weights.

712 **WATSON, THOMAS**, 79 *Provost Street, City Road*—Inventor.

A day or night signal for railways, &c.

[The most perfect code of railway signals is that which is the most simple; one sign, either by day or night, must tell the engine-driver what he has to do, without chance of error; improvements in the machinery by which the signs are made, viz., by moveable discs, or arms, by day, and different-coloured lamps by night, tend to secure certainty of action, and, therefore, are of great public importance.—S. C.]

713 **WHARTON, WM.**, *Euston Station*—Inventor.

Patent railway wheel. The body is principally of wood, the chief features are the radial bolts and wedges to compensate for shrinkage. Model of the same, quarter full size, with wood felloes: the tires can be put on cold instead of being shrunk on in the usual manner. Model of the same, composed wholly of iron.

714 **HINITT, JAMES**, 22 *Vauxhall Row, Vauxhall*—Inventor.

Locomotive engine and tender, working model; scale, inch and a half to the foot.

715 **MANSELL, RICHARD CHRISTOPHER**, *Ashford, Kent*—Inventor.

Patent safety wheel for railway purposes, having its tire so secured that, in the event of a breakage, no part can leave the wheel, which would still remain serviceable. The tire has no holes through it, is made conical on its inner diameter, and is pressed tightly while in a cold state on the disc or body of the wheel, which is made to receive it: it is furnished with an endless groove on each side, and is secured to the body of the wheel by means of two flanched retaining rings, which have their flanches placed into the grooves of the tire, and are bolted laterally through the end of each wedge, forming the timber disc or body. The iron boss is made in two parts, and constructed so as to be tightened in the event of any shrinkage of the timber.

Manufactured by Messrs. Fox, Henderson, & Co., London Works, Birmingham, and other railway wheel manufacturers.

716 **ANGUS, FRANCIS JOHN**, 21 *King Street, Bath Street, City Road*—Inventor.

Railway accident detector, to give instant notice when the carriage is going off the line from the breaking of a spring or axle, or the connecting-chain; it can also be set in motion by any person in or on the carriage. It is equally useful in buildings where valuable property is kept, to detect any tampering with locks or windows.

Model of a life-boat.

726 **FAURE, THEODORE**, 2 *Little Argyll Street, Regent Street*—Inventor.

New snow-sweeping engine, for clearing railways and roads from snow. Its power may be increased according to the duty required, and the same engine may be applied to railways and common roads by changing a pair of wheels.

728 **SHAW, JOSEPH, & Co.**, 91 *Paddock, near Huddersfield*—Inventors.

Patent signals and points or switches on railways.

732 **FAIRBAIRN, W., & SONS**, *Manchester*—Inventors and Manufacturers.

Locomotive tank engine, adapted for working with economy light passenger traffic.

739 **ASHBURY, —**, Inventor.

Model of a railway truck.

750 **WATTS, THOMAS**, 3 *Pelham Place*—Inventor.

Model of a girder suspension bridge for railways, intended to be suspended upon aerial supports at a distance of every 300 feet, proposed to establish a communication by railway between England and France.

752 **BARBER-BEAUMONT, G. D.**, *Twickenham*—Inventor.

Patent locomotive machinery; applicable to all operations of draught, as a steam-tug, or as a substitute for an animal drawing in the traces, on the road or at the plough.

753 **BURSILL, GEORGE HENRY**, 9 *York Terrace, Queen's Road, Hornsey Road, Holloway*—Inventor and Manufacturer.

Improved pressure gauge, of easy adjustment. The graduated scale has, in addition to the two columns of resistance usually engraved upon it for a high-pressure gauge, a third column, which is the sum of the other two.

754 **GUNN, JOSEPH**, 3 *Ebenezer Terrace, Turner Street, London Hospital*—Inventor.

Machine to be propelled by hand-power.

756 **BOWLER, JOHN**, *Birmingham*—Inventor.

Model of a carriage to run on the rim of the wheels instead of the axles: there is no friction whatever on the axles. The wheels are one inch in diameter; in one revolution of the wheel the carriage gets as far again as the circumference of the wheel, and the propelling wheel does not touch the rail. By this method the carriage cannot slip on an incline.

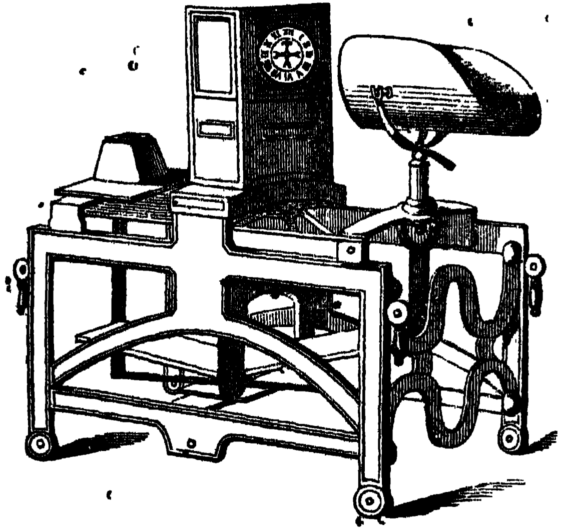
---

758 **DRURY, FRANCIS**, 26 *Albert Terrace, Barnsbury Road, Islington*—Inventor and Manufacturer.

Model of street church bell, invented, designed, manufactured, and registered by the exhibitor. The weight of the bell is 2 cwt., corresponding in strength of tone, to the ordinary bell of 6 cwt., and in depth of tone to a bell of 14 cwt. Forged from one ingot of cast steel.

764 **MORRIS, WILLIAM**, *Priory Place, Dover*—Inventor.

A working model of a machine for ascertaining and recording the weight of goods. This machine is represented in the annexed cut.



Morris's Weighing Machine.

765 **SLIGHT, J.**, 35 *Leith Walk, Edinburgh*—Manufacturer.

Model of Henderson's patent Derrick crane for moving heavy weights.

---

766 **CADELL, H.**, *Thorneybank, Dalkeith*—Inventor.

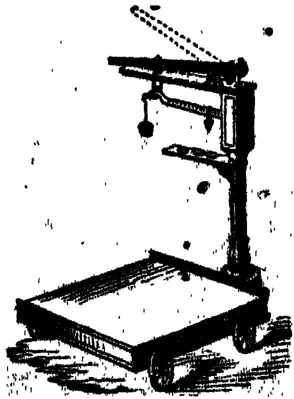
Weighing machine.

770 **NICHOLL, WILLIAM LEWIS, & Co.**, 16 *Aldersgate St.*—Manufacturers.

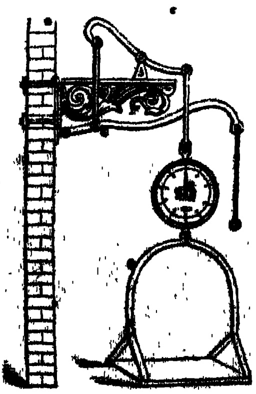
Specimens of improved square-end scale-beams.

Exchequer standard scales, weights, and measures; and various improved scales and weights, including a complete set of scales for bankers.

Improved lever weighing-machines. Dial weighing machine. See the annexed cuts.



Improved Lever Weighing Machine.



Dial Weighing Machine.

771 **OLLIFFE, CHARLES RICHARD**, *Ramsgate*—Inventor and Proprietor.

Fraud-preventor, for indicating the number of people admitted into a public vehicle, or exhibition room. The construction is contained in a small box, which can be made to any size, and to indicate any number up to 1,000,000. The model exhibited will indicate any number up to 10,000.

772 **DAY & MILLWARD**, 118 *Suffolk Street, Birmingham*—Manufacturers and Inventors.

Patent weighing machines. Platform weighing machine.
Inverted counter machine.
Druggist's scale for counters.
Specimens of fishing reels.

---

774 **DAVIDSON, JONATHAN, & Co.**, *Barony St., Edinburgh*—Inventors and Manufacturers.

A variety of steelyards or weighing machines of different constructions, simple and accurate in performance; easily turned when fully loaded.

The particular advantages claimed are compactness, durability, and accuracy; the under levers, beams, supports, &c., are made of malleable iron, with welded steel centres, the bearers are lined with welded steel, &c.

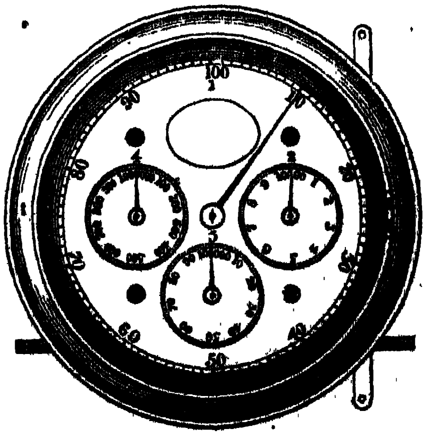
775 **RICHMOND, JOHN**, *Bow, Middlesex*—Inventor and Manufacturer.

Improved engine counter, applicable also to turnstiles for bridges, &c. This machine is represented in the annexed cut.

Description of the counter:—The number of strokes made by the engine can be read off at one view without calculation. The leading or unit hand traverses the entire circumference of the large dial, and the hands of the three small dials, Nos. 2, 3, and 4, all revolve in the same direction. The first motion is given by a sliding bar and fixed spring, instead of a double pallet, so that the first wheel cannot be thrown more than one tooth by one stroke of the engine. No skip-wheels are employed, and the hands are all moved by a train of wheels and pinions, so that the motion is regular and progressive.

It will be seen that the arrangement is very simple.

No. 1, or the large circle dial, contains 100 divisions, and the large hand traverses one division at each beat or stroke. No. 2 dial also contains 100 divisions, each one of which is equivalent to one entire revolution of No. 1 hand, thus registering 10,000 strokes. No. 3 dial is divided in the same manner, registering 100,000 strokes; and No. 4 dial is divided into 100 parts, registering 1,000,000 strokes. Thus any amount can be read off without error.

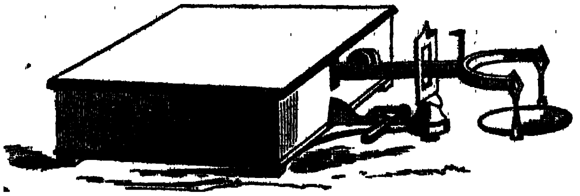


Richmond's Engine Counter.

776 **CRAIG, JOHN**, 51 *Cornwallis Street, Liverpool*—Designer and Manufacturer.

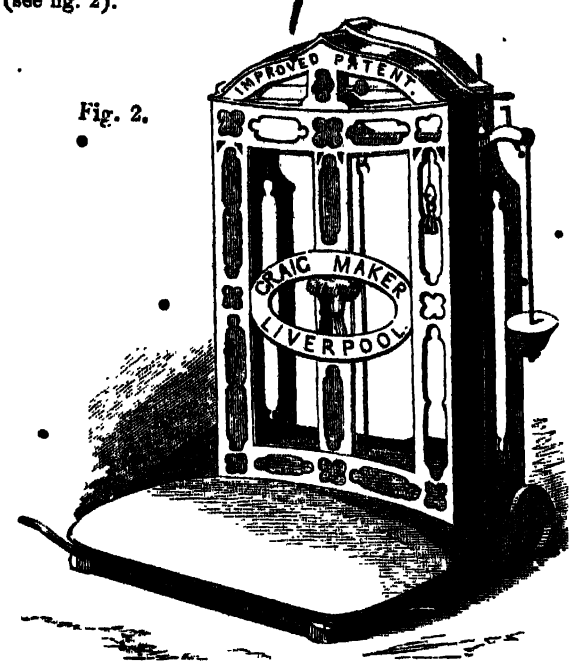
Portable weighing machine, furnished with an enamelled scale-plate to be used at pleasure (see fig. 1).

Fig. 1.



Cotton, sack, or bale weighing machine, on wheels (see fig. 2).

Fig. 2.



Craig's Weighing Machines.

Library machine for weighing, also for measuring the stature.

Chimney-arch and smoke-damper, to be applied in the first construction of chimneys. Its use is to allow the cold air of the apartment to mingle regularly with the heated air in the chimney, and prevent smoke. The damper is worked by a small rod at the back of the grate, and can be regulated at pleasure. When shut, it prevents all down-blasts, and is serviceable when the chimney is on fire. It can be removed when the chimney is to be cleaned, and easily replaced.

A smoke-damper, to be applied to chimneys already built.

777 Yates, William, *Bromley, Middlesex*—Inventor.

An indicator, for registering and detecting change of speed in steam-engines or machinery.

778 Goodfellow, James, 4 *James Street West, Devonport*—Inventor.

Gauge for showing the height of water in steam-boilers, talc being used instead of glass. No change of temperature will cause the talc to break.

779 Howe, George, 119 *Great Guildford St., Southwark*—Inventor and Manufacturer.

Registered transparent water-gauge, for showing the exact level of the water in steam-boilers, consisting of a glass tube fixed in the brass sockets, with vulcanized India-rubber rings, to prevent it from being broken by the expansion or contraction of the metal; when the tube is broken by accident, it can be tightly replaced in a few minutes.

780 Medhurst, Thomas, 465 *Oxford St.*—Manufacturer.

Improved portable compound lever weighing machine.

782 Donbavand, W., 95 *Great Ancoats Street, Manchester*—Manufacturer.

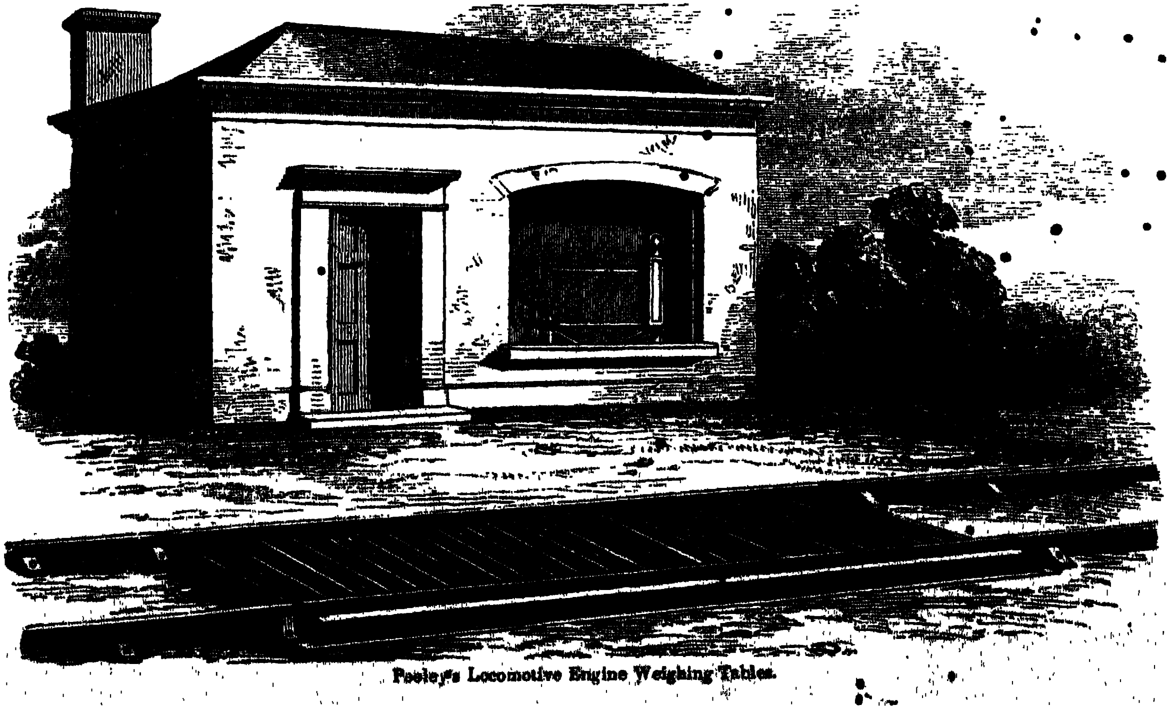
Bright steel box and scale-beam, mounted upon a brass pillar.

784 Pooley, Henry, *Liverpool*—Inventor and Manufacturer.

Patent locomotive engine weighing tables, which give the gross weight, and also the impact upon the rails of each pair of wheels and of each wheel separately. Their use is to enable the superintending engineer to adjust the springs of engines so as to obtain the proper amount of tractive power which is consistent with safety from tendency to run off the line at curves.

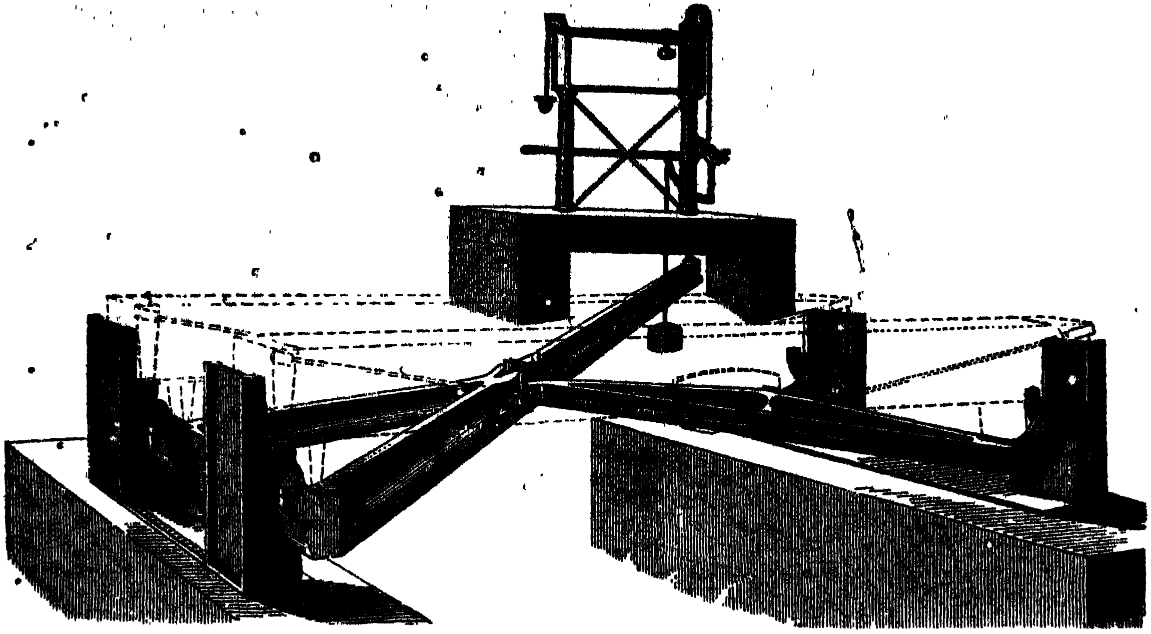
Drawing, in plan and sections, showing the construction, and mode of erecting the same.

Fig. 1.



Pooley's Locomotive Engine Weighing Tables.

Fig. 2.



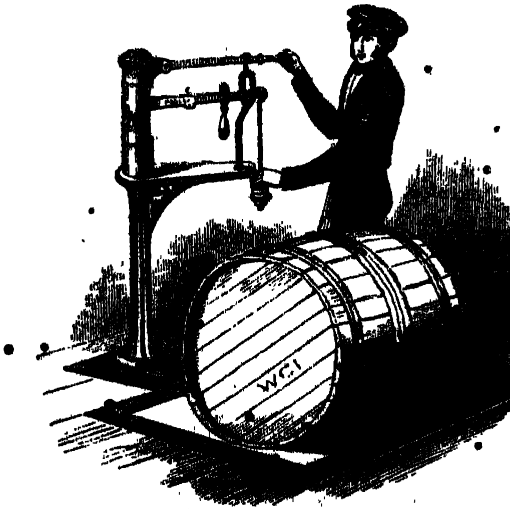
Pooley's Locomotive Engine Weighing Tables.

Drawing, in perspective, showing the construction of the patent railway weigh-bridge. The rails being omitted, this drawing will represent the weigh-bridge as used for carts or waggons on common roads. The adjustment is concealed and cannot be tampered with. There is no strain or wear except while weighing.

Fig. 1.—Elevation of office and weigh-bridge.

Fig. 2.—Shows the internal construction and arrangement; the walls, platform, &c., being removed.

Fig. 3.



Pooley's Weighing Machine.

Drawing in plan, elevation, and sections of a patent lock weighing engine, for weighing canal boats and their cargoes.

Patent dormant platform weighing machine, flush with the floor, to weigh from ¼lb to 2 tons, as used in the merchandise department of the London and North Western and other Railways, and for general weighing in warehouses. The accuracy of the results by this machine is equal to that of the beam and scales, whilst the economy of labour, space, and cost, is at least 50 per cent. It is only by such means that the heavy merchandise traffic could be despatched with sufficient rapidity.

Fig. 3.—The warehouse machine, as it is seen inside.

Machine of similar principle, on wheels, for use on wharfs, &c., to weigh 1 ton.

Machine of similar principle, as used in parcel office and shops, to weigh 8 cwt.

Machine of similar principle, for weighing animals, as used by agriculturists, made of various sizes.

Machine for counter use, from ¼ oz. upwards.

Drawings, in plan and detail, of the first large establishment in England, of baths and wash-houses for the poor, erected by the Corporation of Liverpool, 1845-6.—Architect, Joseph Franklin; Engineer, Henry Pooley, Assoc. Inst. C. E.

[In the Whitechapel baths there were 137,519 bathers last year, two-thirds of whom were second class. The charge for a second-class warm bath is 2*d*., for a cold bath 1*d*. The washers during the last quarter, ending December, were 7,888.]

---

801 **Anderson, Joseph**, *Elgin, Scotland*—Inventor and Manufacturer.

Victoria car, a two-wheeled vehicle, seated for four, and convertible into a two-seated gig or car by a single turn of the key. Made with light springs, high wheels and low seats, to avoid danger from accidents.

---

802 **Andrews, Richard**, *Southampton*—Manufacturer.

Light outside car, with imitation caning, on a new principle.

---

803 **Andrews, J.**, 42 *Great Brunswick Street, Dublin*—Producer.

Irish car.

---

804 **Bashcomb, Geo. H.**, *Chislehurst*—Designer.

Model carriage, with four wheels. It indicates the distance of ground it travels over, and marks the same minutely on a dial, placed so as to be always in view to the driver; it has spiral springs placed under the seat of the driving-box; an elastic bar, so placed as to relieve the feet from vibration; four preventive wheels, in case of accident; two arms provided with roller wheels, which protect the vehicle from collision, and a screw-break, by which the driver acts upon the wheels, so as to ease the vehicle down hill, or stop its further progress.

Model carriage, intended as a curricle, or single-horse dog-cart, for two or four persons.

Registered sporting trap, for three persons, tandem or single; adapted either for travelling, sporting, or trotting. It has high wheels, shifting basket for dogs, and a wire basket for game; is light, and of new construction.

805 **BISHOP, JAMES**, 343 *Strand*—Inventor.

Model of a public conveyance, in two compartments, with improved accommodation, front and back. The front is in the form of a chariot, for six passengers; the back is for eight.

806 **BLACK, HENRY, & CO.**, 1 *Berners Street*—Manufacturers.

A spheroid-back brougham; its object is lightness of appearance and draught, and additional interior space.

807 **PARSONS, —**, *Islington*—Inventor.

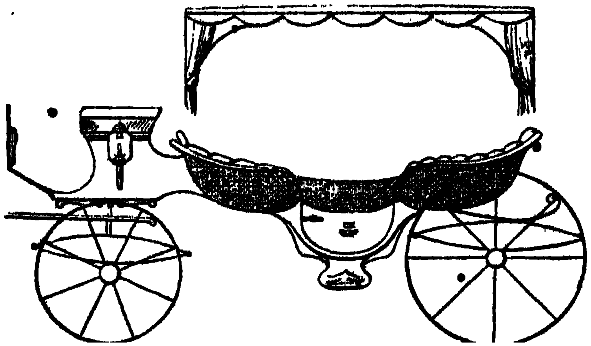
Model of an omnibus.

808 **CABLE, G.**—Inventor.

Model of a coach.

809 **BOOKER, E., & SONS**, 13 *Mount Street, Grosvenor Sq.*—Designers and Manufacturers.

Improved "sociable," forming an open or close carriage at pleasure. See the annexed figure.



Booker's Improved Sociable.

810 **WHEATLEY, J.**, *Greenwich*—Inventor.

Model of an omnibus.

811 **BRIGGS, GEORGE, & CO.**, 45 *Wigmore Street, Cavendish Square*—Designers and Manufacturers.

Town-travelling chariot and mail phaeton.

812 **BROWN, MARSHALL, & CO.**, *Birmingham*—Manufacturers.

Improved safety cab, mounted on Aitken's patent iron suspension wheels.

New light cab phaeton, intended to combine the elegance of the single phaeton with the utility of the double; similarly mounted.

Aitken's patent cart wheel, with part of axle.

813 **BROWN, OWEN, & CO.**, *Lichfield Street, Birmingham*—Coach and Carriage Builders.

Park phaeton, of light construction.

814 **BROWNE, WILLIAM**, 39 *Grafton Street, Dublin*—Manufacturer.

Irish jaunting cars, common and improved.

815 **COATES & BLIZARD**, *Park Lane*—Manufacturers.

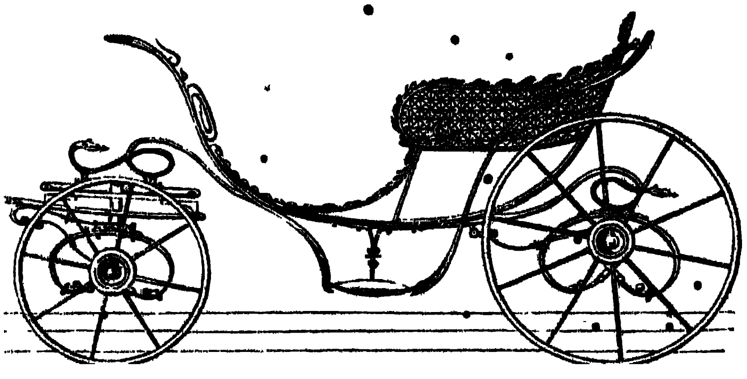
A brougham.

816 **COOK, ROWLEY, & CO.**, *King Street, Regent Street*—Manufacturers.

Patent brougham, having the carriage fitted up with inverted double C springs, and registered transverse connectors, bands, and braces. By the application of those springs to light carriages, the unpleasant motion felt in elliptic spring carriages is obviated, and the easy motion of a perch carriage, with upper and under springs, obtained.

Patent park phæton; the body is attached to the carriage by plated snake hoops, and the carriage fitted up with inverted double C springs. This phæton is represented in the following cut.

Models for public carriages. A cabriolet to carry five persons in separate compartments, and an omnibus divided into compartments, by which the annoyances so frequently complained of in the common vehicles will be prevented. The carriages are patented, the invention of Monsieur J. A. Franklinski.



Cook, Rowley, & Company's Patent Park Phæton.

817 **COLLINGE, CHARLES, & CO.**, 65 *Bridge Road, Lambeth*—Designers and Manufacturers.

Patent axletrees. The right and left-handed screwed nut linch-pin and cap at the end of the arm are intended to prevent the wheel coming off.

818 **CORBEN & SONS**, 30 & 31 *Great Queen Street, Lincoln's Inn*—Manufacturers.

Registered carriage.

819 **CHARD & MUNRO**, *Bristol*—Manufacturers.

A Coburg conveyance.

820 **COUSINS, W., & SON**, *Oxford*—Inventors and Manufacturers.

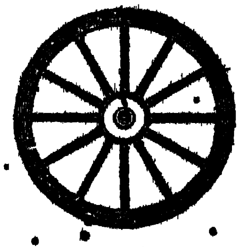
Light two-wheeled sporting carriage, adapted, by a concealed propelling screw, to carry two or four persons.

824 **CROALL, WILLIAM, jun., & CO.**, *Greenside Place, Edinburgh*—Designers and Builders.

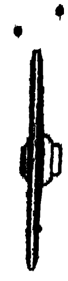
Oriental demi-cabriolet. Hung on a new principle, uniting great ease of motion with lightness of draught and facility of access.

826 **CROSSKILL, EDMUND**, *Vauxhall Wheel Works, Liverpool*—Inventor.

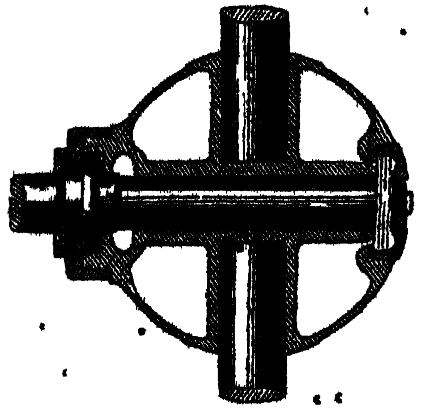
Specimens of improved patent wheel. The particular features consist in the turning of the spokes with strong double-shouldered ends, turning the rims, and boring double-shouldered sockets in the fellies; the hoop-tire is also bent, bevelled, affixed, and turned by patent machinery. The cuts exhibit an elevation, side view, and section of this wheel.



Elevation of Crosskill's Patent Wheel.



Side view.



Section of Globular Nave.

Liverpool town float, lorrie and coal cart; each complete

Specimen of a sporting cart, mounted on new patent wheels and axles, &c, by Messrs. Puckering and Houlgate, Beverley. (See also Class 9.)

828 **DAVIES, DAVID**, 15 *Wigmore Street, Cavendish Square*—Inventor and Manufacturer.

Full-sized light carriage, of new design, with dome roof, patent wheel-plate lock, and patent automatic moveable steps.

Basterna brougham, with patent inverted springs, patent wheel-plate lock, and patent automatic invisible steps

Light summer carriage, specially adapted for hot climates, with patent quadrangular umbrella to form a canopy, &c.

Model of patent railway-carriage break, on a scale of 1¼ inch to a foot.

New single wheel revolving carriage.

Model of accommodation carriage.

830 **DAWSON, F. W.**, 19 *York Street, North Polygon, Bath*—Inventor and Manufacturer.

Wheel chair for the use of invalids.

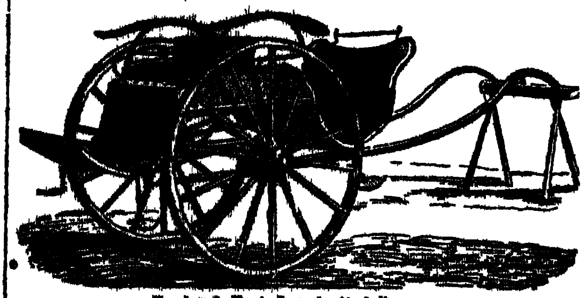
Pedomotive, or self-propelling carriage.

842 **DEARMAN, JOSEPH, & CO.**, 6 *Pancras Lane*—Inventors and Manufacturers.

Patent conical [illegible] and axletrees for waggons and carriages, with various improvements.

[illegible] **FOWLER & FRY**, *Bristol*—Inventors.

Low-bodied dog-cart, which, when fitted with luggage-body, answers all the purposes of the ordinary dog-cart, and is also adapted for park use; the lowness of the body and the height of the wheels render the draught easy. See the following illustration.



Fowler & Fry's Low-bodied Dog-cart.

844 **DUFFIELD, JOHN E., & CO.**, 114 *Aldersgate Street*—Manufacturers.

Highly-finished light phaeton, for a pair of cob horses Set of double harness with plated furniture, adapted for the same. Best quilted Somerset saddle and Weymouth bridle.

845 **FULLER, GEORGE & THOMAS**, *Bath*—Manufacturers.

Landau carriage, with improvements. The head is made to open clear of the heads of the persons inside. The front springs are elastic. The hind ones are divided, and the number of plates being divided also, great easiness of motion is produced.

846 **GEARY, STEPHEN**, 19 *Euston Place, Euston Square*—Inventor

Model of a patent street watering-cart, with fire-engine combined.

848 **GIBSON, THOS.**, 8 *Weaman Street, Birmingham*—Manufacturer.

Railway bearing spring. Registered elliptic spring with India-rubber bearings. Grasshopper spring with scroll irons. Elliptic spring.

Patent mail and Collinge's axletree. Samples of coach ironmongery.

[The application of India-rubber to obviate the unpleasant action arising from the friction of springs at their two points of junction is here attempted. A square block of the material alluded to being placed between the springs, the three thicknesses are held together by a bolt, sufficient play being allowed, and the whole is covered with a brass box

Springs of carriages of all kinds are hammered out of steel bars, in the ordinary method employed to produce steel goods. They are bent to suitable gauges, corresponding to the degree of elasticity required, are hardened by being plunged into water, and tempered by being brought back to a straw, or blue, colour. Elliptic and grasshopper are names given to the different varieties, and are at once understood by the trade.—W. C. A]

849 **DART & SON**, 12 *Bedford Street, Covent Garden*—Manufacturers.

Lace for carriages.

856 **GREVILLE, J.**, 36 *Mary Street, Dublin*—Manufacturer.

Irish jaunting car.

858 **GRISDALE, JOHN EDWIN**, 269 *Strand*—Inventor

Working model of spring carriage wheel; the springs are enclosed in the nave of each wheel, and revolve with them when in motion. Any shock caused by the unevenness of the roads, &c., is received on the springs alternately, and thus the unpleasant motion which is produced by the reaction of the ordinary springs is prevented. The axletrees fitted to these wheels are less liable to break, as the vibration is removed from them.

860 **Hadley, J.**, *London Road, Worcester*—Inventor and Manufacturer

Basterna clarence and brougham. Their wheels are double-tired; the under tire keeps the wheel upright and preserves the felloes when the outside tire is worn out.

The furniture is made of Worcester china.

862 **Hallmarke, Aldebert, & Hallmarke**, 57 *Long Acre*—Inventors and Manufacturers.

Underspring step piece barouche. New Park phaeton, designed by one of the exhibitors. Drawings of a state carriage. Demi-state carriage. State railway carriage, &c.

864 **Harding, W. & Co.**, 68 *Long Acre*—Designers and Manufacturers.

Specimens of carriage laces, linings, and carpets, showing the progressive improvements in their manufacture; also of tassels, bullions, fringes, and other upholstery ornaments.

868 **Heath, James**, 4 *Broad Street, Bath*—Inventor and Manufacturer.

Light open park wheel chair, designed to show the adaptation of glass to the panels of Bath chairs, and other vehicles, for ornamental purposes.

Bath Albert wheel chair, with folding head and shut-up glass front.

Newly-invented reclining and elevating spinal bed wheel chair, designed to enable invalids to take airings without inconvenience.

Close clarence Bath chair.

Merlin invalid room chair, with wheels intended for self-propulsion.

Four-wheel Bath park chair, with shifting shafts, handle, and dashboards, for a small pony

872 **Holmes, Herbert & Arthur**, *Derby*—Manufacturers.

Light park phaeton, having the upper part of the fore-carriage and the requisite branch stays, &c., wrought in one piece of iron-work.

Dog-cart, or sporting-buggy. Set of single buggy harness.

A set of winter shoes for horses, fitted with screwed chisel-points and plain studs.

A series of modern carriage drawings.

874 **Hooper, George**, 28 *Haymarket*—Inventor, Designer, and Manufacturer.

Brougham carriage, for one horse; of improved construction and design, hung by leather braces on an under carriage, with a double set of springs.

Barouche landau, with improvements.

Series of designs of new and improved forms of modern carriages. (By G. N. Hooper, jun.)

Working model of a brougham carriage; scale ¾ in. to a foot. (By W. Hooper, jun.)

880 **Horne, William**, 93 *Long Acre*—Manufacturer.

A patent segmental brougham. From its peculiar construction, it contains the same room as a chariot; and it may be made to accommodate three or four persons. The distance between the wheels is greatly shortened by the application of the eccentric double perch bolt lock in the turning of the fore carriage. The inside is fitted up with an ornamental couch or sofa back; and the improvement in the opening of the doors facilitates the ingress and egress.

A patent segmental chariot, exhibiting all the improvements of the patent brougham; the peculiar serpentine form of the front boot which sustains the coachman's seat, is a new feature in this description of carriage. It is made sufficiently light for one horse; and it is very easy of access, the body being low.

882 **Huttly, F.**, 10 *Lamb's Conduit Street*—Manufacturer.

Coach lace patterns, silk vellum, cut on terry lace, drawn on terry, and relief, cut on terry.

Figured silk ground lace. Registered design.

884 **Hutton, John, & Sons**, *Summerhill, Dublin*—Coach Builders.

Clarence, with front circular lights and concealed quarter spring curtains.

Brougham, with excentric fore carriage.

Park phaeton on C and under springs, with hind seat and head.

Car on a new construction, with sliding power and dog-box, to answer either as car or dog-cart.

888 **Jordan, William Heath**, *Cumberland Basin, Clifton, near Bristol*—Designer and Manufacturer.

Invalid three-wheel chairs, for one or two persons, to be drawn by hand, with reclining apparatus for spinal complaints, broken or injured limbs, &c.

892 **Kent, Richard**, *Saffron Walden, Essex*—Designer and Manufacturer.

Carriage with a low body, for easy ingress and egress, and forming an invalid's pony chaise.

894 **Kesterton, E.**, 80 *Long Acre*—Designer and Manufacturer.

The "amempton" carriage. A close double-seated carriage, of novel design; by a simple contrivance it can be converted into a light, open, step-piece barouche, adapted for summer and winter.

Fig. 1.

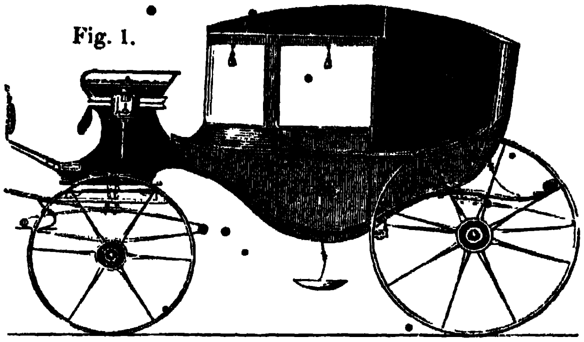


Fig. 2.

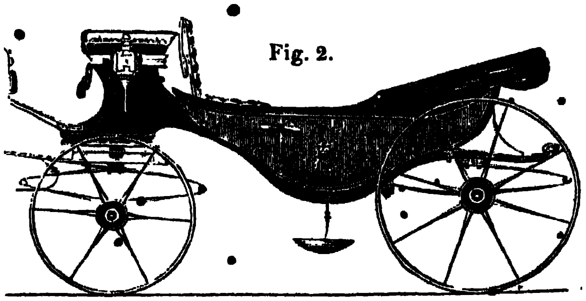


Kesterton's "Amempton" Carriage.

The engraving represents an improved registered carriage, capable of conversion into an open or close carriage, as may be required. Fig. 1 represents the carriage closed, or what is termed the amempton; which can be readily converted into a step-piece barouche. Fig. 2 is the carriage thrown completely open and constructed as an ordinary open carriage, with a half head, which is raised and lowered in the usual manner, with a solid folding knee-flap.

The front portion of the amempton is formed of a framework with circular front glasses, and furnished with doors; the door-glasses and front glass are made to rise and fall at pleasure, and are furnished with silk spring curtains; the whole being surmounted or covered with a roof. This framework is secured to the head with a new kind of fastening; the door-glasses, when down, are received into the lower part of the doors; the back instead of being flat is of a curved form.

895 Kinder & Wheeler, *Granby Place, Leicester*—Designers and Inventors.

An Albert phaeton, either for one or a pair of ponies, with an improved fore-carriage.

896 Kings, W., 101 *Long Acre*—Designer and Maker.

Cabriolet domestique. Its objects are commodiousness, lightness of appearance, and draught. Both bodies being exactly of the same shape and dimensions, the hood is transferable to either in a few seconds.

898 Kinross, William, & Co., *Stirling, Scotland*—Manufacturers.

City omnibus, sufficiently commodious for carrying nineteen passengers inside, with a large well on the roof, fitted up with ornamental glass and ventilators, so that on all occasions there is abundant ventilation, and the passengers, when going out and in, can walk upright. The well also makes a comfortable seat for outside passengers. It is constructed upon the lightest principle for draught consistent with strength, having double hind springs, so that when it is lightly loaded the motion is easy, and when heavily loaded both springs come into action, which cause it still to retain the same motion. It is adapted for two or three horses abreast, with equalizing bars, so that each horse may have an equal proportion of the draught.

902 Lewis, Charles B., 14 *King Street, St. James's*—Inventor.

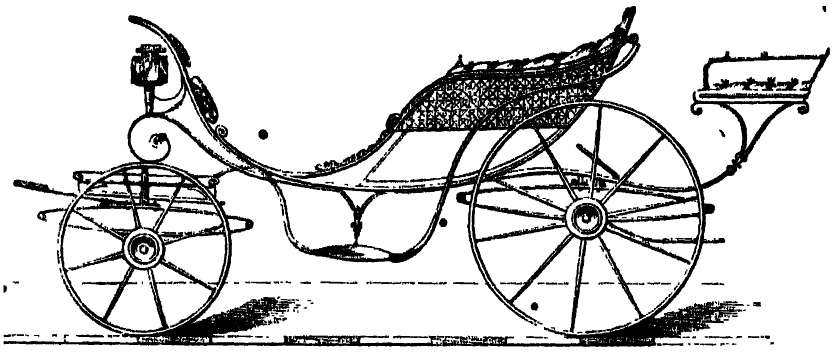
An invention to facilitate the ingress and egress of omnibus passengers.

908 Marks, John Isaac, *Langham Place, Cavendish Square*—Manufacturer.

Patent noiseless wheel, with Collinge's axle, revolving on a model granite pavement. The wheel (in addition to an iron tire) is shod with a solid band of vulcanized India-rubber, said to be as durable as iron. Bath, or invalid chair, fitted with the patent noiseless wheels. R. W. Thomson, C.E., Inventor and Patentee of the noiseless wheels.

910 Mason, William Henry, *Kingsland Road*—Inventor.

A pony carriage, of light and simple construction. This carriage is represented in the cut below.



Mason's Pony Carriage

912 Menzies, Andrew, *Glasgow*—Proprietor.

Model of an omnibus, with three horses abreast, drawing from equalizing bars or levers, connected with the splinter-bar, so that all must have equal draught.

913 Raworth, B. P., *Sheffield*—Manufacturers.

Carriage axles, &c.

914-916 Middleton, William & Charles, 40 *Long Acre*—Manufacturers and Inventors.

Improved convenable carriage, to be used either open or closed.

Model of a fore-carriage, with registered centripetal wheel-plate, for the purpose of bringing the hind and front wheels of four-wheeled carriages closer together.

918 Mitchell, Rev. Graham (LL.D.), *Whitburn, Linlithgowshire*—Inventor and Proprietor.

Model of a safety carriage, with diagram. The carriage, in any perilous circumstances, can be stopped from the inside with facility and safety. (The design of this invention described in 50 different languages).

919 Mitchell, Rev. William, A.M., *Woolwich*—Inventor.

Model of railway engine, carriages, &c., with plan to preserve human life, and prevent serious accidents. A bell is attached to the last carriage, and another at the side of the engine-driver, by which, when danger is apprehended, or when the axle is broken, and the carriage on fire, by pulling a string attached to the inside of each carriage, so as to communicate instantly with the guard and engine-driver, the train can be stopped in a few seconds. This invention is peculiarly applicable to express trains.

922 Mulliner, Francis, *Northampton*—Manufacturer and part Inventor.

Pilentum, suspended on elliptic springs and patent axletrees, with imitation cane-work on body, painted and lined blue; constructed with an improved mode of locking the fore-carriage.

924 Mulliner, Henry, *Leamington Spa*—Manufacturer.

New four-wheeled carriage, or improved brougham. The improved design and construction of the carriage front affords more room inside either for two additional passengers, without the usual heavy appearance of such additions, or increased comfort as an ordinary single-bodied carriage. The novelty is the substance of the registration; being two distinct curves instead of only one in the front part, and trimming inside at the back. Its lightness (7 cwt.) and compactness of wheels, and consequently reduced draught, render it suited for one horse. A further improvement in this carriage is the principle of communicating with the coachman; the voice-conductor being entirely concealed, and the mouthpiece at each side, instead of at the middle of the back as usual, and suspended from the roof. The design is registered.

A series of drawings showing an improved system of curricle-driving, and also of posting with a two-wheel carriage.

Designs of various dog-carts, riding vehicles, &c.

926 Newham, John, *Market Harborough, Leicestershire*—Manufacturer.

New pony carriage, with pole and shafts complete, and hind seat removeable; constructed of iron.

928 **NEWNHAM, BEN.**, 19 *Broad Street, Bath*—Manufacturer.

Bath wheel chair, to be drawn by hand or small pony, having a moveable glass front and solid knee-flap for bad weather, together with the hood and the summer apron attached. A ventilator is fixed in the hood.

932 **NURSE & CO.**, 43 *Crawford Street, and* 200 *Regent St.*—Inventors and Manufacturers.

Curricle and cabriolet brougham, to be used with shafts and one horse, or with a pole and curricle appointments and two horses.

934 **OFFORD, ROBERT**, 79 *Wells Street, Oxford Street*—Inventor and Manufacturer.

Four-wheel carriage for horses.

New carriage: the "semicircular clarence."

936 **PATERNOSTER, T.**, 13 *Charlotte Street, Fitzroy Square*—Designer and Manufacturer.

Lace, in thread, worsted, and silk, for carriage decoration.

938 **PETERS & SONS**, *Park Street, Grosvenor Square*—Manufacturers.

A light step-piece shaped park barouche, with lee and under springs.

940 **QUAN & SONS**, 10 *Talbot Street, Dublin*—Manufacturers.

Improved Irish jaunting cars.

946 **HARVEY, JOSEPH**, 41 *Bridge Road, Lambeth*—Designer and Patentee.

The Richmond car, a patent two-wheel open carriage, suitable for ladies: being hung low, it is very easy of access, and remarkably safe. The seats are spacious, and capable of accommodating four or six persons. The wheels, which revolve under the body instead of the outside, effectually prevent any mud or dust being thrown up. It also has capacious boxes for baggage, &c. May be fitted with a pole, for a pair of horses.

947 **RIGBY & LEE**, 7 *Park Lane, Piccadilly*—Manufacturers.

Private carriage—brougham—adapted for one or for a pair of horses.

950 **ROBINSON & CO.**, 12 *Mount Street, Grosvenor Square*—Designers, Inventors, and Manufacturers.

Britannia phaeton of new design, with registered lock or wheel-plate in the front part of the carriage, which enables a single horse or a pair to be brought near to the driver, or dashing leather, giving the advantage of a high front, bringing the wheels nearer to each other, and allowing any description of carriage to be kept at any elevation from the ground.

952 **ROCK, JAMES, jun.**, *Hastings, Sussex*—Inventor and Manufacturer.

Patent carriage spring of two plates, weighing 11 lbs. 8 oz., and possessing greater strength and elasticity than an ordinary laminated spring of five plates.

Common carriage spring of five plates, weighing 21 lbs.

Improved spring on the same principle as the former, but with only one plate, and weighing 7 lbs. 4 oz.; equal in strength and elasticity to a common spring of three plates.

Spring of three plates of the ordinary kind, weighing 14 lbs. 6 oz.

These springs placed on a testing machine, for comparing the new springs with those of the old construction.

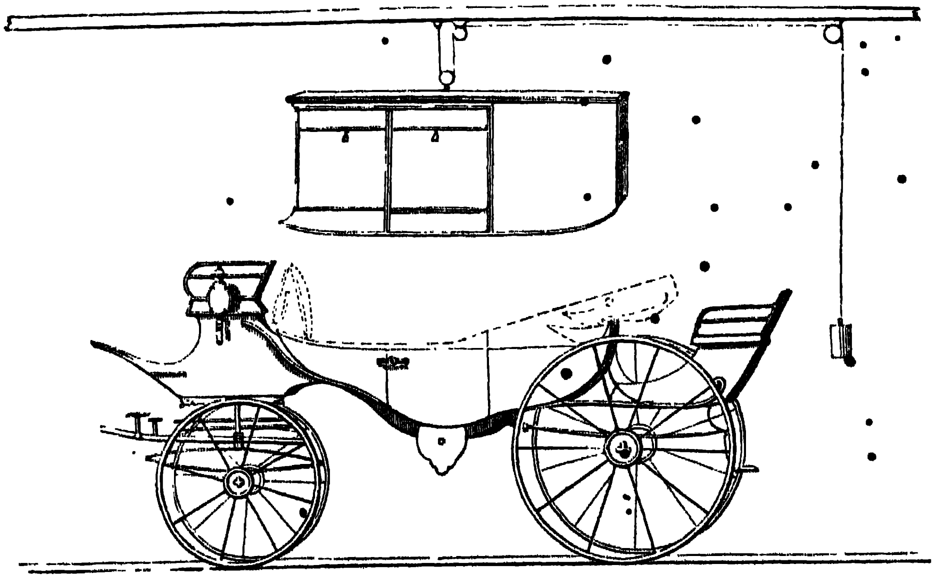
954 **ROCK & GOWAR**, *Hastings*—Manufacturers.

Patent omnibus for the conveyance of passengers, constructed with the upright part of the framework so placed as to apportion to each passenger his proper share of space on the seat, namely, 16 inches. The window frames are made to slide in such a manner as to give considerable additional internal width to the body, without increasing the external dimensions. The front and hind ends are circular, and the door is made to open both ways, so as to enable passengers to get upon the step from either side of the road with safety.

956 **ROCK & SON**, *Hastings*—Inventors, Designers, and Manufacturers.

Patent dioropha, or two-headed carriage, combining, in one, a clarence, or pilentum coach, complete with all its appointments; a barouche, with folding head, and threefold knee-flap; and an open carriage. The heads can be removed or exchanged, with facility, by means of a pulley attached to the ceiling of the coachhouse, aided by a counterpoise weight. The folding steps are on a new principle. The silk of the lining was supplied by Messrs. Draper of High Holborn; the lace by Messrs. Cooper and Blackford of Long Acre; and the axles by Mr. Thrupp, proprietor of Collinge's patent. The whole of the carriage and its appointments (except the silk) are from the designs of James Rock, jun.

Patent pony carriage on improved principles, constructed with single-leaf springs. These springs, which are seven in number, weigh only 12½ lbs.; they have been proved with 4 cwt., without taking any "set" or permanent deflection. They are shown on a testing-machine,



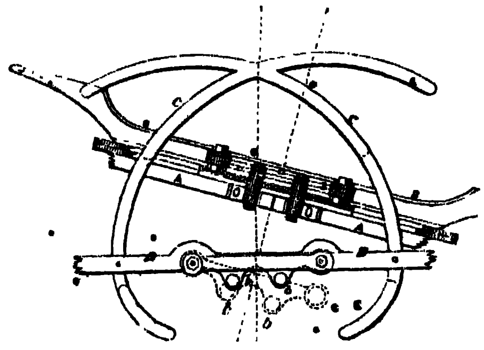
Rock and Son's Patent Dioropha.

by means of which they may be compared with springs of the ordinary kind.

The illustration represents the carriage described above, with the clarence-head suspended over it, ready to be lowered when wanted. The barouche-head and fittings for summer use, are shown by dotted lines. These are removed when the clarence-head is put on. The third form of the carriage (without either head) is shown.

958 SAUNDERS, CHARLES, *New Yard, Great Queen Street*—Inventor.

Newly-designed park brougham with circular front glasses, and round back; also an elegant double sofa back, with fluted roof, and self-acting ventilators, in glass frames. It has a detached driving boot, connected to side cranes that pass under the body, connecting the hind axletree, and dispensing with perch carriage, this being much tighter. By this mode, the body has the ease and motion of a chariot. Being hung with long braces, it destroys all the drumming noise which is too frequently heard in close carriages. It has also got the exhibitor's newly invented double lever wheelplate, locking on two centres to shorten the carriage as much as may be required, bringing the fore and hind wheels closer together, and the axletree does not lose the centre of the body when the carriage is being locked. B shows the top bed, which forms a part of the top carriage. The central part of this bed is allotted to receive three levers *b c c*, which are jointed at each end with a perch bolt. The middle lever *b* is bolted to the under carriage, and the top and bottom levers *c c* are respectively attached to the allotted top bed *b* by fulcrum pins on which they turn; *c c* is the wheelplate attached to the top carriage, the figure of which is made up from curves struck from the centre of fulcrum pins, making two distinct circles (as will be evident on inspecting the drawing). A is the friction plates attached to futchells, and having the same curves as the wheelplate, forming a bed for that to slide over. When locking, the carriage draws the lever *b* from its recess, and causes the upper or the under lever (as the case may be) to accompany it; but immediately the carriage is changed to straight draught, the same effect is obtained as if there was a central bolt attachment. This invention is applicable to any carriage.



Saunders' Double Lever Wheelplate.

960 SAWYER, WILLARD, *St. James's Street, Dover*—Inventor and Manufacturer.

A velocipede.

962 SHANKS, ROB. H., 4 *Great Queen Street*—Manufacturers.

Step-piece landau, on elliptic springs.

964 SHILLIBEER, GEORGE, 1 *Commercial Place, City Road*—Inventor, Patentee, and Manufacturer.

A patent funeral carriage, expanding and contracting at pleasure.

965 CLARKE & WILLIAMS, 447 *West St*—Inventors.

Spring propeller.

966 SHILTON, THOMAS, *Baddesley Ensor, near Atherstone*—Inventor and Manufacturer.

A carriage-wheel, with spoke of improved construction, intended to give greater elasticity and strength to the parts. The same construction may be applied to agricultural purposes.

968 SILK & BROWN, 8 *Long Acre*—Designers and Manufacturers.

Barouche hung upon improved horizontal springs.

Carriage, hung upon a swan-neck perch and C, and under springs.

970 HILL & STONE, 21 *Little Moorfields*—Inventors.

A park phaeton, with head to put up or down by the sitters, at pleasure.

971 SHUFF, WILLIAM, 1 *Dover Street, Islington*—Inventor and Manufacturer.

Public and private carriage retarder.

972 SMITH, O. H., *Pimlico Wheel Works, Upper Belgrave Place*—Proprietor.

Wheels for gun carriages, railways (wood), agricultural machines, Scotch carts, dog carts, brewers' drays, safety cabs, trotting carts, broughams, and carriers' vans, made and put together by machinery.

976 SWAIN, THOMAS, 15 *Charles Street, Hackney Road*—Designer.

A card-board model for a church, painted in oil; the same for a mail coach pulling up to unskid, with country scenery.

978 THOMSON, G., *Stirling, Scotland*—Manufacturer.

Four-seated gig, not liable to duty. By shutting up the hind foot-board, the vehicle is altered in the balancing, and adapted for the use of two persons only.

979 THORN, W. & F., 10 *John Street, Oxford Street*—Inventors and Manufacturers.

Brougham, with æquimotive springs, self-acting invisible step, and a new system of ventilation.

982 THRUPP, CHARLES JOSEPH, 269 *Oxford Street*—Designer and Manufacturer.

Four-wheeled carriage, a landaulet brougham, of a new shape. Two-wheeled carriage, the shamrock car.

984 TILBURY, JOHN, 35 *Gloucester Place, New Road*—Manufacturer.

Light sporting phæton, with patent noiseless wheels, pole, splinter-bar, and shafts.

988 VEZEY, R. & E., *Long Acre, Bath*—Inventors and Manufacturers.

Newly-designed sovereign sociable, with the exhibitors' springs and axles, having India-rubber bearings of new construction, registered 12th March 1851.

The advantages of the improved elliptic carriage spring, with registered hoop or cap, are—1st. That the cap gives greater elasticity to the spring, and imparts to it an easy and quiet motion. 2nd. The concussion, or jar, communicated to the spring by the rotation of the wheels upon the road, is received by the blocks of elastic material, which, acting as a non-conductor, prevent any vibration being given to the upper half of the spring to which the upper beds and body of the carriage are attached, thus producing a soft, easy, and pleasant motion, and releasing the body from the disagreeable noise and vibration caused by the action of the old elliptic spring. One of the new springs is exhibited as a testing machine.

989 **WALKERS, GEORGE, JAMES, & HENRY GILDER,** 16 *White Lion Street, Norton Folgate*—Inventor and Manufacturers.

Registered single brougham carriage; with additional front, to form double brougham at pleasure.

Improvement in lamp-irons, in order to throw light inside the carriage.

Prepared caoutchouc round-robins to hind springs.

990 **WARD, J.,** 41 *Paris Street, Exeter*—Manufacturer.

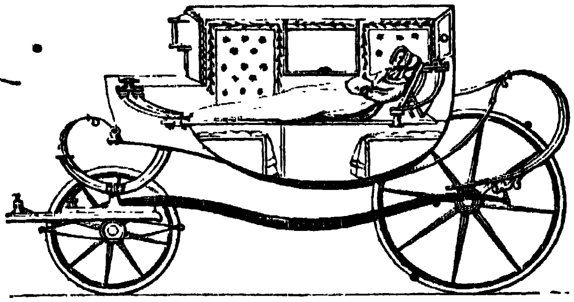
A cab park-phaeton, on springs, with leather robins and axles on Collinge's principle, having a platform behind so constructed that a seat is formed which can be raised if required, and arranged so as to sit forward, or the contrary; when as a platform, it is an opera-board to turn up. The platform seat is applicable to any carriage.

991 **WATTS, CHARLES,** *Parkhurst, Isle of Wight*—Inventor and Manufacturer.

Velocipede, consisting of three wheels.

992 **WILLOUGHBY, SOLOMON,** *John Street, Oxford Street*—Inventor and Manufacturer.

Carriage by which invalids with fractured limbs, or severely afflicted, may be removed from their beds without change of position or fatigue.



Willoughby's Invalid Carriage.

993 **FULLJAMES & CO.,** 4 *Brownlow Mews, Gray's Inn Road*—Manufacturers.

A carriage jack.

995 **WILSON, JACOB,** 26 *Portland Street, Walworth*—Designer.

Improved velocipede, constructed principally of iron, adapted for exercise or amusement.

996 **WYBURN, MELLER, & TURNER,** 121 *Long Acre*—Manufacturers.

Dress chariot.

997 **WARD, JOHN,** 5 *Leicester Square*—Designer and Manufacturer.

Four-wheel pleasure-ground Victoria chair, in framed carriage, upon C elliptic, and body springs, with patent vulcanized India-rubber tires; to be drawn by hand or pony. The chair is lined with blue figured satin, designed and woven by Messrs. Draper of Holborn.

Improved recumbent chair for invalids, spring stuffed, covered with Utrecht velvet, mounted on brass wheels, and adapted for a bed or couch; with shifting elbows, for the convenience of the patient; double action leg-rest, reading-desk, sconces, &c.

Spanish mahogany portable folding-chair, adapted for invalids, and easily drawn; covered in scarlet morocco; mounted on patent noiseless wheels, engine-cut cogs, silver handles, shifting foot-rest, cylindrical guide-wheel, &c.

998 **DUNN, J.,** *Rainton Colliery, near Durham*—Inventor.

A new railway for reversing locomotive engines, &c., instead of a turn-table.

The utility of this reversing railway is stated to be to give quick despatch to the engines and trains, it being unnecessary to disengage them, as is the case when turn-tables are employed. Another convenience is, that there are no facing switches in the up or down lines.

999 **DURHAM, Earl of,** *Lambton Castle, Durham.*

Improved coal drop, for loading ships, extensively used in the exhibitor's mines, collieries, &c.

1000 **TUNSTALL & WILLIAMS,** *Bath*—Inventor.

Self-acting invalid chair, enabling the invalid to alter the recumbent posture with facility.

1001 **WINTERBORN, JOHN,** *Hackney Road.*

Model of a steam-engine.

SECT. II. CLASS 6.

MANUFACTURING MACHINES AND TOOLS.

INTRODUCTION.

THE preceding Class illustrates the development of manufacturing power; the present is intended to represent its applications to the purposes of manufacture. The machinery included in this Class has this distinguishing feature, that it is the representative of man himself engaged in industrial production. Many of the machines to which attention will be drawn in this part of the Catalogue are so constructed as to fulfil functions which were accomplished formerly only by direct human labour. And, what is also highly deserving of notice, the perfection of their execution and the certainty of their operation exceed that attainable in most instances by the highest exercise of human skill. The productive power of such machines, capable of being driven at a high velocity, and of an almost indefinite multiplication of individual producing parts, is limited only by the means of the manufacturer. As the machines in Classes 5 and 6 are intimately related to each other, so as to render the perfection of the one necessary to that of the other, it is deserving of notice that both in the production of admirably-contrived prime movers, and in that of manufacturing machines, the mechanists of this country have made astonishing progress during the last half-century.

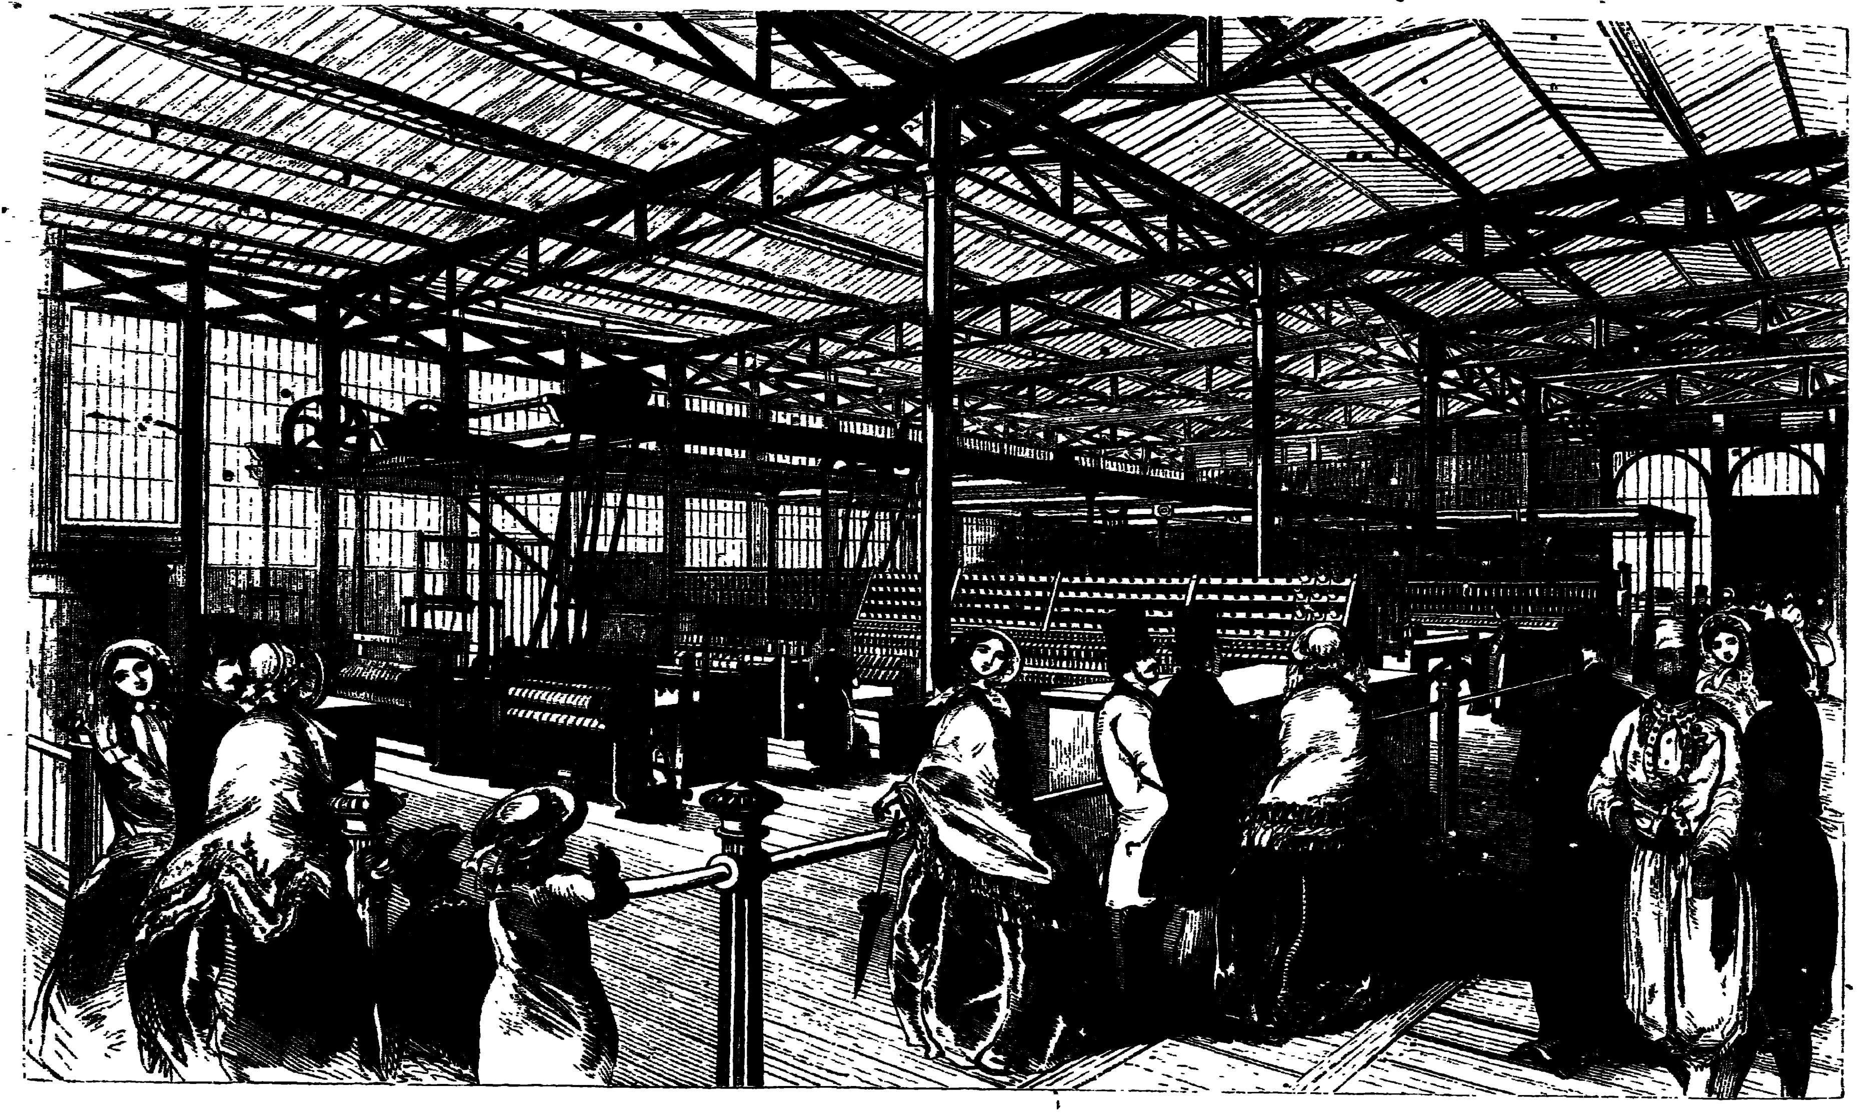
The Class includes manufacturing machines and tools employed in the manufacture—A., of Spun, Woven, Felted, or Laid Fabrics; B. in the manufacture of Metals; C. in that of Mineral Substances, together with Mining Machinery; D. in the manufacture of Vegetable Substances; and E. of Mineral Substances. It also comprises F. Machinery and Apparatus for Brewing, Distilling, and manufacturing Chemistry.

The position in the Building of the machines and systems of machinery, included in this Class, is at its north-western extremity and side. It is approached either from the western end of the Nave, at its proper commencement in the room chiefly occupied by cotton-spinning machinery, or it may be reached from other portions of the Nave by penetrating through the Areas on its northern side. The Class commences at Areas C. D. and E. 1, and extends through the same to 10. This part of the Building is partitioned from the rest, partly with a view of obtaining the requisite degree of temperature for cotton-spinning, partly to exclude the noise, and also the light dust which always fills the atmosphere of rooms in which this process is carried on, and which is destructive to objects in other departments of the Exhibition. Entering another part of the Building at A. B. C. 10, machines in this Class will be found extending to Areas 30 of those letters. And in D. E. F. from 19 to 27, they are also met with.

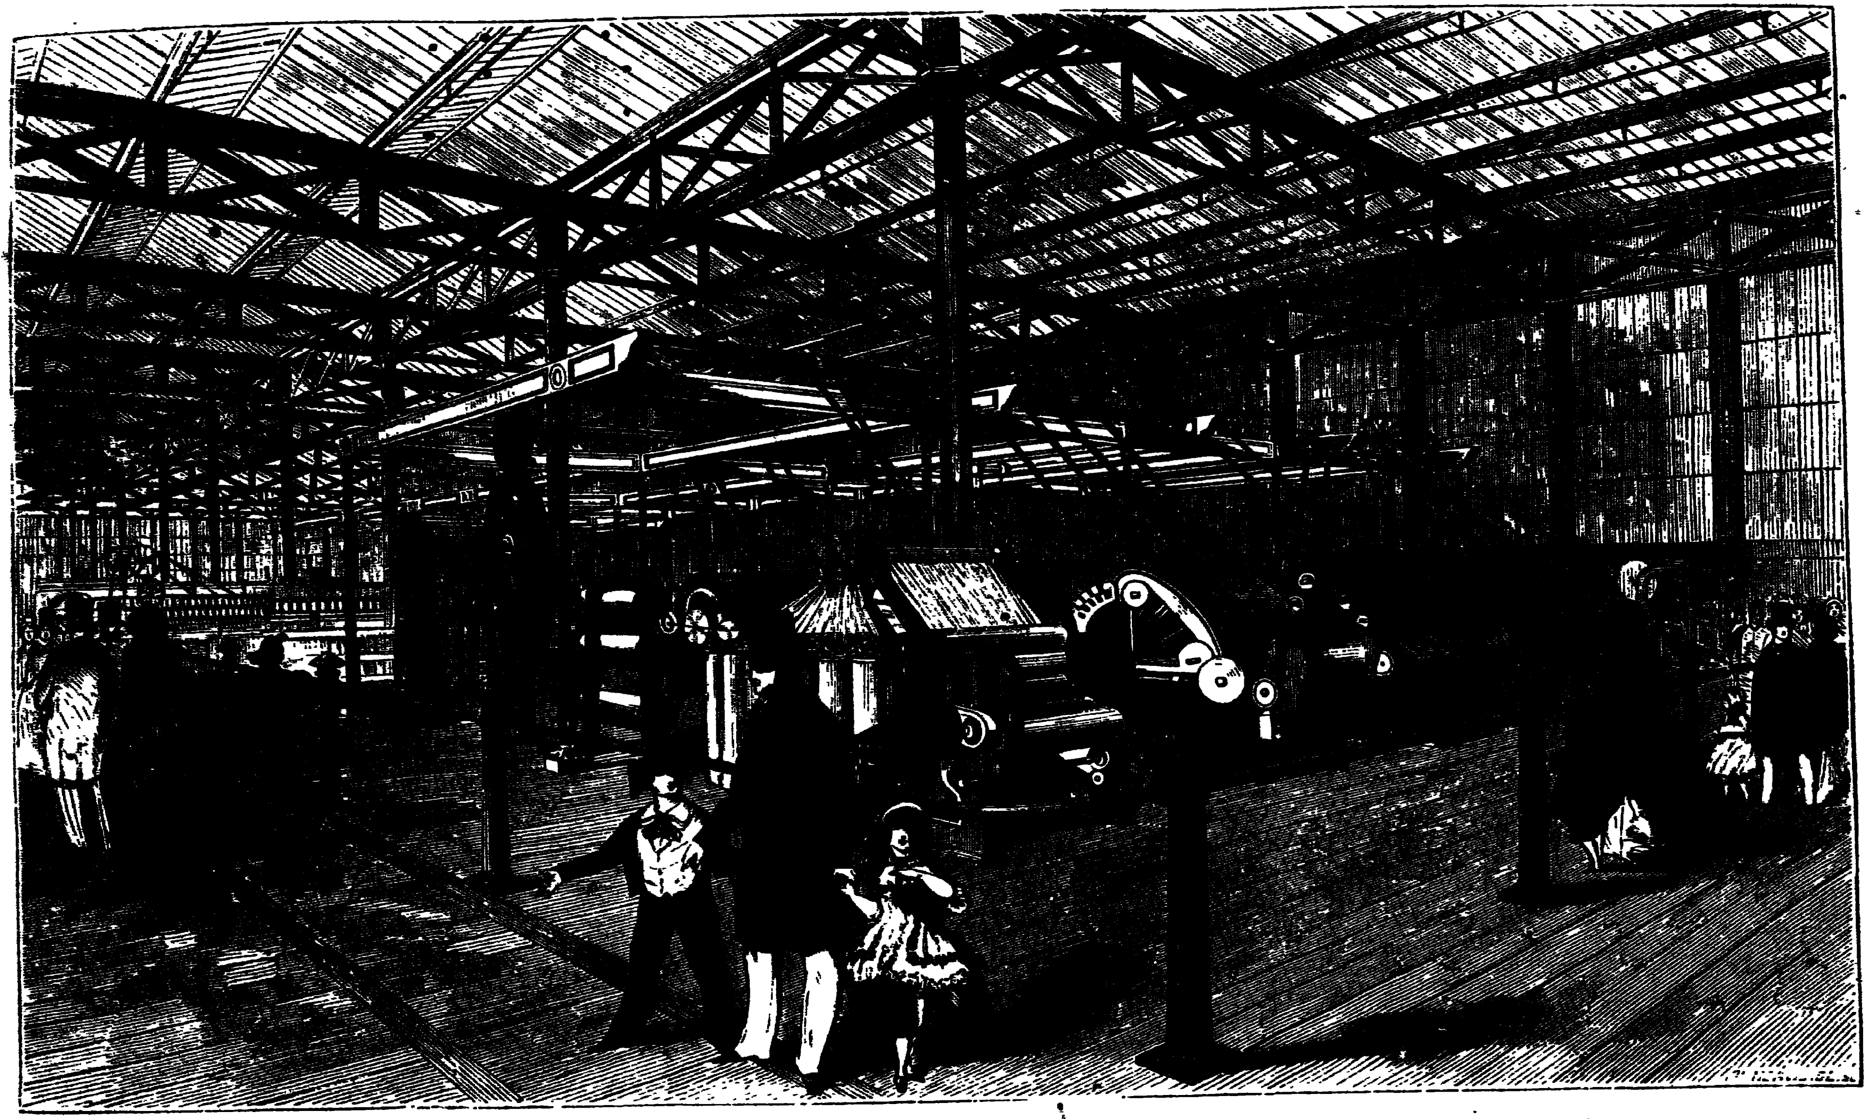
The recorded history of cotton-spinning, and its connexion with that of our country, have been rendered familiar to every person; but the interesting illustrations of the progress and perfection of this department in manufacturing industry, presented in this Class, convey a lesson more forcible and permanent of its kind. A complete series of machines is exhibited in one room, by virtue of the operation of which the raw cotton is opened, carded, doubled, spun, warped, and woven. At one extremity of the space occupied, cotton from the bags is made to enter the preparatory machine, while at the other it emerges completely fabricated and fit for use. Various parts of these machines are likewise shown. The beautiful automaton card-setting engine for making cards for the cotton-carding machines is also in motion, producing those ingenious ribbons of iron-wire brush. The whole of the cotton-spinning machinery exhibited combines the latest improvements, and demonstrates that perfection of workmanship which is capable of uniting in a manufacturing machine facility of motion, compactness and elegance of arrangement, precision of action, and power and speed of production.

A number of looms of different kinds are likewise among the important objects of this Class. The Jacquard loom, with its hundreds of cards and complicated harness, for the production of the patterns of woven goods, and the ordinary power-loom occupied in manufacturing the commonest sort of calico, are alike shown. Factories exist in this country in a single floor of which many hundreds of these looms are in continuous action, impelled by steam-engines of vast size and power. An old loom, of fifty years' date, forms an instructive contrast to the smaller but more powerful and productive engine by its side.

The manufacture of flax is represented by various powerful machines in operation. Several recent improvements are exhibited in these machines, and their product is presented to examination and investigation. The difference of fibre between flax and cotton necessitates the adoption of a somewhat modified system of manufacturing machines: these are shown in motion. Silk throwing and winding are illustrated by the elegant machines specially fitted to that purpose. The production of lace, bobbin-net, &c., by the wonderful mechanical arrangements contrived for that purpose, is also represented, together with the machine employed in the curious process of "gassing," or singeing off by gas-flames, the loose fibres of lace, &c., without injury to the fabric.



123. PERSPECTIVE VIEW, LOOKING WESTWARD, OF MESSRS. HIBBERT AND PLATT'S COTTON MACHINERY, AND MESSRS. HICK AND SON'S DRIVING GEAR.
THE POWER LOOMS ARE IN FRONT—THE THROSTLES AND MULES IN THE REAR.



122. PERSPECTIVE VIEW, LOOKING EAST, OF MESSRS. HIBBERT AND PLATT'S COTTON MACHINES, AND MESSRS. HICK AND SON'S HIGH-PRESSURE STEAM-ENGINE AND DRIVING GEAR. THE LAP MACHINE IS IN FRONT—THE CARDING MACHINES IN THE REAR.

Paper-making machines are illustrated by models; but several large printing machines are exhibited in operation. Several varieties of these are found: the "flat" machine, the horizontal cylinder machine, and the recently-invented vertical machine, capable of performing a very large amount of work in a short space of time. An envelope-folder, and other apparatus connected with paper and printing, are also found among the machinery in this Class.

Many powerful machines employed in metal manufactures are met with. The drilling, punching, and clipping engines, together with the slotting, chasing, and planing machines, and the large power-lathes for turning heavy castings, borings, &c., are extremely interesting, although essentially consisting of simple parts. Mills for various purposes, mineral and vegetable, presses, aerating, and a variety of other machines included in the Class, are represented in various parts of the Building appropriated to it.—R. E.

1 **HIBBERT, PLATT, & SONS**, *Hartford Works, Oldham*, Inventors and Manufacturers.

An improved patent opening and cotton-cleaning machine. This machine differs from others used for the same purpose, inasmuch as all fibre cleaned in it is passed between cylinders so constructed that all motes, seeds, &c. &c., are thrown down beneath it, making the operation of cleaning simple and cheap. The diameters of the cylinders of this machine are 9 and 12 inches, and the width 36 inches, making about 500 revolutions per minute, they consequently require less power than is necessary to drive the machines constructed upon the old principle. The power required for cleaning 3,000 lbs. per day, is from 1 to 1½ horse, according to the state of the material.

[Cotton or cotton-wool is the hairy covering of the seeds of several species of *Gossypium* growing in South America, India, Egypt, &c. It is separated from the seeds by a machine called a cotton-gin, then packed with strong pressure in bags, in which state it is received in this country.

The cotton is cleaned in a willowing machine, or in a batting, or scutching and blowing machine. The willow consists of a conical drum, the axis of which is placed horizontal or nearly so. The surface of the cone carries a series of projecting pegs or spikes, and the upper portion of the case which covers and partly encloses the cone is furnished on its inner surface with a similar series of spikes, the spikes of the cone moving in the intervals between the spike of the case. This machine is fed at the smaller end of the cone by means of an endless apron formed of thin spars of wood, each about three-quarters of an inch broad and half an inch apart, fixed at the ends to two endless leather straps which move round rollers. The cotton being placed upon this creeping apron, is slowly introduced into the willow, where it is seized by the revolving spikes, and whirled round with increasing velocity, due to the increasing surface of the cone, until, in a few seconds, it arrives at the large end, where it falls upon a moving apron, which carries it away or turns it out upon the floor. While the cotton is being teazed out by the spikes of the cone, the heavier impurities, such as twigs, sand, stones, &c., fall out through the open lattice or grid-work which forms the bottom of the machine. The lighter impurities, such as dust, &c., are driven by centrifugal force to the large end of the cone, where they pass out through a spiral cage sieve into square pipes which convey them away.—C. T.]

Single scutcher and lap-machine, used for taking out the remaining sand, &c., and for forming the cotton into laps to feed the breaker carding-engine. The novelty in the construction of this machine consists chiefly in the application of the "patent consolidating calender rollers," by which the "felting" of the cotton is performed in a superior manner, and its bulk so compressed as to admit of an increase of 40 per cent. on the "lap" roller. By this means a considerable saving of labour is effected at the carding-engines.

[The batting or scutching and blowing machine carries on the work of cleaning the cotton which has been begun by the willow, and serves also to open the matted tufts. The cotton being spread upon a feeding apron, is introduced into the machine by means of feeding rollers; as soon as it gets within the machine it comes under the beating action of flat bars, which are moved round with great rapidity, and strike with their fans upon the cotton fibres as they slowly escape from between the feeding rollers. It is then conveyed out of the machine and turned out upon the floor. It is next passed to another scutching machine, in which, after being batted, it is formed into a cylindrical roll or lap, ready for the carding engine.

In many cases, however, the scutching machine and the lapping machine are combined, in which case the willowed cotton is spread by hand upon a feed-apron to the thickness of about 2 inches, and this is carried forward at the rate of about 3 feet per minute between a pair of coarsely fluted iron feed-rollers, which are pressed together by a weight acting through a lever on the brass bearings of the top roller. There is also a wooden roller, which serves to keep the cotton close to the apron, so as to allow it to pass readily between the feed-rollers. As the cotton passes into the machine between the feed-rollers it is struck by the first beater, which consists of two flat bars fixed at right angles upon the arms of a shaft revolving 2,000 times per minute. The cotton, on being struck and whirled round by the beater, is at the same time struck against the edges of long flat bars, arranged in the form of a quadrant of a cylinder. The cotton tufts are thus opened, and the filaments wafted upon an endless apron, near the end of which is a revolving cage cylinder, enclosed under the general cover of the machine; over this cage is a pipe communicating with a rotatory fan, which, by rarifying the air, causes the dust of the cotton to escape through the cage into the pipe, whence it is carried away: the cage also serves to spread smoothly upon the apron the loose cotton filaments into a level mass or lap. This is conveyed away under a wooden roller, and passed between a second pair of feed-rollers, to be exposed to a second scutching by beater-bars revolving more rapidly than the former. This second beater delivers the filaments to a second apron, which passes it under a second revolving sieve cylinder connected with the fan ventilator, by which means the cotton is again formed into a lap, which is passed out of the machine by the rotation of rollers. It is then carried between two pairs of iron rollers, the upper of which are loaded, which compress the filaments and form them into a kind of felt. This felt or lap is delivered to a wooden lap-cylinder, the axis of which is loaded, and thus made to bear down between two rollers which revolve both in one direction, and carry round by their friction the lap-cylinder. As this increases in diameter it rises up, together with the links at the ends of the axis, which carry the weights, and thus the pressure continues uniform. When the coil of lap has attained a certain size, the rollers which turn the aprons, cages, and feed-rollers are thrown out of gear, while the rollers which support the lap coil continue to revolve. By this contrivance the lap is torn across; the attendant then removes it, puts an empty lap-cylinder in its place, and throws the machine into gear.

The laps from different machines are frequently combined into one lap, for the purpose of further equalizing the quality of different varieties of cotton. This is done at a lap machine, in which an endless apron moves between a frame, on which are slot-bearings for receiving the ends of the pins which support the laps. There are as many pairs of slot-bearings on this frame as there are different laps to be mixed. Each lap being unwound by the motion of the apron, the different laps are carried forward in parallel layers lying over each other; they are then all scutched and formed into one single lap as before. This is sometimes called a spreading machine.

For the finer varieties of cotton the laps are formed by hand.—C. T.]

Breaker carding-engines: used for further cleansing, combing, and laying the fibres of the cotton. The laps from the scutcher feed this machine, and are reduced by it into continuous webs, which are delivered into cans at the front of the machine. The novelty of these machines consists, first, in the method of feeding the card by means of a dish, straight-edge, and large roller. Secondly, in the cylinders, doffers, rollers, and strippers being made of iron. And, thirdly, in the method of adjustment of the bearers or carriers for the rollers and strippers. By means of the dish, straight-edge, and large roller, the fibres of the cotton are held until combed away by the cards of the licker-in, and can be adjusted to suit any length of staple of cotton. These machines, being constructed of iron, are not liable to "warp" from variation of temperature, and the method of applying the bearings for carrying the rollers, is so simple as to be capable of the finest adjustment.

Lap-machine: used for making laps to feed the finishing carding-engine. The cans from the breakers feed this machine, and the cotton is again formed by it into laps for the next operation. The patent consolidating calenders are also applied to this machine with the same advantage as in the scutcher.

Finishing carding-engines. The laps made in the last machine are taken in by this; and the fibres are again drawn, combed, and so completely straightened as to insure a more perfect evenness in the web, which is then delivered and coiled into cans. These machines are supplied with the same improvements as the breaker carding-engines.

Grinding machine: used for grinding and sharpening the teeth of the cards on the rollers, and flats of the carding-engines.

[In the laps thus formed, the cotton filaments are in a compressed state, crossing each other in all directions. In the next operation, which is carding, they are made parallel, or brought into a state favourable for parallelism. In this operation also any remaining impurities are completely removed. Carding is a sort of double combing. If we suppose the teeth of one comb to be set or bent in one direction, and the teeth of another comb to be set in an opposite direction, and that these two combs be moved against each other, with a tuft of cotton between them, the fibres will be seized by the teeth, those of one card will pull them one way, those of the other card will pull another way, and by repeating the operation many times the curls, and twists, and crossings of the cotton will be opened and drawn out, and the fibres will be arranged in parallel lines. In the carding-engine the teeth are formed of thin iron wire, arranged on bands or fillets of leather, or other suitable material, made of uniform thickness, and attached to a set of cylinders and curved surfaces, the former being made to revolve so as to sweep over the surfaces of the latter at rest; or a number of parallel cards on the surface of a large drum work against the surfaces of smaller cylindrical cards moving with a less velocity. The two plans may, however, be combined in the same engine. The tufts of cotton are held by the stationary or slow-moving cards, while the quick-moving cards comb out the fibres, and gradually disentangle them.

The main carding cylinder or drum has attached to its surface strips of card-leather, equal in length to the width of the drum. Over a portion of this drum is a number of long strips, the under surfaces of which are covered with card-leather; these strips are called card-tops, and their ends rest on the heads of adjusting screws, projecting from the side framing. Nearly in contact with the large drum are a number of small rollers, called *urchins* or *squirrels*, covered with card fillets, wound spirally round them.

The lap roll, prepared by the lapping machine, is mounted at one end of the carding-engine; and being gradually unwound, passes along the surface of a feed-board, between a pair of feed rollers, until it comes in contact with the first roller-card, or licker-in, which draws in the filaments of the cotton As this card, No. 1, rotates, its teeth come in contact with the teeth the large drum, which strip off the filaments; but the rotation of the drum almost immediately brings it in contact with the squirrel, No. 2, which strips off the filaments from the drum, and, by its revolution, transfers them again to No. 1, which again delivers them to the drum, together with fresh filaments taken up from the feeding-rollers: the filaments which escape the action of Nos. 1 and 2 are seized by No. 4, which is placed much nearer to the drum; the cotton thus taken up by No. 4 is combed out by No. 3, which is nearly in contact with it but moving with greater speed. From No. 3 it is again transferred to the drum, to be carded out again by No. 4, and any filaments which still remain are arrested by the first flat top-cards, and held until they are disentangled by the revolution of the drum. In this way the filaments become gradually arranged on the surface of the drum in nearly parallel lines, which is the condition sought for, and in this state they are not teazed off by the urchins, but pass round to the opposite end of the machine, and are removed from the drum by a smaller drum card, called a doffer or stripper, on the surface of which the cards are arranged in spiral lines. The fine fleece of the transparent web is removed from the doffer by means of a doffing knife, the lower edge of which is toothed like a fine comb, and this, by the action of a crank, is made to strike down with a rapid motion over the points of the cards. The fleece thus shaved off is equal in breath to the length of the card on the doffer, and it is disposed of in one of two ways. There are usually two carding engines, the first called the breaker-card, and the second the finisher-card, and the cotton is passed through both. In the breaker-card, as the fleece is taken off by the crank and comb, it is wound upon a large wooden roller, which, when filled, is removed and used for feeding the finisher-card. As the fleece is removed from the finisher-card it is contracted into a narrow riband, by being passed through a funnel, then through three pairs of rollers, the bottom roller of each pair being finely fluted, and the top roller of each pair covered with leather, and the top rollers are pressed upon the bottom ones by weights suspended from their axes. The middle pair of rollers moves at a greater speed than the first pair or that nearest to the engine, so that while the first pair delivers the filaments the second pair pulls them, before it delivers them to the third, the effect of which is to draw and straighten the fibres, and spread them out into a flat riband, called a card-end or sliver. But before this sliver passes to the third pair of rollers it is opened out and made spongy in texture, by being passed through an upright slit situated between the second and third pair of rollers; it is then passed between the third pair, which are but slightly pressed together, and the sliver is finally received into a tall tin can.—C. T.]

Drawing-machine: used for doubling and drawing the web or sliver prepared by the finishing carding-engine, and delivering and coiling it into cans for the next operation. This machine is furnished with a series of self-acting guides, which stop the machine as soon as the sliver breaks, in passing from the can to the roller. It is also fitted up with the coilers and revolving motions to the cans.

Slubbing-machine, 28 spindles: used for drawing the slivers prepared by the last machine, and afterwards twisting and winding them on bobbins.

Second slubbing or intermediate machine, 54 spindles used for doubling and drawing the slubbings, and twisting and winding them on bobbins for the creels of the roving machines. This machine is introduced in order gradually to reduce the sliver, so as to obtain a more even and smaller thread.

[The next operation is intended to carry out, in a still more perfect manner, the operation which was commenced at the close of the carding, namely, drawing out and elongating the slivers, straightening the filaments, and laying them as parallel to each other as possible. Another object is still further to equalise the quality of the cotton, and make the slivers of uniform strength and texture, by combining many slivers into one; this is called doubling: and all these objects are attained at the machine called the drawing-frame. This consists essentially of three pair of rollers, of which the second pair moves with greater speed than the first, and the third more quickly than the second. These rollers are similar to those used in the finisher-card, with one or two additions. A mahogany bar, faced with flannel, rests upon the top rollers and strips off all the loose fibres; similar bars are also made to press up against the under-fluted rollers. The distance between the first and second pairs of rollers must not exceed the length or staple of the filaments of cotton, or the sliver might be torn apart by the pulling of the second pair, while the first pair held it firmly. The sliver is stretched most in passing from the second to the third pair.

The card-ends are usually supplied to the drawing-frame from the cans filled by the finisher-card, a number of them being guided along the channels of a metal plate, at the top of which they unite and pass between the first pair of rollers, which reduces them to one sliver, the second pair extends every inch of this compound sliver into about two inches; and the third pair extends these two inches into ten. The length of the sliver thus produced is generally equal to the sum of the lengths of all the separate slivers or card-ends employed. The single sliver, formed by the doubling or union of all these separate slivers, is passed between smooth iron rollers, which condense it, and it is then received into a can on the opposite side of the frame. When a number of cans have thus been filled, the *drawings*, as they are now called, are again doubled and drawn out into one, and, by repeating the operation several times, the defects of individual slivers or drawings are absorbed and got rid of, and uniformity is produced.—C. T.]

A roving-machine of 120 spindles: used for the same purpose as the last, and twisting and winding the slubbings on still smaller bobbins for the creels of the spinning machines. The improvements in the construction of these machines consist, *first*, in the self-acting motions for stopping the machine when the sliver breaks (used for the slubber only): *secondly*, in the patent bearing or collars in which the spindles work, and the methods of fitting the flyers on the tops of the spindles whereby a greatly increased speed is obtained: *thirdly*, in the application of the double patent pressure to the flyers, which preserves the equilibrium of the spindles whilst working, whether the bobbin be full or otherwise.

[By the preceding operations the cotton has been cleaned and the fibres laid parallel. It is now in the form of a loose porous cord, too thick to be spun or twisted into yarn. By the next machine, the bobbin and fly-frame, the drawing is again elongated, and partially spun, and the roving, as it is then called, is wound upon a bobbin. The spindle which, by rapidly revolving, puts twist into the drawing, is furnished with a two-pronged fork, called a fly or flyer. One prong of the fly is solid and the other hollow. The bobbin on which the roving is to be wound is threaded upon the spindle, and revolves with it at a different rate, and by a perfectly distinct movement. One frame contains from 30 to 120 spindles, and the action, which is alike in all, is as follows:—The sliver, as prepared by the drawing and doubling frame, is brought in cans to the bobbin and fly-frame, where it is elongated by passing between three pairs of rollers, and twisted, by the rapid revolutions of the spindle, into a soft cord or roving: this is passed into a hole at the top of the spindle, and then down the hollow arm of the fly; it is next twisted twice round a steel finger, which winds it upon the bobbin with a certain pressure. The finger, however, does not move up and down the bobbin, but the bobbin moves up and down upon the spindle, against the finger, by which means the roving is equally distributed upon the bobbin. It is necessary, however, gradually to slacken the velocity of the bobbin, as it increases in thickness by the winding, otherwise the roving would be improperly stretched or broken. The velocity of the front pair of rollers, which delivers the cord, and of the spindle which twists it, is constant; the motion of the bobbin which winds up the roving is quickest when it is empty, and its speed goes on gradually slackening until it is full. This diminution of velocity is occasioned by causing the strap which drives the bobbins to move slowly along the surface of a conical drum, which, revolving with a constant speed, the strap at the small end of the cone would of course impart a greater velocity than when it had arrived at the large end.

The roving is wound on the bobbin by causing the fly and the bobbin to revolve at different rates. If the bobbin, for example, revolve 50 times while the spindle revolve only 40, these 40 turns of the bobbin have nothing to do with the winding; the 10 turns of the bobbin above those of the fly perform the winding; so that while 40 turns of the spindle produce twist, 50 turns of the bobbin produce 10 coils of roving, upon its barrel. In some cases the winding is effected by the spindle revolving quicker than the bobbin, and in fine spinning, two rovings are doubled, and passed a second time through the frames.—C. T.]

A throstle of 160 spindles.

[The rovings thus prepared are finished at one of two machines, namely, the throstle and the mule jenny; the one spins the hard yarns, which are chiefly used in warps, and the other the softer yarns of wefts. This, however, is by no means a general rule.

The bobbins filled with rovings from the bobbin and fly-frame occupy the upper part of the throstle-frame. Each roving is passed through three pairs of drawing rollers, which draw it out to the proper degree of fineness. On quitting the front pair, the roving is guided by a small ring or a notch of glass let into the frame, towards the spindles, which revolve with great rapidity, and produce, by the motion of their flyers, a low musical hum, which is said to have given the name to this machine. By the rapid motion of the spindle, the roving is twisted into yarn, which, passing through an eyelet at the end of one of the prongs of the flyer, proceeds to the bobbin, which is threaded upon the spindle, and is wound upon it. The bobbin fits loosely on the spindle, its lower end resting upon a shelf, called a copping-rail, which has a slow up and-down motion, and thus distributes the yarn equally upon the bobbin. The motion of the bobbin upon its axis is derived from the tension of the yarn in winding: for while the flyer is spinning, the yarn drags the bobbin after it, but its weight and its friction on the copping-rail cause it to hang back; by this contrivance the yarn is kept stretched, and is wound upon the bobbin by the more rapid revolutions of the flyer.—C. T.)

Weft self-acting mule, 402 spindles: used for drawing or elongating the fibres, and twisting and winding the yarn on cops, for the shuttles of the looms.

Twist self-acting mule, 348 spindles. The same kind of machine as the one last described, but used for spinning thread or yarn for the warp instead of weft.

The improvements in these mules consist, first, in an improved patent drawing-out motion for the carriage, which can also be used, if required, for the purpose of "jacking or after-draft," in spinning fine numbers of yarn. Secondly, in the squaring of the carriage by means of a back-shaft, which secures steadiness whilst traversing; and is, consequently, of great utility in long mules. Thirdly, in a new mode of winding-on the yarn by a "catch-box," which dispenses with all the springs and levers previously used, thereby preventing the frequent breaking of the yarn, and the wear and tear of the machine.

[The mule or spinning-jenny consists essentially of two principal portions: one, which is fixed, containing the bobbins of rovings and the drawing rollers; the other a carriage moving upon iron rails, and capable of being drawn out to a distance of about 5 feet from the fixed frame. The carriage carries the spindles, to which a rapid rotatory motion is given by means of slender cords passing round them and a drum. There is one drum to about every 24 spindles, and as many as 1,000 to 1,200 spindles in one mule. At the commencement of the spinning, the carriage is run up close to the drawing rollers, which by their revolutions give out the roving which is twisted by rapidly revolving round the points of the spindles; the carriage is then moved away from the roller-beams somewhat more quickly than the rovings are delivered, by which means the yarns become stretched and equalised. When the carriage has been drawn out about 54 to 64 inches from the drawing rollers, it is said to have completed a stretch; the drawing-rollers cease to give out roving, but hold it firmly, while the spindles now whirling with increased rapidity complete the spinning into yarn. In spinning the finer yarns, the carriage makes a second stretch, during which the spindles are made to revolve with great rapidity. Any threads which may happen to break, are now pieced, or mended by children called, "piecers" or "pieceners." This drawing, stretching, and twisting of a length of yarn being completed, the mule is disengaged from the parts of the machinery by which it was driven out, and the spinner then proceeds to do his part of the work, which consists of three simultaneous operations: he pushes the carriage in with his knee; he depresses with one hand a copping wire, which places the yarns in such a position with respect to the spindles, that they can be wound up upon them; and, thirdly, he moves with the other hand a fly-wheel, which sets all the drums and consequently all the spindles in motion. He causes the spindles to revolve backwards for a moment, in order to slacken the yarns just completed, and to throw them off the points of the spindles. Considerable skill is required to perform these three operations successfully. The spinner must guide the copping wire so as to insure the regular winding of the yarn on the spindle; he must regulate the velocity of the spindles, and he must push the carriage in at such a rate as to enable the spindles to take up the proper quantity of yarn without stretching or breaking. These difficult and delicate operations can now be accomplished by self-acting machinery: the self-acting mule does the work in many respects better than it can be done by the spinner.

The quantity of yarn collected upon each spindle is called a cop. The yarn is wound from the cops, or from the bobbins of the throstle-frame, upon a six-sided reel, one yard and a half in circumference. The reel is mounted in a frame containing the cops or bobbins, and when the reel has made 80 turns, a check is struck, or a bell rung, which warns the attendant that a ley or rap of 120 yards has been wound. Seven of these raps make a hank of 840 yards. The size of the yarn is ascertained by weighing the hanks in a quadrant balance. The number of hanks to the pound may vary from 2 to 600. The hanks are made up in cubical bundles of 5 or 10 lbs. weight, by a machine called a bundling press.—C. T.]

A doubling machine: used for doubling and twisting a number of spun yarns into thread.

[The better descriptions of yarn are gassed, or passed two or three times through a gas flame, in order to get rid of loose fibres, and to make it more level and compact. Two or more yarns, doubled and twisted together in an opposite direction to the twist of the yarns themselves, form thread, properly so called.—C. T.]

A winding-machine: used for winding the yarn from the mules and throstle, and preparing it for the warping-machine. One side of this machine winds from cops spun in the mule, and the other from bobbins spun on the throstle. A warping-machine.

[When the yarn is required for weaving, it is prepared in different ways, according to the purpose for which it is intended. The yarns for the warp or long thread of a woven fabric are wound upon bobbins from which they are drawn in the process of warping. The warping-mill or machine is a large reel or frame-work of wood, with 12, 18, or more sides, which serve to measure the total length of the warp. This reel is mounted on a vertical axis, to which motion is given by an endless band, connecting the lower part of the axis with a wheel set in motion by the warper. One-sixth of the number of the bobbins of yarn required for the warp, is usually mounted loosely upon upright spindles, in a frame called a traverse. The yarns pass from these bobbins to the large reel, through an instrument called a heck-box, which is made to slide up and down between two upright posts by being suspended by a cord which, passing over a pulley at the top of the posts, is made fast to the axle: so that as the reel revolves, the heck is gradually raised from the bottom to the top, and when the mill is turned the other way it descends by its own weight, and thus the band of warp-yarn is wound in a spiral line from the top to the bottom of the reel. The use of the heck is to divide the warp-threads into the lease, or two alternate sets, one set for each heald of the loom. To effect this, the heck-block contains 120 or more steel pins, with an eye in the upper end of each, through which a yarn passes in the process of warping. The pins are arranged alternately in two frames, either of which may be raised at pleasure. The threads being passed through the eyes of the heck, the ends are knitted together, and fixed to a pin upon the mill. The mill is then turned slowly until the top lease pins come nearly opposite the heck. The warper then, lifting half of the heck-frame, raises half the threads, which he places upon one pin, and the other half upon another pin of the mill. In this way every alternate thread is crossed, and the lease is formed. When the warp has described a spiral line round the frame, from the top to the bottom, the threads are again passed over pins, the motion of the frame is reversed, and the warp forms another spiral line in a contrary direction. The operation is thus repeated until the whole length of warp is run out. The lease or crossing of the threads is secured by a band tied through them at the top, and another at the bottom. The warp is then removed, and wound up into a ball.

The bundles of yarn thus formed are spread out upon cylinders or yarn-beams; and, in order to distribute them equally, the threads are passed through a separator or ravel, formed of a number of shreds of cane fixed in two rails of wood. A dressing of glue, size, or paste is next given to the warp-yarns to increase their strength and tenacity, and to lay down the minute fibres which feather the yarn.* In the dressing machine the yarn-beams are mounted in a frame at one end; the threads are passed through a reed to keep them distinct, and then between rollers covered with felt, one of which dips into a trough containing the paste or other dressing. The lower roller gives paste to the yarn, while the upper roller squeezes out the superfluous quantity. The dressing is also rubbed into the fibres of the yarn, and smoothed over by means of cylindrical brushes, one above and the other below the warp, and moving in a direction contrary to that of the yarns. The warp is dried by being passed over a box or chest filled with steam, and a current of air is made to stream over it by means of a revolving fan. The warp is passed to the main yarn-beam of the loom, on which it is regularly wound, the threads being kept distinct by passing through a reed.

The warp-beam thus filled is suspended by its axis, so that the ends of the warp-threads may hang down, and the weaver then draws every yarn through its proper eye or loop in the healds. The alternate crossing of the threads is preserved by the *lease-rods*, and in drawing in, as the operation is called, the weaver can easily make each thread to cross the one next to it. When the threads have been passed through the eyes of the healds they are next drawn through the splits of the reed. The lease-rods preserve the lease of the threads, and the arrangement is as follows:—The first thread passes over the first rod and under the second, the next thread passes under the first and over the second, and so on alternately, the third rod divides the warp into splitfuls, two threads passing alternately over and under it.—C. T.]

Power-looms, the novelty in which consists, first, in the patent uniform winding or taking-up motion, which is effected by surface-rollers, without the aid of ground glass or emery, and is applicable to looms for weaving both light and strong cloths; and, secondly, in the method of holding the edges of the cloth during the process of weaving by an improved "temple."

[The loom used in plain weaving consists of—1. An apparatus for stretching the warp. 2. An arrangement for raising one-half of the threads of the warp and depressing the other half alternately, so as to open a space for introducing the weft. 3. A shuttle for casting the weft into the opening thus made. 4. Means for striking each weft-thread close up to the one previously thrown. The common loom consists of four upright posts with cross beams at the top and bottom. At one end is the beam or roll containing the warp, at the other end the cloth-beam, on which the work is wound as it is woven. The warp is kept stretched between the two by weights slung over the ends of the warp-beam. The alternate arrangement of the warp-threads is preserved by means of lease-rods. One-half of the warp-threads is alternately raised and depressed by the healds, which consist of a number of twines, looped in the middle or furnished with glass eyes, each alternate thread being passed through the loops of one heald, while the intermediate threads are passed through the loops of the other heald. The two healds are united at the upper part by a rope passing over a pulley, and at the lower part a rope proceeds from each heald to a treadle, by which means the lowering of one heald causes the other to rise. The yarns are also passed through the teeth of a reed, which is set in a moveable swing frame, called the lay or batten. At the bottom of this frame is a channel, called the shuttle-race, along which is thrown the shuttle, a boat-shaped piece of wood containing, in a hollow in the middle, the cop of yarn which is to form the weft or cross-threads of the web of cloth. At the side of the shuttle is a small hole, through which the weft-yarn runs freely as the shuttle is shot along. The shuttle is sometimes furnished with wheels on the under side, and may be shot backwards and forwards by hand or by pickers or peckers, as in the fly-shuttle; in which case, the two ends of the shuttle-race are closed, and two pieces of wood, called pickers, move along wires. To each picker a string is attached, and both strings meet loosely in a handle, which is held in the right hand of the weaver. When the shuttle is at one end of the race a smart jerk of the picker projects it along to the other end, and another jerk in the contrary direction urges it the other way. Every time a thread of weft is to be thrown across the warp the weaver has to perform three distinct operations—1. To press down one of the treadles, by which means every alternate thread of the warp is depressed, forming what is called the *shed.* 2. To throw the shuttle across so as to lay a thread of weft in this shed. 3. To drive the thread of weft close up to the web by means of the batten. As the web is completed it is wound round upon the cloth-beam, and the breadth of the unwound portion is kept extended by two pieces of wood, called temples, furnished with sharp points at the ends.

In plain weaving, the warp and the weft-threads are of the same colour and usually of the same degrees of fineness. By introducing yarns of different degrees of fineness, at regular intervals, a striped cotton is produced. By having the warp-threads of one colour and the weft-threads of another colour, shot patterns are formed. Coloured stripes are formed by introducing coloured yarns into the warp. In these and various other cases every thread of the warp and weft cross alternately at right angles. In twilled or tweelled cloths only the third, or the fourth, fifth, or sixth, &c., threads cross each other. Figures, flowers, or patterns of any kind are produced by dividing the warp between a number of healds, which can be raised or lowered at pleasure, while threads of different colours may be either concealed or brought forward upon the face of the fabric, or be made to change places according to the pattern. The Jacquard loom, as it is called, is a contrivance attached to a loom for raising or concealing different threads.

---

* The dressing machine is not exhibited.

In the power-loom, the services of the weaver are dispensed with, the various movements being performed by self-acting machinery, driven by the steam-engine.—C. T.]

Messrs. Benjamin Hick and Son, Soho Foundry, Bolton, are the makers and exhibitors of the steam-engine (6-horse power), together with the mill-gearing and framing for turning the above machinery.

The card clothing on four of the carding engines was manufactured by Joseph Sykes and Brothers, Lindley, near Huddersfield; and that on the other two by Mr. Horsfall, of Manchester.—See Plates 122 and 123.

---

2 **BOOTH & CO.**, *Preston, Lancashire*—Manufacturers.

Mule spindles, with buttons and drum warves, and mule spindles with buttons and cylinder warves, for spinning cotton and silk; they are made capable of revolving at the speed of about 7,000 revolutions per minute. The shape of the top of the spindle lessens the vibration of the yarn, and consequently the breakages.

Throstle spindle and fly, for spinning cotton, silk, flax or worsted.

Roving spindle and fly, for spinning cotton. The fly is supplied with Iver's patent spring, &c.

Winding spindle, for winding cotton, silk, &c.

Spindle, for reeling cotton, silk, &c.

Skewer, for winding cotton, silk, &c.

---

3 **CRABTREE, THOMAS**, *Godley, near Halifax*—Manufacturer.

Card-setting machine; which accomplishes the entire manipulation for producing the complete card from the wire and leather or cloth in their primary state; it will make cards for wool, cotton, or silk; used in the manufactory of Messrs. J. Sykes and Brothers, card manufacturers, Acre Mills, Lindley, near Huddersfield.

[A card, for carding cotton, wool, and other analogous fibrous substances: it consists of a series of forked wires, both ends of which are inserted through holes made in a strap of leather, and then bent very regularly to the required inclination. Cards in the carding engine seem to lay all the fibres of cotton or wool in one direction, accumulating it into a loose mass called a fleece, preparatory to the process of spinning. The first card-making machine was patented by J. C. Dyer, of Manchester, in 1811, and is said to have been the invention of an American named Whittemore. It is a most beautiful and efficient piece of mechanism.—W. D. L. R.]

---

4 **DALTON, JOHN**, *Mottram-in-Longendale*—Inventor.

Machine for printing calicoes, de laines, and other textile fabrics. By one process a corresponding or varied pattern is printed on each side of the fabric. It may be employed as a double printing machine, for printing on one side two pieces at the same time. The construction is applicable to printing machines generally, and consists in substituting for the ordinary iron printing cylinder, a newly-invented cylinder, constructed with the exterior surface of gutta percha, and in dispensing with the use of the endless-web or blanket, and the lapping, which is required in the ordinary machines, to afford a yielding surface to the action of the engraved roller. These new cylinders possess in a great degree the properties of permanence and elasticity, and are superior to other appliances, from their increased efficiency and economy. A more accurate and uniform impression of the pattern is obtained, and a saving of one-third of the power required to work the ordinary machines is effected. When used in two or more coloured machines, the fitting-in of the pattern will be correct, and without variation; and no allowance, as usual, at present, will need to be given to the engraved rollers to compensate for the extension of the web.

5 **PRESTON, FRANCIS**, *Manchester*—Manufacturer.

Spindles and flyers used in preparing, spinning, and doubling of cotton, silk, worsted, woollen, and flax.

[Several American machines exhibited in this portion of the Building.]

---

6 **PARR, CURTIS, & MADELEY**, *Manchester*—Manufacturers and Patentees.

1. Carding engine, made with rollers and clearers.

2. Drawing frame of three heads, three boxes to each head, with four rows of rollers, patent coilers, and revolving can-motion, and patent stop-motion.

3. Slubbing frame, with patent improvements, which consist in the application of a coiled spring to the presser, giving it a more uniform pressure, and reducing the weight of the flyer. A frame is fastened to the beam, on which a carriage moves, carrying the tension weight for lightening the cone strap instead of allowing it to rest on the grooved shaft, and gearing is applied to the shortening and traverse motions.

4. Roving frame with the same patent improvements as applied to the slubbing frame.

5. Patent self-acting mule, 1⅜ inch gauge, similar to Sharp and Roberts, with patent improvements, which consist in the application of a positive motion to produce the required changes, dispensing with the use of the cam shaft, and other important advantages.

6. Patent self-acting mule, 1¼ inch gauge. An adaptation of Sharp's radial arm to Smith and Robertson's mangle wheel and stripping mule, with patent improvements.

7. Patent self-acting mule, 1⅛ inch gauge. Arranged with the headstock at one end, with patent improvements, which consist in the peculiar arrangement of the headstock, and in the novel motion applied to wind the yarn on to the spindles.

8. Planing machine for metals; self-acting in the horizontal, vertical, and angular cuts. Its chief objects are strength and simplicity.

9. General shaping machine, for shaping metals. It planes horizontal, vertical, angular, circular, and polygon work, and hollows down to half an inch radius. Motion is given to the crank by a pair of wheels bored eccentric.

10. Slide and screw cutting lathe, fitted with geared head-stocks, having conical mandril, and case-hardened steel bearings and collars; guide screw the whole length; compound slide rest, self-acting in the longitudinal and transverse direction.

11. Drilling machine for drilling holes to 1½ inch diameter, with self-acting feed motion; the pressure regulated by an improved friction break, or given by the foot.

---

7 **LEACH, THOMAS**, *Oldham Road, Rochdale*—Manufacturer.

Doffing and cleaning plates, for cotton and wool machinery. Temple teeth and springs for power-looms. Springs and under clearers for throstles and mules.

WILD, WILLIAM, 26 *Broughton Road, Salford, Manchester.*

A cask made by machinery.

10 & 46 **MASON, J.**, *Globe Works, Rochdale*—Joint Inventor and Maker.

Single carding engine, lap machine, and self-acting feeder; the same, with condenser attached, intended to produce a number of endless cardings or slubbings, and dispense with the use of the billy machine, and the hands required to work it.

Patent condensor, or endless carding engine for wool, and self-acting feeder for any second or finisher carding engine.

Action of the Machine.—The wool is removed from the doffer of the first carding engine by a comb as usual, and is drawn by a pair of rollers fixed at the side of the frame through a revolving tube, which imparts an amount of false twist to the sliver. It is returned between a lower pair of rollers to the lap machine in front of the engine, which is arranged to form a lap 16 inches diameter, and 4 inches wide. When the required length of sliver is wound on, notice is given by a bell; and if not attended to, another movement doffs the lap, so as to ensure each one being of the same uniform length.

These narrower laps are placed side by side upon rods, so as to form four rows, *a, b, c, d,* fig. 1, each row being the whole width of the engine, which are turned off into the engine by the unlapping rollers *e, f, g, h.* Each sliver passes through a guide or reed as it enters the feeding rollers to keep it in its proper place. The quantity of sliver thus put up at the feeder end of the machine will last a whole day.

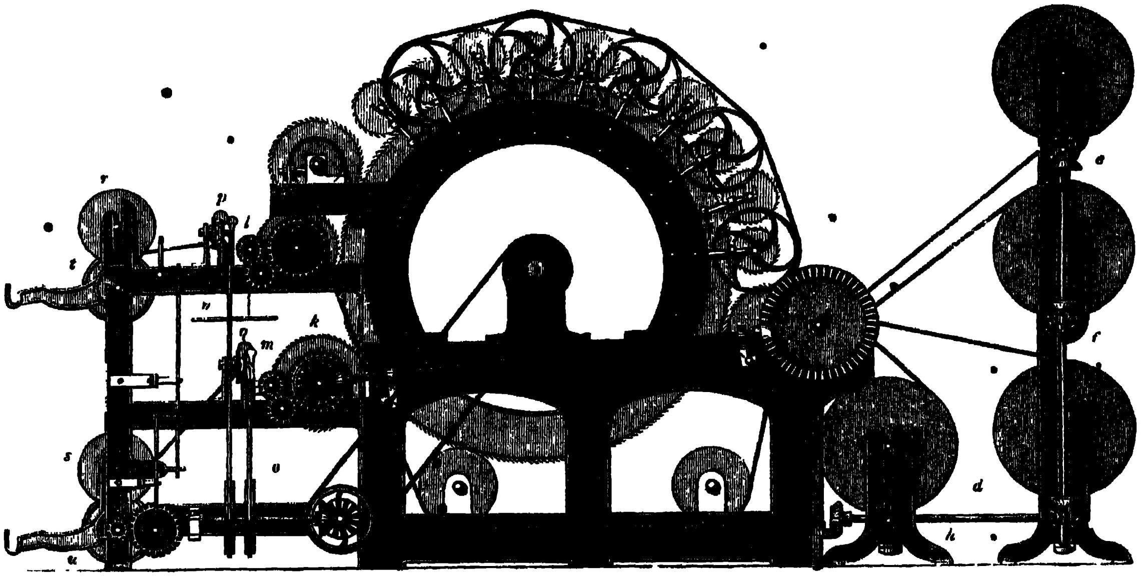
The wool having passed through the engine, and been carded in the usual manner, is removed from the main cylinder by the condensor doffers, *i, k,* which are provided with ring of cards, and alternate blank spaces, so that the wool which is left upon the cylinder by the top doffer is removed by the lower one.

The stripper rollers, *l, m,* take the bands of wool from the doffers, after which they pass between the doubled endless twisting straps, *n, o,* in order to receive a degree of false twist, sufficient to enable them to carry forward to be spun. They then pass between the delivery rollers, *p, q,* to the bobbins, *r, s,* on which they are lapped by friction of contact with the drum *t, u.*

When the bobbins are fitted they are removed direct to the mule to be spun, where they are unlapped in a similar manner by drums.

The advantage of this system consists in a great economy of labour; three operations being entirely dispensed with, viz., feeding, slubbing, and piecing. With the addition of the self-feeder condensor, yarns are found to be more regular and level than those produced by the ordinary method; a greater quantity of work is turned off; the threads are more nappy or oozy, which increases the felting quality in milling; causes a firmer texture in the cloth, and a corresponding fulness of bottom and richness of appearance when finished, not attained by the methods formerly in use.

1.



Mason's Carding Engine

Mule loom grinding-frame.

The patent driving bands made by J. H. Whitehead, Saddleworth.

Slubbing-frame, with Mason and Collier's patent collars or bearings for the spindles: separating plates for the slubbings, and the break motion for readily stopping the machine.

Patent slubbing and roving frames.

This improvement gives a firmer support to the spindles, obtaining greater speed with greater steadiness.

It is accomplished by making the collar in the lifting rail longer (shown detached in fig. 3), and continuing it through the wheel *b,* up the inside of the bobbin-barrel to the top of it, where the bearing for the spindle is formed as shown at *a,* figs. 2 and 3.

The collars are chambered inside, so that the spindle fits only their ends, and they are firmly screwed to the lifting-rail *d,* the wheels and bobbins running loosely around them, as represented.

The separating plates *c,* prevent the broken threads becoming entangled with the other spindles.

Roving frame, with patent collar, separating plates, and additional improvements.

Patent power-loom, for weaving fancy goods by an improved method of working the healds, to form the figure on the cloth. A vice.

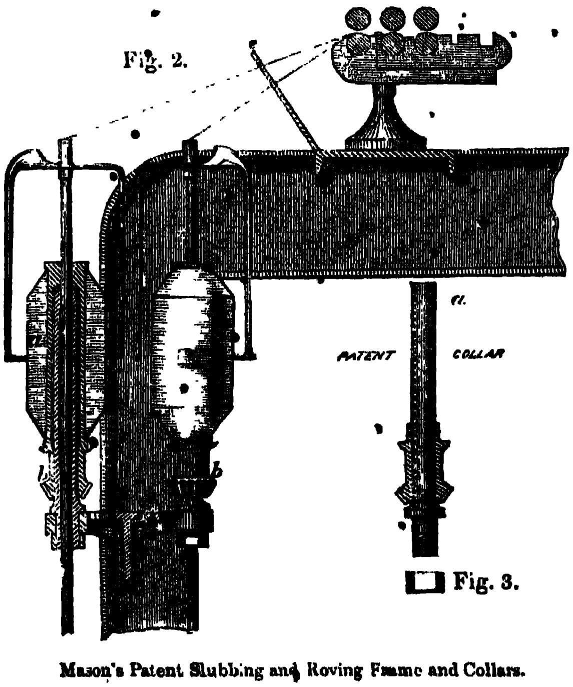


Fig. 2.

Fig. 3.

Mason's Patent Slubbing and Roving Frame and Collars.

14 **HIGGINS & SONS**, *King Street, Salford*—Manufacturers and part Inventors.

Cotton machinery:—Patent roving frame of 72 spindles; double self-acting radial mule, 600 spindles.

Long-line flax machinery:—First drawing frame, four bosses; second, 4 heads, 4 bosses each; patent roving frame, 6 heads, 60 spindles; spinning frame, 144 spindles.

15 **SHARP BROTHERS**, *Manchester*—Inventors.

Danforth throstle, for spinning.

16 **MATHER, W. & C.**, *Salford Iron Works*—Manufacturers.

Calico-printing machine, for printing eight colours at one operation, with drying apparatus. Sewing machine, and patent pistons.

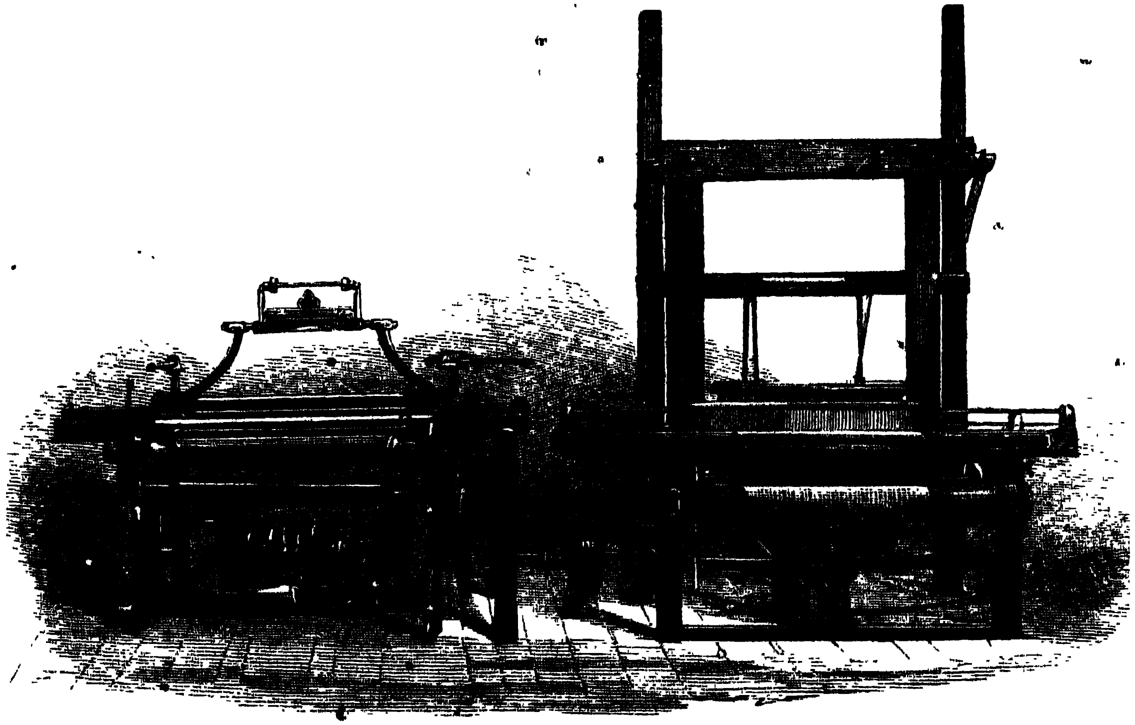
17 **SAXON, ABEL**, *Manchester*—Manufacturer.

Metallic bobbins.

18 **HARRISON, J.**, *Bank Foundry, Blackburn*—Manufacturer.

Power-loom adapted for fabrics of light materials, in cotton, wool, and flax, and not more than 18 or 20 "picks" or "shots" of weft in a quarter of an inch; and for "tweeled" goods up to four leaves.

Power-loom, adapted for heavy and tweelled goods. Power-loom, made 50 or 60 years ago. These looms are represented in the engravings below.



Modern Power-loom. Old Power-loom.

19 **GIBSON & Co.**, *Glasgow*—Manufacturers.

Case containing specimens of shuttles.

20 **HORNBY & KENWORTHY**, *Blackburn*—Inventors and Manufacturers.

Patent sizing or dressing machine, with a peculiar arrangement for laying out the yarn in the form of a "sheet," "tape," or "beers," for "leasing," "boiling," "drying," "registering," and "beaming."

Model of patent warping-machine, with a self-acting backing-off motion. This series of models, together with a model of the loom named below, is represented in the engraving on the next page.

21 **BULLOUGH, J.**, *Blackburn*—Inventor and Manufacturer.

Model of patent power-loom: which stops the motion when the weft thread breaks; it has a self-acting temple, and it coils the taking-up motion

22 **SMITH, MARK**, *Heywood, near Manchester*—Inventor and Maker.

Loom for weaving naval canvas, Dutch and Venetian carpets, and applying the rising-box motion to Scotch and Kidderminster carpets The speed of this loom is 120 picks per minute; it drives a shuttle that will weave a yard of cloth from one bobbin.

Loom for weaving strong fustians, strong ticks, linen, damask, and woollen cloths, on the same principle, with the addition of self-acting temples. It weaves 5 lb. No. 2 cotton weft, or 100 hanks in ten hours; and works safely at 200 picks per minute.

Loom with rising and falling box motion for weaving plaids, checks, ginghams, fancy drills, quiltings, and calicoes.

Loom for weaving silks, fitted up for plain cloths, but applicable to satins and figured work by attaching the necessary cams or tapets, or the Jacquard machine.

Working model, comprising most of the motions of these looms.

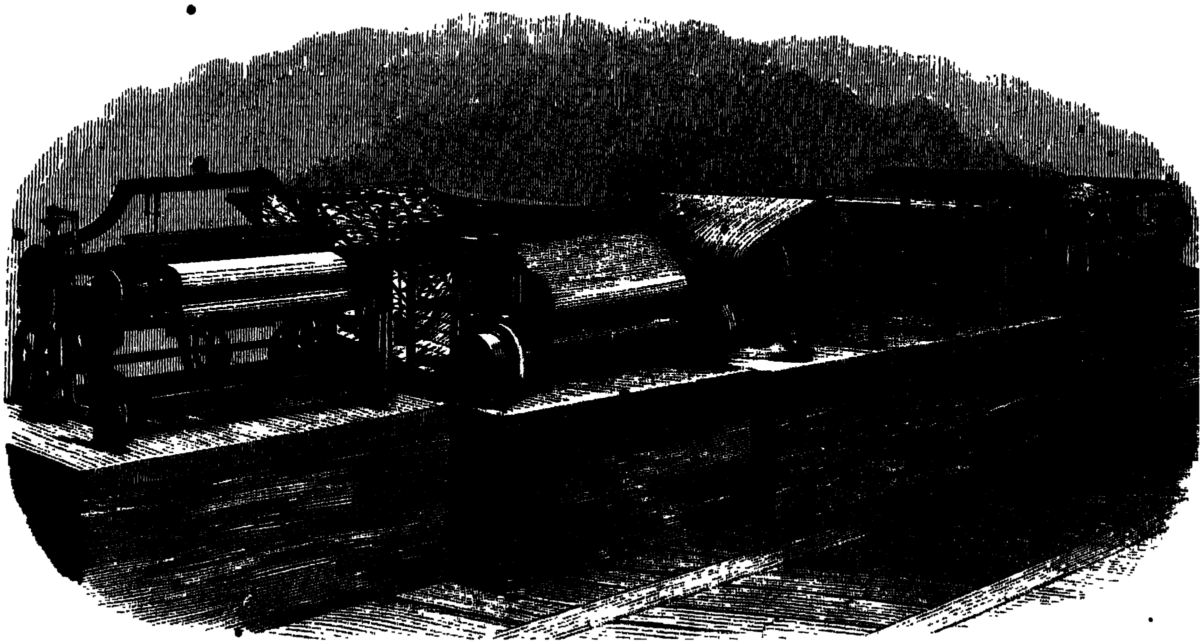
23 **TAYLOR & SON**, *Halifax*—Manufacturers.

A large Jacquard loom, exhibited in the operation of weaving worsted damask goods. (See engraving, page 272.)

[This vast machine, with its array of cards, and confusing lines of harness, furnishes a striking example of a loom constructed on the principle discovered by Jacquard.]

24 **MACINDOE, GEORGE PARK**, *Glasgow*—Inventor and Patentee.

Self-acting mule for spinning cotton wool into yarn, with oscillating or vibrating lever for taking in or putting up the carriage, and a mode of putting down the faller from any of the twist pulleys by centrifugal disengaging catches.



Hornby & Kenworthy's Models of Patent Sizing and Warping Machine.

This mule, for which letters-patent were obtained in 1849-50, by the exhibitor, presents a combination of simple and efficient mechanical movements. The side elevation of the head-stock given in the accompanying Plate, explains how far the attempt at economy, construction, and convenience of arrangement, has succeeded; but the great features of the improvement are comprehended under the following nine heads:—

1. The mode of regulating the twist of the yarn, in direct communication with the spindles. By this plan, the movements of the spindles, and the twisting action, are made to work in complete concert—a point, which every cotton-spinner will appreciate.

2. The taking-in or pulling-up of the carriage by an oscillating or vibrating lever (marked 36 in the Plate). This movement possesses the peculiar feature of causing the carriage to start at a slow yet steady pace, gradually increasing in speed until half way, when its rate diminishes in a similar ratio up to the roller beam. This action is also three or four seconds quicker at each stretch than ordinary mangle-wheel mules, and is not affected by any change which may be made in the mule, to suit particular numbers.

3. The adaptation of a counterpart to the radial arm and screw, for winding on the yarn, as marked 59 in the Plate.

4. The extension of the main driving shaft A, over the whole length of headstock, so as to distribute the various movements in the most convenient manner, and dispensing with additional connections.

5. The extension of the cam shaft *c*, from the drawing rollers at *i*, forward to the front end of the headstock.

6. The power of applying the headstock in the centre of the carriage, without the use of cranks, or connecting rods and joints for connecting the guides, which are in one length—this arrangement being advantageous for new mules, and capable of easy adaptation to old ones.

7. The backing-off motion, being worked by wheels, is capable of regulation to the greatest nicety.

8. The second draw, which is necessary for fine yarn.

9. The use of disengaging pulleys or friction pulleys *g*, with their peripheries indented at certain points, for the purpose of starting and stopping the several movements in connection with the cam shaft, with a steady and unbroken action.

The steel Plate represents Macindoe's patent self-acting mule. In this description, owing to the complication of the references in the plate, only those are given which render clear the peculiar principles of the mule.

[It appears that the first self-acting mule was invented in 1793 by Mr. W. Strutt, of Derby, and the second by Mr. W. Kelly, of Lanark Mills, in 1792, but both were abandoned. About 35 years afterwards, two patents were granted on one day to two parties for self-acting mules. Since these were granted, about 20 others have been obtained for a like purpose, and their success has been as varied as their number. The machine is a wonderful industrial automaton.—R. E.]

25 McNAUGHT, WILLIAM, 26 *Robertson Street, Glasgow* —Inventor.

Coats's patent self-acting bobbin-making machine, intended for the manufacture of spools used in making-up sewing thread. It is capable of turning off two dozen of spools per minute, or about three times as many as can be done by the hand-machine. These are delivered on the lathe arbor, and are finished, and withdrawn in the finished state, by the machine.

27 CALVERT, F. A., 32 *Cannon Street, Manchester*—Inventor and Patentee.

Patent machines for wool-burring and cotton cleaning, for carding and cleaning fibrous substances, and for ginning cotton, or separating the seed from the fibre, as produced on the plantation.

Patent method of constructing burring and carding cylinders.

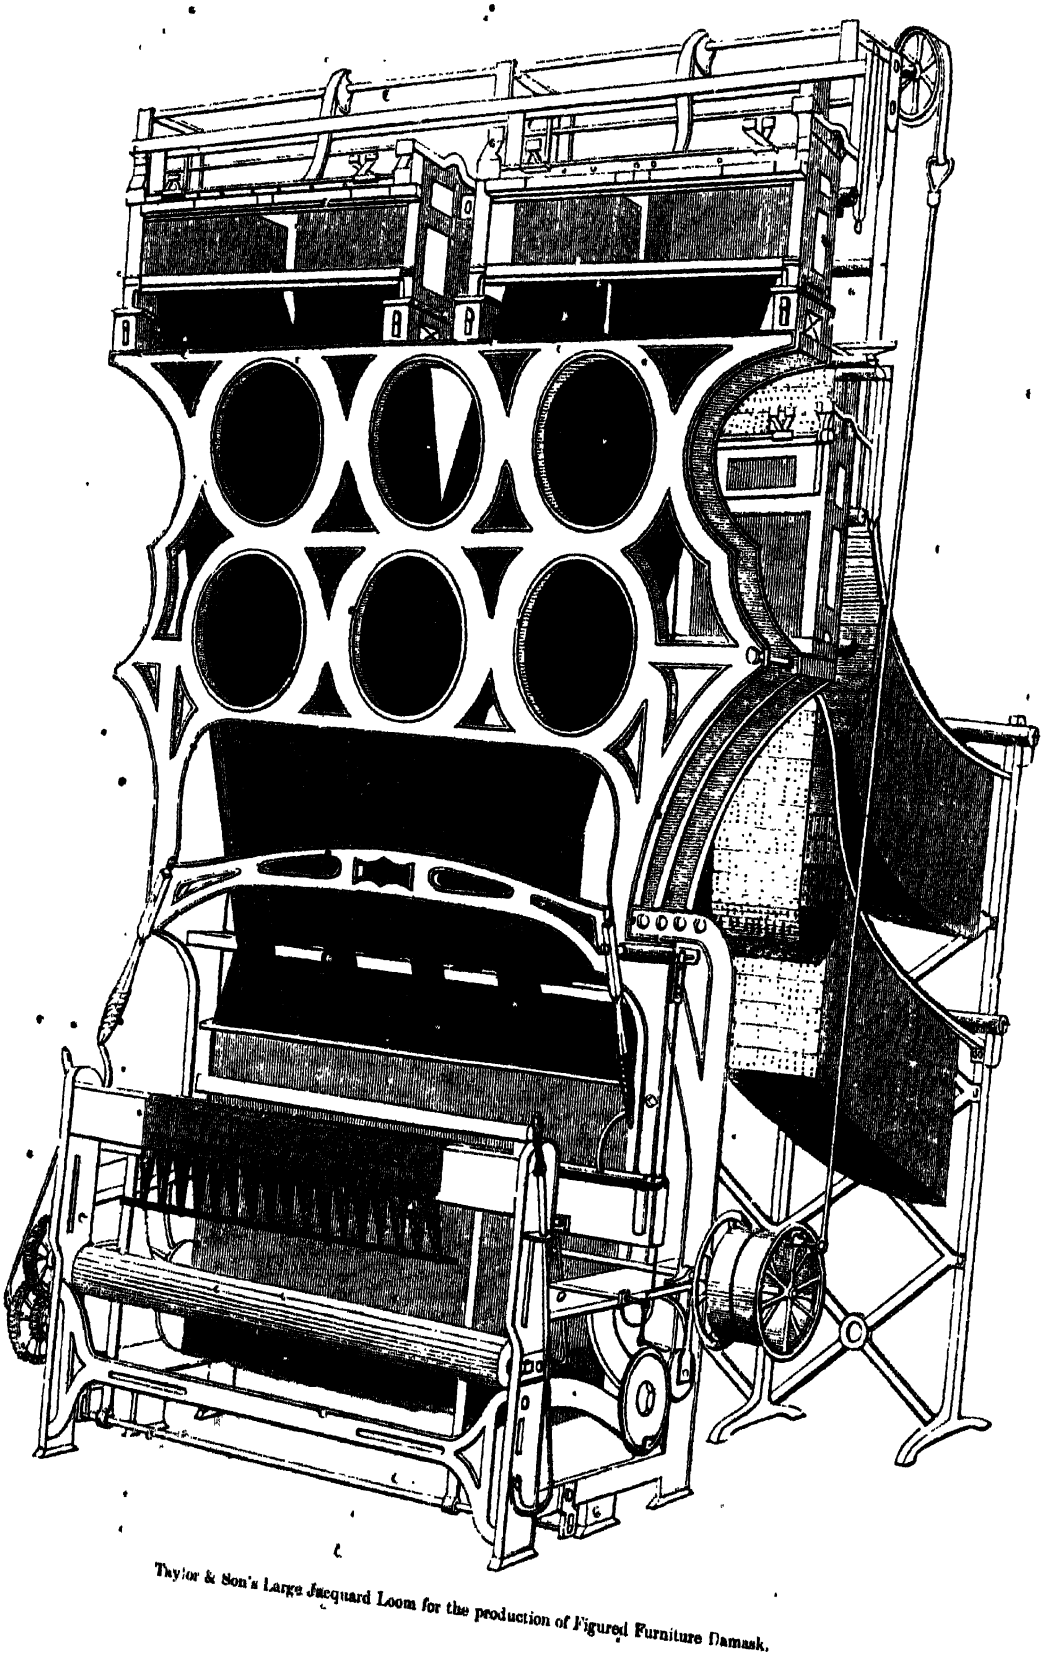
28 PATERSON, T. LUCAS, *Glasgow*—Inventor and Patentee.

Model of a patent machine for winding worsted, woollen, cotton, or linen yarn from the hank, upon the shuttle-cop or pirn; its object is to save waste, and produce an improved "build of cop," at reduced cost.

29 JORDAN, WILLIAM, 43 *Hilton Street, Manchester* —Inventor and Manufacturer.

New warping-mill iron-creel, for silk. The bobbins or reels are made to pass each other, forming the lease instantly, instead of the warper soiling and ruffling the ends with his fingers, so that the twister-in or weaver can separate every end in the warp with facility.

Warping-mill heck, of 224 eyes, with (new) inclined crossing motion, for cotton.



Taylor & Son's Large Jacquard Loom for the production of Figured Furniture Damask.

30 **DE FONTAINE MOREAU, PETER A.**, *4 South Street, Finsbury*—Importer and Proprietor.

Novel apparatus for the working of spindles without straps or cords, for spinning all fibrous substances, and adapted for all spinning machines. The advantage is said to consist in the suppression of cords and straps, in the production of a regular and invariable rotation to the spindles, and consequently a regular tension to the threads. The friction and, consequently, the wear and tear, are said to be diminished, and less than the usual amount of power to be required.—Patented.

Apparatus for replacing the Jacquard machine for weaving figured fabrics and tissues; composed of a cylinder, provided with moveable pegs. When the cylinder rotates, the hammer, in contact with the pegs, is thrown back, and raises the threads of the warp: the apparatus has only 120 pegs, but can have any required number. It is stated that, by this invention, the cards so expensive in the usual Jacquard machine are dispensed with.—Patented.

Apparatus for extracting ores from mines and coal-pits. The object of this apparatus is said to be to replace all kinds of machines hitherto used, and especially the ropes, and to economise time.—Patented in England.

Elevator syphon apparatus, to work which an elevation of at least 33 feet is required: it is stated that the water taken at the curve of the syphon can be employed without any expense, as a motive power.

32 **CHALMERS, D.**, *Manchester Wire Works*—Inventor.

New damask power-loom.

Railway-break, calculated to prevent collision, and to act without shock.

35 **CRICHTON, D.**, 165 *Bradford Road, Manchester*—Inventor.

Model loom, exhibiting a new principle of mechanical action on the yarn and cloth rollers, which impart their required velocities throughout the process of weaving. A mechanical movement, exhibiting the application of the principle in the loom; also its application in the roving-frame, to give the required velocity to the bobbins and the lifting-rail.

36 **CRICHTON, W., & CO.**, *Great Bridgwater Street, Manchester*—Machinists.

Cotton-opener, on Samuel Hardacre's patent principle, being the application of the batting-stick in such a manner as to open from 40,000 lbs. to 50,000 lbs. per week of 57½ hours, requiring only 1¼ to 1½ horse power.

Framed drawing of double-beater lap machine, with fan attached.

37 **NIMMO & SON**, 211 *Cowgate, Edinburgh*—Manufacturers.

Spinning wheel, for spinning fine flax.

A check reel, made to the uniform standard measure of Scotland.

A model wheel in brass, for producing fine yarn or twisted thread.

38 **MILLIGAN, WM.**, *Bradford, Yorkshire*—Inventor.

Patent power-loom made by Hodgson & Haley, to show the taking-up motion. It is stated that this loom will put any number of picks into a given length of warp, and the number of picks may be altered without change-wheels or altering the weight on the yarn-beam, so that the warp may be kept as tight as its strength will bear, without making the cloth uneven; it has this advantage over any friction motion, that it will neither slip, nor fray the cloth; and it will weave wet weft as well as dry.

39 **MACKENZIE, DUNCAN**, 52 *Burton St., Tavistock Square*—Inventor.

A reading machine for frames and Jacquard looms, including in one machine four different apparatus, namely —the reader, the press, the repeater, and the knife; facilitating labour and economising expense; reducing to mathematical exactness operations which have hitherto been matters of uncertainty, and enabling manufacturers to employ persons of ordinary care and attention to read, punch, and recut their designs or patterns with quickness and ease.

40 **DONISTHORPE, GEORGE EDMUND**, *Leeds*—Inventor and Proprietor.

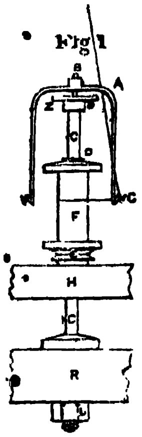
Double wool-combing machine.

41 **BARLOW, CHARLES**, 89 *Chancery Lane*—Importer.

Patent machine, for uniting by stitches all kinds of woven goods, and useful in making articles of wearing apparel. Two distinct threads are used, one of which appears at the back, and the other at the front of the fabric, so that each stitch forms an independent fastening. The seam thus produced is firm and regular.

42 **SUTCLIFFE, R.**, *Idle, near Bradford*—Inventor.

Patent spinning frame, for spinning and doubling cotton, &c. The part patented is represented in the annexed cut. The dead spindle, or stud C, is fixed to the rail R, and traverses in the rail H. In the top of the stud a cavity is drilled, and in this cavity a small cylindrical spindle, B, revolves. This small spindle is attached to the flyer A, the flyer is drawn by the bobbin F, the bobbin is carried upon a revolving tube D, and the revolving tube is driven by a band from the cylinder. G is the eye of the flyer, which carries the thread. To prevent the small spindle and flyer from being jerked or raised from its place, it is made thicker at the lower end, and a brass cap Z, fitted accurately to the spindle, is screwed on the top of the stud, and thus the spindle is kept securely in its place. In this cap the patent consists. The drag is produced by the friction of the small spindle against the stud, and by the resistance of the atmosphere against the wings of the flyer.



Sutcliffe's Patent Spinning Frame.

[The objects attained by this process are a high degree of velocity, and a regularity in the tension or drag, so as to produce perfect evenness in the yarn. This frame works with a speed of upwards of 6,000 revolutions per minute.—G. T.]

43 **HENNING, JOHN**, *Cambray House, Waringstown, County Down, Ireland*—Inventor.

Cambric loom; damask loom; machine for weaving damask, or other figured fabrics, on the Jacquard principle.

44 **SANDEMAN, HECTOR**, *Tulloch Bleachfield, Perth*—Manufacturer.

Machine for stretching cloth after it has shrunk in the processes of bleaching, scouring, dyeing, printing, &c.

45 **DE BERGUE, C.**, 9 *Dowgate Hill*—Inventor and Manufacturer.

Specimens of dents, and reeds or combs, complete, for weaving every description of fabrics, manufactured by patent machinery. This invention is intended to insure regularity in the reed, and uniformity in the fabric and in the shape and finish of the dents, so as to be less liable to cut or break the threads.

47 **MARSLAND & Co.**, *Blackfriars, Manchester*—Manufacturers.

Cotton-winding machine.

48 **BERRY, B., & SONS**, *Bowling, near Bradford*—Manufacturers.

Machinery for the manufacture of worsted yarns, exhibited in operation; consisting of double gill box, open drawing, first process; double gill box, two spindles, second process; drawing head, two spindles, third process; finishing head, four spindles, fourth process; roving head, six spindles, fifth process; spinning frame, sixteen spindles on each side or thirty-two spindles, sixth process.

[This machinery exhibits the processes ordinarily employed in the preparation and spinning of worsted yarns, after the wool has been washed and combed. The slivers, or long fibres of combed wool, are prepared by being gradually drawn out in passing through a series of rollers of regularly-increasing velocity. When thus sufficiently extended and attenuated, they are sent forward to the spinning frame, where they are further drawn out, receive the twist requisite to give strength to the yarn, and are wound upon the bobbins. A yard of these slivers is thus drawn out into about 2,000 yards of yarn.—G. T.]

49 **HUNT, ENOCH**, *Nailsworth*—Inventor and Manufacturer.

A gig-mill, on an improved principle, for dressing cloth, by which the process of dressing with teasles is proposed to be finished in considerably less time than usual, and without removing the cloth from the machine.

50 **ELLIOTT & HEYS**, 93 *Mill Street, Manchester*—Inventors and Patentees.

Improved loom.

51 **TAYLOR, J.**, *Victoria Road, Leeds*—Manufacturer.

Specimens of heckles.

52 **JUDKINS, CHARLES FIOT**, *Manchester*—Patentee.

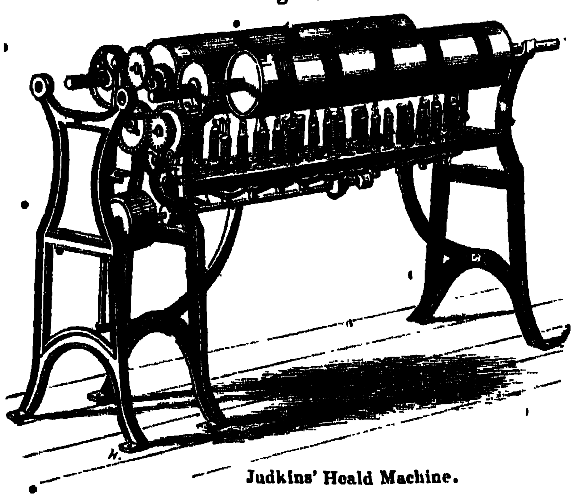
Heald machine.—The machine shown in the drawing, fig. 1, is so constructed as to double and twist the single yarn, and at certain points it braids or plaits the yarn, thus forming the eye or loop of the heddles, without knots of any description, the whole shade or leaf being of one continuous cord. The drawing also shows a small sample of the healds made by the machine, with the eye or loop, as described, which is coated, lined, or covered with a metallic substance suitable for the purpose, which coating or covering has also been patented by the same party. The assumed advantages of these healds are as follows:—One set will outlast fifteen sets of any other sort; more yards of cloth can be produced through them per week, and at the same time the cloth is more perfect, and will weigh heavier per piece, owing to there being less friction upon the warp than is usually caused by the ordinary healds.

Set of healds produced by the machine.

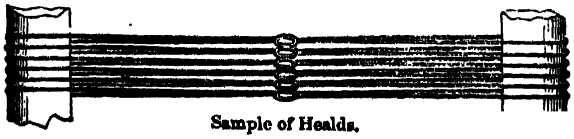
Patent self-acting machine, for closing metal upon the eyes or loops of healds.

Sewing machine (Fig. 2).—This machine is very simple in its construction, and suited to sewing either a circle, curve, or straight line, at the rate of 500 stitches per minute. But for a circle or curve the straight rack is removed, and one of a circular form applied to the side of the machine. This rack, in which the cloth is placed, is moved forward by means of a spring, at a given distance for every stitch. There are two threads employed, one of which is carried in the shuttle, and the other taken from a reel on the top of the machine, and passed through the cloth by the point of the needle, so that when it is withdrawn from the cloth both threads have been locked together, forming a firm and durable stitch.

Fig 1.

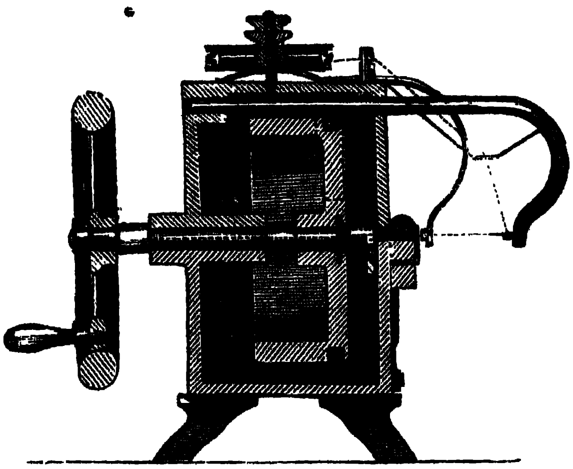


Judkins' Heald Machine.



Sample of Healds.

Fig. 2.



Judkins' Sewing Machine.

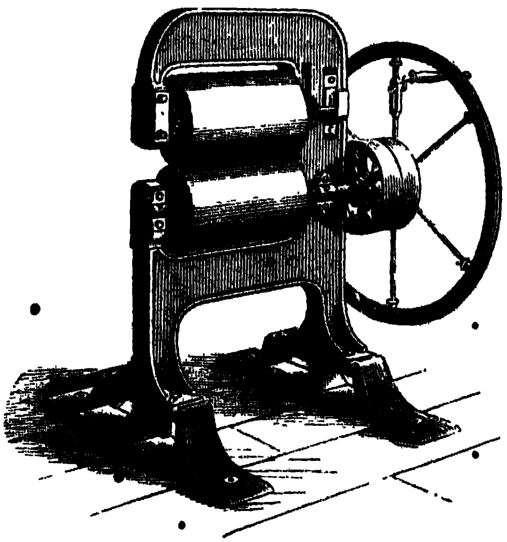
53 **PLENTY, JAMES & EDWARD PELLEW**, *Newbury, Berks*—Inventors.

Machine for tarring yarn.

54 **ROBINSON, RICHARD**, *Belfast, Ireland*—Inventor, Designer, and Manufacturer.

Flax-seeding machine, intended as a substitute for the common process of beating off the seed vessels, or rippling them on an iron comb, and then breaking them to release the seed. These operations are performed at once by this machine. It may also be used for crushing linseed, corn, or beans for feeding.

Flax straw (*Linum usitatissimum; Fr. Paille de lui; Ger. Flachstrop*), grown in the county Down, Ireland, to show the application of the machine.



Robinson's Flax-seeding Machine.

55 **Binns, William**, *Bradford*—Manufacturer.

Six-pitch wool combs, used in the preparation of wool for the Bradford worsted stuff trade.

56 **Browne, Thomas Beale**, *Hampden Andover's Ford, Cheltenham, Gloucestershire*—Inventor.

Loom for sail-cloth.

Tarpauling, without seam.

Flax tube sacks of mixed flax and hemp, wove without seam.

Flax coats, perfectly waterproof.

Flax damasks, cambrics, velvets, and cords.

57 & 58 **Gaimes, Sanders, & Nicol**, *Birchin Lane, Cornhill*—Manufacturers.

A model showing the manufacture of silk hats on cork and linen bodies, with the workmen as employed in the different processes.

A model showing the manufacture of felt caps or jerries, with the workmen employed in the processes of bowing, folting, blocking, &c.

Finished ventilating hat on cork body covered with French velvet. Finished felt cap or jerry, with samples of the different materials of which it is composed.

Model of a hat factory.

59 **Smith, J.**, *Orchard Street, Galston, Ayrshire, Scotland*—Inventor.

Improved spelf-machine, applicable to fabrics of small design, out of the range of traddles.

60 **Gatenby & Pass**, *Manchester*—Manufacturers.

Reeds or combs, applied for weaving textile fabrics, manufactured by steam-power. Designed to improve the appearance of the cloth, and allow coarser yarns to pass through the same reeds than can be done by the ordinary method.

61 **Iles, Charles**, *Bardesley Works, Birmingham*—Inventor and Manufacturer.

Machine for sticking pins in circular tablets, to be worked by steam power. The use of the above machine it to fill patent circular embossed tablets or pin-holders of an ornamental character, which are made of various materials, but generally card-board.

62 **Dickins, T.**, *Middleton, Lancashire*—Inventor.

Working model of a mill, or apparatus for warping silk or other fibrous threads, by which a large number of bobbins may be employed; exhibited for equality of tension, accuracy, and ease in working.

63 **Rigge & Co.**, *Kendal*—Manufacturers.

Sheets of card, of different qualities, used for carding wool.

[The card for cotton wool is a peculiar instrument, formed of a leather foundation, in which are inserted large numbers of minute wire teeth. Cards are employed for the purpose of straightening out the fibres of cotton wool into a uniform sheet or lap. In cotton machinery, the card is applied to the surface of a wooden drum, which acts upon similar drums, and which presents the cotton in a smooth and uniform sheet of great slenderness. In some ingenious machines the leather is cut, perforated; the wire bent, cut, and inserted by automatic arrangements.—R. E.]

64 **Cross, Charles**, 19 *Gutter Lane, Cheapside*—Producer.

Model of loom for plain weaving.

Model of loom for Jacquard weaving.

65 **Searle, Henry**, *Hoxton Old Town*—Manufacturer.

Lint machine, with the material in process of manufacture.

66 **Watkins, W. & T.**, *Bridge St., Bradford*—Inventors.

Ironstone porcelain guides, used in the roving and spinning of worsted, silk, cotton, flax, &c.

67 **Victory, J.**, *St. Leonard's, Hastings*—Manufacturer.

Specimens of lathe tools.

68 **Jaquin, Cornelius**, 7 *New Street, Bishopsgate Street*—Designer and Manufacturer.

Fly-press for punching metal, &c., for buttons.

Lever press, for raising, drawing, piercing, &c., discs of metal for buttons.

Various tools, in sets, as used and fitted to the machines. Various specimens of articles as produced by the machines. Loop for label made by machinery.

69 **Slate, J.**—Manufacturer.

Twine-reels.

70 **Steane, J. Burgess**, *Nottingham*—Inventor.

Carding machine, used in "making-up" or boarding gimps, bindings, or fancy trimmings.

71 **Thom, J.**—Inventor.

Sulphuring apparatus.

72 **Taylor, Edward**, *Kinghorn, Scotland*—Manufacturer.

Superior heckles for linen manufacture; two of these are for hand-dressing, and the rest for the finest description of machine heckling.

73 **Smith, J. W.**, 48 *Fleet Street, Leicester*—Inventor.

Needles, for stocking-frames.

74 **Plummer, Robert**, *Newcastle-upon-Tyne*—Inventor.

Patent machines, viz., rotary disc scutching machine, for flax, hemp, &c; with straw holders, and with straw to scutch. Flax-breaking machine, for flax straw previous to being scutched. Flax-cutting machine, for preparing flax for the cut-flax heckling machine. Heckling machine, for dressing flax, hemp, &c.; with flax holders, and with flax to dress. Flax holders, of various improved forms, showing the application of gutta percha to these implements.

The engraving exhibits the metal disc for scutching flax, with the brushes fitted to it. The disc is seen in fig. 1 from above.

The cut, fig. 2, represents a front elevation of the rotary disc scutching mill. A is an axle having its bearings in an independent framing, *k* and *k i*, of metal; the upper portion being made open with a lining of dials, *l*, *l*; the metal piece *m*, *m*, at the front end being secured by three bolts can be readily removed for the purpose by changing the brushes in the discs. The framing is stiffened by cross pieces, *n*, *n*; *b*, *b*, are pulleys by which a rotatory motion is imparted to the axles. The top, *i*, of the scutching board, *h*, is placed a little above the centre of the axle, A. The heckle or comb e^1 is composed of steel wire.

Fig. 1.

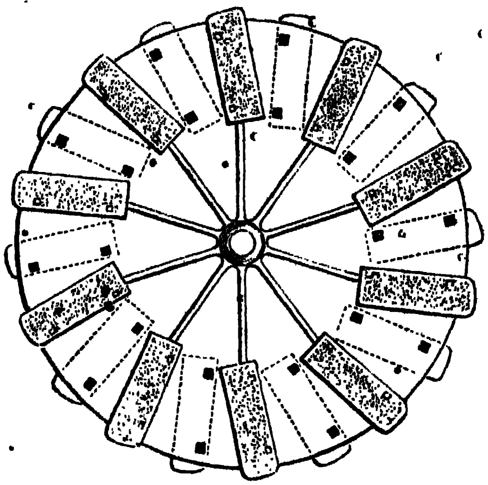


Fig. 2.

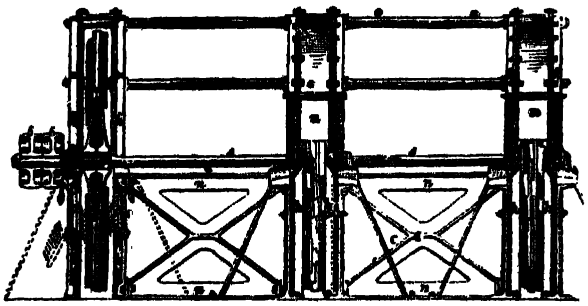

Fig. 3.

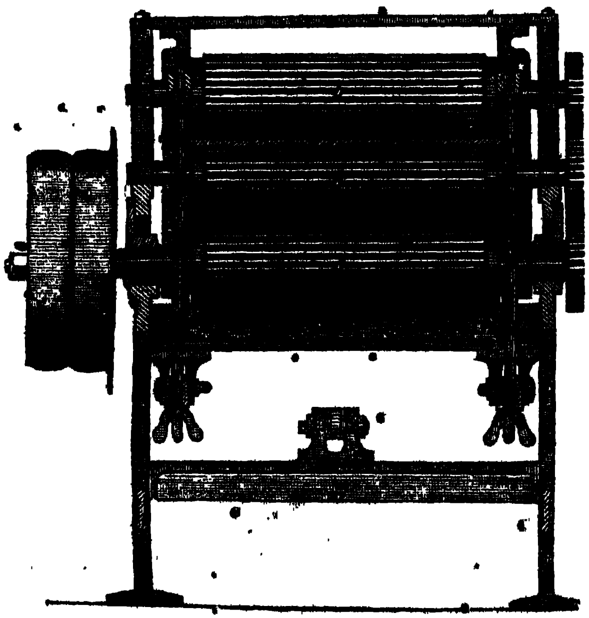

Fig. 3 is a front, and fig. 4 is a side elevation of an improved flax-breaking machine. The letters *b*, *c*, and *d*, are placed upon the grooved metal rollers, to which the flax is presented, as seen in fig. 4, by the direction of the arrow.

Fig. 4.

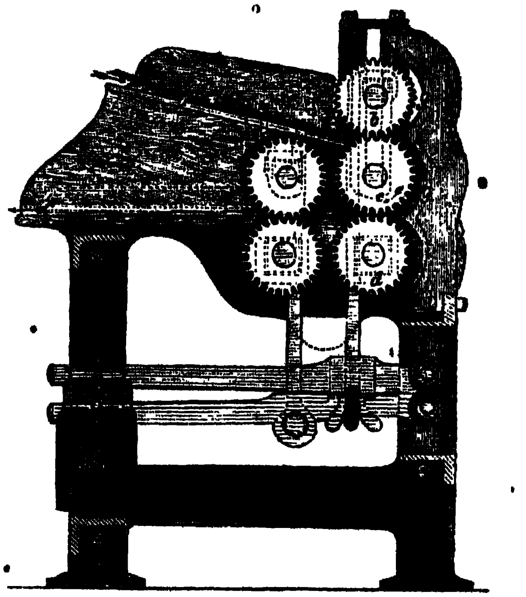

Fig. 5.

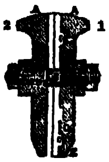

Fig. 6.

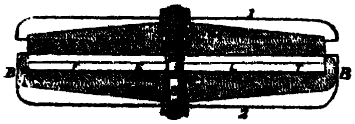
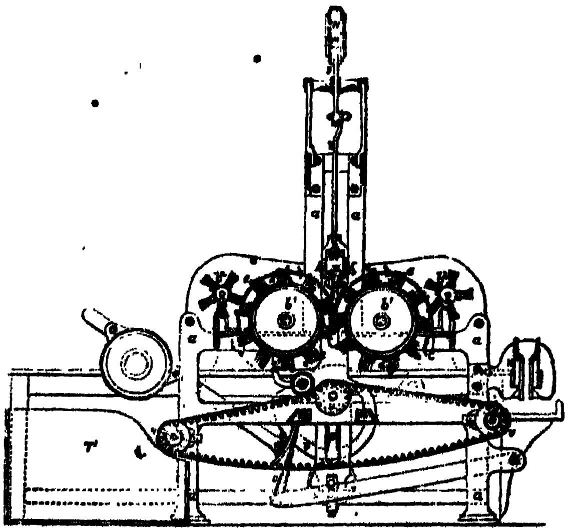


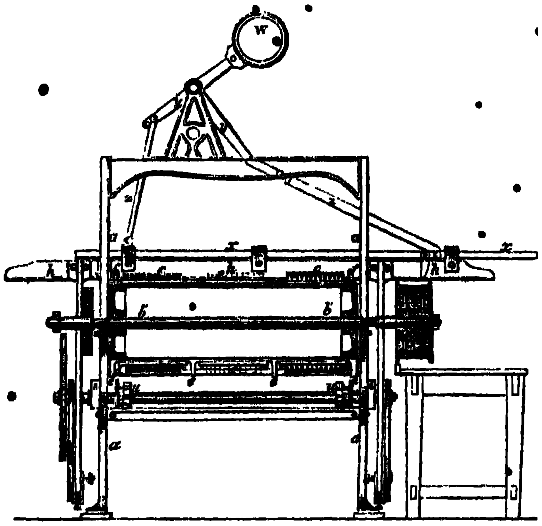
Figs. 5 & 6 represent improved holders for flax heckling.

Fig. 7.



Figs. 7 & 8 represent a side and end elevation of the double cylinder heckling machine, adapted to the dressing cut or short flax, in which elastic brushes are combined with rigid heckles. There are two revolving cylinders, b^1 b^1, mounted in a framework *a*, *a*; added to their peripheries are sets of rigid heckles, c^1, intermixed with the sets of elastic brushes c, c (in any way that may be deemed most advisable). The cylinders are also made to revolve inwardly or in opposite directions, and the rows of brushes and heckles on the one cylinder are placed in an alternating order in regard to those of the other cylinder, as before described. There are also loose stripping bars with guards, that, besides regulating the depth to which the heckles or brushes shall penetrate, doff or throw down the tow from the brushes and heckles, and two smaller cylinders b^2 b_2 fitted with brushes for cleaning the working brushes and heckles c, c'.

Fig. 8.



One of the cylinders, b^1, may, if required, be made to oscillate by means of the link h^1, h^1, which, as it rises and falls with the lifter to which it is attached, moves the cylinder in a horizontal direction to and from the other cylinder; the bearings of the oscillating cylinder being made to slide, and attached by a rod to the radius arm to which the stud pin of the wheel m^1 is fixed, the whole of the wheels, k^3, l^1, m^1, and n^1, are thus kept in gear, to answer the varying position of the oscillating cylinder. Rotation is given to the rotating parts of this machine as in the one first described, but the holder is made to traverse or move forward in the trough (which movement may also be applied to the brushing machine) by the combination of a bell crank movement with the rising and falling motion of the trough, as afterwards described. The mechanism for lifting the trough h, is shown in fig. 8, and consists of a combination of pinions k_2 k_3, wheels m, n, cam p, straps o, pulleys q, and levers r, s, such as is ordinarily used in heckling machines, and well known. When the trough is raised, it pushes up a rod x, which is connected to the long arm of the bell crank y, mounted on a standard affixed to the top of the frame-work a, when a weight W, which is attached to the opposite end of the arm, falls over, and causes the short arm of the bell crank to pull in a rod z^1, which draws forward a finger bar x (of the ordinary construction) to an extent sufficient to advance the holder the breadth of one set of heckles or brushes. The tow and shive or dirt doffed or thrown down from the heckles or brushes is in this case received upon an endless chain of bars t, t (instead of the inclined grating represented in the machine first described), which bars extend the whole length of the machine under the heckles and brushes, and are connected together by two side bands t^3, t^3. The chain of bars revolves round two friction pulleys v, v, and takes into two pinions u, u (one on each side); by means of which pinions rotation is given to the chain from the same first mover by which the other parts of the machine are put in motion. The shive or dirt falls through between the bars on to the floor, while the tow is carried forward on the top of the bars, and delivered into the trough T¹. To separate the tow doffed from each set of heckles or brushes, the space between the endless chain of bars and the cylinders is divided by partitions a_4, a^4, fig. 1, into as many compartments as there are sets of heckles or brushes; and the receiving trough T¹ is also divided into a corresponding number of compartments.

A view of the holder, for this machine, is given in fig. 5, a cross section, and fig. 6, a longitudinal section. It consists of two plates, Nos. 1 and 2, connected traversely by a screw bolt S, and having flanges A, A, at their upper edges, by means of which they are supported in the trough h. The plate No. 2 has two flanges B, B, one on each end, which come within the flanges A, A, of the plate No. 1, and thereby confine the streak at the edges. The inner face of the plate No. 2 is planed perfectly true, and covered with felt, cloth, or some other soft or yielding material; but the plate No. 1 is made on its inner face with flat beads C, and flat grooves D, in alternate order, so that the streak of flax or other material may be the more firmly compressed between the plates without being unduly crimped. At their under edges E, the plates are chamfered off to admit of the holder coming lower down. By this mode of construction, the pins or studs ordinarily made use of to confine the outer edges of the streaks, are dispensed with, and a greater breadth is obtained whereon to spread the streaks, and the holder is also narrowed and rendered more easy to work.

Raw materials in illustration:—English flax seed. Flax straw from Northumberland and Durham; and flax fibre and dressed line. Russian, Irish, and New Zealand flax, as imported, and when rescutched; also Russian hemp rescutched.

Manufactures in illustration:—Yarn, from flax dressed by the patent heckling machine; and canvas woven from the same. Yarns, spun on Peter Fairbairn & Co.'s (Leeds) new patent long line, rotatory gill, spinning frame; and canvas made from these yarns.

75 LAWSON, SAMUEL, & SONS, *Leeds*—Inventors and Manufacturers.

Patent heckling machine for long flax.

Spiral flax-spreader for long-flax. The patent spiral or screw-gill frame was invented by Samuel Lawson and W. K. Westley in 1833. The spiral gill machine is adapted for drawing flax, tow, hemp, and silk waste. The sheet spreader or table was invented and used by Mr. Westley, at Hunslet Mill, near Leeds, in 1821. This simple contrivance was a great boon to the poor females employed in spreading flax, for by its assistance they can either sit or stand in a comfortable position; whereas, on the old plan, or long-board spreading, one girl was obliged to walk at least from 20 to 30 miles per day, in an inclined position, to spread one-tenth of the flax which she now effects in a sitting posture.

Spiral or screw-gill second drawing-frame for long flax.

Spiral or screw-gill roving-frame, for long flax, with an improved spindle-steadier.

Circular iron tow-card, clothed with patent iron clothing made by Birkby.

Patent double-screw tow drawing-frame.

Patent roving-frame, with improved spindle-steadier.

Tow spinning-frame, for dry spinning, with improved tension-pulley, for driving spindles which are always kept up to their speed.

Flax-cutter.

Pair of patent cylinder heckling machines for cut flax.

Spiral spreader for cut flax.

Spiral second drawing-frame for cut flax.

Patent spiral sliver roving-frame for cut flax, invented by W. K. Westley.

Spinning-frame for fine Nos. of yarn, with improved plan of driving the spindles, calculated for spinning the sliver rove.

Twisting-frame for making thread, with improved plan of driving the spindles.

[Common flax is the delicate tenacious fibre surrounding the stems of the *Linum usitatissimum*, a plant which is extensively cultivated in different parts of the world, not only for the sake of its fibre, but also for its seed (linseed), the oil of which is much used. Great Britain is supplied with flax from Russia, the Netherlands, Prussia, and France; small quantities are also received from America, Italy, and New South Wales. The cultivation of flax also forms an important part of the agriculture of Ireland.

When the crop has been pulled, the bolls or seed-heads are separated by rippling. The ripple is an instrument like a comb, with smooth round teeth of iron standing about 12 inches out of the wood, and placed so closely together, that the bolls cannot pass through. By drawing the flax, a handful at a time, through the teeth of this comb the seed-heads are separated from the stalks.

The flax is then steeped, or retted, in ponds or in running streams, in order that the fibre may be separated from the woody portion of the stem. When the flax is exposed to the influence of dews and rain, instead of being steeped, it is called dew retting. In mixed retting the flax is first macerated in water, and the retting is completed in the air.

When the flax is dry, the woody portion, or the *boon*, is separated by breaking. The common brake consists of four wooden swords fixed in a frame to which another frame with three swords is attached by means of a joint, the blades of one frame playing into the interstices of the other. The flax being placed between the two frames, the upper frame is pushed down upon the lower, and by moving the flax about, and repeating the operation, the boon is broken into fragments. The boon is also broken up more expeditiously by passing the flax between rollers.

The object of the next operation, scutching, is to separate the broken boon. This is done by striking the bruised flax with the edge of a flat wooden sword or *scutcher*, or when the operation of breaking is performed by rollers that of scutching is combined therewith: a number of arms projecting from a horizontal axis are made to strike the stalks in a slanting direction until the useless parts are beaten away.

The flax is next divided into lengths. The whole length of the flax varies from 26 to 30 or 36 inches. The part nearest the root is coarse and strong, the middle part fine and strong, and the upper part still finer but not so strong. The flax is divided into three lengths, and the parts from the bottom, middle, and top being collected into separate heaps, or stricks, several qualities of thread are afterwards formed from them. In some cases flax is divided into four or five lengths, called middle, ends, and middle and end-middles. In making these lengths, the ends are required to be rough or jagged; for which purpose the flax is held at both ends, and passed between two pairs of wheels, situated one pair on each side of a wheel furnished with oval teeth: the two pair of wheels hold the flax firmly while the centre wheel, moving with great velocity, divides or tears the flax asunder.

The flax is next heckled. By the process of heckling, the filaments of flax are cleaned, split, separated into fine fibres, and arranged in parallel order. The short fibres which are unfit for spinning, together with dust or dirt, are also removed. The heckle, or hackle, is a comb with iron or steel teeth one or two inches long, very sharp and smooth at the points, and arranged at equal distances upon a block of wood. A number of heckles are in use of various degrees of fineness. In using the heckle, the man seizes a strick, or lock of flax, by the middle, throws it upon the points of the coarse heckle and draws it towards him, at the same time with the other hand spreading the flax and preventing it from sinking too deeply among the teeth. By this operation the flax is divided into two parts, namely, the short fibres forming tow, which remains between the points of the heckle, and is from time to time removed, and the long fibres called line, which remains in the hand of the heckler. One half of the length of the strick being properly heckled, the other half is turned round and prepared in a similar way. The process is then repeated on the fine heckle, and continued until a fibre of the required degree of fineness is produced.

In the heckling machine, a portion of the strick is spread out and held fast in an iron vice or holder. A number of these are then conveyed to a sort of revolving drum, and hooked on at distances of a few inches from each other, their unsupported ends falling on an internal drum covered with sharp heckling teeth, and revolving with considerable velocity, and in a contrary direction to the external one, the motion of which is slow. When one machine has performed its work, the holder is thrown off upon a rail from which the machine-minder removes it to the second heckling machine, where the other side of the strick is heckled; from the second it is removed to a third, where the points are finer, and so on until the line is sufficiently fine.

The tow produced in the above operation being similar to cotton in its fibre, cotton machinery in a modified form has been applied to the spinning of tow.

The heckled line is sorted according to its fineness, and is then converted into ribands or slivers. For this purpose it is arranged upon a feeding-cloth in such a way, that the ends of the second strick shall reach the middle of the first. As the heckled stricks are thicker in the middle than at the ends, a uniform thickness is thus preserved. The flax is passed between one pair of rollers, which deliver it through gills or heckling points to a second pair, which, moving with greater speed than the first, increase the length and diminish the thickness of the sliver, which is received into a tin can. A number of these cans being filled, the slivers are doubled and drawn, as in the manufacture of cotton yarn. The spinning of flax does not greatly differ from the throstle-spinning of cotton; but as the fibres of flax have not the same tendency to combine together as in cotton, it is necessary to moisten them with water to make them adhere to each other during the process of spinning, and also to render them more pliable and easy to twist. The water used is either of the ordinary temperature of the atmosphere of the mill, or is warmed to 120° Fahr. The water is contained in a trough which extends the whole length of the spinning frame.

Yarn is made into linen thread by doubling; it is then bleached and formed into balls or wound upon reels into hanks. The size or fineness of linen yarn is reckoned by the number of leas to the pound weight; this varies from 15 to 150 or 240, and from that to 300 and 400.—C. T.]

---

77 **PARKER, C. E. & C.**, *Dundee, Scotland*—Inventors and Manufacturers.

Parker's patent mathematical power-loom for weaving navy sail-cloth, and other heavy fabrics. The warp is delivered from four beams at the same time, or from bobbins without any beams. The delivery of the warp is regular and uniform, which secures uniformity in the wefting, the number of weft-threads being the same in any given space. The taking-up motion is so arranged that the tension or strain on the warp may readily be adjusted to yarns of different strengths or cloth of different weights, and uniformly maintained from the beginning to the end of the web. The loom is self-acting in all its parts, and from the commencement to the termination of the web, no change or alteration is required.

78 Crawhall, Joseph, *Newcastle-upon-Tyne*—Inventor.

Improved patent machine for manufacturing ropes.

80 Davenport, Joseph L., *Derby*—Manufacturer.

Silk-throwing machinery, for the conversion of raw silk into threads, made at Derby, by Mr. William Abell.

Engine for winding and cleaning. Mill for spinning or twisting one or more threads.

Frame for doubling or uniting on one bobbin two or more threads, either before or after the process of spinning.

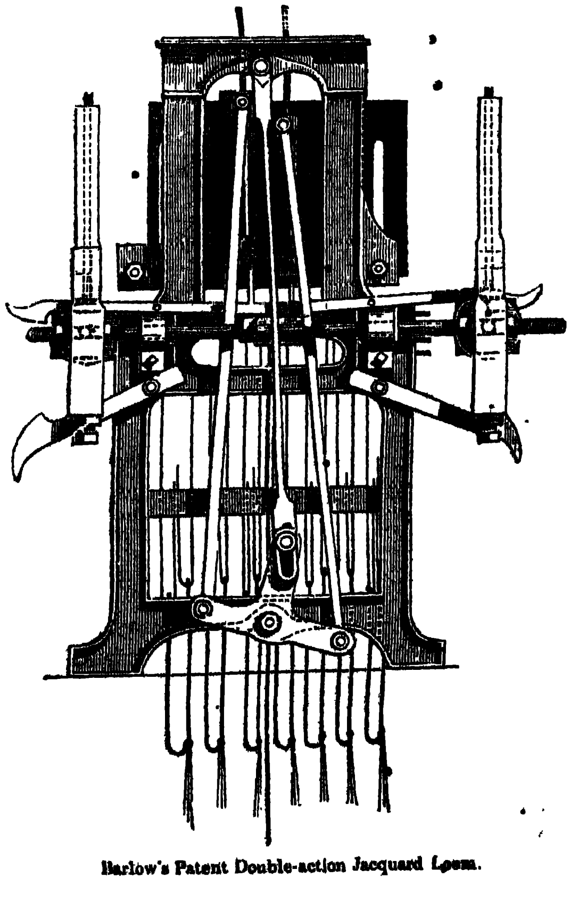
Machine for reeling the thrown thread into skeins.

"Dramming" apparatus, for ascertaining the relative thickness of the silken threads.

[The history of the manufacture of silk in England has peculiar associations with the town of Derby. Until the commencement of the eighteenth century, England was dependent entirely upon Italy for thrown silk for the purposes of the weaver. Machinery made at that time in England failed to accomplish the manufacture satisfactorily. A Mr. Lombe went to Italy, succeeded by artifice in gaining admission to the mills, and gained an entire insight into the method of manufacture. Escaping at the hazard of his life, he returned to England; erected a large mill on the Derwent, near Derby, where the manufacture was shortly established, and soon attained great prosperity. The machinery now employed for this purpose is of great ingenuity, and exhibits the peculiar characteristics of the mechanical workmanship of Great Britain.—R. E.]

82 Barlow, Alfred, 26 *Bread Street*—Inventor.

Patent double-action Jacquard loom, for the expeditious weaving of figured goods by the use of counterpoised griffs and apparatus for simultaneously raising and lowering different portions of the suspending wires; applying two barrels or cylinders and two sets of cards; and constructing hooked wires for giving motion to the harness or heddles.—Patented in Great Britain, Ireland, the colonies, France, Belgium, Prussia, and Austria.



Barlow's Patent Double-action Jacquard Loom.

The figure represents the upper part of the loom, showing its peculiar principles.

84 Frost, J., *Macclesfield*—Inventor.

Models of improved silk winding machine and cleaning same.

Model of a machine spinning and doubling at one operation.

Model of a throwing mill, in which the spindles are turned by friction.

Throwing mill, with spindles turned by friction. Iron roller inlaid with wood, placed in segments, turns a spindle with iron warf, is stated to give regular spin, take less power, and stands in less space than common throwing mills.

Improved winding engine.

Cleaning tram: the cleaners are fitted up with a slop, so as to be fixed on the guide rail, to answer the purpose of the eye or guide.

Spinning and doubling machine, which works two operations by one process, and can be converted into a tram doubler.

85 Reed, Thomas Sadler, *Siddal's Lane Mills, Derby*—Inventor.

Patent power-loom, for making fringes and like fabrics without the use of shuttles.

86 Claussen, P., 26 *Gresham Street*—Patentee and partly Inventor.

Circular hand-loom, for weaving looped fabrics, elastic cloth, &c.—Manlove and Alliott, proprietors.

87 Gardner & Bazley, *Nottingham.*

A 48-spindles' doubling-frame, for the production of lace-thread, in which the motion is communicated to the spindles by conical contact, without the aid of cords or bands. During the Exhibition, it will be worked, and will produce No. 160 lace-thread.

88 Hudson & Bottom, *Nottingham.*

Lace-dressing machine.

89 Carver, Thomas & Thomas Gilbert, *Nottingham*—Proprietors and Manufacturers.

Model frame for weaving stockings.

90 Ball, Dunnicliff, & Co., *Nottingham*—Manufacturers.

Warp-lace machine, making plain blonde.

91 Cowslade & Lovejoy, *Reading, Berks*—Inventors.

Self-inking platen hand-printing press, consisting of an adaptation of an inking apparatus to the ordinary press. By one turn of a handle attached to a spindle, the carriage and tympan are rolled simultaneously in opposite directions, the type receiving ink at one end of the platen, and the tympan the blank sheet at the other. A reversed action of the spindle brings them together, beneath the platen, there to receive the impression. The printed sheet is freed from the form by springs attached to the tympan, which rises with the platen.

92 Sewell, Thomas Robert, *Carrington, near Nottingham*—Inventor and Manufacturer.

Machine for making bobbin-net lace. Figured and plain net, made by the machine.

94 **BIRKIN, RICHARD**, *Nottingham*—Manufacturer.

Machine, on Leaver's principle, for the production of bobbin-net lace, ornamented and embroidered by the Jacquard; adapted for the production of lace articles of different patterns, in either silk, cotton, or other filamentary materials.

95 **FUSSELL, F. RALPH**, *Nottingham*—Designer.

Two pictures illustrative of the Nottingham lace manufacture.

96 **BURTON & EAMES**, *Lenton Works, near Nottingham*—Proprietors.

Patent gassing machine, for burning the loose fibre from lace, muslins, and other goods, thereby giving them a more thread-like appearance, without injuring the fabric. Exhibited to show the process of gassing lace, as practised in the town and neighbourhood of Nottingham.

[The operation of "gassing" consists in causing lace, thread, or similar delicate tissues, to pass with such velocity through or between jets of gas as to singe off the loose fibres, without injury to the fabric itself. It was formerly effected by passing the fabric over heated iron cylinders.—R. E.]

100 **FOURDRINIER, G. H.**, *Hanley*—Inventor and Manufacturer.

Patent steam press, for printing the impressions which are to be transferred to earthenware or china.

Patent oscillating double-piston steam-engine, with potters' flint and colour mill.

Original model of the exhibitor's patent paper machine.

Specimen of the exhibitor's pottery tissue paper, in one continuous length of upwards of 2¼ miles. Manufactured from old coal-pit ropes and hawsers.

[The pottery tissue paper is prepared exclusively for the purpose of transferring the impressions of designs from copper plates to earthenware in producing the ordinary patterns.]

102 **HARDING, PULLEIN, & JOHNSON**, *Guildhall Chambers*—Proprietors.

Patent apyrotype machinery. Self-acting machine for the manufacture of printing type from copper, zinc, or other metal, without heat, by means of dies and powerful pressure; its object is to produce a letter of more exact form than usual; and it is stated that the metal, hardened by the compression to which it is subjected in the process of manufacture, attains a durability estimated at sixty times that of ordinary cast type.

Machine for dressing the letter after leaving the first machine.

Machine for regulating the height of the types, so that, when set up in pages, their faces may be perfectly even.

Other objects contemplated by this invention are economy of type and ink, and greater resistance to pressure.

103 **UNDERWOOD, T.**, *Birmingham.*

Lithographic colour press.

104 **SHERWIN, COPE, & CO.**, 5 *Cumberland Street, Shoreditch*—Inventors and Manufacturers.

Printing press, for letter-press printing, possessing a simple combination of levers, and economising labour.

Arming-press, for bookbinders. By the simplicity of its parts great power is obtained, and the arrangement of its table allows of different thicknesses to lay on.

108 **TIDCOMBE, GEO.**, *Watford*—Manufacturer.

Machine for cutting paper in the continuous sheet.

[Paper manufactured by machine is made into a continuous web the width of the machine. As it runs from the drying apparatus it passes through the cutting-machine, where it is first slit into several continuous bands: this is effected by means of a series of circular shears formed of circular discs of steel, adjustable on two parallel axes common to the series. The bands then pass on to a kind of shears placed transversely, and acting at predetermined intervals, the paper being arrested at the point of division by the mechanism, without stopping its onward progress through the slitting-shears. Mr. T. B. Crompton, in conjunction with Mr. E. Miller and Mr. (now Professor) Cowper, obtained patents in the same year, 1828, for the cutting apparatus applicable to the above purpose: since this period several other very ingenious machines have been devised.—W. D. L. R.]

110 **SHAW, W.**, 8 *Bachelor's Walk, Dublin*—Manufacturer.

Improved machine for ruling paper.

112 **WILSON, G.**, 27 *St. Martin's Court, Leicester Square*—Inventor and Patentee.

Diagonal paper and mill-board cutting machine. Perpendicular paper-cutting machines.

114 **GREIG, DAVID & JOHN**, *Lothian Road, Edinburgh*—Designers and Manufacturers.

Iron lithographic press, 30 inches by 45 inches, with Gothic frame, eccentric pressure by side lever, and frame for registering coloured printing, counter-balance weights for bringing out carriage, and stoppers.

Iron lithographic press, 22 inches by 23 inches, with side levers, circular cross-head, ornamental frame, and stoppers for stopping carriage.

Iron lithographic press, 18 inches by 27 inches, with side lever, a kind of press much used.

Specimen of 18-inch copper-plate press, with single motion.

Portable fanners for cooling apartments in hot climates, suggested by Captain Davidson, 18th Bombay Infantry.

116 **MARRIOTT, WILLIAM**, *Leeds Road, Huddersfield*—Inventor.

Registered machine for packing in paper packets any dry substance, such as coffee, chicory, &c.; with an improved and continuous printing apparatus for printing the label before pasting it on the packet.

118 **COOKE, H.**, *High Street, Oxford*—Inventor.

Printing apparatus of a new construction, designed to give increased facilities to the compositor.

120 **NELSON, T., jun.**, *Hope Park End, Edinburgh*—Inventor.

Working model of a new printing machine. Illuminated book-titles.

121 **ULLMER, E. and W.**, 110 *Fetter Lane, London*—Inventors.

Self-inking press.

122 **INGRAM, HERBERT**, 198 *Strand*—Proprietor.

A printing machine, on the vertical principle, as used at the "Times" office.

The chief advantage of this new arrangement is, that the whole motion or circuit of the type can be made available for printing, whereas, in the flat machine, more than half the motion of the reciprocating type table is lost; and the reason for placing the cylinder in a vertical position is to obtain more easy access to the type, inking rollers, and other parts of the machine, and to permit more impressing cylinders to be arranged around the type drum than can be done when it is fixed horizontally.

The circumference of the central drum, or path of the type, is exactly 200 inches;—in the machines at the "Times" office eight impressing cylinders surround the type, which therefore print eight sheets at every revolution; but in those machines the type is not truly cylindric, but is *segmental*, which involves the necessity of using large cylinders, but when the type is purely cylindric smaller impression rollers may be used, and the produce very much increased.

The machine which is erected in the Exhibition is made to print circular woodcuts and type in the best manner. Each of the four impressing cylinders has 50 inches space for itself and its attendant inking rollers, and the form has the advantage of receiving its ink or colour from several rollers, each of which is *well distributed* or evenly covered with ink.

The vertical position of the inking rollers also conduces greatly to the production of good work; for the type or engraving is only touched on its extreme surface, while, on the flat principle, where the inking rollers act by *gravity*, the sides of the type are liable to receive colour. Another advantage is, that any dust in the paper is shaken out by the act of stopping, and falls upon the floor in place of being deposited upon the inking rollers and distributing table as in the flat machine: this is in practice a real advantage, for 50,000 impressions have been taken without once stopping to *brush out* the form or table. Another technical advantage in the printing of wood engravings, where delicate *overlaying* is required, is that the impressing cylinders are in direct connection with the type drum, so that no irregularity of motion can occur, and the *overlays* can be placed precisely where required without any fear of derangement.

Attention is also directed to the superior smoothness of the action of the vertical machine, as compared with the heavy blows produced in a flat or reciprocating machine at each change of motion in the ponderous type table and its appendages.

The action of the machine is very simple, the "*layer on*" draws a sheet of paper towards a small roller in rapid motion, which descends and causes the paper to enter between the vertical tapes which carry it downwards, when, having arrived at the proper position, it is suddenly stopped by narrow upright strips of wood, which advance and slightly compress the sheet between them, the vertical tapes at the same moment releasing it;—the stoppers are then in their turn withdrawn, leaving the sheet of paper momentarily suspended by two small pulleys, mounted on delicate springs called finger rollers. The sets of vertical rollers seen in rapid motion on each side of the sheet now advance against it, and impel it sideways towards the impressing cylinder, where it receives the impression from the type; the sheet continues its side motion, supported only by a single pair of tapes, which at the proper place are stopped, leaving the printed sheet suspended until the "taker off" draws it down upon the taking-off table.

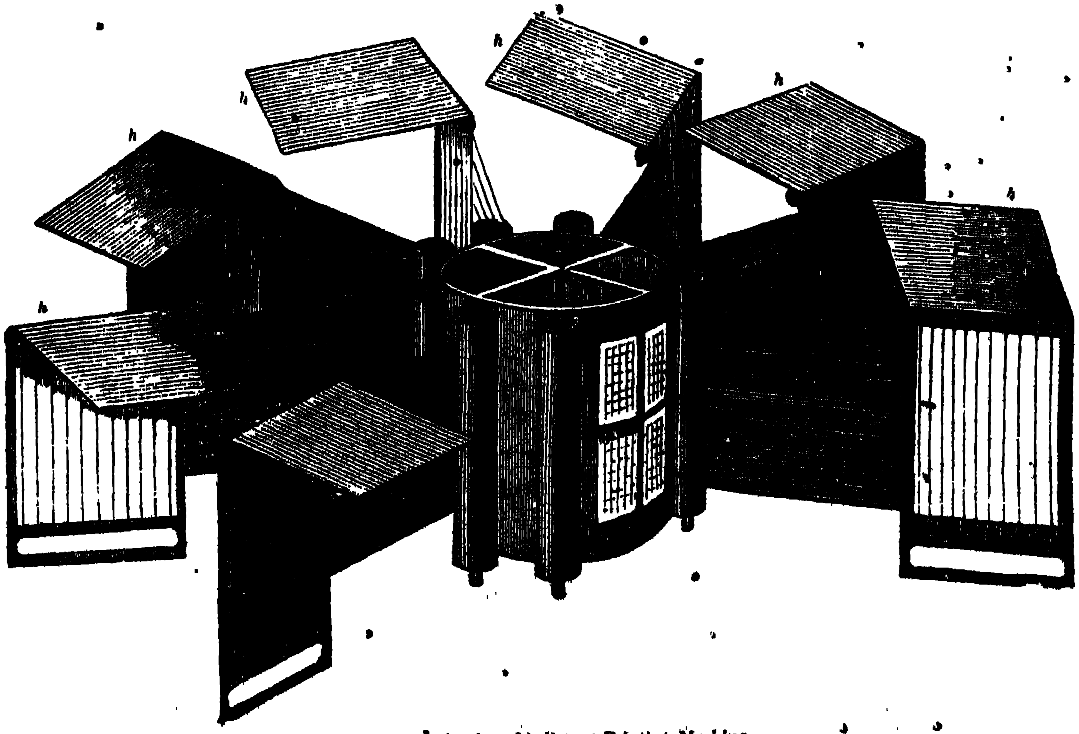
The diagram below will explain the action of the machine employed for the "Times;" *h, h, h,* represent the position of the laying-on tables.

The chases which hold the type are made with circular beds, and are securely fixed to the iron rings of the type drum. The column rules are converted by means of screws into tension bars, and they bind the sides of the chase or type-holder together, so that each column can be set up by means of a screw at its foot to any required degree of pressure. The inking rollers, which are seen in a vertical position between the impressing cylinders, are caused to press against the type and distributing table by long coiled springs, adjusted to a proper tension; they receive the ink from a circular distributing surface placed opposite to the type, and which, during its revolution, rises up and down by travelling upon an undulating railway. The ink is deposited upon the distributing table by a roller which occasionally vibrates against the ductor roller of the ink-box.

The wheels which connect the type drum and the impressing cylinders are beneath the machine, motion is communicated to the ink-box by the upper bevil wheel seen on the spindle of the type drum, and to the feeders by the lower bevil wheel.

The vertical principle admits of great variety of construction, and is equally applicable to perfecting machines for book work.

It is the patent invention of Mr. Augustus Applegath, of Dartford. Manufactured by Mr. T. Middleton, of Loman-street, Southwark.



Applegath's Patent Printing Machine.

124 **CLYMER & DIXON, G. & S.**, 10 *Finsbury Street, Finsbury Square*—Patentees and Manufacturers.

Demy Columbian printing press.

128 **REDMOND, AMEDÉE FRANÇOIS**, *Birmingham*—Inventor.

Working model, in wood, of a machine for dry-cementing envelopes, patented by the exhibitor. By this process, the envelopes can be immediately folded without requiring the tedious process of drying, in common use.

130 **DONKIN, BRYAN, & CO.**, *Bermondsey*—Manufacturers and part Inventors.

Model of a machine for making paper, with patent improvements.

132 **BREWER, JANE**, 19 *Surrey Place, Old Kent Road*—Manufacturer.

Endless brass wire cloth for a paper machine.

Straight laid, spirally laid, and wove wire dandy rollers, for producing in paper, made by machine, the "laid" watermark, devices, names, &c.

Laid and wove wire paper moulds, used in making paper by hand.

Wove wire of different degrees of fineness.

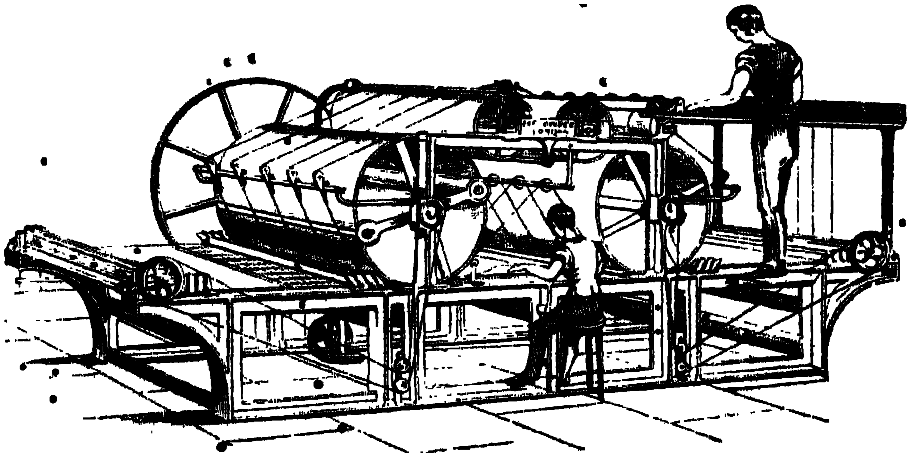
[The use of dandy rollers of the kind described is to communicate to paper made by mechanical power the "wire" and other marks generally supposed to indicate the fact of hand-labour having been employed in the manufacture of the papers.—R. E.]

134 **COWPER, EDWARD**, F.R.S., *King's College, London*, and 9 *Kensington Park Road, Notting Hill*—Inventor and Patentee.

Model of the printing machine now in general use. The Catalogue of the Exhibition is printed by these machines. The model was made by T. B. Winter, Esq., a student in King's College, London.

[The following is a brief review of the progress of printing by machinery:—In 1790, Nicholson proposed placing both the types and paper upon cylinders, and also distributing and applying the ink by means of cylinders. Another plan was to place the types upon a table, and the paper upon a cylinder, and to cause the table and type to pass backward and forward under the paper cylinder. In 1813, Donkin and Bacon proposed placing the types upon a prism, and causing it to revolve against an irregular-shaped cylinder upon which the paper was placed. Neither of the above machines came into use, but in the latter, Donkin introduced the "composition" inking rollers (*i.e.* elastic rollers, made of treacle and glue), for distributing and applying the ink. In 1814, Koenig made the first working machine, and erected two of them at the office of "The Times" newspaper, each of which produced 1,800 impressions per hour, and they continued in use until 1827; he also made two machines for Mr. Bensley, one producing 800 impressions per hour, and the other printing 800 sheets, both sides, per hour. In 1816, Cowper made machines to print from curved stereotype plates, and in 1818, one to print from ordinary type. These machines printed from 800 to 1,000 sheets on both sides, or from 2,000 to 2,400 impressions on one side of the sheet. Machines to print only one side are generally called newspaper machines, and machines to print both sides are called book machines.]

The cut represents one of these book machines; it consists of a cast-iron frame, about 14 feet long and 4 feet wide, in which an iron table slides backward and forward, passing in its progress under two cast-iron cylinders, called the paper cylinders. Two sets of type, technically called the form, are fixed on the table at such a distance from each other that one form passes under one cylinder and the other form under the other cylinder, the sheet of paper being held on the cylinder by means of tapes. At each end of the machine is a reservoir, or trough, of ink, the trough being made by an iron roller, about 3 inches diameter, turning in contact with a flat iron bar, which only allows a very small quantity of ink to pass; this iron bar is the *abductor*, but is commonly called the "doctor," and the iron roller the "doctor" roller. An elastic composition roller is made to vibrate between the table and the abductor roller, and conveys the ink from the latter to the table. A number of composition rollers are placed across the table, their axes resting in notched bearings. As the table passes backward and forward under these rollers, the ink deposited by the vibrating roller becomes very evenly spread upon the table. This spreading, or *distribution*, as it is called, is effected by three or four of the rollers (called the "distributing rollers") not only having a motion round their axes, but also a motion in the direction of the length of their axes, *i.e.*, in an *end* motion. This motion was produced in Mr. Cowper's first machines by giving an end motion to the frame, which supported the distributing rollers. Mr. Applegath suggested the more simple mode of placing the rollers in a diagonal or sloping position across the table, and making the axis long enough to slide in their notches. Three or four other rollers, called the "inking rollers," have no end motion; their office is to take the ink up from the table, and apply it to the types. Thus the "taking," "distributing," and "inking" is all done by the machine itself.



Cowper's Printing Machine.

The sheet of paper is laid by a boy on a web of tapes, whence it is carried forward, and enters between two sets of tapes; and as these tapes are carried round one paper cylinder, and then over and under two wooden "drums" to the other paper cylinder, the sheet of paper necessarily travels with the tapes, and the sheet is thus conveyed from one paper cylinder to the other; in the course of its progress, the sheet is turned over, receiving one printed impression on one side from the first form, and the second impression on the other side of the sheet from the second form, and as the tapes leave the second cylinder they divide, and the printed sheet falls into the hands of another boy.

The machines are commonly known as "Applegath and Cowper's machines."

[Mr. Napier's machine differs from Applegath and Cowper's: his machine is described in a separate article. In 1827, Cowper & Applegath jointly invented the four-cylinder machine, which Applegath erected for printing "The Times" newspaper. It at once superseded Koenig's machines, which were taken down. This machine printed from 4,000 to 5,000 impressions per hour. The diagram will give a general idea of these machines, which are still in use at "The Times" office. They consist of a table, moved backwards and forwards under four iron cylinders (called the paper cylinders), about 9 inches in diameter, which are covered with cloth, and round which the sheets of paper are held between tapes. The form is fixed on one part of the table, the inking rollers lying on another part, on which they distribute the ink. Some of these rollers are placed in a diagonal position on the table, so that, as it moves backwards and forwards, they have a motion in the direction of their length, called the "end-motion," which, combined with the rotatory motion, causes the ink to be more effectually distributed. The ink is held in a reservoir or trough formed of an iron roller, called the ductor, against which the edge of an iron plate rests, and, by its pressure, regulates the quantity of ink given out. The ink is conveyed from the ductor-roller to the table by means of an elastic roller vibrating between them. The feeding is performed by four "layers-on," who lay the sheets of paper on the feeding boards, whence they enter the machine between three pairs of tapes, by which they are conveyed round the cylinders, and thence to the spot where the "takers-off" stand, into whose hands the sheets fall as the tapes separate.

The last great improvement in rapid printing was invented by Mr. Applegath, in May 1848, when he erected at "The Times" office two vertical cylinder machines, each producing 10,000 sheets per hour.]

135 CHURCH & GODDARD, *Birmingham*—Manufacturers.

Machine for cutting cardboards into cards for printing and other purposes, capable of cutting from 300,000 to 600,000 cards per day, by the labour of one person.

Machine for manufacturing railway tickets, or printed cards. It cuts, prints, numbers consecutively, counts, and packs about eighty tickets per minute, without waste.

Machine for dating railway tickets. It gives a clear and distinct impression, which is intended to prevent the unpleasant disputes which frequently occur at railway stations, in consequence of the illegibility of the date on passengers' tickets.

136 TAYLOR, W., *Nottingham*—Designer and Manufacturer.

Machine for forming hemispherical paper shades from flat discs of paper. Ornamental paper work, &c.

138 BLACK, JAMES, *Edinburgh*—Manufacturer.

Patent folding machine.

140 WHITAKER, RICHARD, *Bury St. Edmunds*—Inventor.

Patent bookbinding press, for rolling the backs of books, cutting the edges, and impressing the ornaments on the back, intended to supersede the hammering process. Printers' types may be used. Manufactured by Messrs. Mordan and Son, City Road, London.

142 STRAKER, SAMUEL, 80 *Bishopsgate Street Within*—Manufacturer.

Side-lever lithographic press, fitted with improved registering-machine, and adapted for every description of colour printing.

144 BREWER, C. & W., *Malcolm Works, Larkhall Lane, Clapham*—Patentees, Inventors, and Manufacturers.

Plain ring and plain laid pattern dandy rollers for making endless paper.

Patent bank note moulds, of various patterns, for making notes by hand and vat.

Watered pattern moulds for fancy writing paper made by hand and vat. Angular moulds for making paper for envelopes. Autograph moulds for paper making.

Bundle of paper made from the moulds and rollers, to illustrate.

146 RANSOMES & MAY, *Ipswich*—Manufacturers.

Model of patent excavator, for railways or canals. Henry Potter Burt, London, proprietor.

Models of improved apparatus and machinery, for preparing timber with creosote. Exhaust-pump. Force-pump. Tank for the solution. Steaming and heating apparatus. Moveable tramway and crab, for loading and unloading the cylinder.

The timber to be prepared is loaded on trucks, and drawn inside the cylinder; the cover is then closed, and the air-pump employed to exhaust the cylinder, and extract the sap or moisture from the timber. The air-pump is then disengaged, and a sluice valve communicating with a reservoir opened, which charges the cylinder with creosote, previously heated to 120° Fahr. Force-pumps are then employed, which work, until the timber in the cylinder has been saturated with from 7 to 10 lbs. of oil per cubic foot; this is found to be a sufficient quantity to effectually prevent decay, from the attacks of the "Teredo navalis," &c.

Leggat's Queen press, with self-inking apparatus.

Shavings of iron.

148 POPE, THOMAS, & Co., 56 *St. Paul's Square, Birmingham*—Manufacturers.

Screw press (called the "Lion Press"), for embossing paper, &c.

Screw press, with an arm, a substitute for a double-sided press.

A small powerful lever press, called "The Model," for embossing paper with dies up to one inch diameter; only 4½ by 2½ inches base; height 3½ inches; weight 2¾ lbs.

"The Cornucopia" lever press for the same and other purposes, with dies 1½ inch diameter.

The portable desk press; base 5½ by 2½ inches diameter.

Large quarto screw copying press of improved construction, the pillars and beams being in one solid piece.

A small quarto screw copying press.

A folio screw copying press.

150 COBB, T., 19 *Portugal Street, Lincoln's Inn*—Manufacturer.

Working model of iron printing press, with improvements by the exhibitor.

151 HARRIS, C., *Shalford, near Guildford*—Inventor and Manufacturer.

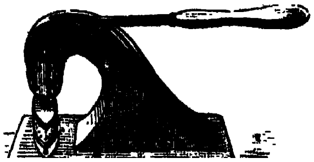
Fly press, for stamping envelopes, note paper, &c., in colours. On the fly-spindle is fixed an inclined plane to give motion to the force spindle, which carries the force or die. On the top is a tooth wheel, which gives motion to other wheels for the colouring apparatus.

152 **Lightfoot, Thomas M.**, *South Shields*—Inventor.

Patent beating engine for reducing rags into pulp.—The improvement consists in the introduction of a second beating roll, and a new adaptation of washing apparatus, which is said to enable the engine to produce four times the quantity of pulp produced by an ordinary engine in the same time.

154 **Jarrett, Griffith**, 45 *Lee Street, Kingsland Road*—Inventor.

Improved embossing presses, constructed with steel levers, double enclosed springs, and prepared for moveable dies; the dies made of highly tempered steel, and furnished with copper counterparts.



Jarrett's Embossing Press.

155 **Collett, C.**, 8 *Great Cambridge St., Hackney Road*—Inventor.

Specimens of embossing presses.

156 **Sullivan, Thomas**, *Foots' Cray, Kent*—Inventor and Manufacturer.

Improved double-sized, brass-bodied, laid dandy roller, for producing the water-mark, &c., in machine laid paper.

Interlinear laid roller for producing fancy designs.

Improved spiral laid roller.

Improved brass-bodied wove roller, with fancy designs.

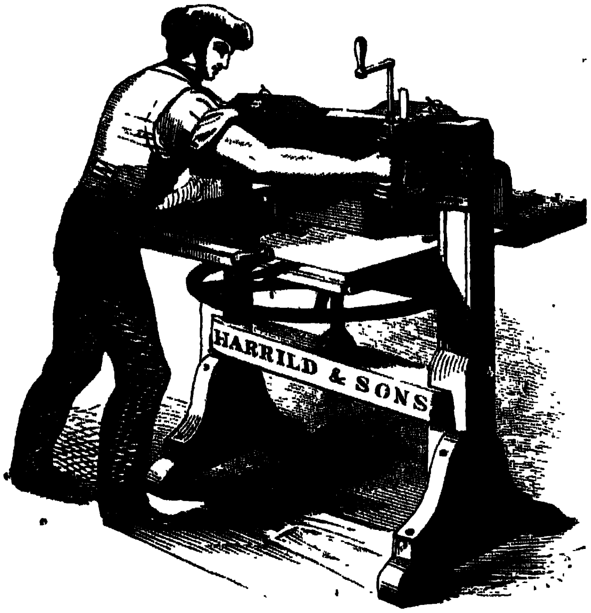
Models.

157 **Harrild & Sons**, 10, 11 & 12 *Great Distaff Lane*, and 22 *Friday St.*—Inventors and Manufacturers.

Improved galley press, used for pulling proofs in "galleys;" represented in the following cut.

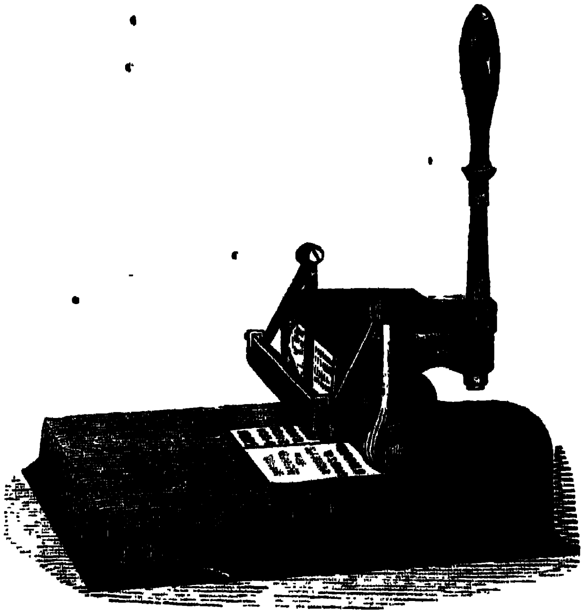
Harrild's Galley Press.

Registered plough cutting machine, calculated to cut with ease any kind of paper or card; represented in the following cut.



Harrild's Plough Cutting Machine.

Numerical printing apparatus, calculated to print a few lines with a number attached, which alters consecutively up to 99,999 with each impression, or alternatively, as may be required. The printing is effected by laying the paper on the surface, and then simply bringing the handle to a horizontal position and pressing on the paper, the action of which not only effects the inking of the type and figures, but the distribution of the ink and printing. This apparatus is represented in the following cut.



Harrild's Numerical Printing Machine.

Seamless composition printing rollers for wood-cut and fine printing.

Improved composition balls for printing.

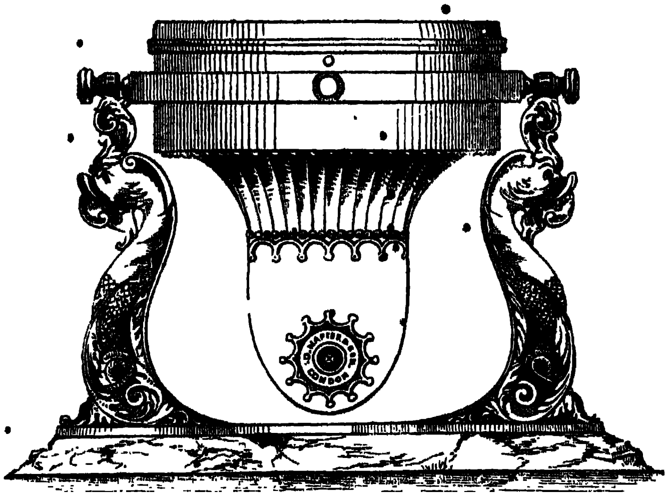
[These rollers and balls are intended to distribute the ink evenly over the surface of the type.

In fine printing and wood-cut printing, the equal distribution of the ink is of great consequence to the perfection of the work.]

158 **NAPIER, D., & SON**, *Lambeth*—Inventors and Manufacturers.

A captain's patent registering compass. This instrument registers on paper the exact compass course which a vessel has been steered for 24 consecutive hours. Its object is to enable the captain at any time, by mere inspection, to ascertain if the ship has been steered correctly, and if not, to show immediately the period and amount of the deviation. This machine is represented in the annexed cut.

Letter-press perfecting and printing machine, worked by a small steam engine; when in operation, it is arranged with a combination of tapes and grippers, by which the "flying" of the sheet in laying on, required in tape machines, is rendered unnecessary.



Napier's Registering Compass.

Another machine, of the same description, for a larger form.

Single cylinder letter-press printing machine, suitable chiefly for bookwork.

Patent self-feeding and self-discharging centrifugal apparatus suited to the separation of the molasses from the crystal in sugar manufacture, also to other purposes. Exhibited as a novel and useful invention. The advantages are, a continual discharge and supply of the matter to be operated upon, and, consequently, great saving of time and labour; as the machines at present used must be stopped, discharged, and re-discharged by men in attendance. The time saved by the improved machine not only includes that now consumed in taking out and filling the charge (which, on an average, must be done every eight minutes), but that necessary for stopping and starting the machines, the working speed being 1,500 revolutions per minute, and which is very considerable. There are also many other advantages.

160 **M'CLURE & Co.**, *Bow Churchyard, Cheapside*—Producers.

A lithographic press.

162 **HOPKINSON & COPE**, 14 *New North Street, Finsbury*—Inventors and Manufacturers.

The Albion printing press.
Holm's patent Scandinavian printing machine.
A two-horse power high-pressure table engine.
A cylindrical inking apparatus.

164 **WATERLOW & SONS**, *London Wall*—Producers.

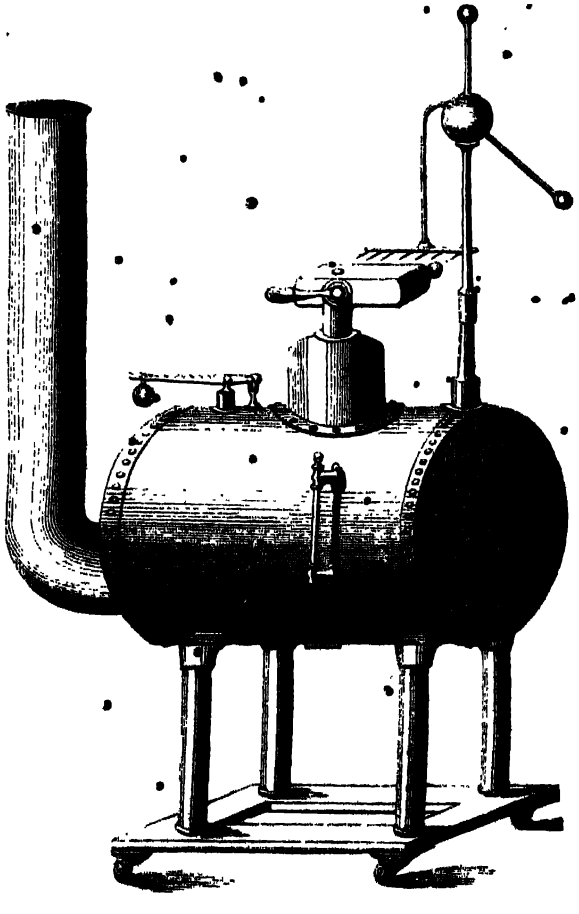
Printing machine. Patent self-feeding envelope machine, producing envelopes folded, gummed, and embossed. Machine for numbering bank notes, &c. Patent autographic press.

---

165 **WATSON, HENRY**, *Newcastle-upon-Tyne*—Manufacturer and Inventor.

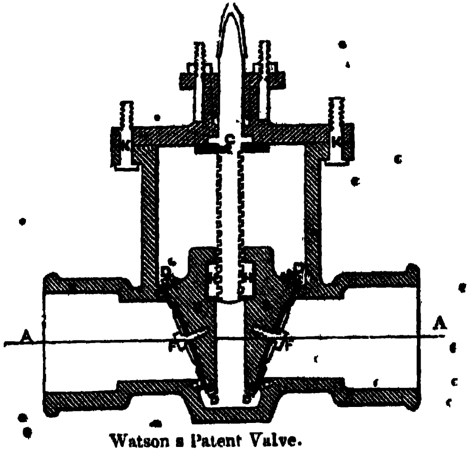
Improved pulp strainer, for paper manufacturers.

Hydro-electric machine. This machine is represented in the annexed cut.



Watson's Hydro-electric Machine.

Patent valve for fluids; represented in the annexed cut.



Watson's Patent Valve.

The cut shows a vertical section of a straight cock. A A is the water-way represented, as closed by the block or key B B, made to move vertically up and down by turning the screw C, which works through a nut H H, fitting loosely into the key. The dark line is an elastic facing, which may be of leather, gutta percha, India-rubber, felt, or any material most suitable for the purpose to which the cock is intended to be used, and is secured in its place by the brass ring D D, three screws through which prevent the possibility of its afterwards moving, or the facing material becoming displaced. F F is a bolt screwed into the centre, having a plate which draws the elastic material tightly over the face, and fitting closely the seat G G G G. The horizontal section or plan through the line A A, shows the form of the cock; E E are guides for the key working freely up and down when moved by the screw C.

166 COWAN, ALEX., & SONS, 45 *Upper Thames Street*—Manufacturers.

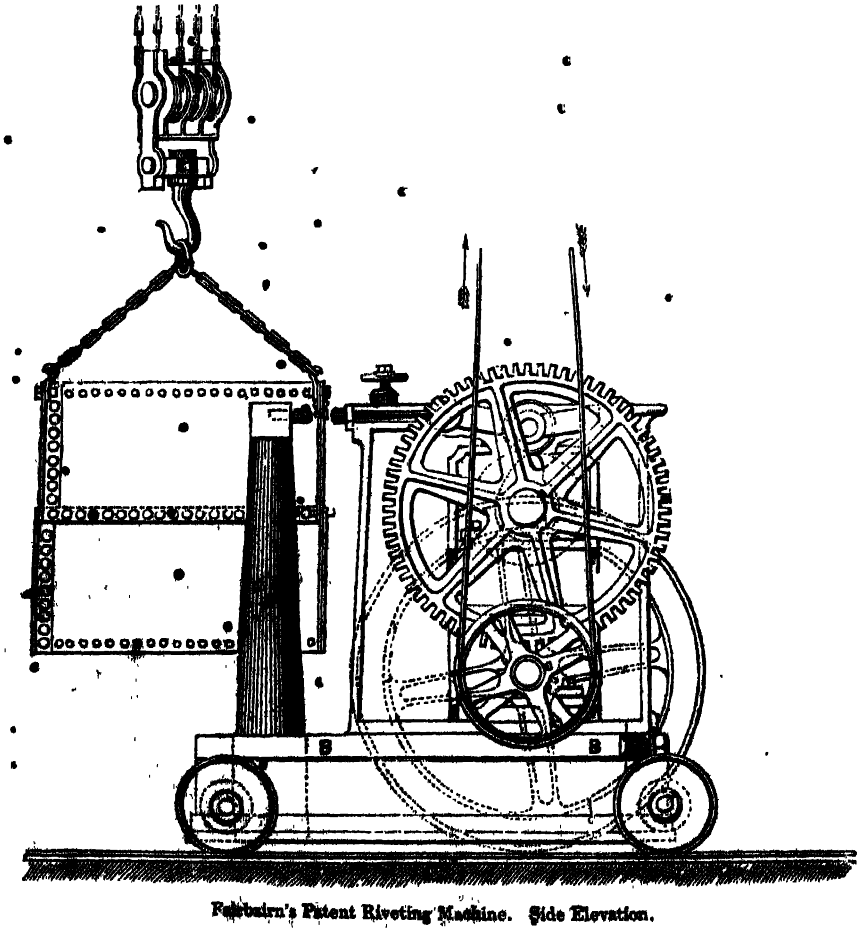
Paper pulp-meter. Patented by Charles Cowan, Valley-field, near Edinburgh. The object of this apparatus is to measure out a uniform and exact supply of pulp to the paper-machine, according to any width and thickness of the web of paper which it may be desired to make. The pulp, after having been prepared in the engines, and mixed in ascertained proportions of raw materials and of water, is kept in the pulp or stuff chest. The cup of the pulp-meter, which is driven in connection with the paper machine, is made to dip into a box, which, by means of a ball-cock or valve, is always kept full of pulp from the pulp-chest, and lifts and delivers the requisite quantity of pulp to make the width and thickness of the web required. This is done by means of the slide upon the cup, which can be set even while the apparatus is in motion, so as to deliver the number of cubical inches of pulp at each dip required for the particular paper to be made, which can be ascertained by a very simple calculation. In this way uniformity of thickness in every sheet of the paper manufactured is readily obtained.

168 SCHLESINGER & Co., 8 *Old Jewry*—Producers.

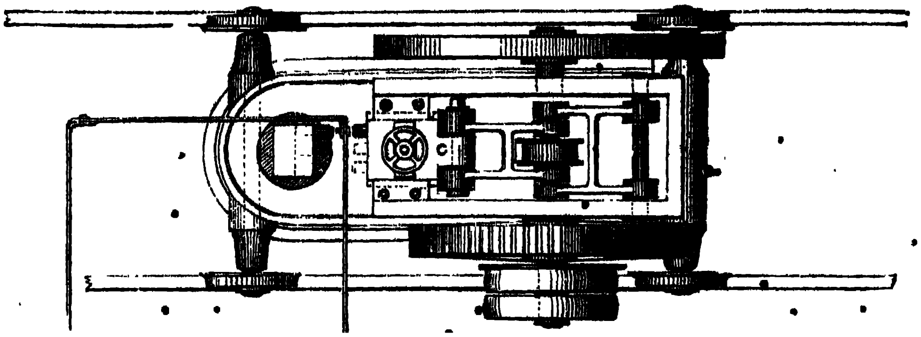
Paging and numbering machine.
Ticket printing machine.
Machine for printing bank notes.

200 FAIRBAIRN, W., & SONS, *Manchester*—Inventors and Manufacturers.

Patent riveting machine, for riveting boilers, and other vessels, constructed of wrought iron. The moving slide and die are worked by the action of a revolving cam upon an elbow joint, which gives a variable motion, and exerts the greatest force at the closing of the joint and the finishing of the rivet. The following figures represent this machine.



Fairbairn's Patent Riveting Machine. Side Elevation.



Fairbairn's Patent Riveting Machine. Plan.

[The invention of the riveting machine originated in a turn-out of the boiler-makers in the employ of the exhibitor about fifteen years ago. On that occasion the attempt was made to rivet two plates together by compressing the red-hot rivets in the ordinary punching-press. The success of this experiment immediately led to the construction of the original machine, in which the moveable die was forced upon the rivet by a powerful lever, acted upon by a cam. A short experience proved the original machine inadequate to the numerous requirements of the boiler-maker's trade, and the present form was therefore adopted about eight years since.

The large stem, A, is made of malleable iron, and having an iron strap, BB, screwed round the base, it renders the whole perfectly safe in the case of the dies coming in contact with a cold rivet, or any other hard substance, during the process. Its construction also allows the workman to rivet angle iron along the edges, and to finish the corners of boilers, tanks, and cisterns; and the stem being now made 4 feet 6 inches high, it renders the machine more extensive in its application, and allows of its riveting the fire-box of a locomotive boiler or any other work within the given depth.

In addition to these parts, it has a broad moving slide, C, in which are three dies corresponding with others in the wrought-iron stem. By using the centre die every description of flat and circular work can be riveted, and by selecting those on the sides it will rivet the corners, and thus complete vessels of almost every shape. This machine is in a portable form, and can be moved on rails, with care, to suit the article suspended from the shears.

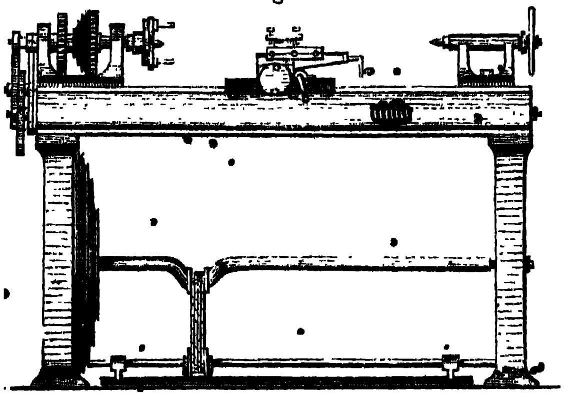
The introduction of the knee-joint gives to the dies a variable motion, and causes the greatest force to be exerted at the proper time, viz., at the closing of the joint and the finishing the head of the rivet.

In other respects the machine operates as before, effecting by an almost instantaneous pressure what is performed in the ordinary mode by a long series of impacts. The machine fixes in the firmest manner, and completes eight rivets of ¾ inch diameter in a minute, with the attendance of two men and two boys to the plates and rivets; whereas the average work that can be done by two riveters, with one "holder on," and a boy, is 40 ¾-inch rivets per hour; the quantity done in the two cases being in the proportion of 40 to 480, or as 1 to 12, exclusive of the saving of one man's labour. The cylinder of an ordinary locomotive-engine boiler, 8 feet 6 inches long, and 3 feet diameter, can be riveted and the plates fitted completely by the machine in four hours; whilst to execute the same work by hand would require, with an extra man, twenty hours. The work produced by the machine is likewise of a superior kind to that made in the ordinary manner; the rivets being found stronger and the boilers more free from leakage, and more perfect in every respect. The riveting is done without noise, and thus is almost entirely removed the constant deafening clamour of the boiler-maker's hammer.]

201 **WHITWORTH & Co.**, *Manchester*—Manufacturers.

Self-acting foot lathe, fig. 1, with motions for sliding, screwing, and surfacing, including double-geared head-stocks, conical steel mandril and bearings, case-hardened, compound slide-rest, with quick hand traverse. Guide screw, with disengaging nut, and 24 change wheels for screw cutting. Anti-friction treadle motion, crank and speed pulley, for band, with equal tension. Hand-rest with eccentric lock, two-face plates, clements driver, drill, bell, and cup chucks.

Fig. 1.

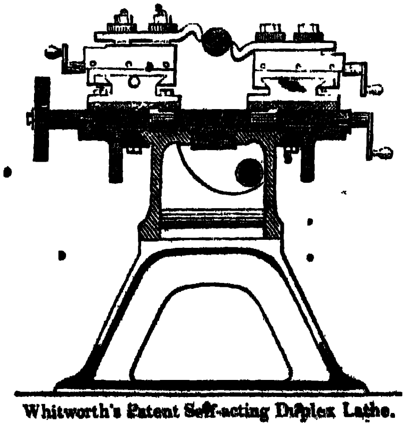


Whitworth's Self-acting Foot Lathe.

This lathe is intended for amateur use, and exhibits a complete sliding, screwing, surfacing, and boring lathe. Ornamental chucks can be applied to this as to other lathes.

Patent self-acting duplex lathe, fig. 2, with two cutting tools, for sliding screwing, and surfacing, having double-

Fig. 2.



Whitworth's Patent Self-acting Duplex Lathe.

geared headstocks, with conical steel mandril and bearings. Slide-rest, with quick hand traverse, two compound top rests, one on each side of the lathe centres, with independent adjustments, two extra slides, with right and left screw for working the top rests simultaneously. Guide screw, disengaging nut, and 23 change wheels for screw cutting; two-face plates, clements driver, drill, and bell chucks.

[The duplex principle consists in the employment of a cutting tool at the back of the lathe opposite to the tool in front, and in inverted positions to each other. The transverse forces are thus balanced, the work produced is more correct, and is accomplished in less time than by the ordinary lathe.]

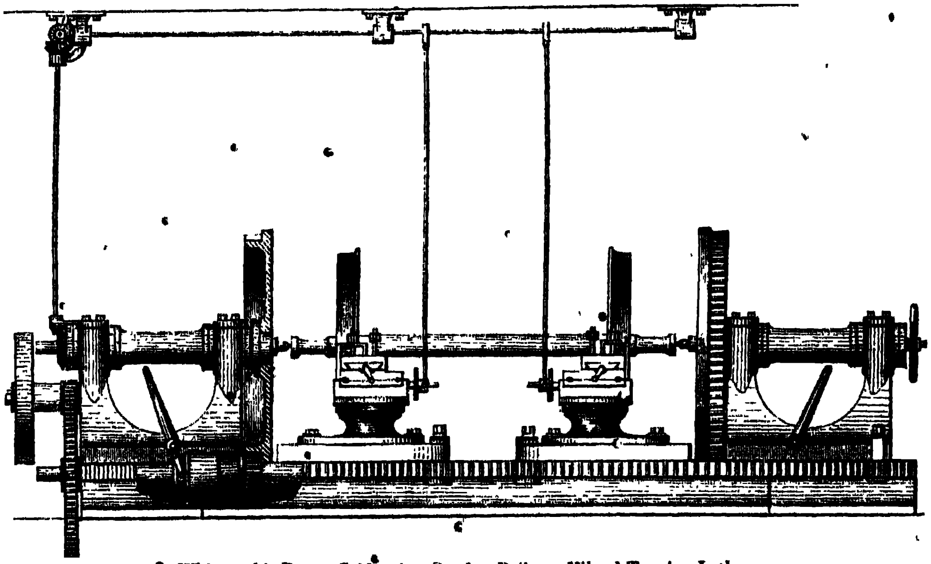
Patent self-acting compound duplex lathe, with four cutting tools, for sliding, screwing, and surfacing.

[The arrangement of this lathe is similar to the foregoing, except that this has a duplicate independent series of self-acting motions and tools, which may either be worked separately or simultaneously. The bed is of great length, in one casting, and may be used for two distinct lathes, by employing an extra set of headstocks. The lathe, though suited for general work, is intended more particularly for sliding long shafting, and for cutting screws. In sliding a shaft, the two series of tools commence in the middle of its length, and proceed in a direction right and left. There is, consequently, a balance of force longitudinally, as well as transversely.]

Patent self-acting duplex railway-wheel turning-lathe, fig. 3, including two sets of double-geared headstocks and face plates, driven independently, to prevent torsion of the axle; four compound slide rests, with separate self-acting motions to each, and swivel plates.

[Four cutting tools are employed, two acting upon opposite sides of each wheel. Both wheels are turned at once upon their axle, and the slide rests are readily removeable in order to get the wheels into and out of the lathe.]

Fig. 3.



Whitworth's Patent Self-acting Duplex Railway Wheel Turning Lathe

Patent self-acting planing machine, with reversing tool, to plane both ways; grooved table, with screw traverse, by which the driving is removed from the middle to the end of the bed. Self-acting motions, for horizontal, vertical, and angular planing.

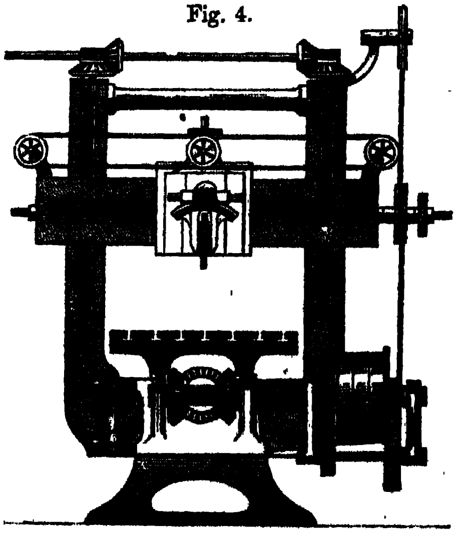
Self-acting planing machine, to plane one way, with quick return motion. (Fig. 4.)

The arrangement of this is similar to the foregoing, except that this has a quick return motion applied to the screw, and has a fixed tool instead of a reversing tool. The tool-holder is fitted with a segment wheel and worm, for shaping internal curves, and has a self-relieving motion. It is self-acting in all cuts.

Patent self-acting crank planing machine, uniform in cutting, with a quick return motion. The tool holder is fitted with segment wheel and worm, and has a self-relieving motion as in the last machine. The general arrangement of parts, such as the bed, table, uprights, and cross-slide, is the same. The motion from the crank is imparted to the table by means of a grooved lever, in which the crank pin slides, a connecting rod being attached to the top end of this lever and to the table. The connecting rod consequently vibrates through a very small arc, and enables the ordinary V slides to be used in the bed and table.

Patent self-acting universal shaping and planing machine, fig. 5, with adjustable crank, acting uniformly in cutting, with a quick return motion; with bed grooved on the front side, two tables for fixing the work, moveable vertically and longitudinally; horizontal slide moving the full length of bed, for planing flat work; transverse

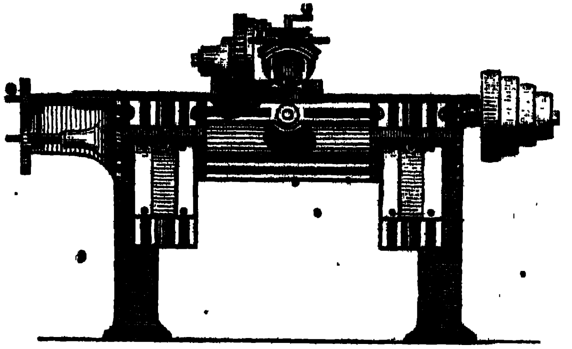
Fig. 4.



Whitworth's Self-acting Planing Machine.

slide and tool-holder, with segment wheel and worm for internal curves; vertical slide and swivel for angular work; conical mandril, with worm and wheel for circular work.

Fig. 5.

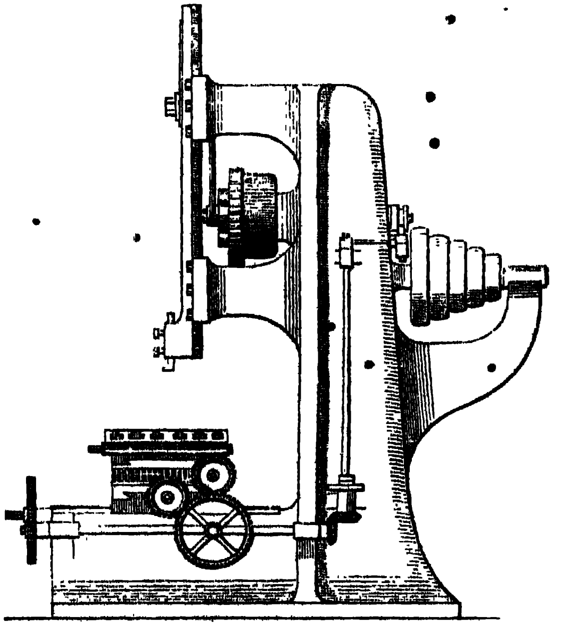


Whitworth's Patent Self-acting Universal Shaping and Planing Machine.

These machines are used for shaping and planing levers, cranks, straps, cross-heads, &c., and for curves and planes in general. They have five independent self-actions, viz.: for flat, vertical, angular, and circular work, and for internal curves.

Patent self-acting slotting and shaping machine, fig. 6, with independent upright framing, adjustable crank and quick return motion; vertical slide and tool holder; table for holding the work, fitted with two series of transverse slides; worm-wheel for circular work; self-acting transverse and circular motions.

Fig. 6.



Whitworth's Patent Self-acting Slotting and Shaping Machine.

These machines are used for cutting keyways in wheels, and for shaping work in general. The upper series of transverse slides give increased facility in chucking work to be shaped.

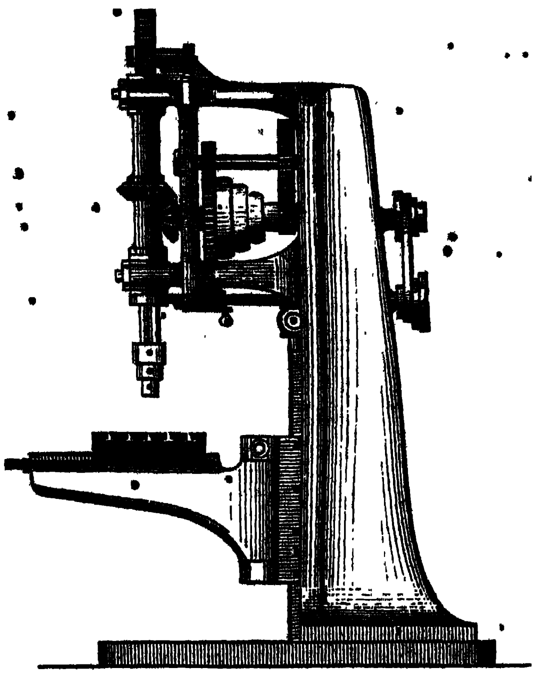
Patent self-acting bench slotting and shaping machine, similar to the foregoing, but adapted particularly to small work.

Small self-acting vertical drilling machine, single geared, with independent framing, drill spindle in tube, with variable down motion, plain elevating table.

The spindle, by passing through a tube and not revolving in bearings, undergoes very little wear. It may be quickly raised by hand.

Self-acting vertical drilling and boring machine, fig. 7, double geared, with independent framing, drill spindle in tube, variable down motion, and radial table, with vertical and horizontal slides.

Fig. 7.

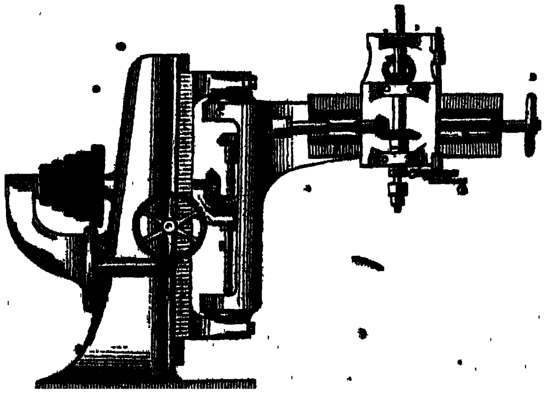


Whitworth's Self-acting Vertical Drilling and Boring Machine.

The radial table affords greater facility than a fixed table for chucking work; and any number of holes may be drilled after once fixing without disturbing the work till finished.

Self-acting radial drilling and boring machine, fig. 8 (medium size), with independent framing, vertical elevating slide, radial arm, moveable through an arc of 190°, slide carrying drill spindle, with variable self-acting down motion.

Fig. 8.

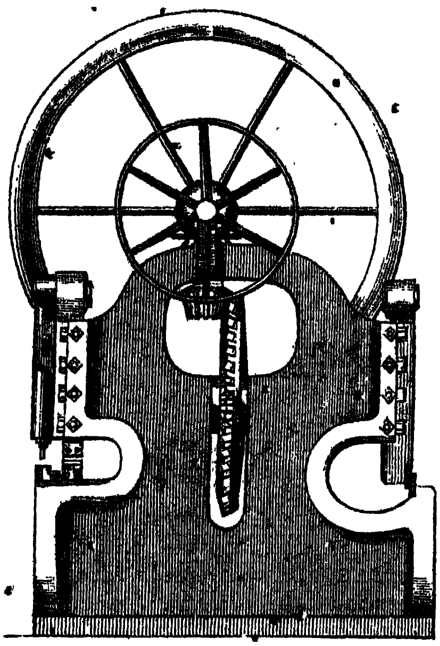


Whitworth's Self-acting Radial Drilling and Boring Machine.

These machines are used for drilling the end plates of tubular boilers, and for work in general. All holes within the range of the machine can be drilled without removing the work till finished. These machines are also adapted for work of a massive character, such as large cylinders, &c., which could not be conveniently lifted and placed on the table of the ordinary drilling machine. A pit should be provided in front for objects of great length.

Punching and shearing machine, fig. 9, for hand or power, with separate slides for the two operations, one on each side of the machine, worked by eccentrics. Apparatus for raising the punch quickly without stopping the machine. Small shears for cutting off bars of any length. Punching and shearing, or bar cutting, may be carried on at the same time without interruption.

Fig. 9.

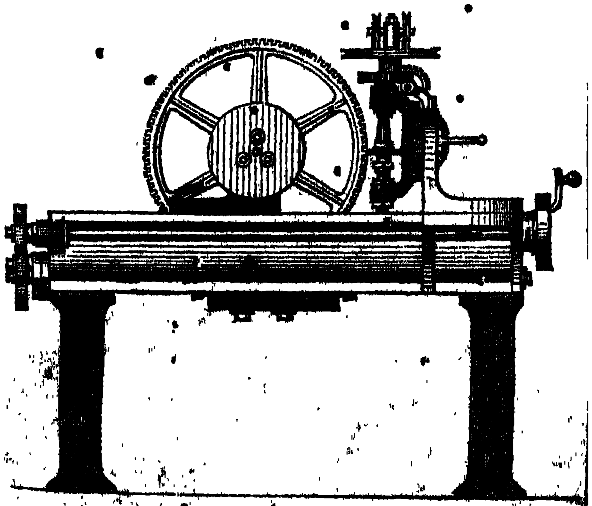


Whitworth's Punching and Shearing Machine.

Hand-punching and shearing machine, with single slide, worked by eccentric, only one process being carried on at a time.

Self-acting wheel-cutting and dividing machine, fig. 10, for bevel spur and worm wheels, with headstocks and dividing wheel, moveable horizontally for different diameters of wheels, cutter frame, with universal adjustment, self-acting traverse for cutter, self-adjusting driving pulleys, change wheels, for all numbers up to 100.

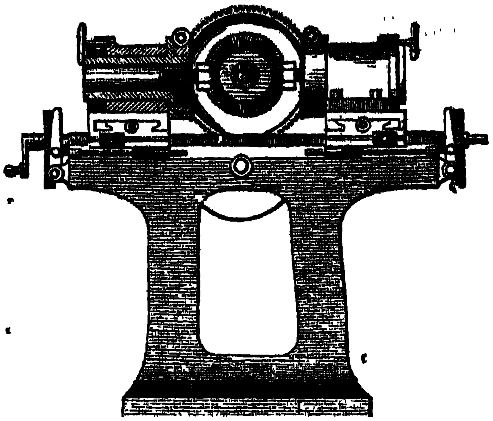
Fig. 10.



Whitworth's Self-acting Wheel-cutting and Dividing Machine.

Self-acting bolt-head and nut-shaping machine, fig. 11, with two circular cutters, for shaping two sides at once, two concentric chucks, for two objects to be operated upon at the same time. Duplicate compound slides, with independent self-acting and self-disengaging motions to prevent injury from the cutters.

Fig. 11.



Whitworth's Self-acting Bolt-head and Nut-shaping Machine.

The chucks are respectively placed on opposite sides of the centre of the circular cutters, by which the forces are balanced, and a much greater quantity of work is produced than if one chuck only were used. These machines are applicable for shaping and squaring nuts, ends of shafts, &c. The concentric chucks are removable, so that other work may be shaped and squared.

Patent screwing machine, for bolts and nuts, with hollow mandril, die holder, with four radial dies, two on each side of the centre, complete sets of dies and taps, with chucking apparatus for bolts and nuts. The radial die holder is similar in principle to the patent guide screw stock. The dies are cut by master taps, of double the depth of thread larger in diameter than the working taps, so that the circle of the dies in contact is the same size as the screw blank. A perfect guide is thus obtained, and a thread of correct pitch is formed at the commencement. The inner edges of the dies being filed off to an acute angle, they cut with ease without distorting the thread; and by the direction in which the dies are moved, their cutting power is preserved for the full depth of thread. Their action in cutting is similar to the chasing tool, which they resemble in form, and may in like manner be sharpened on a grindstone.

Patent screwing apparatus, fig. 12, including the patent guide screw-stock and dies, working taps, master taps, for cutting up the dies, hobs, for cutting screw tools, and case-hardened tap wrenches. The dies of the screw stock are cut by a large master tap, and their action is the same as explained in the bolt-screwing machine. The diameter of the working taps are made to standard gauges; the angle of the thread in all cases is 55°, rounded off at top and bottom to two-thirds of a complete angular thread; small fractional pitches are avoided, and the principle of uniformity in pitch, form of thread, and diameter, is rigidly adhered to.

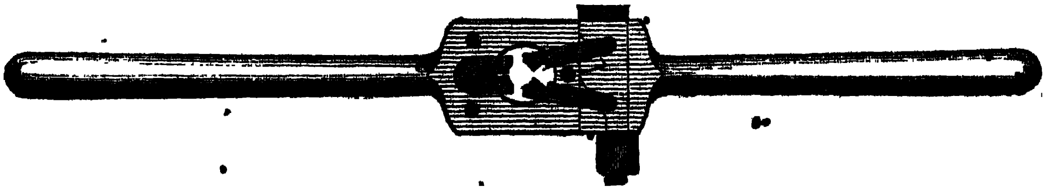
Measuring machine, and standard yard measure.

Internal and external standard cylindrical gauges, of sizes from 1-8th to 6 inches diameter, tested by the measuring machine.

Set of stepped gauges, external only from 1-8th to 6 inches.

Patent knitting machine, knits one stitch at a time, similar to hand knitting: may be worked by hand or power.

Fig. 12.



Whitworth's Patent Screwing Apparatus.

202 **FOSTER, T.**, *Manchester*—Inventor.

Apparatus for preserving the surface of copper rollers and steel dies, with a coat of etching ground, so as to resist the action of nitric-acid, for the purpose of deepening the engraving.

203 **LYONS, MORRIS**, 143 *Suffolk Street, Birmingham*—Inventor.

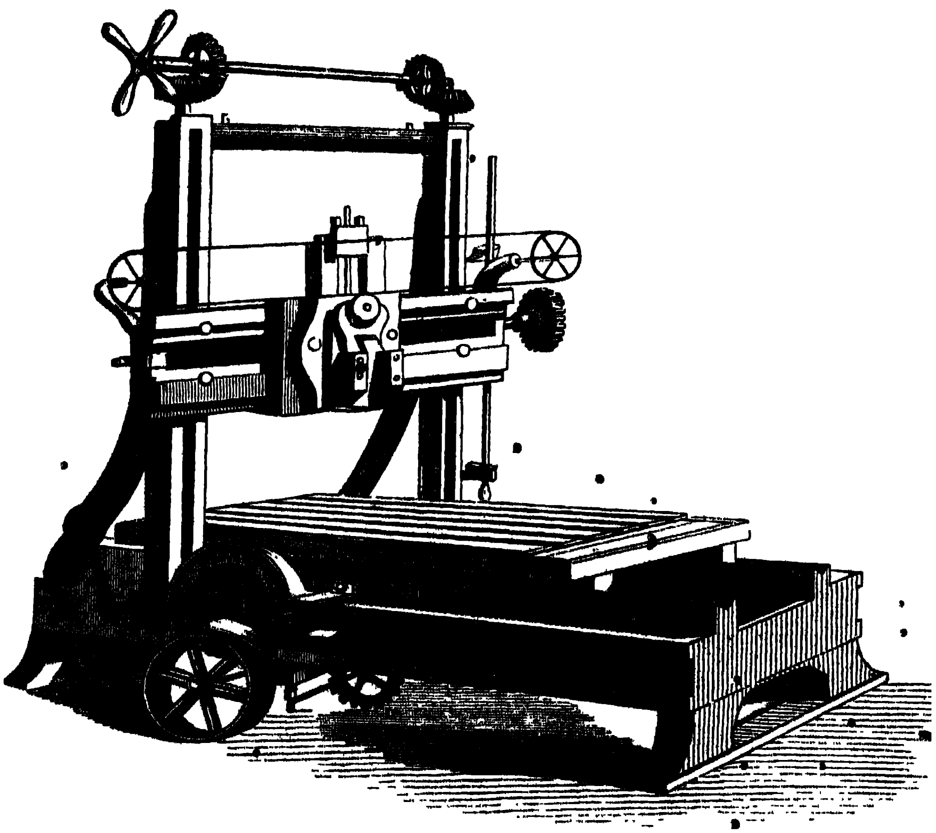
Apparatus and specimens to illustrate the process of bright electro-plating, gilding, electro-engraving, and deposition of copper for the formation of tubes. This process differs from others, in at once depositing the metal in a bright state, requiring no after polishing. Hence it is particularly adapted for embossed works of art. The economy of this process consists in its requiring less battery-power, and a smaller consumption of the precious metal.

[Bright electro-plating has been effected by mixing a few drops of the sulphuret of carbon with the silver or gold solution in the precipitating trough.—R. H.]

204 **SHARP BROTHERS**, *Manchester*—Inventors.

Lathe, slotting-machine.

Powerful self-acting planing machine; represented in the following engraving.



Sharp's Powerful Self-acting Planing Machine.

205 **MORDAN, SAMPSON, & Co.**, *City Road*—Manufacturers.

Bright steel fire-proof jewel-box, decorated with or-molu ornaments.

Carved inkstand, inlaid with pearl and gilt ink-glass attached, with gold pen.

Large frame containing an assortment of every description of gold pens, and gold pen-holders.

Complex self-acting rose engine and tracing machine.

Combination copying and seal-press, on a stand; which combines the double purpose of a seal or embossing-press, and a copying-press.

206 **MUIR, WILLIAM**, *Salford, Manchester*—Manufacturer.

Amateur foot lathe, slide rest, eight gun-metal chucks, joiner's bench, tool-chest, and German cramp.

Large and small patent coffee-mill for grocers and private use.

Screw embossing press, for stamping envelopes, with dies, sets of alphabets, &c.

Lever embossing presses, for embossing crests, &c.

Copying presses.

Screw-stocks, taps, master-taps, and tap-wrenches.

Machine taps and hand-screw tools.

Oil-testing machine. Invented by Emanuel Thomas, of Manchester.

Registered theodolite. Designed by Henry Goss, of Salford.

Specimens of embossing. Lithographs of copying and embossing presses.

Soap-cutting machine. Invented by Walter Storey, of Manchester.

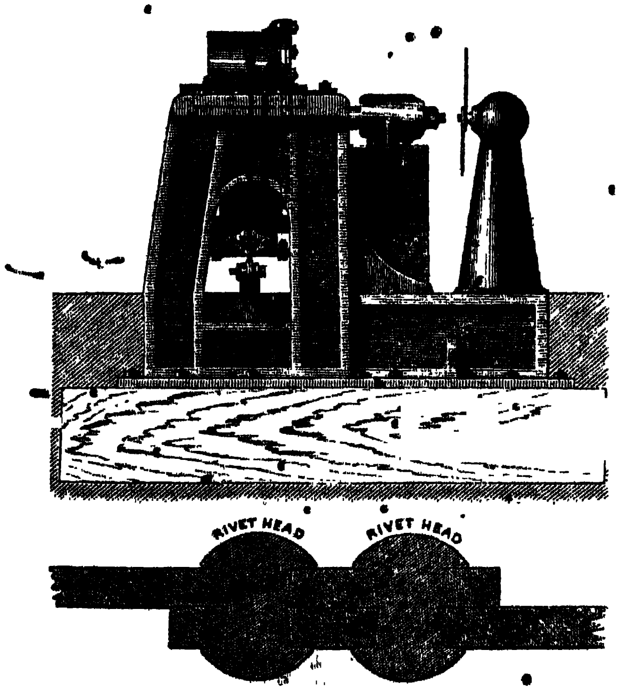
207 **HUNT, JOHN**, *per* C. BOYD, 15 *Addison Road, Kensington*—Inventor.

A mineral washing-case, designed for the more expeditious and effectual washing of gold, silver, tin, copper, and lead ores, and applicable to all kinds of mineral, the specific gravity of which is greater than the foreign matter with which it is mixed. The superiority is said to consist in the great ease, rapidity, and economy, with which ores can be treated, as compared with the ordinary system, the latter requiring that the mineral to be operated upon should be previously separated from [illegible] matter and stony particles. The inventor

and lead ores from the "débris" of the ancient mine of "Pont-pean," near Rennes, in France, of which he is the occupier.

208 **GARFORTH, WILLIAM, JOHN, & JAMES**, *Dukinfield Iron Works, near Manchester*—Manufacturers.

Steam riveting machine, having direct action. The following engraving gives the form of the machine, which consists of a strong cast-iron frame, a cylinder 36 inches in diameter, with piston and rod, on to which high-pressure steam is alternately let and discharged; the riveting portion being acted on directly by the piston rod, and the plates are thus closed and the rivet formed.



Garforth's Steam Riveting Machine.

With this machine, one man and three boys can rivet with perfect ease, and in the firmest manner, at the rate of six rivets per minute, or three hundred and sixty per hour.

Annexed to the drawing of the riveting machine is a section of two pieces of boiler plate, riveted together by this machine, and planed through the centre of the rivet, to exhibit the accuracy of the work.

209 **LEWIS, FRANCIS, & SONS**, *Manchester*—Manufacturers.

Wheel-cutting and dividing engine for cutting bevel-spur and worm wheels.

Model of Lewis and MacLardy's patent roving and slub spindle for cotton, wool, flax, and other fibrous substances, and of spindle for doubling any descriptions of yarns on the same principle.

210 **SHANKS, ANDREW**, 6 *Robert Street, Adelphi*—Inventor and Manufacturer.

Bolt screwing and tapping machine. This machine cuts a perfect screw at one operation, and not by successive cuts.

Improved high-pressure steam engine.

Detail planing machines, one being for hand power for opticians and amateurs.

212 **JOHNSON, R., & BROTHER**, *Dale Street, Manchester*—Manufacturers. (Agents in London, Messrs. TOOTAL & BROWNE, 73 & 74 Piccadilly.)

Wire-drawing benches, showing the process of drawing strong and fine sizes of iron wire.

Specimens of fine-drawn iron wire.

213 **PARR, CURTIS, & MADELEY**, *Manchester*.

Planing-machine. Lathes, &c.

214 **TAYLOR, W.**, 33 *Little Queen Street, Holborn*—Inventor.

Metal press used for striking medals for the Exhibition.

215 **BENNETT, JOSEPH**, 1 *Thistle Street, Oldham Road, Manchester*—Designer.

Shaded drawing of a large and powerful self-acting slide lathe for surfacing. Headstocks 42 inches high.

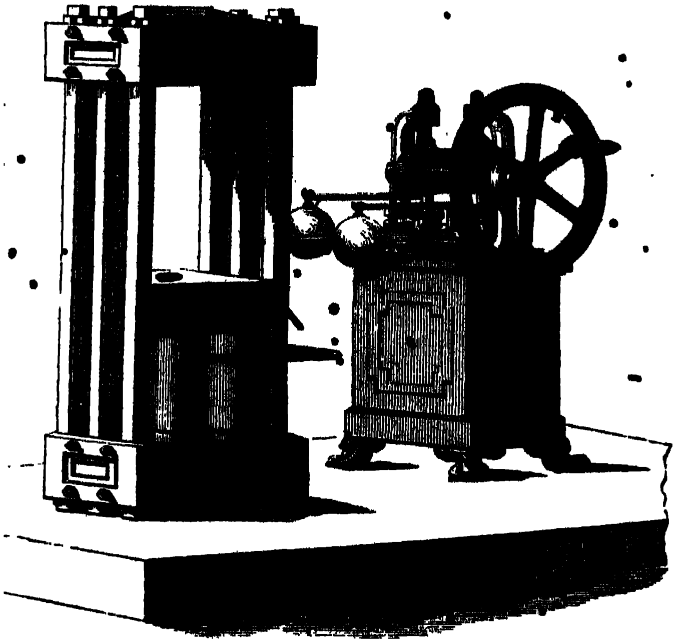
A lathe of this nature has been manufactured by Messrs. J. & D. Glasgow, Manchester, for Her Majesty's Dockyard, Plymouth.

218 **HICK, B., & SON**, *Bolton*—Designers and Manufacturers.

Model of exhibitors' improved compound hydraulic press. This model shows the arrangement of an improved press, now at work on the premises of the exhibitors at Bolton, having four cylinders of such area as in the aggregate to be equal to 2,500 tons pressure. Among the various advantages attributed to this plan, are, that the four cylinders may be worked together or two at a time; and much better castings are obtained in consequence of the diminished weight, each of the cylinders weighing only two tons (about eight tons for the four), whereas one cylinder equal in power would weigh 20 tons. The model pumps and apparatus attached are equal in power to a single press with cylinder six inch diameter. Accompanying this model are several blocks of iron, eight inch diameter, which have been punched cold by the large press. The pressure necessary for such an operation, being, for iron, 1¼ in. thick, 700 tons; 2 in. thick, 950 tons; 2½ in. thick, 1,250 tons; 3 in. thick, 600 tons, and 3½ in. thick, 2,050 tons. Fig. 1 represents this machine.

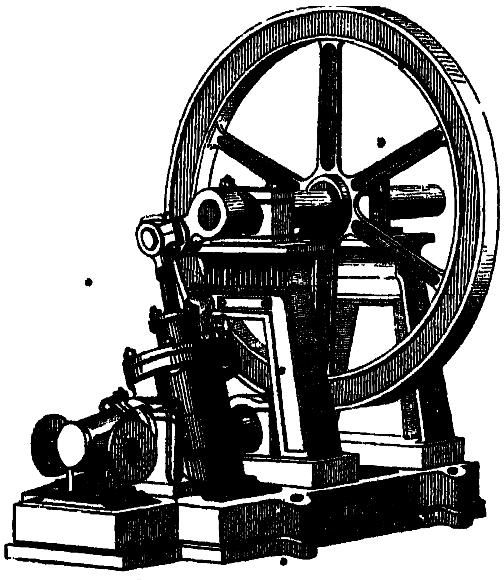
[The hydrostatic press was invented by the late Mr. Joseph Bramah, A.D. 1796. Motion is communicated to the ram by injecting water (or other fluid capable of sufficient resistance) into the cylinder, within which the ram moves. The amount of force given to the ram depends upon the proportion between the area of the plunger of the injecting pump and that of the ram, and the force can be indefinitely increased, either by extending these proportions or by increasing the leverage of the

Fig. 1.



Hick's Hydraulic Pre

Fig. 2.



Hick's Two-horse Oscillating Steam-engine.

pump handle. These machines are most valuable for lifting great weights, testing the strength of girders, and packing compressible goods into a small space, &c.—S. C.]

Two-horse high-pressure non-condensing oscillating engine of very simple construction, the steam being admitted to the top and bottom of the cylinder by its own movement from side to side, the ordinary valve motion and eccentric being dispensed with. This engine is almost incapable of disarrangement; it is represented in fig. 2.

Portable smiths' hearth, with fan attached, for the use of ship-builders and others.

Smiths' hearth (of another description) for artillery purposes, adapted for fixing upon the back of a horse or mule, its weight being only about 180 pounds.

Improved ball safety-valve, invented by the late Mr. Hick: it consists of a brass globe or sphere filled with lead, and merely resting over and closing a circular orifice, having no joints or levers connected with it; it will always blow off steam at a given pressure, thus preventing the possibility of accident from over-pressure.

Wheat-cleaning machine. This machine consists of two conical cylinders, formed of a series of files which are placed vertically, and are secured at top and bottom by means of cast-iron rings; a space is left between the inner and outer cylinders, which can be increased or diminished as required, the inner cylinder revolves rapidly upon its axis. The object of the machine is to separate and remove the smut and other impurities from the grain, which it accomplishes in the most effectual manner, and will clean about 200 bushels per hour.

Model of exhibitors' patent open-ended three-cylinder locomotive engine with a tender.

Radial drilling machine (full size). This will drill holes up to 4 in. diameter, and extending over a circle 11 ft. 6 in. diameter; the jeb can be raised or lowered at pleasure, by means of a square threaded screw cut upon the upright spindle, and moves freely round with its spindle on a series of small rollers placed under the rising block or nut.

Models of a pair of condensing steam-engines of 120-horse power each; the models are made on the scale of 1½ in. to the foot.

In addition to the above, the exhibitors have sent an engine of six-horse power, together with a considerable amount of mill-gearing and framework, supported upon a number of ornamental columns. This mill-gearing and steam-engine give motion to the machinery contributed by Messrs. Hibbert, Platt, & Sons, of Hartford New Iron Works, Oldham.

Improved mandrils.

---

219 GLASGOW, JOHN, *Manchester*—Inventor.

Improved screwing machine, with dies, taps, chucks, &c., complete.

---

220 SHEPHERD, HILL, & SPINK, *Hunslet Road, Leeds*—Manufacturers.

Self-acting side lathe, for longitudinal, conical, and transverse surfaces, complete; with screw-cutting apparatus, self-acting surface motion, and improved disengaging motion.

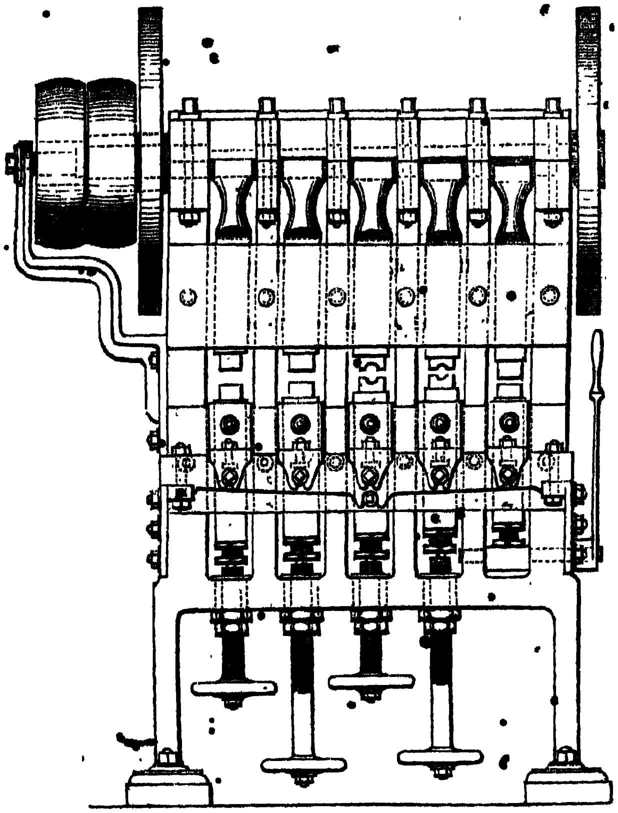
221 **COTTAM & HALLEN**, 2 *Winsley Street*—Inventors and Manufacturers.

Hydrostatic press for proving girders. The improvements consist in the addition of a dial index, to denote the weight applied by the pump, and of a dead hand to mark the weight at the time, if the object under trial be fractured.

---

222 **RYDER, W.**, *Bolton*—Inventor and Patentee.

Forging machine, to forge, draw down, and swage by steam-power small articles up to two inches, round or square, such as rollers and spindles for cotton and other machinery, bolts, studs, shaft-ends, &c., without the use of hammer or anvil. The following figure represents this machine.



Ryder's Patent Forging Machine.

This machine is driven by Messrs. Hick and Son's oscillating steam engine.

Selection of articles the machine is capable of producing:—Slubbing, roving and throstle spindles and flys, and all kinds of rollers for cotton machinery.

223 **SANDFORD, OWEN, & WATSON**, *Phœnix Iron Works, Rotherham*—Inventors, Designers, and Manufacturers.

Improved screw-cutting lathe, exhibited for simplicity of construction and economy in working. The improvements consist in working the saddle, and throwing out the back gear of the fast headstock. The saddle is worked thus: the nut is solid with a spur wheel cast upon it, working into another spur wheel on a back shaft, on which there is a bevelled pinion; the latter works into a bevelled wheel, and is keyed on an upright shaft working through the saddle; there is another bevelled wheel, keyed upon the top of that shaft, working into a bevelled pinion upon the handle-shaft, which moves the saddle backward and forward at pleasure; in addition to this, there is an index disc upon the handle-shaft, which divides the screws into as many threads as are required, without interfering with the change wheels. The bevelled wheels on the saddle communicate motion to the screw in the saddle, which acts of itself transversely. The improvements in the fast headstock consist in a worm and wheel for throwing out the back gear.

224 **EADES, W., & SON**, *Birmingham*—Manufacturers.

A small four-feet screw cutting and slide lathe on iron stands, with back gear, &c.; quadrant slide rest; traverse screw, with reversing motion; a set of change wheels; fly wheel and treadle motion; face plate; universal and other chucks; tools and apparatus complete.

A plain useful foot lathe on stands, quadrant slide rest, fly wheel and treadle; division, and spring face plate, and several useful chucks.

A small portable foot lathe on stands, fly wheel and treadle. One a size smaller.

Set of screw stocks, dies, and taps, for engineers, smiths, &c.

Screw plate and taps, for engineers, for pins and nuts.

226 **DALGETY, ALEXANDER**, *Deptford*—Inventor and Manufacturer.

Self-acting and surfacing lathe, with set of eighteen gun-metal change wheels, for screw cutting, from three threads in a foot, to 95 in an inch.

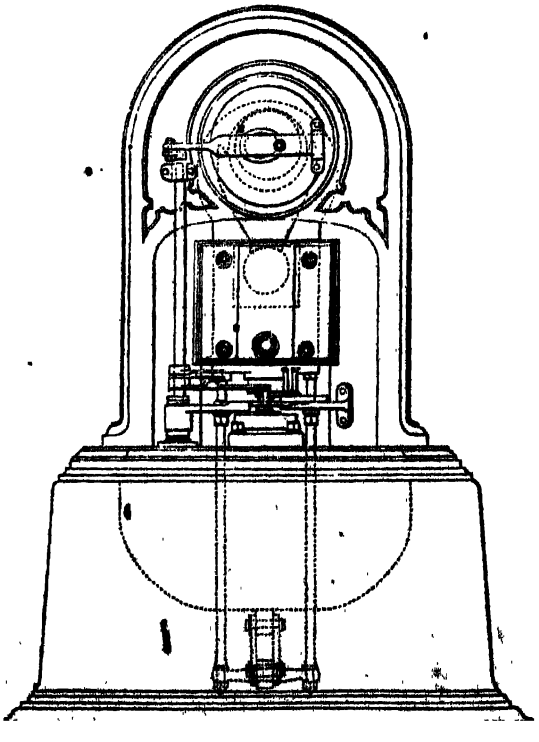
Self-adjusting chuck, with three jaws always working parallel to each other, for fixing any sized wire perfectly central, from the smallest needle to a bar ¾ inch in diameter; particularly adapted for holding drills of various sizes, and making small screws.

Self-adjusting boring collar, for supporting various sized bars or tubes, from ⅛ to 2¼ inches in diameter.

Self-adjusting face chuck, for holding circular flat surfaces from ¾ to 7 inches diameter.

228 **MAUDSLAY, SONS, & FIELD**, *Cheltenham Place, Lambeth*—Manufacturers.

Coining-press, in which the motion to give the impression is obtained by an eccentric, instead of by screw or lever. This press is represented in the cut below.



Maudslay & Co.'s Coining Press.

230 **Smith, Beacock, & Tannett**, *Leeds*—Manufacturers.

Self-acting slide lathe, with bed 18 feet long, head-stock 15 inches, self-acting surfacing motion, slide-rest, self-acting rack; traverse motion; leading-screw and change-wheels for cutting screws; index-plate for showing the wheels to be used for cutting various pitches of thread, face-plate and screw-keys.

Self-acting drilling-machine, with cross-slide and revolving table-gearing for slow motion; drills, cutter-bar, and steady bush; different speeds from 5 to 500 revolutions per minute; slide-vice for gripping work that cannot be readily fixed on the table.

Self-acting planing machine, for planing straight and circular work, with 6 inches stroke, and 16 inches traverse, table raised and lowered by rack and pinion, and slide-vice.

---

232 **Holtzapffel & Co.**, 64 *Charing Cross*, and 127 *Long Acre*—Manufacturers.

A five-inch centre lathe for amateur ornamental turning.

Eccentric, oval, spherical, geometric, and other chucks.

Compound sliding rest, with screw-cutting and curvilinear apparatus.

Drilling instrument.

Vertical, horizontal, universal, eccentric, and elliptical cutting frames.

Sets of engine tools, drills, and cutters.

Sets of turning tools, &c., in ivory and hard wood handles.

Instruments for sharpening tools and drills.

Turning squares, bevels, callippers, &c.

Decimal, parallel, and sliding gauges.

Sliding centres.

Polishing apparatus.

Geological hammers.

Engine-divided scales in cardboard.

Odontagraphs.

Parlour printing apparatus.

Aportadometer, for taking offsets in land-surveying, &c.

Specimens of plain and ornamental turning by amateurs, in ivory and other materials; cannel coal, &c.

234 **Williams, J.**, 18 *Westgate Buildings, Bath*—Manufacturer.

A one-horse portable steam-engine, for amateurs, designed by the Rev. C. R. Davy, Bath.

A self-acting foot-power slide and screw-cutting lathe, double-gear head-stocks, a new tool-holder, &c.

Foot-power drilling machine, with moveable bed, flat plates and experimental straight edges. Model of a private door. Ornamental cutting apparatus for lathes.—The above articles designed by the exhibitor.

Bolt and nut shaping machine for slide-rest, invented by John Wilson, Esq., Bath.

Ornamental screw-lifting jack, designed and made by the Rev. C. R. Davy, Bath.

236 **Nasmyth, J.**, *Manchester*—Inventor.

Steam hammer.

[This steam hammer is capable of adjustment of power in a degree highly remarkable. While it is possible to obtain enormous impulsive force by its means, it can be so graduated as to descend with power only sufficient to break an egg-shell.—R. E.]

238 **Stewart, D. Y., & Co.**, *Glasgow*—Manufacturers.

Model of patent mould-making machine for cast-iron pipes. Model of box or flask, in which the moulds are made. Model of core carriage, with core bars upon it. Pipes from 44 inches diameter downwards, cast in moulds made by the machine. Ten tons of pipes have been moulded in an hour. This machine is represented in the following page.

Machine for testing the strength of cast-iron.

[In making hollow castings, an inner mould, of the exact contour of the intended hollow, is formed in loam; it is, when dry, inserted in the sand-imprint of the pattern, the shape of the outside of the required casting. This inner mould is called the core, and when the casting has been made, is sufficiently friable to be easily broken away.—W. D. L. R.]

240 **Morrall, A.**, *Studley Works, Warwickshire*—Inventor and Manufacturer.

Knitting-pins. Steel, gilt, and plated bodkins. Needles in the different stages of manufacture. Specimens of machinery for making needles. Stamp-press, or eyeing machine. Filing, heading, and curing machine. London agent, T. Linnell, 134 Upper Thames Street.

242 **Vaughan, G.**, *Westmoreland Street, Marylebone*—Inventor.

Machine for setting the teeth of saws.

244 **Church, J.**, *Chelmsford*—Manufacturer.

Model lathes, with vice attached.

246 **Campbell, George**, *Charlton, Woolwich*—Inventor.

Portable steam forge, with blowing apparatus.

301 **Beart, R.**, *Godmanchester, near Huntingdon*—Inventor.

Patent brick and tile machine, combining grinding, screening, and pressing of clay through dies.

Specimens of the bricks and tiles made by the machine; and of the clay of which the bricks were made.

Patent brick and tile machine, to be worked by hand, combining the same objects except the grinding of the clay.

Model of a patent apparatus for boring Artesian wells. The "débris" broken up by the boring tools is carried up the boring pipes by a current of water.

Patent apparatus for boring stone. A current of water is applied to remove the grit, and keep the cutter cool.

Machine, worked by steam or other power, for cutting thin plates of stone, by means of vertical knives or saws.

Sand-stone filter, containing 5,000 superficial inches of sawn surface.

---

304 **Brunton, W., jun.**—Inventor.

Machine for washing ores.

---

305 **Waring, C. H.**, *Neath Abbey, Glamorganshire*—Inventor and Manufacturer.

Machines for cutting or working coal, &c., horizontally and vertically.—Provisionally registered.

---

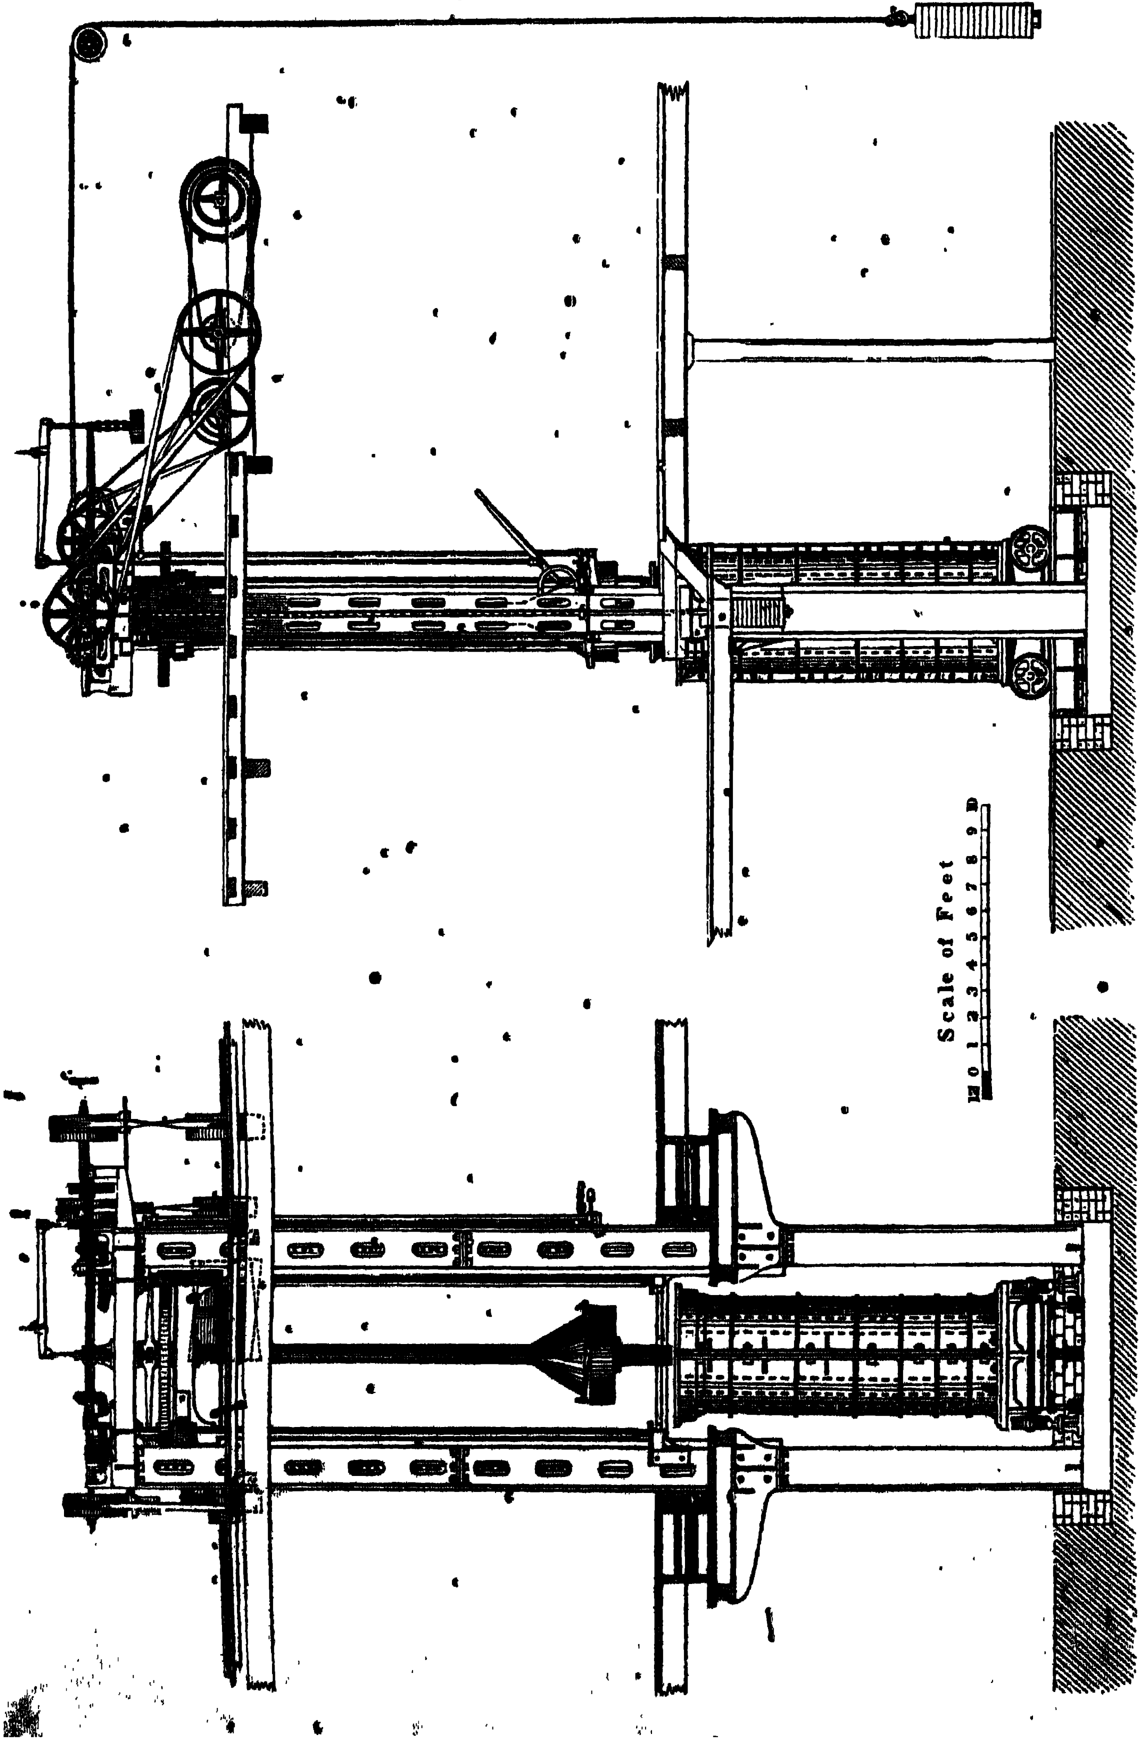
306 **Claudet & Houghton**, 89 *High Holborn*—Props. (Invented by A. Claudet.)

Machine for cutting round, square, and oval glass shades. The diamond being always kept on its cutting point by a spring and two castors, and being mounted on moveable apparatus, it is only necessary to push the apparatus slightly by the hand. With some modifications in the means of supporting the glass, but with the same apparatus for holding the diamond, this machine is used to cut the ends of the cylinders, which are the first form assumed by sheet glass.

Machine for cutting round shades exclusively.

308 **Hart, James**, 5 *Seymour Place, Bryanstone Square*—Inventor and Manufacturer.

Patent portable brick machine. When set in motion, two boys at one end of the machine place the empty moulds on the chain, which are then carried by the chain



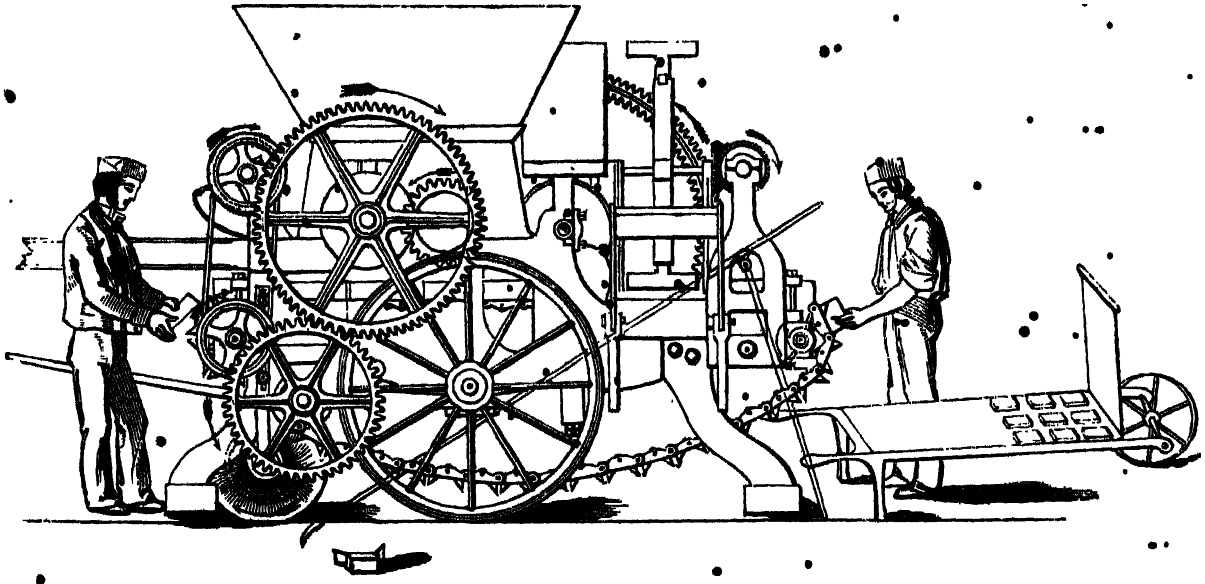
STEWART'S PATENT MOULD-MAKING MACHINE.

under the pug mill to the other end of the machine, where two other boys remove a perfect brick ready for the drying ground.

Two-horse steam engine and boiler.

Machine for drilling holes in machinery, exhibited as a specimen of mechanical skill.

New patent portable tile machine, to be worked by hand. This machine is represented in the annexed cut.



Hart's Patent Tile Machine.

310 **Bradley, R., & Co.**, *Wakefield*—Inventors and Manufacturers.

A machine for moulding bricks, of various sizes and shapes.

A working model of a colliery, on a scale of one inch to a foot, showing the operations both above and below ground; with the latest improvements

312 **Hunter, J.**, *Leysmill, Arbroath, Scotland*—Inventor.

Working model of Hunter's stone-planing machine, with specimens of planed stones from Leysmill Quarries, near Arbroath.

314 **Mackenzie, John Stafford**, *Newark-upon-Trent*—Inventor and Manufacturer.

A triturator, consisting of a mortar, fixed in a wooden frame, and a pestle, to which, by means of apparatus attached, a rotatory motion is given. This machine is useful for triturating or levigating various articles used in chemistry, particularly mercurial preparations, paints, printers' inks, and such articles as require continued friction and agitation.

317 **Marsden, Benjamin**, *Leeds*—Manufacturer.

A washing, wringing, and mangling machine, the novelty being the fitting-up and action of the machinery in the interior of the cylinder, including oscillating frames, springs, &c., and resembling the action of the human hands. Occupies little room; is easily removed, and is capable of washing and wringing four blankets in ten minutes. Can be worked with ease by a girl; saves time, soap, and labour; and with it, infected linen and other articles unfit to be washed with the hand can be easily cleansed. The principles and details are equally applicable to a machine on a large scale to be worked by steam power.

324 **Randell & Saunders**, 14 *Orange Grove, Bath*—Inventors.

Patent machine for driving saws, for the purpose of cutting stone in its natural beds. The novelty consists in driving saws from one end only, and in placing the guide frame on the same axis as the crank shaft by which the saws are driven; by this arrangement the saws adapt themselves to their work at any angle. Each saw is allowed an independent action.

Traversing crane driven by steam power, and constructed for working in underground quarries.

Patent saw frame for cutting blocks of stone, marble, &c., balanced, and turning on the same axis as the crank shaft by which the saws are driven.

Patent portable saw frame.

328 **Radcliffe, Augustus**, 67 *St. John's Street Road*—Inventor and Manufacturer.

Model of a trigger for shutting off the steam of a locomotive engine, and stopping it in cases of danger.

Improved shifting quarry-board, for cutting to any angle at which the window may be set out.

Circle-board for cutting block, barometer, compass glasses, &c.

Glaziers' diamonds for cutting plate, sheet, crown, and all kinds of window glass; a portable circle cutting machine, or beam compass diamond, and a cylinder or shade cutting machine.

Artists' diamonds or points for etching, dragging, ruling, medallion engraving, &c.

330 **Spiller, W.**, 14 *York Street, Blackfriars Road*—Manufacturer.

Well-boring implements for procuring water from the main spring at whatever depth. Also suitable to ascertain the strata of the earth for mining, railways, &c.

400 **Bessemer, Henry**, *Baxter House, Old St. Pancras Road*—Patentee and Manufacturer.

A model of a slate table for holding plate-glass during the grinding and polishing process: this is effected by atmospheric pressure acting on the upper side of the plate, while a partial vacuum is formed below it by an air-pump or steam jet; for this purpose the two pieces of slate forming the table have a series of grooves formed between them, which communicate with the holes upon the surface, so that whenever a plate of glass is laid upon the table, a cock is opened communicating with an exhausted vessel, when the plate will be firmly held thereon, but which may be instantly removed by again admitting the air. The plan in general use for holding down sheets of glass is to imbed them in plaster of Paris, which operation has to be performed four times for each plate, and which, in some establishments, consumes 40 tons of plaster per week. Patented and manufactured by the exhibitor.

An improvement on the centrifugal machine for separating molasses from crystals of sugar. The peculiarity of this machine consists in the mode of driving it by a pair of emissive arms on the same axis as the centrifugal drum, thereby dispensing with the upper driving gear, and also in making the centrifugal drum to lift on and off the machines, so that the operator removes the charge of finished sugar from one drum, and recharges it with matter to be operated upon while the other drum is in use upon the machine; by which arrangement one man with this machine can operate upon as much material as two men and two of the original machines were capable of doing. Patented by the exhibitor. Proprietors, Messrs. Rotch & Finzel, 2 Furnival's Inn, London.

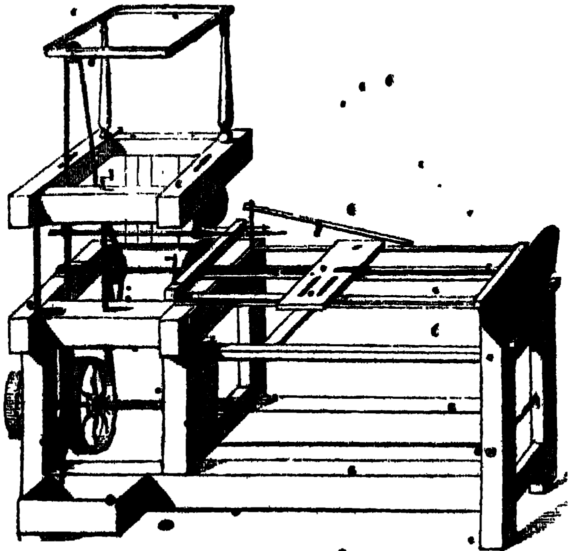
401 FURNESS, WILLIAM, *Liverpool*—Patentee.

Patent machines for working in wood. Power mortising machine, stated to be simple in adjustment and operation, and self-acting in its half-rotary reverse motion, which changes the face of the chisel.

Foot mortising machine; to be used with any size of chisel, from an eighth of an inch to two inches; the peculiar form of the chisel enables it to hold the cone and lift it out of the mortice at each return stroke.

Tenoning machine; to be worked either by hand or steam power. The tenon is finished at one operation, without gauging or setting out the work.

The annexed cut represents this machine.



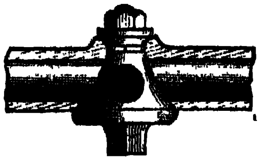
Furness's Patent Tenoning Machine.

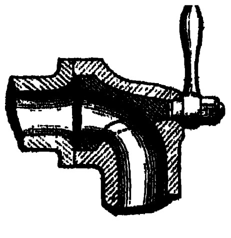
Planing machine; adapted for squaring up hard or soft wood, from four to fifty feet in length, from eight to forty inches in width, and from one quarter of an inch to thirty inches in thickness.

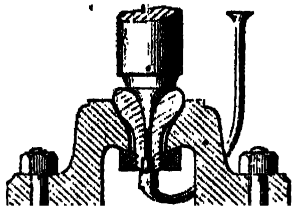
Moulding machine. Any description of joiners' mouldings can be cut by this machine with great rapidity, and in such an accurate manner as not to require the use of any other tool. It is equally useful in sash-sticking, either in hard or soft wood. Its construction is simple, and is easily kept in order.

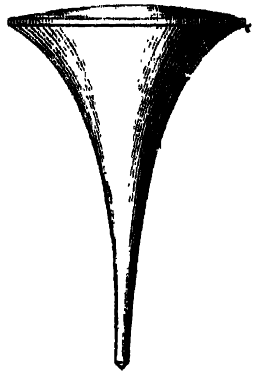
402 SCHIELE, C., *Manchester*—Inventor and Manufacturer.

Specimens of the construction of revolving rubbing surfaces by a patent rule which determines the form best adapted to reduce friction to a minimum under any given strain. Form for a strain in the direction of the axis.









The preceding figures are intended to represent various applications of the peculiar form for rubbing surfaces. The lower figure represents this form.

Portable grinding mill, driven by Lloyd's steam-engine, with the exhibitor's condensor attached, and with the rubbing surfaces formed according to the patent rule.

A similar mill, fitted as a handmill.

Four-and-a-half-inch cock.

Spindle-joint, used on locomotive regulators, instead of stuffing-box. 1½-inch stop-cock, with pump-valve attached. Steam whistle.

Glass water-gauges: in which the packing is tightened by direct pressure without any twisting strain on the glass. Gauge-cock.

Self-acting feed regulator for a ten-horse power boiler, with curved surfaces.

Fire-cock, with stand pipe.

Glass taps for acids, filters, &c. Lathe spindle.

Samples of screws and nuts.

Instruments for describing the curves required in the construction of the foregoing articles. Equation and formulæ relative to the antifriction curve.

Ventilator for exhaustion or compression.

403 FAIRBAIRN, W., & SONS, *Manchester*—Inventors and Manufacturers.

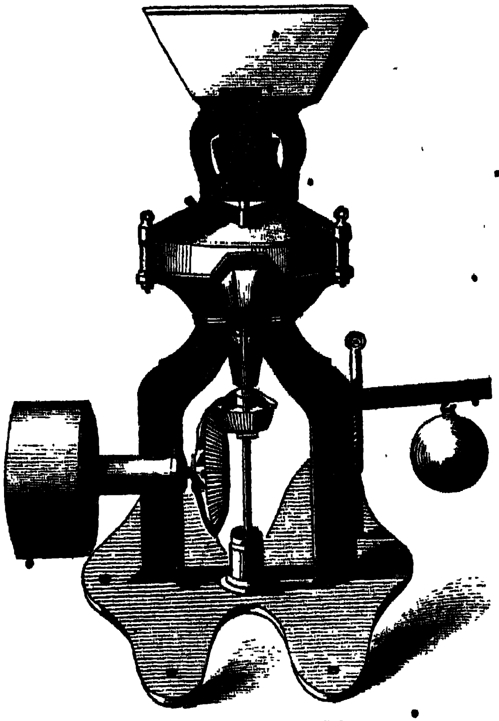
Specimens of corn-mill work:—Improvements in the manner of driving, in the means employed for adjusting and regulating the grinding-stones, and in the means of feeding.

404 CROSSKILL, WILLIAM, *Iron Works, Beverley*—Patentee and Manufacturer.

Patent mills for grinding vegetable substances. They consist of—mills for steam, of two and four horse power, for grinding broken bones into fine powder, at the rate of about 25 bushels per hour, suited for fine manure;

another for grinding malt, also oats, barley-meal, &c. Fig. 1 shows this machine.

Fig. 1.

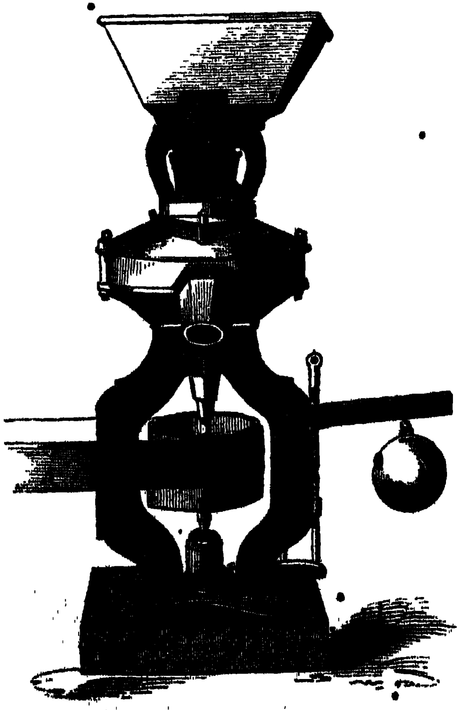


Crosskill's Mill for Vegetable Substances.

Mills for power or hand use, for grocers, druggists, confectioners, &c.

Patent mills for grinding mineral substances. The particular features in these mills consist in their strength as power-mills; their adaptation, by changing finer or coarser plates, for grinding various mineral substances to fine dust; and, from the position of the two centres, the peculiar eccentric motion is obtained for each of the revolving metal plates. They consist of—mills for steam, of four-horse power, for grinding iron, zinc, copper, and gold ores, plumbago, manganese, &c.; another for grinding raw or calcined flints for pottery purposes, also quartz, &c.; will grind 8 to 10 cwt. of raw flints per hour by the first process, and by the second process reduce 12 to 15 cwt. per hour to the finest powder. Fig. 2 shows this machine.

Fig. 2.



Crosskill's Mill for Mineral Substances.

Mill for steam, of two-horse power, for grinding paints or liquid substances.

Mill for hand or power, for grinding paint or liquid substances. With this mill a boy will grind from ¾ to 1 cwt. per hour.

Improved portable and fixture steam-engines for manufacturing or agricultural purposes.

405 **ROTCH & FINZEL**, 2 *Furnival's Inn*—Inventors.

Centrifugal machine for separating molasses from sugar. Manlove and Alliott, manufacturers.

406 **BIRCH, JOHN**, *Edward Street, Regent's Park*—Inventor.

Model of a machine designed and used for the purpose of cutting sash and roof bars, and applicable to the preparation of mouldings, &c. It is so contrived as simultaneously to work the two sides of the bars or mouldings. The cutter blocks are so contrived as to work seven bars at the same time.

---

407 **MAIDLOW, JOHN**, 24 *Queen's Terrace, St. John's Wood*—Inventor.

Improvement in carpenters' bench screw, check, and stop, having two screws to the check, both acting at the same time with one lever, causing the check to work parallel, and have equal pressure at both ends; adapted for joiners, cabinet-makers, bookbinders, &c. The stop is so arranged that, by turning a screw which is let into the top of the bench, it will rise to any height required.

[The bench-screw is to the joiner and cabinet-maker what the vice is to the smith, the moveable block or check and the fixed block which is fixed in and to the bench, and which contains the matrix of the screw forming the jaws of such vice. That the check should press upon the body to be held equably is highly important to the ease of the workman and to the strength of the work; and any arrangement that tends to secure the parallel movement and even binding of the check, up to and upon the side of the bench which covers the fixed block, the counterpart of the check is worthy of consideration.

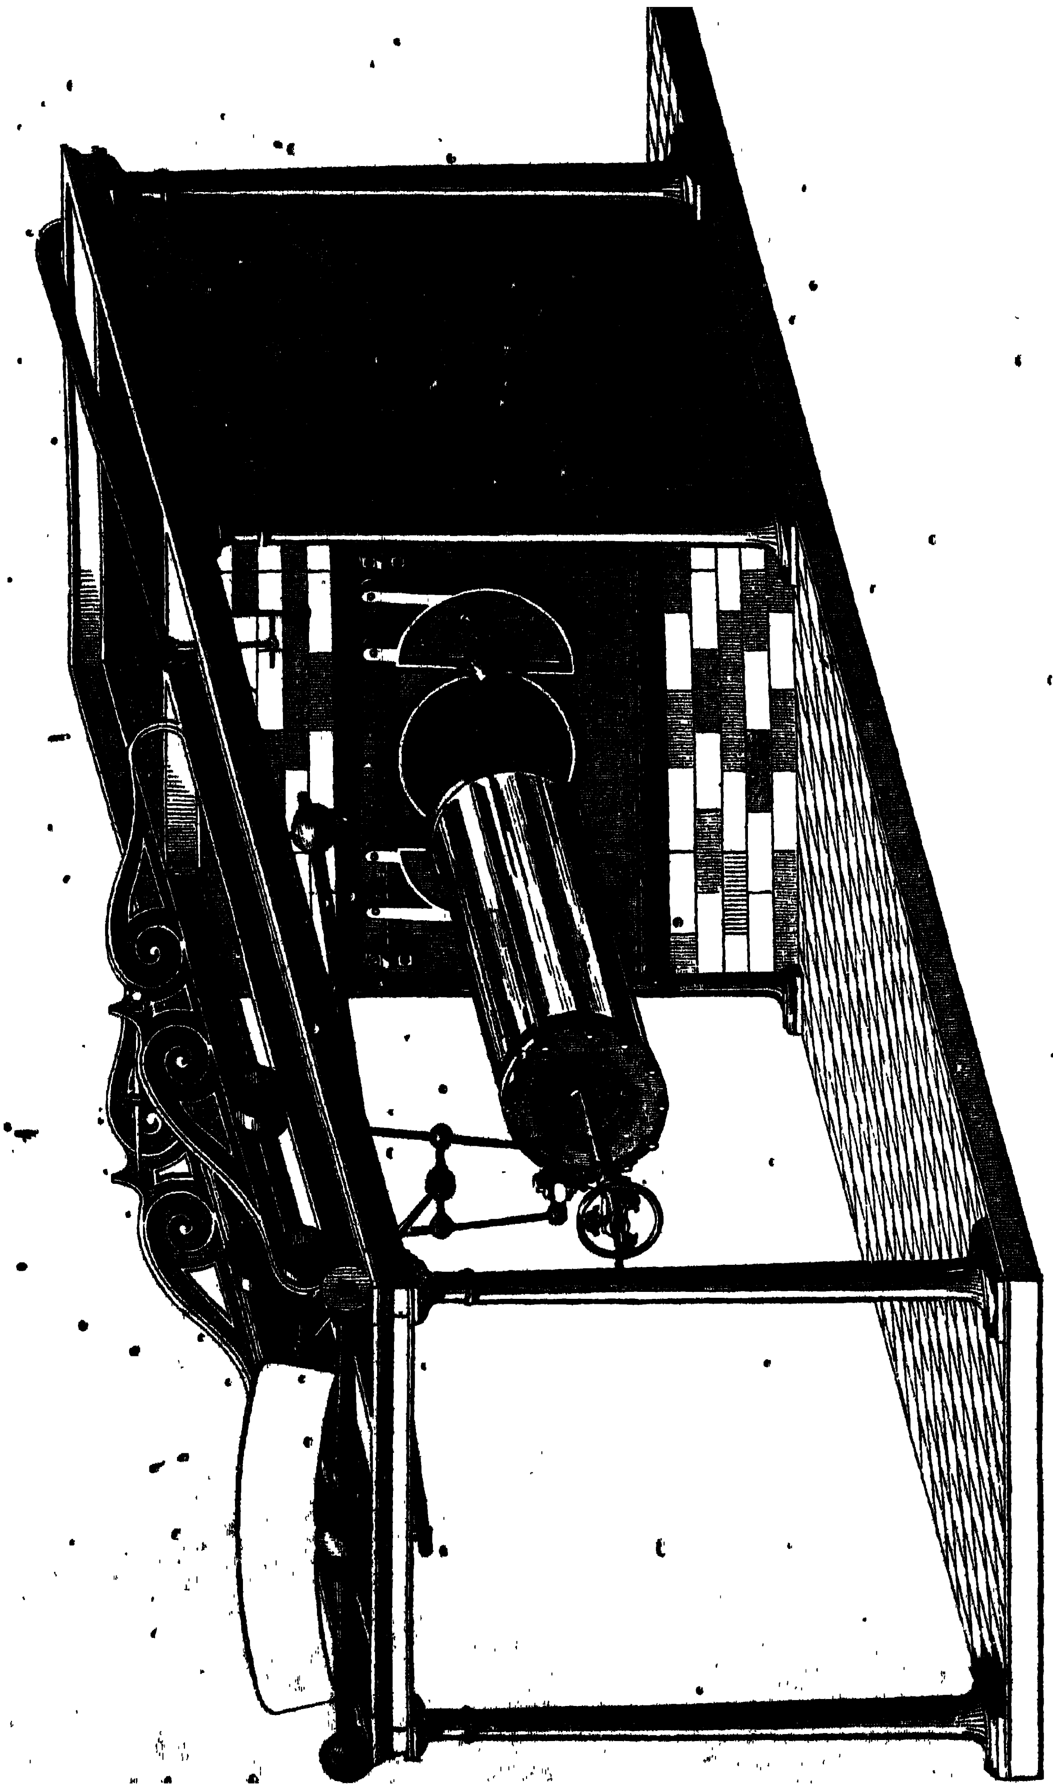
The "stop" is an end-grained block of wood passing through the top of the bench and capable of being made to stand more or less above the surface of the piece of stuff to be tied up or otherwise planed, and to resist pressure; the use of the stop being to hold the work up to the plane as the workman pursues the operation of planing.—W. H.]

---

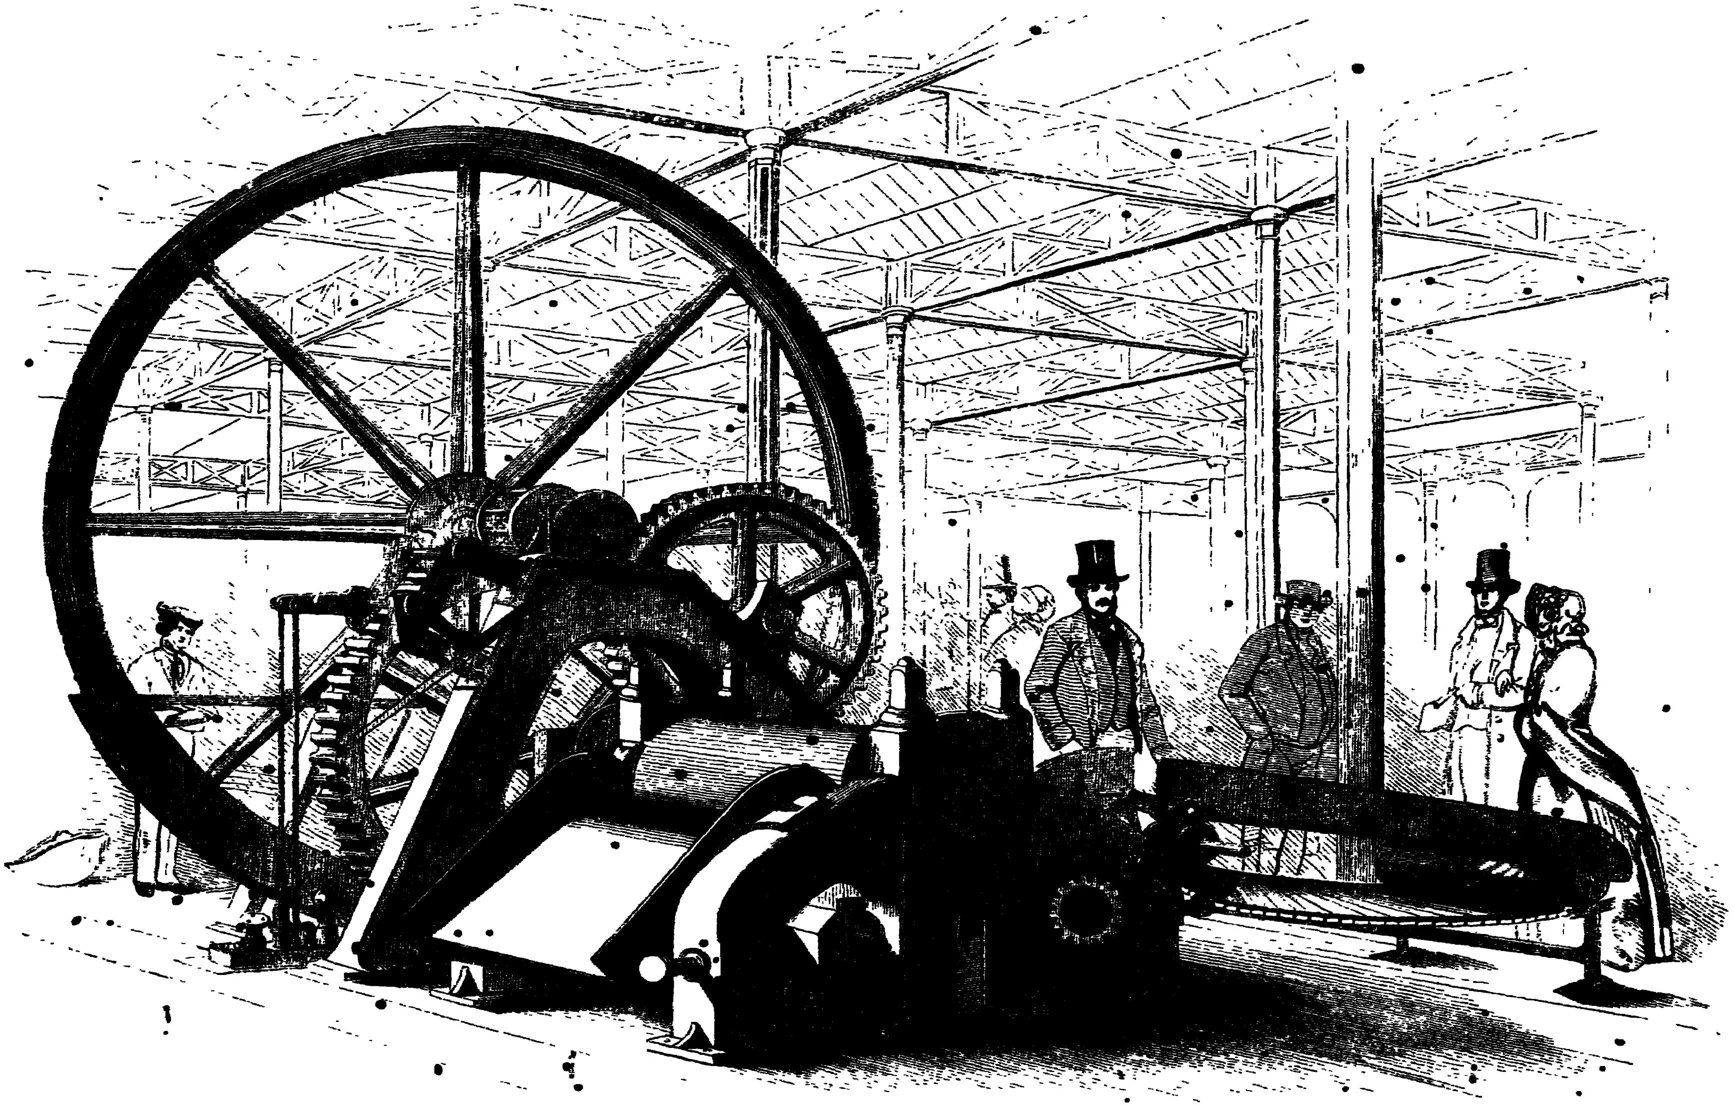
408 **DAKIN & CO.**, *St. Paul's Churchyard.*

Patent apparatus for roasting coffee in silver.

The illustration in the following page represents the arrangement adopted in this



DAKIN'S PATENT COFFEE-ROASTING APPARATUS.



53. ROBINSON AND RUSSELL'S STEAM SUGAR-CANE CRUSHING-MILL.

410 **BARRETT, EXALL, & ANDREWS**, *Katesgrove Iron Works, Reading*—Manufacturers & Inventors.

A combination of machinery, by which flour, &c., is passed through the various processes of manufacture to the complete preparation of the biscuit. The flour, &c., is put into the first machine, where it is thoroughly mixed; it then passes to the breaking-machine, where it is kneaded until it becomes sufficiently tenacious to be passed through rollers. From these rollers it is conveyed to the adjusting rolls which reduce it to the required dimensions. It then passes in a continuous sheet, by means of an endless canvas, to another machine, where it is cut, docked, crimped, and stamped. The biscuits are then divided from the waste dough, and conveyed to the oven. The waste dough is collected and passed by means of a shute to be re-rolled.

---

412 **WASLEY, JAMES**, *Pool, near Redruth*—Inventor.

Trammel for striking helices or spiral lines.

Frame for "setting up" mitre joints.

414 **HURWOOD, GEORGE**, *College Street, Ipswich*—Inventor and Patentee.

Patent metal mills for grinding wheat, barley, Indian corn, peas, and beans, fitted on a stand, and arranged with a series of four cutting rings on each grinding plate, to work horizontally by gearwork and pulleys. The surface plates are prepared to receive the cutting parts, which are made in a series of rings. Fans are fixed to the periphery of the revolving plate, to cause a current of air to pass between the grinding surfaces. Adjusting screw fitted in shoot to arrest stones and other objectionable materials.

Surface plate, with four cutting rings attached, to show the grinding surface.

Single cutting ring detached from the plate.

Patent ventilating apparatus fitted to case, and model of a pair of stones for grinding wheat (full size), for the purpose of supplying a current of air between the grinding surfaces.

416 **CORCORAN, BRYAN, & CO.**, 36 *Mark Lane*—Designers and Manufacturers.

Model of an improved drying kiln for malt and all other grain, on a scale of one inch to a foot. The improvements are said to consist in economy of fuel, regularity of heat, and the prevention of condensation of steam.

Flour-dressing machine, consisting of a case containing a mahogany cylinder lined with woven wire, enclosing brushes hung with regulating screws upon a shaft, which, revolving rapidly, separates the flour from the bran.

Samples of very fine wire:—No. 150, woven brass (or 22,500 holes in a square inch), 18 inches wide. No. 100 by 650, twilled brass. 3,252 feet of iron wire-thread, weighing only two ounces. 3,900 feet of brass wire-thread, weighing only one ounce. Paper-machine wires, 7 feet wide joined. A woven wire malt-kiln floor, 20 feet by 16 feet, with flat seams. A corn-meter's shovel, bushel measure, and other implements used in the corn trade.

Millstones for grinding wheat made of French burr-stones, as generally in use in this country.

Portable corn-mill made of French burr-stones, to be worked by two or three horse power, and intended for the use of emigrants, and others.

[French burr-stones are in great request for the purposes of grinding in this country. They possess both geological and lithological characters of much interest. They are met with only in the Paris basin and the adjoining districts, in the lacustrine, or fresh-water deposits (*Pleistocene*), occurring in beds either continuous or interrupted, and generally mixed up with beds of sand or of ferruginous marls, which penetrate between them, filling up their fissures and honeycomb cavities. The beds sometimes contain no organic forms, at others they seem to be full of fresh-water shells and land plants, which have assumed a silicious character. The texture of the stones is occasionally cellular, the cells or cavities being irregular in number, size, and shape, and they are frequently traversed by thin plates, or coarse lines, of silica. They are quarried close to the surface, and are cut on the spot into parallelopipedal pieces called "panes," which are bound together by iron hoops, and then form millstones.—J. W.]

417 **BARKER, CHARLES M.**, 22 *Portsmouth Place, Kennington Lane*—Inventor, Patentee, and Manufacturer.

A curvilinear sawing machine, or ship's timber and ordinary sawing frame, for sawing one or any number of curves in timber, with bevels of various degrees. The machine requires only one attendant, and obtains a speed of 120 revolutions per minute.

A circular sawing, or rack bench. The machine consists of a number of circular saws (in segments) upon one shaft, so that by one direct feed the saws cut a piece of timber or deal into any desired number of parallel planks or boards.

418 **ROBINSONS & RUSSELL**, *Mill Wall Works*—Inventors.

Patent steam sugar-cane mill, in which the engine, gearing, and mill, are all combined upon the same base plate, to render it portable and independent of the expense of masonry.—(See Plate 53.)

420 **BLUNDELL, SPENCE, & CO.**, *Hull*, and *Upper Thames Street*—Manufacturers.

Hydraulic seed presses. The figure in the next page represents the ground plan and elevation of these presses, drawn to scale. The press No. 1 contains ten cakes of 3 lbs. each, No. 2 contains four cakes of 8 lbs. each.

A pair of presses, when fixed with the pumps attached thereto, occupy a space of 9 feet by 3 feet. They are usually placed on a stone landing of this size, to which the pump cistern is securely bolted, as shown on the drawing; and this is all the fixing required.

The presses are so portable in their construction, that they can be fixed up, or removed in two or three days by any competent mechanic.

The pumps and valves are made of the best gun-metal and workmanship.

A pair of presses with the pumps will weigh altogether from nine to ten tons.

The pumps are driven from the lever end by a connecting rod, at a speed of about thirty-six strokes per minute, and do not require more than one-horse power to work them.

With a pair of presses, No. 2, one man and a boy working the usual hours of a "single spell" (say from 6 A.M. to 6 P.M.) will make from 28 to 35 cwt. of linseed cake.

The whole of the oil is extracted from linseed by one operation of pressing. But in the manufacture of rapeseed, it is in most cases necessary, in order to obtain all the oil, that the cake should be worked over a second time; it is therefore desirable, when working on a large scale, to have a press expressly adapted for the first operation, which is called clodding.

The current expense for wear and tear on these presses is small, and chiefly confined to the occasional renewal of the leathers or packings of the pumps and cylinders.

421 **FAIRBAIRN & CO.**, *Manchester*—Manufacturers.

A flour-mill.

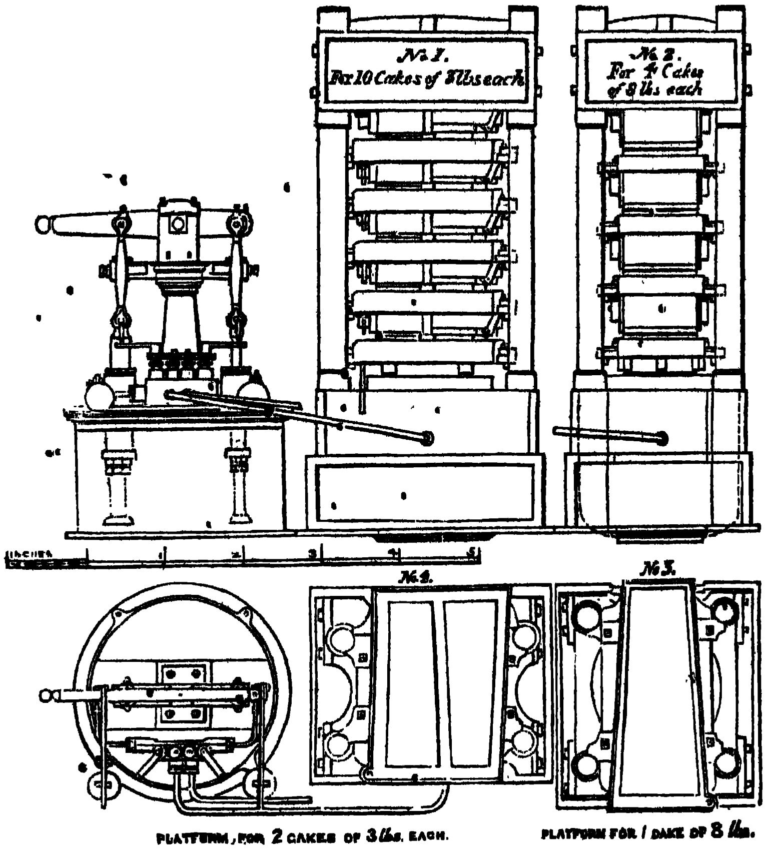
---

422 **HUNT, JOHN**, *Botley Mill, near Orford*—Inventor and Manufacturer.

Flour-dressing machine, on a new principle.

424 **GUTTA PERCHA COMPANY**, *Wharf Road, City Road*—Manufacturer.

Printing, folding, and cutting machinery for working from gutta-percha castings.



No. 1.
For 10 Cakes of 3lbs each
No. 2.
For 4 Cakes of 8 lbs each
INCHES 1 2 3 4 5
No. 4.
No. 3.
PLATFORM, FOR 2 CAKES OF 3 lbs. EACH.
PLATFORM FOR 1 CAKE OF 8 lbs.

Blundel, Spence, and Co.'s Hydraulic Seed Presses.

426 **BEDFORD, JOSEPH,** *Mill Hill, Leeds*—Manufacturer.
Flour-dressing machine, complete.

---

428 **BLACKMORE, WALTER,** *Wandsworth*—Proprietor.
Model (half size) of an improved bolting-mill, showing the mode of dressing flour through patent bolting cloths, without seams, with gutta-percha flaps revolving on the outside of the cloth, for clearing the cloth while dressing. Improved by James Ayton, of Norwich.

---

429 **ADAMS, S. & C.,** *Oldbury, near Birmingham*—
Inventors, Patentees, and Manufacturers.
Patent durable steel hand mill for grinding flour for colonial and domestic use. New cutters may be applied in lieu of the old ones when necessary. The grinding part only of the revolving cutter touches the grain, whereby much friction is avoided. The grain is forced in between the cutters by a series of inclined planes, rendering short cutters only necessary.

---

430 **THOMSON, W.,** *Shotts Foundry, Edinburgh*—
Designer and Manufacturer.
Planing-machine of novel construction. Tool for cleaning off flooring-boards and deck-planking.

---

432 **COLLINGE, CHARLES, & Co.,** *65, Bridge Road, Lambeth*—Designers and Manufacturers.
Patent horizontal sugar mill, intended to be worked by cattle, wind, or steam power.

436 **SPILLER, J.,** *Battersea*—Inventor.
Flour-dressing machine.

438 **SHORE, THOMAS,** *City Road*—Inventor.
Patent atmospheric flour-dressing machine.

The usual mode of dressing flour is to brush it through a cylinder clothed with wire, by means of brushes revolving on a spindle or shaft within. The object of this patent is to supersede the use of brushes by means of fans of steel plate, or other suitable material, which, being placed at a certain angle within the cylinder, are found to possess the following advantages:—

The fans being placed at some distance from the wire clothing the cylinders, the ordinary friction between wire and brushes is avoided; whereby the wire is prevented from wearing, and a considerable saving of power effected.

The flour is perfectly separated from the offal, and, being fanned instead of brushed through the wire, it is much more free from specks or greys than flour dressed in the usual method, while the strong current of air to which it is subjected causes an improvement in the quality, and the wire also is kept constantly clear while dressing.

Brushes are a continual source of expense, whereas it is scarcely possible to wear out a set of fans. The case or box which contains the cylinder is furnished with a hole at each end for the purpose of supplying the air required by the fans, which air, when it has been driven, together with the flour, through the wire clothing of the cylinder, is carried off by means of a chimney into the meal-hutch above.

The speed varies from 14 to 16 sacks per hour with an 18-inch cylinder, from four to five sheets being used for flour.

440 **SHARP, STEPHEN,** *Stamford*—Inventor and Manufacturer.
Sugar-cutting machines.
Model of a printing machine, in which the crank is applied.
Model of oscillating steam-engine.

441 **WEATHERLEY, H.,** *54 Theobald's Road*—
Inventor and Manufacturer.
Machine for cleaning currants by a simple process, and rendering them perfectly free from grit.

442 Westrup, Walter, 282 *Wapping*—Inventor.

Patent corn mill, made at the works of Mr. Thomas Middleton, Lomax Street, Southwark.

This mill consists of two pairs of stones, with conical grinding surfaces, fixed on one shaft. The upper pair crushes the wheat, the finer parts of the flour produced thereby are instantly driven away through a cone of wire placed under them; the residue of the meal then passes through the lower pair of stones, where the grinding is completed.

The superior advantages of this system of grinding are—

1st. Eight to ten bushels of wheat can be completely and perfectly ground per hour.

2nd. Is a very considerable saving of power.

3rd. The meal is delivered from the stones quite cool, having undergone no pressure; the flour will consequently keep in good condition, and be therefore less likely to be injured by any atmospheric change.

4th. A better quality of flour is produced than by the common mode of grinding.

5th. The stones are more easily kept in truth, and take much less time in dressing.

443 Fieldhouse, G., & Co., *Wolverhampton*—Inventors.

Mills on pillar-stand for grinding coffee and pepper, with two fly-wheels, friction boxes, and multiplying wheels.

[The ordinary mill in use for grinding coffee, pepper, &c., is extremely simple in its construction, and consists of a conical cylinder, which is cut into a series of ridges in its internal diameter: a taper piece of steel fits into this, and its outer diameter is cut with a corresponding series of ridges, but in the reverse direction; a temper pin regulates, by its projection, the fine or coarse quality of granulated particles, and the whole is set in motion by a winch handle. The addition of fly and multiplying wheels are not essentially parts of the mill, but they very materially facilitate the operation of grinding.—W. C. A.]

444 Coombe, Benjamin, & Co, 30 *Mark Lane*—Manufacturers.

A smut-machine and corn-screen combined. The objects of this machine are stated to be to produce on the surface of the wheat the utmost amount of friction that it can bear without breaking or injuring the grain; to fan it at the same time; scour off the fibrous end and all that adheres to it, and thus clean the wheat of all dirt-clods, smut, &c. The best wheat is said to be considerably improved by passing through this machine. This machine according to its size will clean ten to fifteen quarters of wheat per hour.

A model of a flour-dressing machine, with registered fan-brushes and flanges complete; also samples of brushes and fine wire-cloth used in the above.

Specimens of wove and twist wire in brass and copper, containing 500 picks or shoots in an inch, which is said to be the finest wire-cloth ever manufactured; also other specimens of very fine wove wire-cloth, and wove wire for covering kiln-heads.

445 Graham, West, & Co., 304 *Wapping*—Manufacturers.

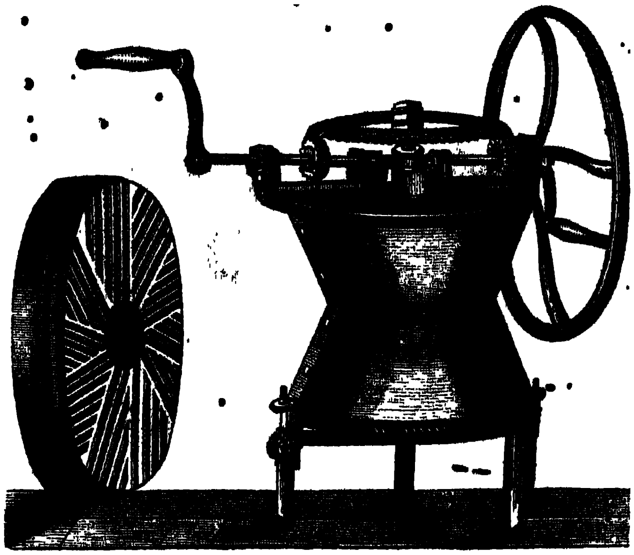
Model, made to the scale of 1¼ inch to a foot, of a horizontal mill, for crushing sugar canes. Instead of three, the usual number, this mill has five rollers, which are so arranged that the canes, in passing once through the mill, are pressed four times, whereas in a single passage through one of the three-rollered mills they are pressed but twice. The two upper rollers of the mill are held down by six bolts, the lower ends of which go through, and are secured to two wooden spring beams, so that, in the event of the rollers being subjected to any extraordinary strain, the spring-beams yield, and prevent the mill from being damaged.

Model, made to the scale of 1¼ inch to a foot, of one of the old vertical sugar-cane mills.

Model, made to the scale of 1 inch to a foot, of a set of evaporating-pans, in common use for sugar-cane juice.

446 Huxhams & Brown, *Exeter*—Inventors and Manufacturers.

Mill to grind bark for tanners, adapted for horse, steam, or hand power; it operates upon the long bark as it is usually delivered at tan-yards, and saves the cost of chopping the bark separately. This mill is exhibited in the annexed engraving.



Huxhams and Brown's Bark Mill.

Emigrants' or domestic flour-mill, with a new method of working by hand.—Registered.

Millstones to grind wheat.

447 Gilbert, J., 79 *Wardour Street, Soho*—Inventor.

Guillotine cutting machine, for cutting end joints in wood to any angle with facility and accuracy; for mouldings and other work in joinery and cabinet-making, &c.

448 Adorno, J. N., 6 *Golden Square*—Inventor and Patentee.

A machine for making cigarettes. It performs 14 different operations from a single motive axis, and is capable of making, simply from paper and tobacco, 80 to 100 cigarettes in a minute, and neater than those made by hand.

Machines for making cigarettes, in the French and Spanish styles, and for making cigars in Havannah, Manilla, or Mexican style.

Patent accessory machines, employed in the manufacture of the above articles.

449 Squire & Co., *Great Dover Street, Borough*—Inventors.

Direct-acting sugar-mill.

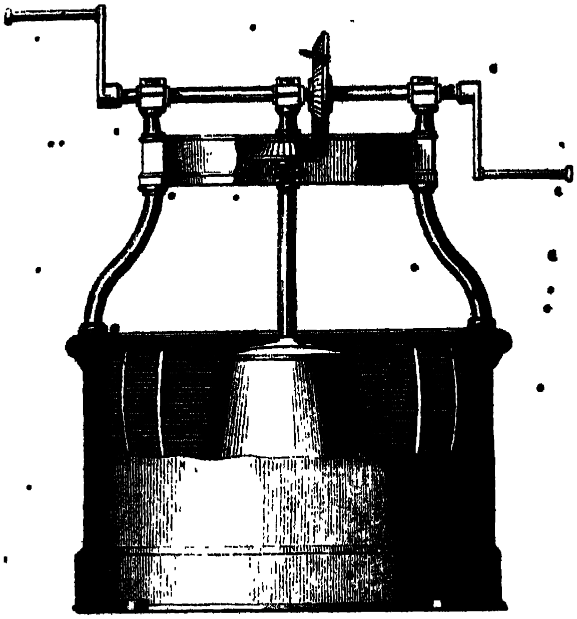
450 Gatti & Bolla, 129 *Holborn Hill*—Manufacturers.

Model of a machine for the manufacture of French and Italian chocolate. The good qualities of the cocoa are intended to be retained by the process.

454 Manlove, Alliott, & Seyrig, *Lenton Works, Nottingham*—Inventors.

Centrifugal washing and drying machine, for washing or cleansing, by forcing water centrifugally through goods requiring to be cleansed, and subsequently drying them in the same machine. It is also used in the separation of moisture from starch, and other finely divided substances.

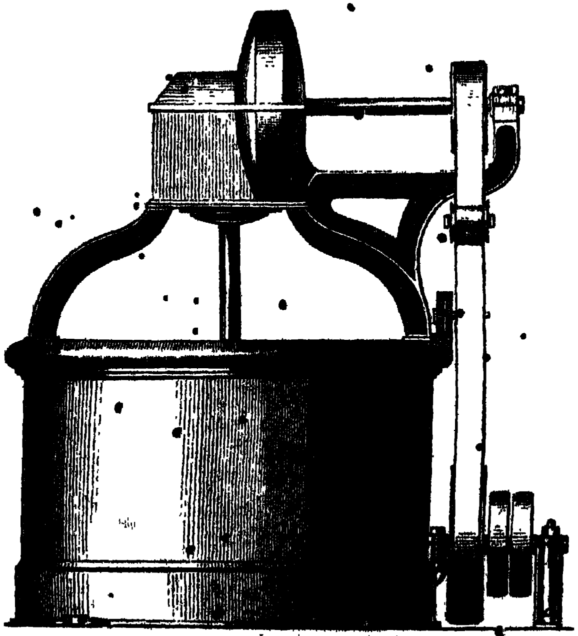
Fig. 1 is an engraving to show the form of this machine adapted for hand-power; part of the outside cover is removed to show the interior.



Manlove, Alliott, and Co.'s Centrifugal Washing and Drying Machine.

Circular looped fabric machine frame for the manufacture of woollen cloths and hosiery goods; exhibited for the great speed and economy of labour with which goods can be manufactured, and elasticity given to them by its application.

Fig. 2 is an engraving to show the form of this machine adapted for steam power, with the gearing attached.



Manlove, Alliott, & Co.'s Centrifugal Washing and Drying Machine.

455 **STAIGHT, DANIEL, & SONS**, 85 *Charles Street, Hatton Garden*—Proprietors.

Ivory comb-cutting machine, capable of cutting 120 teeth in one inch of ivory.

Part of an elephant's tusk. Other parts of the same, cut into continuous rolls, applicable for veneering, &c., with the remaining part. Pieces of ivory cut and prepared for miniature painting.

Lady's work-table, exemplifying the utility of cutting ivory, upon the new principle. Piece of ivory cut upon the old method. Various articles in ivory.

456 **PROSSER & HADLEY**, 20½ *Clipstone Street, Marylebone*—Manufacturers.

Patent ornamental sawing machine, adapted for curvilinear cuttings, both in outline and perforation.

457 **TOMS, G. BAILEY, & CO.**, *East India Chambers*—Importers and Agents.

French millstones, made at La Ferté-sous-Jouarre, to which is applied Hanon Valcke's patent aërator. By the rapidity of the rotation of the runner, the air is driven into the deep canals made for it, and escapes by the furrows of the stones. An active circulation of fresh air is thus brought into contact with the meal, and it is continually renewed and dispersed by the centrifugal action of the stone.

458 **SAVAGE, A.**, 43 *Eastcheap*—Manufacturer.

Mill for grinding coffee, &c., ornamentally finished in gold bronze, to stand on floor. Mill, finished bright, for hand or steam power. Bronze mill of smaller dimensions, for counter.

Mills for grinding wheat, malt, &c.; for bruising oats, and coarsely grinding other corn; for splitting beans, grinding coffee, cocoa, drugs, &c., and for crushing raw sugar.

Improved portable lever roaster, for coffee, malt, &c. Sample roaster.

Portable vibrating woven-wire-bottomed cooler, and iron stand, for rapidly cooling coffee, chicory, malt, &c., after roasting. Machine for sifting. Mills for making chocolate.

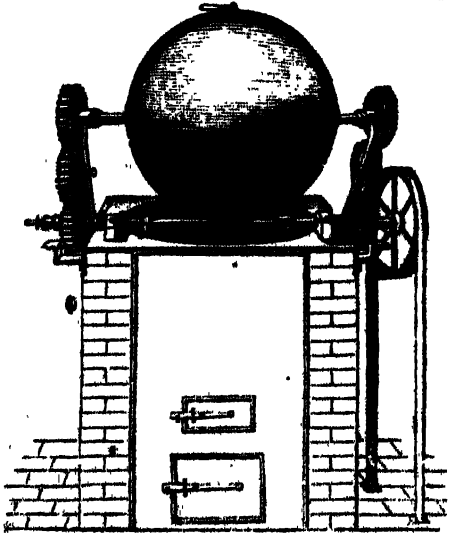
459 **HUGHES & SONS**, 1 *Great Dover Street, Borough*—Manufacturers.

Millstone made of French burrs, with wind-chest and ventilating holes, for grinding with Bovill's patent air-blast, by which the meal is delivered at once from between the grinding surfaces of the stones on its production, and in a cool state, so that it can be dressed as soon as it is ground. The stones, by this patent, grind eight bushels per hour.

Two millstones of a superior manufacture, for grinding wheat.

460 **LAW, W.**, 31 *St. Andrew's Square, Edinburgh*—Inventor.

Machine for roasting coffee. The globe-roaster, with double rotatory motion, is heated in an atmosphere of hot air through a cast-metal casing. The constant complex motion presents every part of the machine, in regular rotation, toward the source of heat. The following cut shows this machine.



Law's Globe-roaster for Coffee.

462 **MILLINGTON, BRYAN & EDWIN**, *Newark-upon-Trent*—Inventors and Manufacturers.

Patent smut machine, for cleaning corn of all soft impurities; it consists of the six-wire brushes, revolving at a speed of 800 revolutions per minute, within the frustum of a cone, lined with woven wire of a sufficient fineness to prevent any corn from going through; after the operation of this machine, the corn passes a small blower attached, which may be regulated so as to take out the inferior kind.

Samples of the grain, cleaned and uncleaned.

466 **RANKIN, RICHARD & JOHN**, *Liverpool*—Manufacturers.

Patent vertical smut machine and corn screen. The internal rotary cylinder with beaters is made of wrought iron, and the external stationary cylinder of cast iron. A strong continuous current of air is made to pass through the wheat, while it is between the two cylinders, carrying off the dust, at the upper part of the machine, as soon as it is disengaged from the wheat by the beating process. A separator is attached, for extracting sand, seeds, and small grain.

Registered portable driving apparatus; invented for driving the above machine.

Models of both machines, to be driven by hand.

467 **SQUIRE, CHARLES**, 20 *Old Fish Street, Doctors' Commons*—Inventor.

Timber-preserving apparatus.

468 **BURT, H. P.**, 238 *Blackfriars Road*—Inventor.

Timber-seasoning apparatus.

---

470 **ASHBY, W.**, 8 *Prospect Place, Sheffield*—Inventor.

Upright flour-dressing machine, which cools the meal in the process, and separates it into the required parts, with an economy of power.

472 **HALL W.**, *Castlecomer, Ireland*—Inventor.

Model of grinding-mill.

501 **PERRY, HENRY JAMES**, 3 *Greenwich Road, Greenwich*—Inventor.

Model of a sausage chopping-machine.

502 **MANSELL, THOMAS**, 94 *Bull Street, Birmingham*—Inventor and Manufacturer.

Patent fly press for cutting with steel tools or knives on an even surface of steel, with accuracy. By the system of "bed and punch," and the still more imperfect mode of cutting on a bed of lead, zinc, or wood, both beds and tools are soon out of repair and destroyed; by the patent press both remain uninjured, being accurately adjusted to each other, so that every part of the tool has an equal bearing on the steel bed.

Patent boot-blocking machine, to complete the shape in about one-eighth of the time employed in the usual method, and also to preserve the upper leather of boots from breaking under the joints.

---

503 **THOMPSON, W.**, *King's College*—Inventor.

Hair-working machine.

504 **WAIT, JOSEPH**, 12 *Duke Street, Portland Place*—Inventor.

A series of machines to supersede the necessity of clickers in the cutting of women's and children's goods in the boot and shoe trade. The process is the sole invention of the patentee, and has been in operation for upwards of twelve months. The advantages of this new system are as follow:—That six hundred dozens of boot-linings can be properly prepared for the binders in twelve hours; and that the skins used in the above manufacture can be prepared for the binder in one-tenth part of the time now required, and at a less cost.

A machine for modelling instep pieces for ladies' and children's boots and shoes.

A series of pattern-printing blocks for printing every description of leather, &c., used in the boot and shoe trade.

506 **BIERTUMPFEL, HENRY**, 68 *Albany Street*—Manufacturer.

Improved mould frame, for the production of superio candles from various materials.

508 **GILBERTSON, JOSEPH**, *Hertford*—Inventor.

Model of furnace for preventing effluvia in boiling fat, &c.

---

602 **PONTIFEX & WOOD**, *Shoe Lane, Fleet Street*—Proprietors.

Vacuum pan, as used in sugar refineries and in sugar works in the West and East Indies, and in beet-root sugar manufactories.

Defecator, or clarifier, for clearing the saccharine liquor before evaporation.

Heater, as used in sugar-works.

Set of pumps, used in manufactories. Liquor pumps, used in West India distilleries. Copper pipes. Pumps, for house and other purposes. Brass cocks.

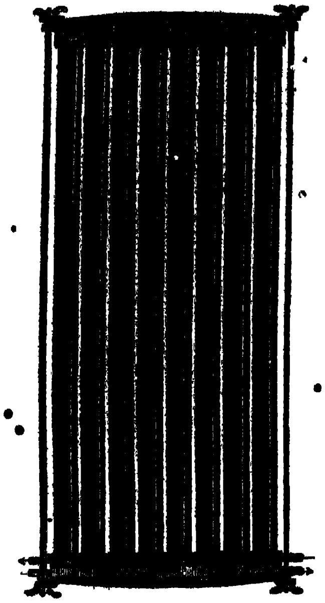
[The vacuum pan was the invention of Howard, the chemist, and answers, more completely than any other arrangement, the refiner's purpose of safety and expedition. It consists of two hemispheres (the inferior one being double, so that it may be surrounded by steam), which are secured by bolts and screws, and rendered, by packing, perfectly air-tight. An air-pump is attached, by which the air is removed from the interior, and by the heat of the steam, which is in the lower steam-chest, the sugar syrup is brought to boil at a low temperature, the atmospheric pressure being removed. These pans usually contain about 100 gallons of syrup, and yield at each discharge about 11 cwt. of granulated sugar. It will be understood that the air-pump is also employed to remove the aqueous vapour as fast as it is formed from the boiling syrup. Formerly the chest was merely filled with steam; but a recent improvement has been made by applying heat to the syrup by means of steam, at the temperature of nearly 250° degrees, circulating through pipes, by which the evaporating power is greatly increased.—R. H.]

604 **LAWRENCE, JAMES**, sen., *Colnbrook, Slough*—Designer and Inventor.

Distributor, consisting of an iron block with six outlets, in which to screw six perforated pipes.

Patent refrigerator, having six iron pipes, with several divisions, coupled together by cast-iron ends. Each of the iron pipes contains seven tinned copper pipes, fastened at either end by a flange and nut. The iron pipes are for the purpose of passing cold water around the copper pipes, while the copper ones convey hot wort or water in an opposite direction; the whole showing how quickly the heat of the wort can be transmitted to the water. The figure on the next page illustrates the arrangement of this apparatus.

Patent store-cask or vat, made with oak staves, having a tinned copper attemperating pan, with air-tight lid, for the purpose of containing cold water to regulate the heat of the ale or beer with which it may be filled.



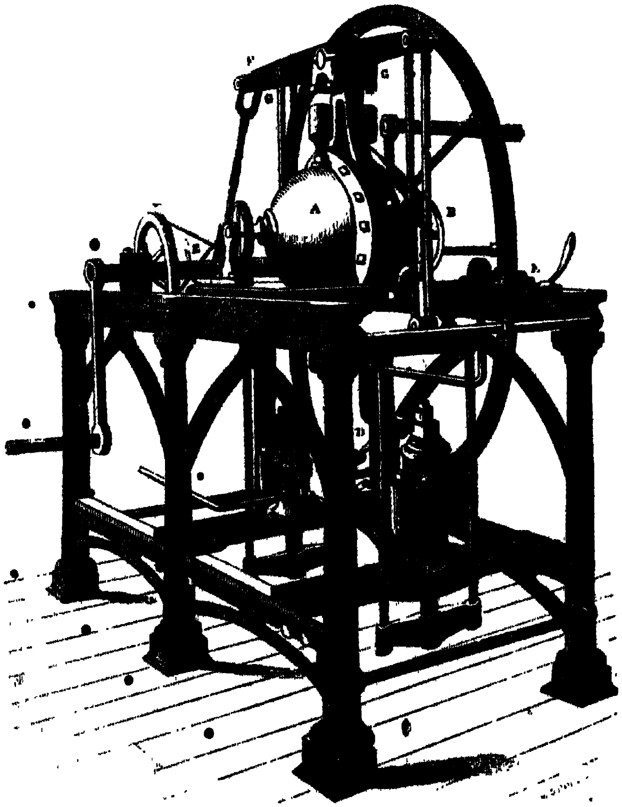
Lawrence's Patent Refrigerator.

605 **TYLER, HAYWARD & CO.,** 85 *Upper White Cross Street, St. Luke's*—Inventors and Manufacturers.

A patent double soda-water machine for two bottlers, capable of making 300 dozen per day. The gasometer and generator are not exhibited for want of space.

The annexed cut represents a patent continuous-principle soda-water machine, made by the exhibitors.

This machine will supply two bottlers, one at each end, and is capable of producing from 300 to 400 dozen per diem. The general arrangement combines two distinct machines in one frame, which can be worked together, or separate, as may be required. A, is the condenser of gun-metal, tinned or silvered inside, and separated by a partition in the middle, thus forming two condensers in one. Each half provided with an agitator, driven by the wheels B, for intermixing the gas and water. C, C, are two condensing pumps, each having regulating cocks, D, D, for the admission of gas water. E, E, are two bottling cocks, attached to their respective halves of the condenser A. The pumps are worked by a beam F, similar to that of a steam engine, having a connecting rod at one end attached to a crank, with fly-wheel and two handles. The pumps are attached to the beam by side rods at G, G. When the crank is in action, the beam by its reciprocating motion causes the plungers H, H, underneath the pumps, to ascend and descend in the barrels of the pumps, forcing at each successive stroke, the gas and water together into the condenser. About ten minutes is required to get the charge up, and when this is done, the bottling goes on without interruption. The machine is kept constantly going during the bottling. The corks having been properly regulated and the supply kept up, as much carbonic acid gas and water will be forced into the condenser as will equal that which is being drawn off by the bottlers, thus keeping a continuous supply.

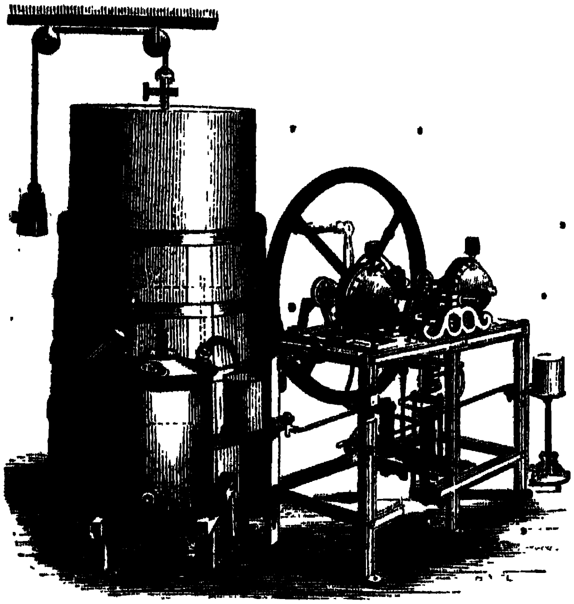


Tyler, Hayward, and Co.'s Soda-water Machine.

606 **TYLOR & SON,** *Warwick Lane, Newgate Street.*

Small fountain soda-water machine, with electro-plated fountain with two cocks.

Double soda-water machine, complete, with improved form and arrangement, by which it may be used either as a single or double machine. By placing the two bottles at the opposite ends of the machine, they are out of the way of the fly-wheels, the index cocks being in the most convenient position, one on the right and the other on the left hand. See figure in the next page.



Tylor and Son's Soda-water Machine.

Well engine-pump, fixed in iron frame, for raising water to a great height.
Bottle or corking-machine, &c.

608 **Cox, William,** *Manchester*—Patentee.

Improved apparatus for the manufacture of aerated waters and other liquids by means of which the impregnating gas may be sustained at a pressure sufficient to cause its absorption by the water or other liquid to be aerated, without the aid of force pumps or other mechanical means; also an improved construction of cock or tap, to be employed with this or other apparatus of a similar nature.

609 **Saddington, Samuel & William,** 63 *Wood Street, Cheapside*—Manufacturers.

Drum sieve, for sifting freely all kinds of powders required by druggists and others. Straining sieve, of silk lawn, for straining starch, colours, &c.

610 **Bourra, Louis Aime,** 31 *Rathbone Place*—Inventor, Patentee, and Proprietor

Patent colour-extractor apparatus. The apparatus turns over on a pivot, to empty the substance extracted.

611 **Askew, Charles,** 27½ *Charles Street, Hampstead Road*—Inventor and Manufacturer.

Model refrigerator, for cooling beer; the quantity to be cooled, and the degree, are regulated by the supply of cold liquor at the different inlets.

612 **Dawson, John,** *Green Park Distillery, Linlithgow*—Inventor.

New distiller or rectifier's recording close safe, for the purpose of protecting from fraud and dishonesty the process of distillation. It is close in all its parts, and covered with plate glass; it is accessible for samples at all stages of the process of distillation; but no quantity of spirit can be drawn unrecorded. The mechanism is composed of gauges, valves, and fixed and movable conduits, acted on by horizontal and vertical rods, by means of which the safe can be applied to any method of distillation, or to any number of stills.

613 **Barlow, H. B.,** *Manchester,* for **Le Forestier, Aime,** *Havre*—Proprietor.

Model of a press for making wine, with improved gearing.
Cask for excluding the air, and registering the contents (invented by Louis Hervot, Havre).

615 **Coffey, Thomas,** 4 *Providence Row, Finsbury Square*—Inventor.

Refrigerator, of a new construction, in two parts, showing the perpendicular or horizontal form of each. In cooling worts, or condensing steam, it exposes a great cooling surface in a small space. It is easily cleaned, and is applicable on a large scale.

617 **Halliday, A. P.,** 6 *Bank Place, Salford, Manchester*—Inventor.

Patent apparatus for the manufacture of pyroligneous acid from saw-dust and spent dye-wood.

618 **Hulls, J.,** *High Wycombe*—Manufacturer.

Wheeler's patent refrigerator, to cool 10 barrels (from 120° to 60° Fahrenheit), the cooling fluid being 52°.
Wheeler's patent condenser, to work a 30-gallon still.

619 **Hill, Evans, & Co.,** *Worcester*—Proprietors.

Model of a patent vinegar apparatus. The process of acetification is conducted in a close vessel, and instant combination of the oxygen of the atmosphere ensues. By this apparatus the use of sulphuric, pyroligneous, or other foreign acid, is rendered unnecessary.

621 **Masterman, John & Thomas,** 38 *Broad Street, Ratcliff*—Inventors and Patentees.

Apparatus for bottling liquors, and machine for corking bottles. The principle of the bottling apparatus is the filling of bottles through syphons, from an open vessel, into which the liquor flows from the cask, in a stream so regulated as always to maintain the liquor in the vessel at nearly the same level.

[The principle of the corking machine, is, to force the cork into the bottle through a conical tube in contact with its mouth, so placed as to form one continuous tube with its neck, and having the lower orifice so small that the cork must be considerably compressed in passing through it.]

623 **Thomson, Andrew, & Younger, W., & Co.**—Designers and Inventors.

Apparatus for heating and cooling worts in the process of fermentation.

[Wort is the fermentable infusion of malt. In the apparatus for heating and cooling worts, the hot liquor is passed through a series of pipes encased in others, through which the cold liquor passes in a contrary direction: thus the hot liquor meets a progressively cooler medium, and, on the contrary, the cold liquor comes in contact with a hotter. The object is the saving of fuel. —W. D. L. R.]

624 **Cooper & Bursill,** *Eastbourne, Sussex, and* 9 *York Terrace, Hornsey Road*—Proprietors.

Patent aerating machine; a carbonating machine, adapted to the manufacture of aerated waters.

630 **Tizzard, W. L.,** *High Street, Aldgate*—Proprietor.
Model brewery, in operation.

631 **Plimsell, S.,** *Sheffield*—Inventor.
Improved warming apparatus.

SECT. II. CLASS 7.

CIVIL ENGINEERING, ARCHITECTURE, AND BUILDING CONTRIVANCES.

INTRODUCTION.

THIS Class embraces a variety of objects directly or indirectly connected with the purposes of construction. While the preceding had reference to the personal or domestic wants of mankind, this occupies a wider field, and includes contrivances adapted to the preparation of public works, as well as of private dwellings, and embraces the sciences of architecture and civil engineering in their most extensive sense. The general title of the Class, "Civil Engineering, Architecture, and Building Contrivances," sufficiently indicates its extent and defines its limits.

The following subdivisions include all that can be properly said to belong to this department of the Exhibition:—A. Comprises Foundations and Building Contrivances connected with Hydraulic Works, such as Piles and Pile-driving, Coffer-dams, Diving-bells, Boring Tools, &c. These are necessarily represented by models only, or in great part, as the works themselves are of too great magnitude for exhibition. B. Scaffolding and Centerings for the erection of Chimneys, Columns, Towers, Bridges, &c.; Portable Scaffoldings, Ladders, Fire-escapes, &c.; Centerings for Arches, Domes, Vaults, &c. C. Forms an important subdivision, comprehending Bridges, Tunnels, and Engineering contrivances for crossing ravines, &c. D. Relates to Dock, Harbour, River, and Canal Works. E. Lighthouses and Beacons. F. Roofs, Buildings, and contrivances for covering large areas. G. Water-works, and the Engineering contrivances connected with the obtaining, storing, and distribution of Water in towns. H. Gas-works, and contrivances connected with the economical production of Artificial Light. I. Sewerage, Cleaning, Paving, and the contrivances connected with the sanitary conditions of towns. J. Warming and Ventilating Domestic Residences, and contrivances for such purposes.

Objects in this Class are found in the Building at the western end of the North Gallery, and also in the Areas and Avenues partly occupied by Classes 5 and 6 in the Ground-floor, North side. Several beautiful models connected with this Class have likewise a place in the Central Avenue or Nave.

Containing a number of costly and beautiful models of many of the great triumphs of civil engineering and architecture, this Class presents an interesting view of the state and capabilities of the sciences it represents at the present day. Among the objects included under the subdivision of Bridges, &c., will be found some of the most elaborate and accurate models probably ever constructed. Some of these are so minutely correct, that it is stated that even the threads of the screws are reduced to a scale. Tubular, suspension, and other bridges, are represented by some of these models, which are on a large scale. Chain-piers, and piers of other descriptions, each indicative of their applicability to the particular purposes for which they are designed, or to the positions occupied by the originals, are also exhibited in their models. The application of iron chain-cables to purposes of this kind, and its history, are recorded in this Catalogue and illustrated in the Exhibition. A variety of bridges on new principles, or upon new modifications of principles already known, are also shown, and their respective merits are capable of being ascertained in the models.

Dock and harbour works are also adequately represented by their respective models. Among others is a model of the Breakwater in Plymouth Sound, executed in limestone, and presenting a favourable idea of that great work. The lens-apparatus of lighthouses, in most recent and improved forms, is exhibited not by models but by the apparatus itself. A large number of models are of works proposed to be executed, and convey a strong impression of the various directions in which inventive skill is exercised. Interest will be excited by many well-executed models of structures in cast and wrought iron. The application of these metals to the purposes of construction, so largely illustrated in the Exhibition Building itself, forms an important feature in the history of modern architecture, and is also represented by various models of conservatories, such as the great Palm-house at Kew, roofs of railway stations, &c. The miscellaneous contrivances connected with the simpler construction and arrangements of private dwellings are found in great numbers. Many of these relate to ventilation, to windows, doors, and chimneys, and appear to promise improvements of importance in these respects.

The study of this Class is instructive, as the means of attaining an approximate idea of the present state of the sciences of civil engineering, architecture, and construction in our own country. The objects illustrating the Class can scarcely be said adequately to represent the subjects embraced by the Class, since they lose the advantage of being seen of their due dimensions. While in Class 5 it is possible to exhibit the actual machine engaged in raising the Britannia Tube to its site, in the present Class the Tube itself, the most wonderful engineering structure of its kind, can only be exhibited in a model, bearing but a small proportion to the size of the original. This is of little moment to the engineer or architect, but to others, unaccustomed to estimate from a scale, Class 7 does not appear so imposing as the preceding Classes, although in reality it contains practical representations of the most mighty works of construction undertaken by any nation in recent times.—R. E.

1 **Siebe, Augustus**, 5 *Denmark Street, Soho*—Inventor and Manufacturer.

Three-motion diving machine air-pump, with a figure of a man equipped in a diving dress and helmet for working under water. The annexed figure represents the diver's dress, &c.

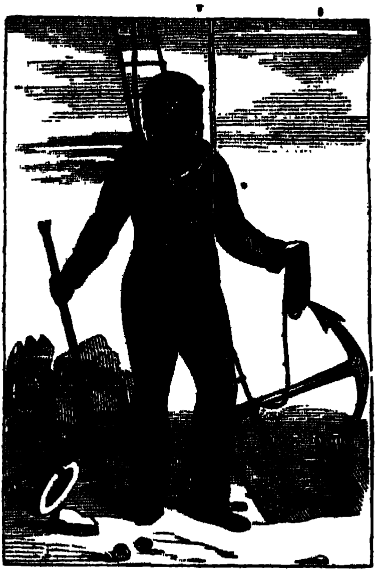


Figure representing the Diver's Dress.

Vase made of the wood and metal of the wreck of the Royal George, sunk at Spithead in the year 1782.

2 **Geary, Stephen**, 19 *Euston Place, Euston Square*—Inventor.

Model of a patent stationary fire-engine, fitted up within the pedestal of a lamp or other post, or fixed in a cast-iron framed box under the pavement, containing hose-pipe, &c.

Improved Venetian perforated blind and shutters.

Model of stone-paving for streets, &c., by trams framed on a new principle.

Model of improved railway carriages, containing open coupées and accelerating driving-wheels, with model of a railway truck for running narrow gauge trains on the broad gauge lines.

3 **Green, Ben.**, 3 *Arcade, Newcastle-upon-Tyne*—Designer.

Model of the central arch of the Ouse-burn and Willington viaducts of the Newcastle and North Shields Railway, erected by John and Benjamin Green, in 1837-8.

Geometrical drawing and view of the Ouse-burn viaduct; also of the Willington viaduct.

The piers and abutments are of stone: each arm is composed of three ribs, formed to the proportionate curve shown in the model. Every rib is put together with 3-inch deck deals, in lengths of from 20 to 45 feet, and two of the deals in width. The first course is formed of two whole deals in width, and the next of one whole and two half deals; and so on alternately until the whole rib is formed. Each rib consists of 15 deals in height or thickness, and the ends are butted one against the other, breaking joint, so that no two of the horizontal or radiating joints shall come together; the whole are connected with oak trenails, or pins, each of which passes through three of the deals in thickness. Between every deal a layer of brown paper, dipped in boiling tar, is laid, to secure the joints from being affected by wet, and so as to make the timbers bed tightly one upon another. The ends of each rib are inserted into large cast-iron shoes or sockets, which are first fixed to the springing stones of the masonry, and secured with long iron bolts, four to each plate, run in with lead; the three ribs are connected together with diagonal braces and iron bolts.

The spandrils formed by the arches, being great, on account of the span, the framing is made in proportionate strength. A beam, 14 inches square, is fixed about the middle of the spandril, inclining upwards to the crown of the arch, from which struts are carried, both above and below it; the above, are perpendicular to the longitudinal beams of the roadway,—and those below, are radiating to the centre of the arch.

The longitudinal beams under the roadway are 14 inches square, and transverse joists, 3 feet 6 inches apart, and projecting about 2 feet on each side, are laid across to receive the 3-inch planking, which is covered with a composition to form a roadway.

The spandril-framing is connected and bound, both to the roadway and to the ribs, by means of iron bolts, straps and keys, in the different situations shown on the model. One of the radiating struts in each spandril is carried on from the rib to the longitudinal beams, passing through and run down the piers about 8 feet.

In this system of timber-bridge building, the straight trussing is the main principle of support is dispensed with, for the spandril-framing must not be looked upon as such; it is merely a combination of wood-work, to convey the weight coming upon the roadway on the simple curved rib, and all timbers in a state of tension are avoided; for when a weight comes upon a roadway, the whole structure undergoes compression.

[The cost of the Ouse-burn viaduct was 24,500*l.* That of the Willington viaduct was 23,002*l.* It was when engaged in designing the bridge for crossing the River Tyne at Scotswood, in 1827-8, that Mr. Green first projected the laminated arch; but the depth of water, its rapidity during floods, and the uncertainty of the foundations, rendering the building of many piers expensive, caused Mr. Green to recommend a suspension bridge at this spot. On the day of opening of this suspension bridge, 12,000 persons rushed on at once, when the weight on its centre was not less than 468 tons, and it proved capable of sustaining this weight.—S. C.]

Model of the monument erected on Pensher Hill to the late Earl Durham, in 1844.

Geometrical drawing, in colour, of the first proposed wooden bridge with stone piers across the Tyne, at Newcastle-on-Tyne, at a high level, in 1838.

Geometrical drawing, in colour, of design for the proposed high-level bridge, in stone and iron, at Newcastle-on-Tyne, in 1841.

Plan from Gateshead, through Newcastle, in the line of the high-level bridge, 1841.

View of Scotswood wrought-iron suspension bridge over the Tyne, erected in 1828-9.

View of the monument erected on Pensher Hill.

Model of the Grey Column at Newcastle-on-Tyne, 1837.

View of Grey Street, Newcastle-on-Tyne, as designed previous to its commencement.

View of the interior of the library of the Literary and Philosophical Society, Newcastle-on-Tyne.

M'Kirdy, J. G., *Birkwood, Lesmahago, Scotland*—Producer.

Model of a wooden bridge, for foot passengers, 46 feet span, besides 2 feet of bearing at each end. All the principal timbers incline to one centre, thereby forming, as it were, three arches. It may be erected (on piers, rocks, or piles) at little expense beyond the materials.

Asser, Louis, 147 *Regent Street*—Inventor.

Model of a bridge. The invention consists of blocks of form which may be applied to stone, iron, wood, or other materials in the construction of bridges, tunnels, breakwaters, &c. From the form of these blocks, and their mutual bearing, the pressure is equally distributed over the whole mass.

Riddell, Thos., 1 *Market Terrace, Southgate Road, Islington*—Inventor.

Model of a building, showing how talc may be used instead of glass.

7 **TURNER, R.**, *Hammersmith, Dublin*—Inventor.

Model (scale, ½ inch to the foot) of the segmental curved patent iron roof at the London and North Western Railway station, Lime Street, Liverpool. The area, roofed over, extends from the façade in Lime Street, to the viaduct, over which Hotham Street passes; and from the new offices to the parcel offices on the opposite side; the extreme length is 374 feet, and the breadth 153 feet, in one span.

Model (scale, ½ inch to the foot) of section of the great iron and glass palm house, in the Royal Botanic Gardens at Kew. The building contains upwards of 40,300 superficial feet of glass, or nearly an acre. The total length of the building is 362 feet 6 inches, the centre portion being 137 feet 6 inches long, and 100 feet wide, and 69 feet high to the top of the lantern light, the wings are each 112 feet 6 inches long, and 50 feet high. It is heated by hot water, on an improved principle.

Brass model (scale, ¼ inch to the foot) submitted to His Majesty the King of Prussia, for a winter garden at Berlin, to cover half an English acre.

Model (scale, ½ inch to the foot) of the winter garden, in iron and glass, curvilinear form, in part erected for the London Botanic Society, at their garden in the Regent's Park.

Model (scale, ½ inch to a foot) of a curved iron roof for a wet dock, sufficient to cover a man of war, in full sail, on entering for examination and repair previous to being sent out to sea.

Model (scale, ½ inch to the foot) for a dockyard, curved iron roof, for man-of-war ship building. The two preceding models were submitted to the Admiralty by the exhibitor.

Models and sections of the structures proposed for the Great Exhibition Building, by the exhibitor. One of these is the only model out of the 243 submitted in competition, that had the Transept, which with the Nave was to be semicircular, and was all throughout 110 feet high in the centre.

Brass model of one of the modes of constructing the 200-feet dome of metal zones and ribs, with wrought-iron chain bars within, by the exhibitor.

Double range of columns and galleries, to form the support in lieu of walls for the said 200 feet dome.

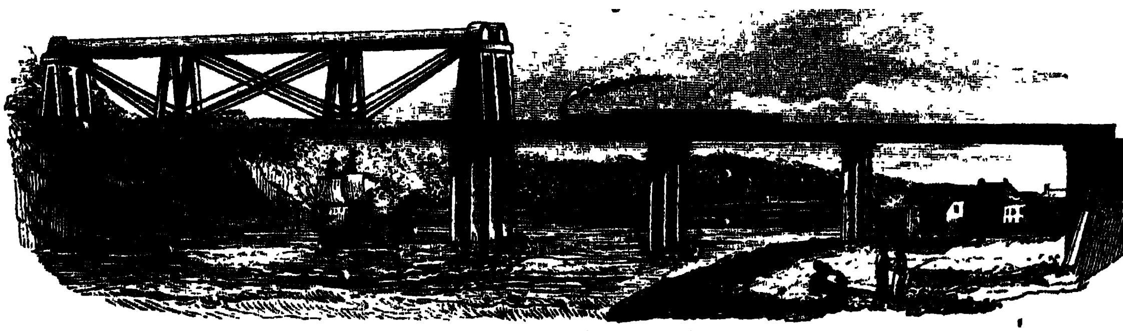
Models of a railway, a range of conservatory, and a round conservatory. (*With Class 8.*)

CLARK, GEORGE DELIANSON, 12 *London Street, Greenwich*—Producer.

Iron castings to be used for architectural purposes, in combination with, or instead of, bricks or stone. Specimen wall—showing the mode of using them.

FINCH & WILLEY, *Windsor Foundry, Liverpool*—Manufacturers.

Model of a wrought-iron bridge to carry the South Wales Railway over the river Wye at Chepstow. Designed by I. K. Brunel, Esq., C.E., and now in course of construction by Finch and Willey, of Liverpool, engineers. The following engraving represents this bridge. (*Main Avenue West.*)



Brunel's Wrought-iron Bridge over the Wye.

Working model of a high-pressure steam engine, having a glass cylinder and glass valve box, through which the piston and valves can be seen working while the engine is in motion. Maker, William Pemberton.

10 **OATES, WILLIAM**, *Mirfield, near Leeds*—Inventor.

Two self-acting cloughs, which divide the fall of water into two parts, drawing at half fall. A boy could draw one made to any size, or with any depth of fall. It would answer for drains into tideways. The power to draw increases in exact ratio with the pressure.

11 **COLES, W.**, 3 *Charing Cross*—Inventor.

Two anti-friction pulleys.

Two models of anti-friction railway carriages.

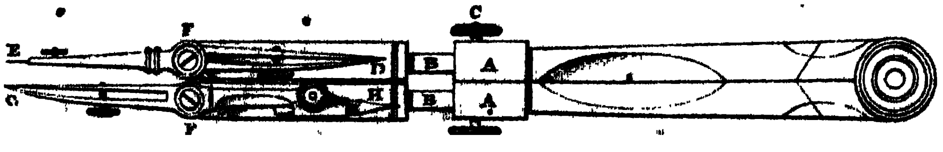
12 **REDMAN, J. B.**, 5 *New Palace Yard, Westminster*—Designer.

Model of the royal terrace pier at Milton-on-Thames, next Gravesend, designed by the exhibitor, and made by Salter of Hammersmith. The pier is constructed of iron by Fox and Henderson. The pillars are founded upon piers of brickwork and masonry below the bed of the river, resting upon the solid chalk substratum, at a level of 14 feet below low water of spring tides. These foundation piers were erected without the expensive aid of coffer-dams, by the novel means of cast-iron cylinders six feet in diameter, kept always above the rise of the tide, the upper portions being removed as each pier was finished.

13 **BERMINGHAM, THOMAS**, *Clarendon Lodge, Sandymount, Dublin*—Improver.

A box of improved patent compasses. The legs, which draw out, have fine needle points, and a pen and pencil to turn on a swing, forming a useful set of instruments in one. This instrument is made after the pattern of Désiré Lebrun, by Elliot, London.

In the following cut, A A represent the stems of the compasses. B B, elongated bars which run into the stems worked by screws. C C, the screws. D, pen, and



Bermingham's Improved Compasses.

E, needle point, either of which may be turned to the end by pivot F. G, H, pen and pencil, worked same as D, E. The entire forms but one instrument.

A model of Thénard's moveable flood-gates or lifts, called "hauses," for rendering rivers navigable, and supplying the place of fixed stone weirs, which exhibits a mode of fixing the lifts, or hauses, at the bottom of the river, so as to prevent stonework impeding the current. They are cheaper than weirs; prevent the flooding of adjacent lands; and are useful in fisheries, mill-power, arterial drainage, and navigation. They are in operation in the river L'Isle, in France.

14 **Jeffery, Robert**, *Upper North Place, Gray's Inn Road*—Inventor.

Railway tunnel signal, intended to prevent accident to a train while in a tunnel, from being overtaken by another train. At present, if from slackness of speed, temporary stoppage, or any impediment, a train is detained in a tunnel, great alarm is felt by the passengers, lest the following train should overtake it. This invention exhibits a large white disc by day, and a lamp by night, either of which is self-acting; and it is displayed conspicuously at the upper edge of the arch, immediately on the train entering, remaining in sight until the train leaves the other end of the tunnel, when it instantly disappears. This is repeated whenever a train enters and quits the tunnel, without any assistance. The following train is always reminded by the presence or absence of the disc or lamp, whether the tunnel is clear or not. It also indicates to the authorities, by any unusual length of time during which the disc is in sight, the existence of some interruption in the tunnel.

15 **Hammond, Richard Charles**, 45 *Baldwin's Gardens, Leather Lane, Holborn*—Inventor and Manufacturer.

Model of a convex-chain suspension bridge.

16 **Pratt**, Major, 7 *Upper Area, Hungerford Market*—Inventor.

Moveable flight of steps, for tidal rivers. The steps are entirely independent of each other.

New self-acting trap for street drains; it can be easily fixed or moved, without displacing the brick-work on which the grating rests.

17 **Green, Joseph**, *Caledonian Road*—Inventor.

Model of moveable dam for river operations; and of a new plan of shifting a dam for constructing sea-walls for docks, piers, harbours, &c.

18 **Clark, Charles**, C.E., *Sea-side Hotel, Hastings*—Inventor.

Model of a proposed grand ship canal through the isthmus of Suez, to save 5,000 miles of sea passage, or half the distance to India.

19 **James, Jabez**, 28a *Broad Wall, Lambeth*—Manufacturer and Designer.

Model bronzed fountain, with steam-engine for supplying it. (*Main Avenue West.*)

20 **Watt, W.**, *Glasgow*—Manufacturer.

Hydro-pneumatic lift, for canal locks.

Hydro-pneumatic elevators.

Patent hydro-pneumatic ship-lift.

Application of compressed air for the prevention of vessels from sinking.

21 **West & Gregson**, *Union Street, Oldham*—Designers and Manufacturers.

Model station-meter for gas-works.

Experimental meter, for ascertaining the consumption of gas per hour, of any description of burner, in cast-iron case.

Consumers' gas-meter: patent enamelled inside, whereby the iron is preserved from oxidation.

24 **Morton, Samuel & Hugh**, *Leith Walk, Edinburgh*—Inventors and Manufacturers.

Model of a patent slip, for hauling up ships, of the largest class, for repairs—a cheap substitute for dry docks—with model of a frigate.

[Slips for hauling up ships for repair were very early used at the Mediterranean ports; but the mechanism which removed the excessive labour of the operation was invented and patented by Mr. Morton in 1818. Before this system was adopted, the cost of hauling up a ship of 500 tons was 170*l.*; it is now reduced to 3*l.* A slip may be constructed for one-eighth part of the expense of a dry dock. Upon a well-constructed slip, a steam-engine exerting 1-horse power for every 100 tons will draw a ship at the rate of 2½ feet per minute.—S. C.]

25 **Martin, John**, *Lindsey House, Chelsea*—Designer and Inventor.

Self-acting valves for sewer and house-traps.

Plan and model of railway, invented 1834. This principle of rail has been adopted on the Great Western line.

Section of rail and laminated beam. This beam is employed on the South Western and South Eastern Railways, and in other structures.

Sections of fire-proof and laminated beams, and their application to strong, light, and durable roofs.

Elevation of proposed bridge at Westminster.

Elevation and sections of centre arch of bridge, showing the laminated beams, stays, and cast-iron planting; the general principle of construction being applicable to all bridges across rivers with low banks.

Model of framework cube used in the construction of ships, floating batteries, harbours, and piers.

Plans and sections showing the application of framework cube and laminated fire-proof beams to ships, harbours, &c.

Lighthouse for the sands, and sand indicator, invented 1829. Lighthouses on this principle have been erected on the Maplin Sand, and elsewhere.

Cleaving anchors, with piles and cables of wood laminated with iron.

Drawing and model of life-boat.

Mode of working and ventilating coal mines.

Drawing and model of pipes and couplings, which can be quickly connected together, or disunited.

Drawings and models of filter drain pipe and mode of laying.

26 **Forster, James**, 5 *South John Street, Liverpool*—Inventor and Patentee.

A fountain, and four household filters; the whole of the water being filtered by the apparatus in its passage through the service pipe. The sole manufacturers are, Cochrane and Co., Woodside Iron Works, Dudley. (*Central Avenue.*)

27 **Renezynski**, Captain **George Alexander**, 31, *Tonbridge Place, New Road*—Inventor.

Self-sustaining suspension bridge, which may be built of wrought-iron or wood; free from side oscillations, and having little deflection.

Steam-power engine for railways or turnpike roads, with six wheels, and self-feeding boiler, requiring no tender; with locomotives, &c.

A hand-power-speed machine for railways and turnpike roads.

An improved quadrant stand.

28 **Stuart, William**, M. I. C. E., *Plymouth, Devon*—Designer and Superintendent of the Plymouth Breakwater Works.

Model, in limestone, of the breakwater in Plymouth Sound, on a scale of 1 inch to 42 feet, with silver lighthouse and beacon, made for the Exhibition, under the direction of the Lords of the Admiralty. The breakwater was commenced on 12th August, 1812, agreeably to a Report dated 21st April, 1806, of the late John Rennie, civil engineer, and of Joseph Whidbey, a Master of the Royal Navy; and has been constructed under the auspices of the Lords of the Admiralty. Its length is 5100 feet at the top, and about 1 mile or 5280 feet at bottom, being nearly three times the length of the Exhibition Building. At the top, it is 45 feet wide, and has a slope to seaward of 5 to 1, and a slope to landward of 2 to 1. It is already composed of 3,768,879 tons of stone. It has been 38 years in construction, and has cost the nation about 1,500,000*l.* The area of Plymouth Sound is 1800 acres, and within the breakwater there is anchorage for 40 line-of-battle ships, besides a fleet of merchant vessels. The exhibitor of the model, who is the resident engineer, has been connected with this undertaking for 40 years. The lighthouse and beacon on the breakwater were designed by Messrs. Walker and Burgess, civil engineers.

Polished marble slab, on pedestals, from the breakwater quarries.

Model, in limestone, of a general section taken through a part of the centre of the breakwater, with wood-jetty and crane, showing dove-tailed stones and truck on jetty.

Model, in limestone, of a section of the breakwater, taken through the buttress and foundation of the lighthouse, with inverted arch at the west end; and showing dove-tailed stones.

Circular lewises, used in lifting and setting stones at the breakwater, invented by the exhibitor in 1808.

Model, in mahogany, of a breakwater stone vessel.

Models of the breakwater and lighthouse, set in marble. (*Main Avenue West.*)

[The breakwater in Plymouth Sound is formed by the deposit of stone in unshapen blocks of various sizes, but disposed upon a regular plan as a huge, rough, broad-based wall, mole, mound, or dike, massive enough, if it be compact enough, to check, if not wholly to stop the roll of the sea under the influence of gales of wind, and to render the part of the Sound within it a safe anchorage during gales from the south-west. The Isle of Wight is a breakwater afforded by nature to Portsmouth, and the breakwater in Plymouth Sound is the result of an endeavour to supply Plymouth with some compensation for its natural deficiencies.

The breakwater is a mass of rock-like blocks of stones deposited in a heap at random, as far as regards the placing of the blocks of stone, though the heap takes the form, in plan and section, which the model exhibits. In this circumstance, that it is a deposit and not a construction, the weakness of the breakwater consists. The blocks on the outer slope, or foreshore, are liable to be taken up singly and displaced by the action of the sea upon it, deprived as every loose block is (and the bulk of the work still consists of loose blocks) of two-fifths of its weight when immersed in sea-water; and probably no heavy sea runs into Plymouth Sound without occasioning change of place to some of the blocks of the outer slope. The blocks range from one ton to five tons in weight—a block of limestone weighing five tons being in bulk equal to a cube of 4 ft. 6 in. or a yard and a half on every side. The greatest quantity of the material is of the smaller sizes, and is known as rubble; but many blocks have been deposited of considerably more than the largest size named, and many even of these have been known to be taken up by the sea from the outer slopes and thrown upon the crest of the mound, whilst thousands of tons, have since the commencement of the work been thrown over the mound from the outer to the inner slope. It may be questioned whether the breakwater is not, at this time, from this cause, further up the Sound than when it was originally planned.

The breakwater is disposed in three connected compartments—the central, or main body, which is 1000 yards long, and the eastern and western parts respectively, which are each about 350 yards long, above high water.

The Digue, or breakwater, at Cherbourg, opposite to Plymouth on the other side of the Channel, is, in like manner, mainly a mass of deposited rubble, but of generally smaller-sized stones. It is more than double the length of Plymouth breakwater, or about 2¼ miles.—W.H.]

29. THE ROYAL SCOTTISH SOCIETY OF ARTS, *Edinburgh*—Producer.

A square bar of Low Moor iron, of superior quality, 2¼ inches square, twisted, in a cold state, into a spiral form by the action of the steam-engine, while carrying the borer of a cylinder which had suddenly stuck fast.

Model of a suspension bridge, designed to show the best position of the under stays (which are not placed symmetrically, but at irregular distances from either end of the bridge) to prevent the destructive effects of vertical oscillation.

[After the most careful calculation of the strength of iron, when subjected to the application of force, in the direction of its length, or its tensile resistance, bridges constructed of iron-chains and rods, which promised to last as long as those made of stone, have suddenly given way. The principal cause of the sudden disruption of the rods or chains of an iron suspension-bridge, and its consequent fall, is the tendency to vibration or oscillation in the whole structure from its uniformity and catenarian form. A chain-bridge, from its very nature has a tendency to swing to and fro, and unless this be prevented by ties or fastenings to some rigid structure fixed in the ground, it will, after a certain number of regular oscillations, snap in two at the weakest part, in consequence of the momentum acquired by the swinging mass.—R. W.]

Model of a steam-boat, constructed for an inkstand.

30 ROEBUCK, JOSEPHUS JAGGER, *Huddersfield*—Producer.

Model and drawings of No. 4, skew arch of the Huddersfield viaduct, built in stone, over the Bradford Road. Scale one inch to three feet.

Model of one of the springer quoins, showing the oblique checks for the insertion of the voussoirs of the spiral courses of masonry.

Model of springer course complete, showing the whole of the checks.

Models of two of the arch quoins, showing the form and twist of Nos. 4 and 5 arch quoins of the obtuse angle of the arch.

Model of one of the spiral courses of the voussoirs, showing the spiral plane from the acute angle of the arch.

Drawing of No. 4 skew arch of the Huddersfield viaduct, by which the above model and detail models were constructed. Scale one inch to six feet.

[Skew, or oblique arches, are those the faces of which are not at right angles with the abutments. It is believed that the first skew bridge was built by Mr. W. Chapman, in 1787, over the Kildare Canal, near Naas. The method of finding the directions of the courses of brickwork or masonry, and the shapes of the various moulds for the latter, are explained fully in treatises on oblique arches. —S. C., jun.]

---

31 HERWOOD, GEORGE, *College Street, Ipswich, Suffolk*—Inventor and Patentee.

Window made to open and close in one or in several parts by the application of the patented apparatus. Used for ventilating the Exhibition Building.

Various models, showing the mode of applying the invention to different windows.

Patent ship-lights and scuttles.

Model and drawing of a breakwater.

32 **SANKEY, WILLIAM H. V.**, *Civil Engineer*—Inventor and Manufacturer.

1. Drawing of a tubular bridge, to be called the "compound hollow girder bridge."

2. Drawing to show sections and details of the above bridge.

3. Model of the "compound hollow girder bridge," showing a proposed form of piers for bridges to be built over rivers.

4. Drawing of a proposed railway carriage, with a new guide-rail for preventing carriages running off the rails.

5. Drawing of a proposed method of building stone bridges.

33 **LOWE, WILLIAM**, *Belton, near Grantham*—Inventor.

Model of a portable bridge, for the use of an army in crossing rivers; and adapted for a landing stage in a tidal river, when fixed on a wharf, as it can be worked out, or in, to suit the ebb and flow of the tide, leaving clear the whole width of river at high water. It might also be used to form communications with the upper floors of detached warehouses, &c.

34 **BAIN, CHARLES**, *Morden Street, Greenwich*—Inventor.

Radial gauge cock for steam boilers, to show the height of the water within by the index hand on the outside.

Elevating machine, to be used in the construction and repair of towers, chimneys, &c. The platforms are alternately closed on the building, and elevated or depressed by the vertical screws.

Compound bridge, to allow the passage of masted vessels without interrupting the roadway.

Tubular bridge, the pressure in which is sustained by the fluid in the tube.

35 **GANDELL, EDWARD FREDERICK**, 3 *Princes Street, Westminster*—Designer.

Model of a method for erecting a lighthouse on the Goodwin Sands.

[The difficulties that have attended the erection of a lighthouse on the Goodwin Sands have hitherto been insurmountable, owing to their great depth, and their constant liability to shift. No erection can be considered secure that does not at least rest upon the chalk, and possess gravity or strength in itself sufficient to resist the violent action of the sea: the greatest observed pressure per square foot of surface, exposed to the action of the waves, is 4,335lbs.—S. C.]

36 **BYNE, RALPH HORACE**, 10 *Eccleston Street, South, Pimlico*—Draughtsman and Modeller.

Model of a design for an iron girder railway bridge.

37 **HUNT & GANDELL**, 3 *Princes Street, Westminster*—Designers.

Design for the new bridge at Westminster. Spans, 250 feet, 300 feet, and 250 feet; headway, 27 feet; inclination, 1 in 36.

38 **SACRED HARMONIC SOCIETY**, *Office, Exeter Hall*—Producer.

Model of the orchestra of the Sacred Harmonic Society, Exeter Hall, an amateur society established, in 1832, for the performance of oratorios, &c. Its orchestra comprises 114 stringed instruments (including 16 double basses), 31 wind instruments, and chorus of 500 voices, numbering in all 645 performers (there is also a large organ), conducted by Mr. Costa. The model was executed by Mr. Phidias Clarke, on a scale of half an inch to the foot. (*Main Avenue West.*)

39 **TOWNLEY, WILLIAM**, 99 *Holborn Hill*—Inventor.

Specimens of machinery, &c., accompanied by a model of the surface or superstructure of London Bridge, upon a scale of three-quarters of an inch to the foot; and working models illustrative of a new system for washing and watering streets, lanes, courts, alleys, &c. (*With Classes 5 & 6.*)

40 **NICHOLSON, G., jun.**, 1 *Harcourt Street, Marylebone*—Inventor.

Model of railway spring-buffer carriage, with self-acting spring life preserver appended; of scaffolding for building purposes; of a fire-escape; and of a machine for simultaneously watering and sweeping streets, &c.

41 **CLIVE, JOHN HENRY**, 12 *Stanhope Place, Hyde Park, and Tunstall, Staffordshire*—Inventor.

An illustrative model of a bar-trellis suspension bridge, to make a more secure and cheap roadway over rivers, without obstructing the navigation by high-masted vessels. The greatest part of the weight is laid on the lower parts of the suspension towers, by tapering the construction throughout from the base, beginning with strong suspending bars, and decreasing their strength to the summit, so that the tops of the towers shall have the least possible weight upon them, trussing and bracing together the suspension bars. The shortest suspension bars being made the heaviest, and the longest bars the lightest, without affecting their efficiency, each being constructed so as to be equal to its task, expense is saved by lessening the quantity of material to be used, and undulation and lateral motion as in chain bridges avoided, the bracing and trussing giving rigidity and a united hold.

42 **WOODS, F. F.**, 5 *Pelham Terrace, Brompton*—Inventor, Patentee, and Manufacturer.

Patent union paving, for public and private roads; a new application of materials, being a combination of wood and stone; designed to possess the following advantages:—Less noise than stone-paved roads; less mud than roads made with loose stones; less slippery than wood paving; besides having a better foothold for horses, and being more durable than the latter.

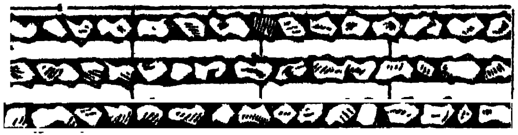
The principle of this invention consists in the application of stone and wood to the construction of a paving material, which is effected in the following manner: the stone which is employed for the purpose, is broken into pieces, and inserted in grooved or perforated blocks of wood, as in fig. 1, which is a section of one of the blocks, showing the position of the broken pieces of stone in the grooves or holes of the block.

Fig. 1.

Block of Woods' Union Paving.

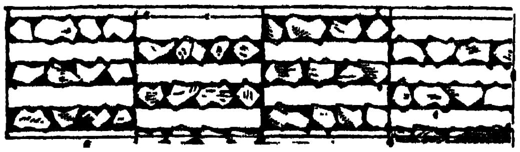
The grooves or holes in the wood are about 3 or 4 inches deep; 2 or 2½ inches wide, and 2 inches apart. The pieces of stone are driven into the grooves tight with a hammer, and their angles or corners are made to penetrate the wood at each side, so as firmly to retain their position. The pieces of stone are driven hard on to the wood at the bottom of the grooves or holes, which are previously lined with a small portion of a composition consisting of small gravel and ground lime. When the grooves or holes are filled up with the pieces of stone, a portion of the same composition is poured over the surface, and compressed with a brush or otherwise, in order to fill up any interstices that may remain between the stones and the wood. There are various designs which may be formed for the arrangement of the grooves, either for beauty or utility; and circular holes may be also used, according to a variety of patterns. These ought to be of 3 or 4 inches diameter, and within an inch or half an inch of each other. When straight grooves are used, which are most easily constructed, the illustrations in fig. 2 and fig. 3 will show the appearance which the paving will assume. These designs may be applied to blocks of any size.

Fig. 2.



Straight grooved Blocks; parallel and continuous.

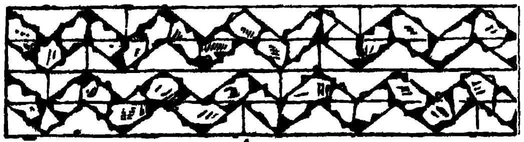
Fig. 3.



Straight grooved Blocks; parallel and discontinuous.

When the grooves are cut in a zig-zag form, the illustration, fig. 4, shows the appearance of the pavement. This design is to be applied to planks 3 inches by 11 inches.

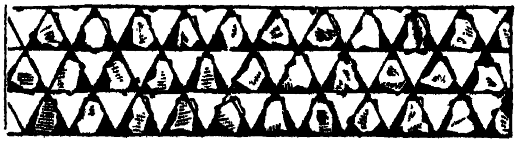
Fig. 4.



Zig-zag grooved Planks.

The fourth illustration, fig. 5, shows a design intended for the use of round timber, and causing but small waste in preparation. The holes in these blocks are cut in the form of equilateral triangles.

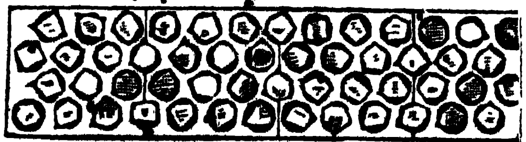
Fig. 5.



Equilateral perforated Blocks.

The fifth design, fig. 6, is applicable to blocks of any size and, instead of grooves, has circular holes in the blocks. The angles of the stones are seen, in this figure as well as in the other figures projecting into the wood.

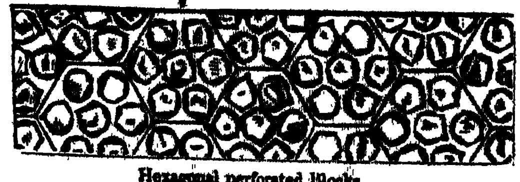
Fig. 6.



Circular perforated Blocks.

The sixth design, fig. 7, is intended for the same use as that in fig. 5. The holes in this design are circular, and so disposed that five holes are contained in every block, which is constructed of the hexagonal form.

Fig. 7.



Hexagonal perforated Blocks.

The blocks can be placed on thin boards, laid close to assist in keeping the under soil from coming up through the joints between the blocks; to aid in distributing the load passing over the blocks more equally; and to promote the under-drainage of the paving. (*Outside, West Entrance.*)

43 **BODLEY, —**, 2 *Queen Square Place, Westminster*—Inventor.

Revolving window-sash. (*With Classes 5 & 6.*)

44 **TEASDELL, WILLIAM**, *Great Yarmouth*—Inventor and Designer.

Model of a coffer-dam, on a new principle.

Model of a life-boat and carriage.

45 **CHAPMAN, JOS.**, *Frome*—Designer and Manufacturer.

Model of a bridge across the Wylye, at Upton Lovel, Wilts. Span 42 feet. Each parapet is formed by trussing a beam of red pine, on the system of Herr Laves, of Hanover; but to increase its rigidity an additional beam, 9 × 5½, is bent to form an arc, chord 38 feet, versed sine 23 inches; the ends abutting into cast-iron shoes, through which the outer suspending bolt is made to pass. The solid ends of the trusses have their bearings on stone piers, and the outer transverse girders have bearings on corbels in the abutment walls. The roadway is suspended by inch screw-bolts, and rises nine inches towards the centre.

46 **DONKIN, BRYAN & CO.**, *Bermondsey*—Producers.

Model of the shield or frame invented by the late Sir M. I. Brunel, and used by him in the construction of the Thames Tunnel.

47 **GROUT, ABRAHAM**, 8 *Shepherd Street, Tenter Ground, Spitalfields*—Inventor and Manufacturer.

Wire bridge for pieces of ornamental water in gentlemen's parks, &c.; in which all the weight is borne by the hand-rail; its object is lightness and durability.

48 **ASKEW, C.**, 27½ *Charles Street, Hampstead Road*—Inventor.

Improved and ornamental shutters, either in metal or wood, adapted for shops and private houses.

Patent filter. Paddle-wheels.

49 **BRUFF, PETER**, *Ipswich*-

Model for a proposed national harbour of refuge on the east coast of England, with two entrances, one from Hollesley Bay westward of Orfordness; and the other from Aldborough Bay, eastward of that point.

50 **GARDNER, HANNIBAL**, 3 *Essex Street, Islington*—Inventor.

Double cone blocks, or artificial hollow stones for building wharf and sea walls, docks, harbours, breakwaters, lighthouses, baths, warehouses, &c. The object is to facilitate building in water to any depth without damming, and with unusual rapidity; when the cavities are filled in with cement or concrete, a solid mass is formed.

51 **BEADON, WILLIAM**, 1 *Crescent, Taunton, and Otterhead, Churchstanton, Honiton*—Inventor.

Patent door; and *with Classes* 5 & 6, the following—

New patent water-shoots, for security against drip, made of clay, stoneware, glass, cement, and other substances; applicable to thatch, and not influenced by temperature or exposure.

New patent barge covering.

Patent water-shoot coping; which saves brackets and wall plates; and combines water-shoot, wall-plate, and coping. Its object is to supersede external wood work connected with roofs.

52 **TODD, C.**, *Leeds*—Inventor and Designer.

Model of a girder (*with Classes* 5 & 6), or the vertebral arch, representing its most simple form; originally invented and designed for a bridge to cross the river

Mersey, at Runcorn Gap, in one span of 1,263 feet. The span of the arch of this model is 31 feet, being about $\frac{1}{40}$th of the span proposed for the bridge. The principle was suggested by considering the construction of the back-bone of an animal.

53 **Heinke, Charles E.**—Inventor and Manufacturer.

Patent submarine helmet, dress, and apparatus, for examining and repairing of ships' bottoms, at sea or in dock, for the recovery of property from sunken vessels, and for making and repairing the foundations of viaducts and harbours.

Patent helmet air valve, for protecting the diver's life in case of any accident happening to the air-hose. It contains a sufficient quantity of air (say from ten minutes to a quarter of an hour) to give the diver time to ascend.

Patent helmet slide, which the diver can instantaneously close should the glass be accidentally broken.

Improved connecting joints, calculated to resist powerful pressure, having a double safety-cap attached.

New-invented signal dial, by which the diver is enabled to make known his wants.

[The earliest mention of the use of the diving-bell in Europe was in 1509: in 1687 treasure was brought up from a sunken ship by William Phipps, a native of America. But the first practically useful diving-bell was the invention of Dr. Halley, in 1720, who also contrived a helmet to enable the diver to go out of the bell, and walk at the bottom for a considerable time. These diving helmets and dresses have been improved from time to time, and are now extensively used by engineers in hydraulic operations.—S. C.]

54 **Devey, Geo.**, 16 *Great Marlborough Street*—Inventor.

Model, illustrating a proposed method for obviating the nuisance arising from the smoke of ordinary house fires, by combining with the present sewerage a general system of underground smoke drainage.

The following cut shows the mode of application to existing buildings, and the general arrangement proposed:—

1. By connecting the ordinary flues with the sewer in the streets.
2. By adapting these flues, now formed for transmitting the smoke upwards, to the downward current proposed.
3. By providing, in these arrangements, for the present action being resumed at any time, for the purpose of inspection or repair.

Fig. 1. A, Sewer.

B, Horizontal connecting flue from chimney in kitchen.

C, Valve, or register for regulating opening.

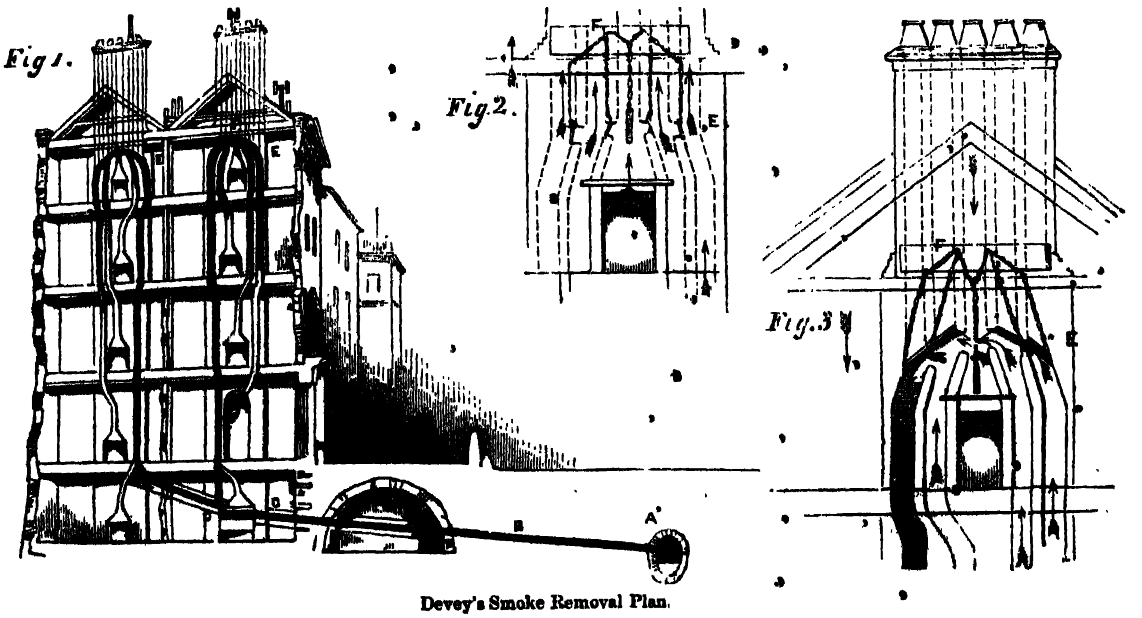
D, Junction (by present flues from basement,) of flues from chimneys above; the smoke from which, ascending in the usual way on reaching the openings at E, would be drawn down by the current produced by exhaustion in the sewer; the action being assisted by the heat from the kitchen fire.

E E, Openings forming passage for smoke across chimney-breast, cut through partitions or withs, with a valve set in each. By means of a balance weight, these would be made to act simultaneously, and remain open or shut as required; forming, when open, a downward passage for the smoke under the action of the new system, and, when shut, a passage upwards by the existing flues. Thus, allowing the ordinary action upwards to be instantaneously resumed in case of accident, or during any operation, such as cleansing or repair.

F F, Stone to front of chimney-breast in roof, to take down for access to valves.

Fig. 2. Openings at E E to larger scale, with valves shut for passage of smoke upwards as at present.

Fig. 3. Openings at E E; open for passage of smoke downwards as proposed.



Devey's Smoke Removal Plan.

55 **Banks, Langley**, 23 *Parliament Street, Hull*—Designer and Manufacturer.

Twin geometrical staircase. It requires the space of one flight only, admitting persons to ascend and descend independently of each other. Adapted for confined places, and particularly for public buildings where show-rooms are required.

56 **Boydell, J.**, 54 *Threadneedle Street*—Inventor and Manufacturer.

Skeleton frame of a building, iron and wood, exhibiting a new method of joining iron joists and rafters to wood, and framing a roof by wedging iron laths in grooved rafters. Also a light framework of iron, rolled at once into the shape required to form a ceiling, and receive the usual plaster. Its object is to limit the ravages of fire.

Door to be used in a fire-proof house.

Section of a ship's side, showing a method of casing iron ships with wood, without using bolts or rivets. By the introduction of a non-conducting substance (that used in the model being silex and gutta percha), between the wood and the iron, a vessel may be coppered without risk of decomposition from contact of the copper with the iron.

New method of framing the sides of iron ships, the object of which is to obtain greater strength at less cost.

57 **DOBB, WILLIAM**, 2 *Hewell Place, Southampton Street, Camberwell*—Inventor.

Self-adjusting chimney-sweeping machine. (*With Classes 5 & 6*).

58 **GRISDALE, JOHN EDWIN**, 289 *Strand*—Inventor.

Model of a wind-guard for smoky chimneys.

59 **MORRELL, G.**, 149 *Fleet Street*—Inventor.

Registered iron abutments and tension rods on piers.

60 **HERRING, C.**, 177 *High Holborn*—Inventor.

Patent window and model. A new and simple invention for taking out both sashes to clean, &c.

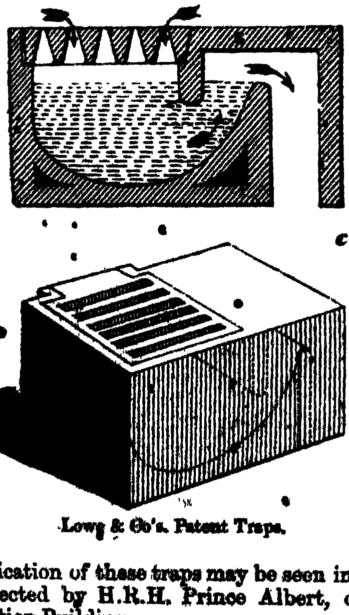
61 **SADLER, JOHN H.**, *Leeds*—Inventor and Patentee.

A bridge for railways or other purposes, composed of a series of girders balanced upon piers, presenting singly the appearance of the letter T. The entire bridge is composed of a chain of these girders and piers, TTT; the girders are firmly locked together at the centre of the arch, each having teeth, like those of a spur-wheel, cast on both sides at each end, and plates with similar teeth cast on them, which are nicely fitted, teeth within teeth, and bolted firmly together, making a very strong joint; the bolt-holes through the girders being made oblong, an allowance for contraction or expansion is provided.

[A continuous beam, or bridge girder, resting on several piers, is stronger than if the girders were disconnected at their points of support, in the proportion of about 5 to 3. —S. C.]

62 **LOWE, ALICE, & Co.**, *Salford, Manchester*—Inventors and Patentees.

Patent effluvia trap gratings or grids, applicable to public streets, courts, passages, hospitals, houses, and sink stones, for preventing the noxious effluvia in main sewers and drains from escaping to the surface. (See the annexed cuts.) A sewer grating.



Lowe & Co.'s. Patent Traps.

The application of these traps may be seen in the model cottages erected by H.R.H. Prince Albert, opposite to the Exhibition Building.

63 **BELL, WILLIAM**, 40 *Pickering Place, Paddington*—Inventor.

Suspension-bridge for railway purposes, made rigid by girders attached to the suspension chain. Suspension-bridge on the same principle, designed for northern rivers, thickly frozen in winter, so as not to impede the passage of the ice when it breaks up.

Bridge of one arch, of 250 feet span, designed for ornamental waters. Constructed on the tensile principle, and calculated to support with safety a load of 472 tons.

Roof, of 400 feet span.

Self-acting flood-gate, for keeping up a uniform head of water in mill-dams, weirs, &c.

[The power of the same water wheel depending upon the quantity of water admitted upon it, and uniform motion being requisite in the prime mover of all machinery, it follows that the height of water in the mill-dam should be maintained at an uniform level, or a self-acting sluice worked by a varying head, added so as to regulate the supply. If the first can be attained with certainty, it will ensure more perfect action.—S. C.]

64 **NAYLOR, WILLIAM**, 56 *James's Street, Oxford Street*—Inventor.

New glass registered ventilators, opened and shut by the means of a rack and pulley, as a sun blind.

65 **OLIVER, O.**, 68 *John Street, Tottenham Court Road*—Inventor.

Registered ventilator and chimney-pot.

Fire-escape, applicable to all the storeys of a building at the same time.

66 **HURST, G.**, *High Street, Bedford*—Designer and Inventor.

Model of a partition, to rise from and sink into the floor, as required.

67 **HORN, ARCHIBALD**, 39 *Baker Street, Pentonville*—Inventor.

Self-acting iron shutter for the protection of shop-windows or doors, bankers' or merchants' safes, ground-floor windows, &c.; claiming, in use, convenience, portability, and freedom from friction.

68 **HILL, SAMUEL**, *Clifton, York*—Inventor.

Model of a window, with six panes to open and shut separately, swinging top-heavy to ensure their remaining open, and fastened with a spring.

Model of a fireplace with ventilating air chamber behind.

Sliding guard, intended as a protection against accidents by fire.

69 **BATES, T.**, 9 *Domingo Street, Old Street*—Inventor and Manufacturer.

Mode of sash-frame and sashes, to open inwards, for being cleaned.

70 **REMINGTON, G. W. & J.**, 138 *Sloane Street*—Inventors.

Model No. 1 represents an engine with a straight-working shaft. Upon it are fixed two levers, which are connected together by means of a spindle, which carries a circular bolt; this bolt is fitted into an opening formed in the centre of the plate which connects the piston. By this arrangement of parts being applied to the inside of a cylinder, the reciprocating motion of the piston is converted into rotatory motion, and an engine of great simplicity is obtained.

Model No. 2 represents an engine. The reciprocating motion of the piston is changed into rotatory motion by means of cylindrical wedges, two of which are fixed upon the working shaft, and the third is placed between; to the centre wedge is attached the piston, which is retained in a right line by means of the covering pipe and cross-heads shown outside the cylinder. The power of this engine is uniform throughout the stroke; its construction is simple and difficult to derange, and is suited for farm and agricultural purposes.

Breakwater model, No. 1.—The chief part of the superstructure is to be composed of wrought iron, forming a square or other rectangular figure of any required dimensions; the inside is strengthened with diagonal and longitudinal ties and braces. Tiers of masonry are to be constructed at intervals, and each section of the breakwater will extend from the centre of one pier to the centre of another, leaving bays or openings between the piers, below the level of low water, for the free passage of the tide; and in this way harbours formed by enclosures from the sea deep water may be always maintained.

Breakwater model, No. 2.—This model is upon the same principle of construction as the above, but designed for harbours in less depth of water. The superstructure is composed of wrought iron; the cross sections are circular. This is applicable to landing-stages, piers, and jetties.

1. Plans, drawings, and description of metropolitan railway union, and great central station, proposed by the exhibitors.
2. Elevation of the proposed iron breakwater.
3. Drawings of patented locomotive engines.
4. Drawings and description of an improved fire-escape.

---

71 Giles, Alfred, 9 *Adelphi Terrace*—Designer.

Model of a curved timber roof, suitable for warehouses, &c.

Model of a repairing or dry dock, constructed of brick, with stone copings. The form of the dock, and the use of brickwork for such a purpose is stated to be new, and the economy, as compared with stonework, considerable.

72 M'Lean, Charles, 110 *Fleet Street*—Inventor.

Models for shop fronts.

---

73 Bouch, Thomas, *Edinburgh*—Inventor and Designer.

Model of an apparatus for shipping and unshipping the trains of the Edinburgh, Perth, and Dundee railway, at all states of the tide. The large steam vessels, in connexion with the apparatus, were designed and constructed by Mr. Napier, of the Lancefield engine works, Glasgow.

74 Harris, J. C., *Bristol*—Inventor.

Model of a shop front.

---

75 Jackson & Clay, 21 *Homer Street, Lambeth*—Inventors.

Fire-escape, in the form of an ordinary piece of furniture, to be fixed to the floor by thumb-screws opposite a window. Provisionally registered.

76 Spurgin, John, *Guildford Street*—Inventor.

Endless ladder and crane, intended to obviate the chances of being upset at the summit.

Patent paddle apparatus for boats and steam-boats, to prevent backwater.

Model of a patent vertebrate or jointed bridge, its strength being derived from wrought iron on the edge, by an arrangement which allows of flexibility in one direction, but effects a resistance or abutment in the other; its object is strength, facility of construction, and portability.

---

77 Peile, J. J. & Co., 74 *Market Place, Whitehaven*—Inventors and Manufacturers.

Specimens of ship screws.

---

78 Russell, Henry Heathcote, C.E., 20 *George St., Adelphi*—Inventor and Designer.

Invention for a tidal staircase for landing passengers from craft at any elevation of tide, which by its arrangement (upon the Archimedian screw principle) revolves as the water ascends or descends, and thus preserves the steps perfectly dry.

Model of a jetty, or landing-pier, designed for Douglas, Isle of Man, upon the same principle, constructed of wire rope, in lieu of chain plate and rods, the vertical rods are composed of iron tubing, the whole supported on screw piles, with a tidal staircase at the extremity.

[The screw pile, the invention of Mr. Alexander Mitchell, of Belfast, is one of great interest and value; it has been employed for the foundations of lighthouses, beacons, jetties, and other submarine works (see Minutes of Proceedings of the Inst. of Civil Engineers, February 22, 1848).—S. C.]

Speedy louis, invented to expedite the hoisting of light stones in the erection of buildings, &c. By this contrivance it will be seen that it is impossible to lose any of the component parts, as may be the case in the ordinary louis, which consists of five separate pieces, the loss of any of which renders the remainder useless. This model has been tested by the hoisting of a block of 5 tons of Portland stone with safety. An ordinary louis for comparison.

Model of suspension-bridge, upon the exhibitor's patent principle, whereby undulatory and vibratory motion is prevented, and the bridge rendered sufficiently rigid for the purposes of railway trains, marching troops, or other transit.

Competition design, upon the same principle, for the railway suspension and lift bridge uniting Cologne and Deutz. (*On Wall.*)

Improvement upon Taafe's slating; registered by the exhibitor. By this mode each slate is secured at all the four angles, with the advantage that any single slate may be taken out and repaired, without disturbing the rest.

Skeleton model of a Gothic tie-beam roof, to show the comparative modes of slating, the arrangement of the rafters, the saving of timber, &c.

Design and proposed site for a bridge at Westminster, to harmonize with the New Houses of Parliament, and preserve the present approaches; dispensing with the necessity of erecting a temporary wooden bridge for the traffic during its erection; thereby saving 40,000*l.* (*On Wall.*)

Design for a new bridge at Cologne.

79 Shield, Joseph, *Newcastle-upon-Tyne*—Producer.

Model, showing the process of manufacturing shot from lead.

[Shot are made by melting lead, with which, usually, some arsenic is combined, at the top of a high tower. The melted metal passes through a cullender, and falling through a large column of air, at length falls into a water-butt on the ground. The heights of these towers vary from 200 to 300 feet. In the progress through the air, the sphericity of the shot is obtained, and after being cooled in the water, they are selected, mixed with a little plumbago, and put into a small octagonal cask, which is made to revolve by mechanical power—in this way all roughness is removed, and the shot are polished.—R. H.]

80 Hooke, Thomas, 80 *New Cut, Lambeth*—Inventor and Manufacturer.

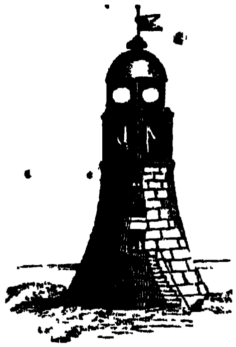
Registered portable bed-room fire-escape.

81 Naylor, Matthew, 121 *Radnor Street, Hulme*—Producer.

Illustration of sewering, paving, &c., at Manchester.

82 Wells, George, *Admiralty Office*—Inventor.

Universal telegraphic lighthouse, intended to prevent mistake as to its identity; this is accomplished by cutting four or more apertures in the present buildings just below the lantern, and fitting the openings with ground plate glass painted so as to leave the illuminated initial of the particular lighthouse distinct. The annexed figure represents the proposed lighthouse.



Wells' Universal Telegraphic Lighthouse.

[Owing to the difficulty of identifying lights on a coast, the least number that can be employed is the best; but if some distinguishing mark can be fixed to a lighthouse, by which all possibility of mistake is prevented, some objections to frequent lights would be removed.—S. C.]

83 **MORGAN, STEPHEN**, 28 *Robert Street, Grosvenor Square.*

Model of an oval staircase.

84 **LAVANCHY, JEAN BAPTISTE**, 9 *Richmond Buildings, Dean Street, Soho*—Inventor.

Model of a portable bridge (known in France under the denomination of Pont portaline), extending or retracting on grooves.

86 **HAWKS, CRAWSHAY, & CO.**, *Gateshead, Newcastle-upon-Tyne*—Manufacturers.

Model of the high-level bridge across the Tyne, at Newcastle-on-Tyne.

Samples of cable and other chain, as used in Her Majesty's navy, from the greatest diameter to the least.

90 **DUNHILL, THOMAS, C.E.**, 19 *Fortress Terrace, Kentish Town*—Projector.

Model of an aggregate cattle market, abattoir, carcase market, &c., occupying 65 acres, and proposed to be established in the N. by W. suburb of the British metropolis, and embodying the following arrangements:—

A principal entrance, with 500 feet frontage for offices, &c., flanked with buildings, their interior areas forming carcase and other markets. The market would occupy an area of 23 acres, and would accommodate 6,000 oxen with 40,000 sheep. Calf and horse markets are also provided for, and pasturage would surround the whole.

91 **HADLEY, CHARLES**—Producer.

Specimens of patent paving.

92 **TIPLER, T. W.**, *Rugby*—Inventor.

Model of a fire-escape.

93 **LEGRAS, L. N.**, 2 *Tennison Street, York Road, Lambeth*—Inventor.

Various inventions in connexion with sewerage, &c.

94 **ELL, GEORGE**, 3 *Tottenham Court, New Road*—Inventor and Improver.

Adjustable scaffold observatory or fire-escape, applicable to a variety of purposes, and may be adjusted to any height within its range, supporting itself with safety, independently of any attachments.

The machine consists of a series of hollow rectangular frames, sliding one within another, after the manner of the tubes of a telescope; mounted upon wheels, and hoisted or lowered by ropes and pulleys, by means of winch handles, turning a barrel, round which are twisted the lower ends of the ropes of the second frame. By a repetition of this arrangement each frame is raised out of the frame below it, at an equal rate with all the others, but the absolute velocities of all the frames successively are in arithmetical progression.

Adjustable ladder; supports itself by means of swinging pole attached to the back, braced by light iron work; can be easily taken to pieces, and put away in a small compass.

Wheelbarrow, for the use of excavators and others.

Folding steps, with bowed sides, suitable for general household purposes.

95 **BREMNER, JAMES, DAVID, & ALEXANDER, C.E.**, *Glasgow*—Inventors.

Model of an apparatus for building sea-walls in deep water.

Models of life-boats, with a large chamber in the centre, in which are three paddles worked with cranks instead of oars.

Model of the means used for raising the iron steamship, "Great Britain."

Model of cranes used in making the harbour of Lossiemouth, Scotland.

Scale of the models, ½ of an inch to a foot.

96 **SMITH, B.**, *Bron Seiont, Carnarvon, Wales*—Inventor.

Models of a double line of railway (of four-rail mixed gauge), for the assimilation of railway gauges; see the engraving on page 319.

Models of two tunnels in wood, and one in glass.

Models of five railway carriages.

The accompanying two diagrams are in illustration of a new system of working railways, intended to dispense with all break of gauge.

The plan suggested is to convert the narrow-gauge railways into broad-gauge lines, by laying down rails of the seven-feet width on the outer sides of the present narrow-gauge railways, so as to form them into four-rail mixed-gauge lines, until the traffic be entirely transferred from the narrow-gauge to the broad-gauge rails, when the inner or narrow-gauge rails would be permanently removed. The new form of carriage here proposed, as shown in the diagrams, has three pairs of large wheels placed on the outer sides of the body.

Description of the Engraving.—The arch represents one of the tunnels on the London and North Western Railway; in height 22 feet above the rails, and in width 24 feet.

The horizontal line across the arch and above the carriages represents the height above the rails of the lowest bridge between London and Holyhead, being 14 ft. 3 in.

A. End section of the new wide-gauge second-class carriage, intended to form part of this plan and to hold 48 passengers.

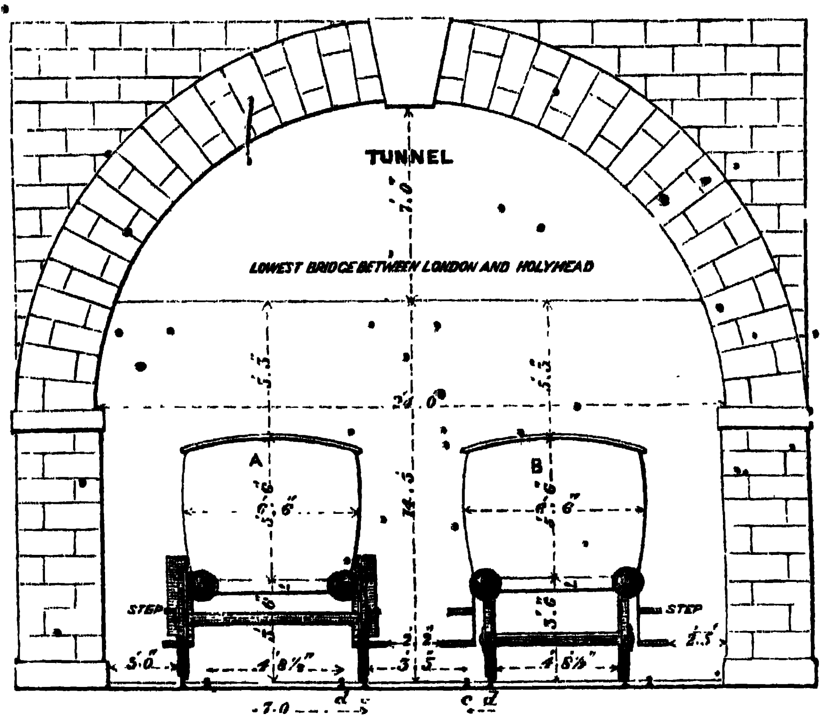
B. End section of one of the narrow-gauge second-class carriages in use on the London and North Western lines, which holds 24 passengers.

c. End sections of the (seven feet) wide-gauge rails, to be laid down on the outer sides of the narrow-gauge lines.

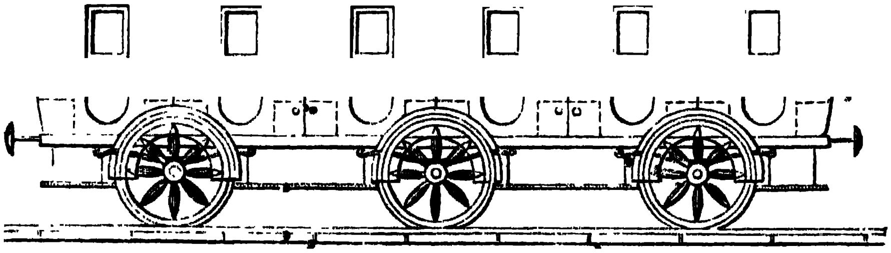
d. End sections of the (4 ft. 8½ in.) rails, forming the present narrow-gauge lines.

The four lines of rails taken together represent the four-rail mixed gauges, to be temporarily laid.

E. Side section of the new wide-gauge second-class carriage, intended to form part of this plan, and to hold 48 passengers; and be the steadiest at high velocities, to the wheels being placed nearer to the ends.



Scale of eight feet to an inch.



Scale of eight feet to an inch.

Smith's Assimilation of Railway Gauges.

97 WILSON, M., *Middle Church Street, Whitehaven*—Inventor.

Vertical water-wheel, to be used as a breast-wheel, or undershot-wheel, having governor-paddles so constructed as to obviate the back-water, and increase the efficiency of the wheel. Its peculiar features consist in the feathering action of the paddles, and the application of the balance-balls in connection with them, to adjust their gradual descent upon the abutments at each revolution, by which repeated rotary concussions are avoided.

98 RENNIE, G., 21 *Whitehall Place*—Inventor.

1. Model of a stone bridge proposed for Westminster, and submitted to the Committee of the House of Commons in 1846. Total length, 827 feet; number of arches, 7; total waterway, 768 feet. Spans of arches—Middle arch, 130 feet; two arches, each 120 feet; two arches, 100 feet; two arches, 95 feet. Height above Thames high water—Middle arch, 27 feet; two arches, each 25 feet; two arches, 28 feet; two arches, 20 feet.

2. Model of a bridge proposed for Westminster. Total length, 752 feet; number of arches, 5; total waterway, 690 feet. Middle arch, 150 feet; two side arches, 140 feet; two side arches, 130 feet. Height above tidal waterway—Middle arch, 27 feet 6 inches; two side arches, 25 feet; two side arches, 24 feet.

3. Model of a bridge proposed for Westminster. Number of arches, 7; spans, each 100 feet; height above Thames high water, 26 feet.

4. Model of a bridge recently constructed over the river Meuse, in Belgium, for the Namur and Liege Railway, at Val St. Lambert. Length, 525 feet; number of arches, 5; width, 26 feet; spans, each 80 feet; versed sine, 10 feet.

5. Model for a bow and string girder bridge, proposed to carry the Prussian Railway over the Rhine at Cologne, agreeably to the programme of the Prussian Government. Span of each opening, 572 feet; span of drawbridge, 96 feet, by George Banks Rennie, jun.

6. Model of a design of a Harbour of Refuge for Dover, submitted to the Commissioners, by the same.

99 THE COMMISSIONERS OF NORTHERN LIGHTHOUSES, *Edinburgh*—Proprietors. Mr. ALAN STEVENSON, Engineer.

Revolving dioptric apparatus of the first order (same as that at Skerryvore). This apparatus consists of two parts. The principal part is a right octagonal hollow prism, composed of eight large lenses, which throw out a powerful beam of light whenever the axis of a single lens comes in the line between the observers and the focus. This occurs once in a minute, as the frame which bears the lenses revolves, in eight minutes, on the rollers placed beneath. The subsidiary part consists of eight pyramidal lenses, inclined at an angle of 50° to the horizon, and forming together a hollow truncated cone, which rests above the flame like a cap. Above these smaller lenses (which can only be seen by looking from below) are placed eight plane mirrors, whose surfaces being inclined to the horizon at 50° in the direction opposite to that of the pyramidal lenses, finally cause all the light made parallel by the refraction of these lenses, to leave the mirror in a horizontal direction. The object of this part is to turn to useful account, by prolonging the duration of the flash, that part of the light which would otherwise escape into the atmosphere above the main lenses. This is effected by [illegible] light that passes below the great lenses, and by means of two reflections and an intermediate reflection project them in the shape of a flat ring to the horizon.

Fixed dioptric apparatus of the first order (same as that at Isle of May, with various improvements). The principal part consists of a cylindric belt of glass, which surrounds the flame in the centre, and by its action refracts the light in a *vertical* direction upwards and down ward so as to be parallel with the focal plane of the system. In this way it throws out a flat ring of light equally intense in every direction. To near observers, this action presents a narrow vertical band of light depending for its breadth on the extent of the horizontal angle embraced by the eye. This arrangement, therefore, fulfils all the conditions of a fixed light, and surpasses in effect any arrangement of parabolic reflectors. In order to save the light which would be lost by passing above and below the cylindric belt, curved mirrors, with their common focus in the lamp, were formerly used; but on the suggestion of the present engineer, the adaptation of *catadioptric* zones to this part of the apparatus was, after much labour, successfully carried out. These zones are triangular, and act by *total* reflection; the inner face *refracting*, the second *totally reflecting*, and the third, or outer face, a second time *refracting*, so as to cause the light to emerge *horizontally*. The apparatus has received many smaller changes by the introduction of a new mode of grouping the various parts of the framework, by which the passage of the light is less obscured in every azimuth. During the last four years, these improvements have been introduced into the lighthouses in Scotland.

[The dioptric system of lights was invented by M. Fresnel A.D. 1819.—S. C.]

Model of the Bell Rock Lighthouse, lighted in 1811. This lighthouse was executed according to the design, and under the superintendence, of the late Robert Stevenson, Esq., F.R.S.E., Engineer to the Commissioners of the Northern Lighthouses. The model shows the progress of the work; the temporary barrack-house of timber; the railways, stone lighters, and cranes used in its construction; and on the pane at one end of the case, the courses of masonry, with their dovetails and joggles. Cost 61,331*l.* 9*s.* 2*d.* The bird on the top of the model was carried against the lantern in a gale, broke a pane of glass, injured one of the reflectors, and fell dead on the floor of the lightroom.

Model of the Skerryvore Lighthouse, on the same scale as No. 3. The light was exhibited in 1844. The lighthouse was executed according to the design and under the superintendence of Mr. Alan Stevenson, LL.B. F.R.S.E., the present engineer. Cost 86,977*l.*

Model of balance crane, designed by the late Mr. Robert Stevenson, and used by him in the erection of the Bell Rock Lighthouse, for raising and setting the stones at any distance from the centre of the tower, in which the stone and the counterpoise balance each other by being continually kept at an equal distance from the shaft of the crane.

Model of the apparatus of an intermittent light. Designed by the late Mr. Robert Stevenson, and introduced by him at the lights of Tarburtness, Barrahead, and Mull of Galloway, on the coast of Scotland. This apparatus eclipses the light suddenly for half a minute of time, and as suddenly reveals it to view, when it continues in sight for two and a half minutes, and is again suddenly eclipsed; thus producing its whole effect in three minutes of time. The suddenness of its eclipse and reappearance, and the inequality of the periods of light and darkness, form a marked contrast to the gradual waxing and waning which precede the brightest phase and dark periods of a revolving light, all the phenomena of which recur at equal intervals of time.

Model of a lighthouse lantern, on the diagonal arrangement. Designed by Mr. Alan Stevenson, for the purpose of avoiding the unequal distribution of the light to which the old lanterns were liable from the interception of rays in certain azimuths by means of the vertical astragals. Great rigidity and strength are also insured by this arrangement, and the triangular form of the panes renders them less liable to be broken by the force of impinging bodies.

Mechanical lamp of four wicks, in which the oil is kept continually overflowing by the means of pumps, which raise it from the cistern below; the rapid carbonization of the wicks which would be caused by the great heat is thus avoided. The flames of the lamp reach their best effect in three hours after lighting, *i. e.*, after the whole of the oil in the cistern, by passing and repassing over the wicks repeatedly, has reached its maximum temperature. After this the lamp often burns 14 hours without sensible diminution of the light, and then rapidly falls. The light varies from 16 to 20 times that of the Argand flame of an inch in diameter; and the quantity of oil consumed by it is greater nearly in the same proportion.

Holophotal arrangement of lighthouse apparatus, prepared by Mr. Thomas Stevenson, C.E., in which the whole sphere of light is brought under instrumental action thus:—The posterior hemisphere of light is reflected by the hemispherical mirror (and in some cases by reflecting hemispheres of glass), and passes with the usual loss by reflection again through the flame, where it is parallelized, partly by refraction at the lens, and partly by the parabolic mirror which is truncated in the parameter. The anterior hemisphere of light is also parallelized partly by the action of the lens, and partly by the parabolic mirror. In this manner there is no loss of the posterior portion as in the lens, nor of the anterior portion as in the mirror.

100 **STEVENSON, THOMAS**, F.R.S.E., 84 *George Street, Edinburgh*—Inventor.

Revolving light, with axial rotation, by which one-half the number of reflectors, and one-half the quantity of oil, are designed to be saved. Intended for illuminating any arc of not more than 180 degrees. The intervals of time of illumination are equal within the whole of the illuminated arc, instead of unequal as in the reciprocating light. The reflectors are also of a new form, consisting of parabolic strips of different focal distances.

Ordinary parabolic reflector, rendered holophotal (where the entire light is parallelized) by a portion of a catadioptric annular lens. The back part of the parabolic conoid is cut off, and a portion of a spherical mirror substituted, so as to send the rays again through the flame. All the light intercepted by the annular lens is lost in the ordinary reflector.

Holophotal catadioptric annular lens apparatus (unfinished). This is a combination of a hemispherical mirror and a lens with totally-reflecting zones; the peculiarity of this arrangement is, that the catadioptric zones, instead of transmitting the light in parallel horizontal plates, as in Fresnel's apparatus, produce, as it were, an extension of the lenticular or quaquaversal action of the central lens, by assembling the light around its axis in the form of concentric hollow cylinders.

(The above instruments belong to the Board of Northern Lights.)

[The early method of illuminating lighthouses was by coal or wood fires contained in "chauffers." The Isle of Man light was of this kind until 1816. The first decided improvement was made by Argand, in 1784, who invented a lamp with a circular wick, the flame being supplied by an external and internal current of air. To make these lamps more effective for lighthouse illumination, and to prevent the rays of light escaping on all sides, a reflector is afterwards added; this threw the light forward in

parallel rays towards such points of the horizon as would be useful to the mariner. Good reflectors increase the luminous effect of a lamp about 400 times: this is the "catoptric" system of lighting. When reflectors are used there is a certain quantity of light lost, and the "dioptric" or *refracting* system, invented by the late M. Augustin Fresnel, is designed to obviate this defect to some extent: the "catadioptric" system is a still further improvement, and acts both by *refraction* and *reflection*. Lights of the first order have an interior radius or focal distance of 36·22 inches, and are lighted by a lamp of four concentric wicks, consuming 570 gallons of oil per annum.—S. C.]

101 TUCKEY, R., *Hampton Court Palace*—Inventor.

Proposed fire-escape.

102 MAXWELL, JOHN, *Stakeford Foundry, Dumfries*—Manufacturer.

Hatch-window for house-roofs.
Another, of plate-glass.
Cottage-windows, all of cast-iron.
Iron skylights and iron sashes.

104 HOPKINSON, JOSEPH, *Chapel Hill, Huddersfield*—Inventor.

Bobbin ladder for vessels in port or in distress, and suitable for a fire-escape or other purposes.

105 VIGNOLES, CHARLES, 4 *Trafalgar Square*—Designer.

Model of the wrought-iron bar-chain suspension bridge at Kieff, now erecting across the river Dnieper, by command of H. I. M. the Emperor of Russia. Its length is about half an English mile, and breadth 52½ English feet. The area of the roadway is 140,000 superficial feet. (*Central Avenue.*)

The bridge of which this is a model is the largest work of the kind hitherto undertaken; the chains on the right, or Kieff side of the Dnieper, are moored in an isolated abutment, built in the river, at a sufficient distance from the shore to allow vessels to pass. This is effected by a drawbridge, 52½ feet broad, spanning an opening of 50 feet. The supports are hollow beams of wrought iron, about 130 feet long; the drawbridge revolves in one leaf, and centres like a railway turn-table; the counterpoise required is very small. The whole weight of the drawbridge is about 150 tons.

The four principal suspension spans are each of 440 English feet. Each chain extends over the five river piers and through the two abutments, and is more than half an English mile long.

The platforms are suspended from the chains by wrought-iron rods of 2 inches diameter. The roadway is made peculiarly stiff, to resist the various strains to which it is liable.

The total quantity of iron employed in constructing the bridge, including the machinery used, is 3,500 English tons (3½ millions of French kilogrammes, 78,000 German centners). The whole was manufactured in England; the chains by Fox and Henderson, Birmingham.

Sixteen vessels were employed in transporting the iron from Liverpool to the port of Odessa, whence it was conveyed on bullock-carts to Kieff, a distance of 400 English miles.

The channel of the river Dnieper at the bridge is about 35 feet deep in summer, but the spring floods increase the depth to 50, and sometimes to 55 feet.

Eight coffer-dams were required for getting in the foundations, and 10 steam-engines were employed on the works, two being of 50-horse power each.

The foundations are on piling and concrete; the piers and abutments are brick, faced with granite. About 1,000 tons (English) of granite ashlar are inserted in each abutment as an extra mass, for the mooring plates of the chains to bear upon.

The granite was brought across a country destitute of hard roads, from a distance of nearly 100 English miles. The hydraulic cement employed is prepared artificially, according to the system pointed out by the celebrated French engineer, Vicat.

Cost of the bridge about 400,000*l*. sterling. Time of building will have been about five years; but from the climate and other circumstances not more than 100 working days in each year could be calculated on for the principal and more difficult parts of the work.

The whole of the piers and abutments will be brought to the level of the roadway in the course of the present summer (1851); two of the river piers will also be carried to their full height; and the bridge will be completely finished in the autumn of 1852.

Every part of the model is in exact proportion to the original bridge. The scale is 1 inch to 8 feet.

The two views in chromolithography, which illustrate this bridge, are from drawings executed on the spot.

[Suspension bridges of iron were introduced about the year 1741, at which date one of 70 feet span was thrown over the river Tees. Scamozzi, "Del Idea Archi," published 1615, conveys some notion of these structures, but Bernouilli first explained their true principles. The Union bridge over the Tweed, 449 feet span, constructed by Capt. Sir S. Brown, in 1820, was the first large bar chain bridge erected in Britain. The Newhaven and Brighton suspension piers were also erected by the same engineer. The great bridge by Telford across the Menai Straits is 570 feet span; it was commenced in May, 1819, and completed in December, 1825. The Hammersmith bridge, 422 feet span, by Tierney Clark, was completed in 1824. The Montrose bridge, by Rendel, 412 feet span, was erected in 1829; and the Hungerford bridge over the Thames, 676½ feet span, by Brunel, was built in 1844. The *wire-rope* bridge of Freiburg is 820 feet span. The roadways of suspension bridges must not merely be *hung* from the chains, but be rendered stiff to resist the undulatory motion caused by the wind. See Minutes of Proceedings of the Institution of Civil Engineers, Feb. 16, 1841, on this subject.—S. C.]

106 CLARK, EDWIN, 448 *West Strand*—Producer.

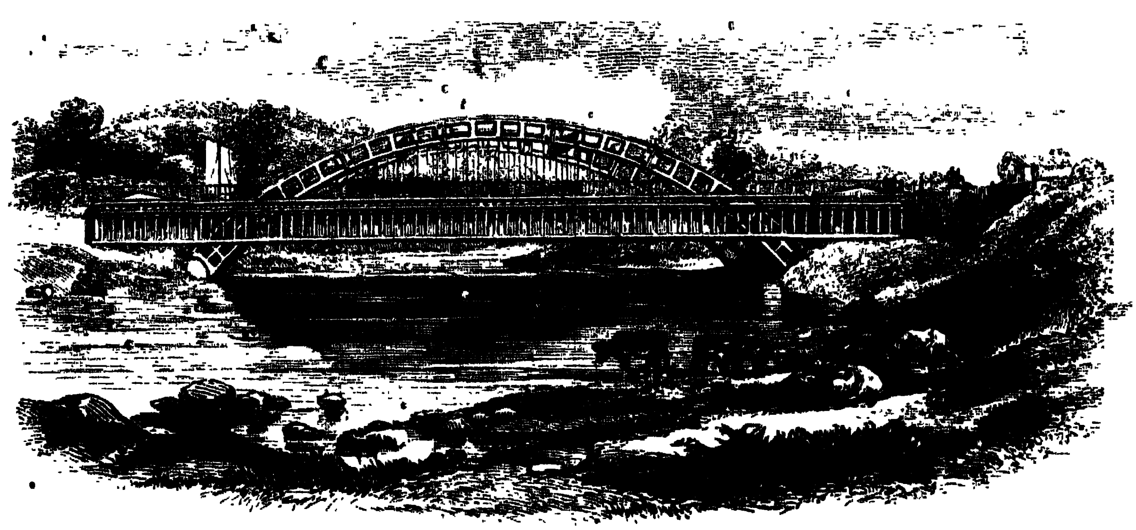
Model of the Britannia bridge, and of the apparatus used in floating and raising the tubes. Scale 1-8th of an inch to the foot. Engineer, Robert Stephenson; model executed for Charles Mare, Esq., by Mr. Jabez James. (*Central Avenue.*)

[This bridge consists of a tube, formed of iron plates rivetted together, and of sufficient dimensions to allow a loaded train to pass through each. It crosses the Menai Straits, and connects the Isle of Anglesey with South Wales. It was commenced August 10, 1847, and was finished March 5, 1850, and on the 18th of the same month was opened for traffic. The total expense of erection was 601,860*l*., of which the iron work cost 443,160*l*., and the masonry 158,700*l*. It contains 1,500,000 cubic feet of masonry, 9,480 tons of wrought iron, and 1,988 tons of cast iron.—S. C.]

107 LEATHER, JOHN W., *Leeds*—Designer.

Model of suspension aqueduct over the river Calder, at Stanley, near Wakefield. (Designed by George Leather and John W. Leather, civil engineers, Leeds, and executed under their direction.) This aqueduct is represented in the following engraving.

The canal which is carried over the river Calder by means of this aqueduct is navigable for sea-going vessels of 7 feet draught of water, and 120 tons burthen.



Leather's Suspension Aqueduct over the Calder.

This model and unique mode of construction was adopted in order to preserve the whole width of the waterway of the river free and uninterrupted by piers, which was important.

The tank or trough is 9 feet deep, and 24 feet wide within, and it contains between the points where it rests upon the abutments, 940 tons of water, more than is contained in the whole 19 arches of the celebrated Pont-y-Cysyllte aqueduct in Wales.

There is a towing-path on each side, which projects partly over the water within, and partly on the outer side of the trough. By the introduction of a colonnade and entablature (of the Grecian Doric order) terminated by an octastyle portico and pediment on the abutment at each end, the heavy and unsightly appearance which so large a surface of tank would have presented, is got rid of, and a light and elegant character is given to the structure. The suspending-rods pass through the columns to the ends of the transverse bearers; and the steps upon which the columns appear to rest serve to conceal the transverse bearers, as well as further to maintain the architectural effect.

The following are the principal dimensions and particulars:—

Span of the suspending arcs . . .	155	feet.
Width between the suspending rods	30½	,,
Length of trough between the abutments	165	,,
Width of trough	24	,,
Depth of trough	9	,,
Depth of water (sometimes 8½ feet) ordinarily	7½	,,
Diameters of suspending rods . .	2½	inches.
Thickness of tank-plates (cast-iron) .	3½	,,
Weight of each suspending arc . .	101	tons.
Total weight of iron—cast, 730 tons, wrought, 30 tons	760	,,
Weight of the water in the tank (8½ feet deep)	940	,,
Total weight supported by suspending arcs, including their own weight	1,700	,,

First pile for the foundations driven July 20, 1836. Aqueduct opened August 8, 1839.

Iron-work executed by Messrs. Graham, Milton Iron Works, near Sheffield.

Masonry by Hugh M'Intosh, contractor, Bloomsbury Square, London.

[The first cast-iron aqueduct was erected by Telford, A.D. 1793, to carry the Shrewsbury canal over the river Tern.

In 1794-5 he designed the celebrated cast-iron aqueduct to convey the Ellesmere and Chester canal, at an elevation of 127 feet, over the river Dee at Pont-y-Cysyllte: since that time many have been erected. The advantages of cast-iron aqueducts over those of stone, which are of considerable antiquity, are their security from leakage, and their economy in point of cost.—S. C.]

2. Model of a cast-iron bridge over the river Aire at Leeds. This bridge is represented in the following engraving.

The objects aimed at in this design have been to combine with apparent lightness, real strength, and by taking advantage of the facilities afforded by the metal, to give, as in the case of the Calder aqueduct, almost without additional expense, a pleasing, ornamental, and purely architectural character to a useful engineering work.

The following are the principal dimensions and particulars:—

Span of the arch	120	feet.
Rise of arch from springing . . .	12	,,
Width of roadway	30	,,
Width of each footpath	6	,,
Total width outside to outside . .	43½	,,
Weight of cast-iron	410	tons.
Weight of wrought iron	5½	,,

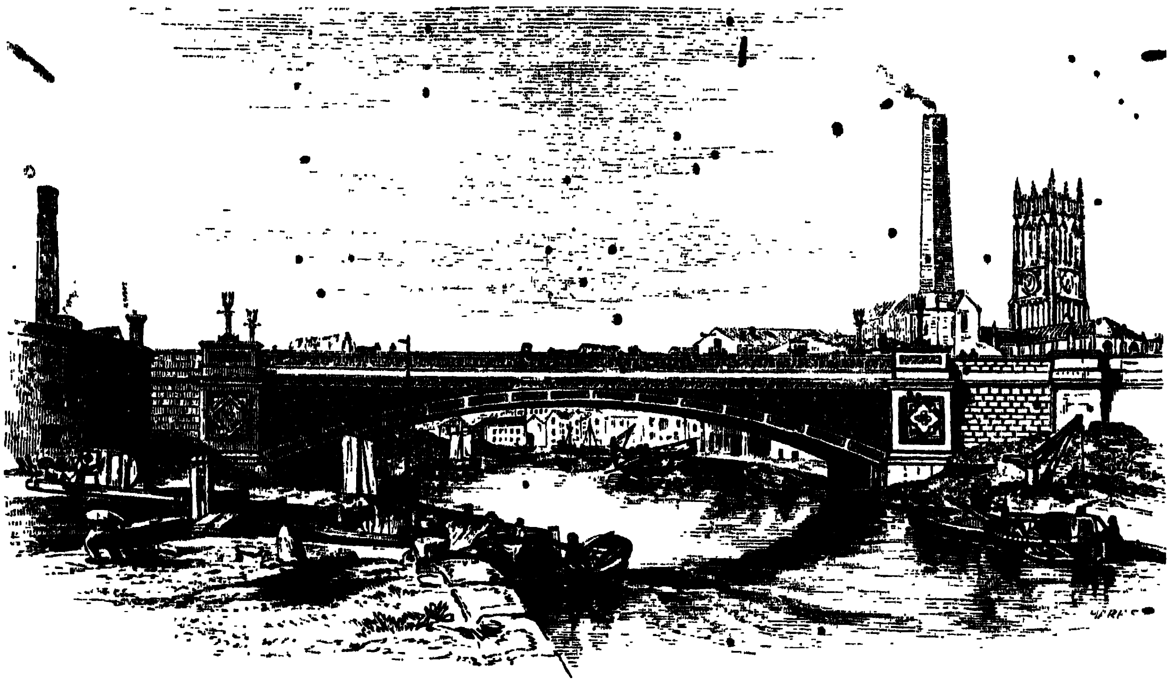
First pile for foundations driven May 1, 1841.

Bridge opened to the public, July, 1842.

Iron-work executed by Messrs. Booth & Co., Park Iron Works, Sheffield.

Masonry executed by Mr. James Bray, contractor, Moor Park, Harrogate.

Both the above models were made by Mr. Stephen Salter, Elvan Cottage, Hammersmith, London; carved by hand from crayon paper made into cardboard, and show (as nearly as can be done on so small a scale) the details of the iron-work, &c. (*Main Avenue West.*)



Leather's Cast-Iron Bridge over the Aire.

109 **Williams, Cadogan**, *Bridgend, Glamorganshire, Wales*—Inventor.

Models of machines for pressing, tearing, and clearing the surface of land; for grubbing; for breaking stones for roads; for working the surface of land and mixing manure with it; and for preparing land for planting sugar-canes in it.

Specimen of artificial stone for lining water-tanks and pools. Model of a filter. Models of pumps on a new principle.

Model of a new plan for raising weights, and propelling vessels, so that emigrants might assist to expedite their voyage.

Model of a plan for taking carriages over the Avon, and of a plan for making a footpath under the iron bar across the Bristol river, at Clifton, without interrupting its navigation.

Hints for fire-escapes, and removing soot from chimneys by an artificial current of air; for economising heat, and for boiling water by means of a current of air.

110 **Croggon & Co.**, 2 *Dowgate Hill, City*—Inventors.

Patent asphalte roofing felt, particularly applicable for warm climates. It is a non-conductor. It is portable, being packed in rolls, and not liable to damage in carriage. It effects a saving of half the timber usually required. It can be easily applied by any unpractised person. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small. The felt can be laid on from gable to gable, or across the roof from eaves to eaves. It is essential that it should be stretched tight and smooth—overlapping full one inch at the joinings, and closely nailed through the overlap, with twopenny fine clout nails (heated in a shovel, and thrown when hot, into grease, to prevent rust), about 1½ inches apart, but copper nails are preferable. The whole roof must have a good coating of coal tar and lime (about two gallons of the former to six pounds of the latter), well boiled together, kept constantly stirring while boiling, and put on hot with a common tar mop, and while it is soft some coarse sharp sand may be sifted over it. The coating must be renewed every fourth or fifth year, or more or less frequently, according to the climate. The gutters should be made of two folds, one over the other, cemented together with the boiling mixture.

Inodorous felt, for damp walls, and for damp floors, under carpets or floor-cloths.

Patent felted sheathing, for covering ships' bottoms, &c.

Dry hair felt, for covering steam-boilers, pipes, &c., preventing the radiation of heat, and saving 25 per cent. of fuel.

111 **Willett, Francis**, 5 *Edward Street, Portman Square*—Proprietor.

Models in timber and slate; in timber and glass; and in glass and iron; with diagram to show the principle of "Taaffe's patent" for the roofing of houses and other buildings.

Williams's patent locks, without a keyhole.

112 **Thompson, F. jun.**, C.E. *Water Works Chambers, Orange St., Leicester Square*—Inventor.

New apparatus for economising the consumption of gas, and increasing its powers of giving light; it may be attached to any existing gas fittings.

113 **Wilson, Thomas Hood**, *Twickenham*—Inventor.

Slides on a pair of folding doors, for excluding the wet and the cold from hall doors and shutters; also for hatchways and portholes of ships.

Invention for securing carriage gates and coach-house doors, being self-acting; stops and bolts for the same.

114 **Dobson, John**, *Newcastle-upon-Tyne*—Designer.

Model of the roof erected over the passenger shed of the Newcastle-on-Tyne Central Railway Station.

Model of a roof for Messrs. Smith's ship-building yard, St. Peter's, near Newcastle-on-Tyne.

Model of a rolling machine, designed by Mr. Thomas Charlton, used in rolling iron for the circular principals of the passenger-shed roof of the Central Railway Station.

Model of original design for the portico and arcades of the Central Railway Station.

115 **PRATT, HENRY**, *St. Swithin Street, Worcester*—Inventor.

Design of a mill and new power machine for variou purposes.

Wooden model of the building, with drawings and explanations.

---

116 **MCCLELLAND, D.**, 3 *Palace New Road, Lambeth*—Producer.

Model of roof of 100 feet span. Scale ¼ inch to a foot

---

117 **BARCLAY, JOHN**, *Tongue, by Goldspie, Scotland*—Designer and Inventor.

A portable pressing machine, designed for copying letters and for other purposes.

Model of a wooden float bridge and appendages; applicable to narrow straits or rivers in calm situations.

Mechanical time and tide tables, for ascertaining the number of days from any period in one year, to any other period in the same or following year; the day of the week or month; the state of the tide at any given port; the moon's age, &c.

---

118 **TUTTON, JOHN**, 20 *South Audley Street, Grosvenor Square*—Inventor and Patentee.

Models of patent improvements in the construction and arrangement of the window spaces of dwelling-houses. A window fitted up to combine a water-closet, a washhand-stand, and a dressing glass, representing, when shut, a neat piece of cabinet furniture.

A window fitted up as a knee-hole writing-table, with drawers, &c., for papers, which may be rendered fire-proof. The exterior has a sunk flower-box, with glass shade, applicable to different forms of windows.

---

119 **WALKER, E.**, *Cardington Street, Hampstead Road*—Inventor.

Patent wire window blinds.

119A **SMITH, J.**, 50 *Bartholomew Close*—Inventor.

Model of a door.

---

120 **EVERY, SIMON FREDERICK**, *Quorndon, near Derby*—Inventor and Manufacturer.

Patent Vulcan chimney-sweeper.

Circular and oblong chimney-sweeping machines. Oblong self-adjusting machine, for sweeping difficult chimneys.

Full-sized drawing, representing one of these machines in action.

---

121 **NEALE, W. J.**, 30 *Basinghall Street—Hon. Sec. to Chimney-sweeping Machinery Committee*—Producer.

Prize machinery for sweeping chimneys.

Prize plans and estimates for altering, at the least expense, in conformity with the Act of Parliament, difficult and awkward chimneys.

---

122 **ALLAN, JAMES**, sen., *Glasgow*—Manufacturer.

Portable apparatus for the manufacture of gas from resin, having a steam-boiler for the purpose of cooking food for cattle, heating conservatories, halls, &c.

Gas candelabrum of cast-iron with globes, adapted for vestibules, halls, &c.

---

123 **NESS, MARY**, 24 *Mold Green, Huddersfield*—Inventor.

Window-cleaner, for the protection of female servants from fatal accidents and public exposure, by enabling them to work from within the apartment.—Provisionally registered.

---

124 **HILL, ORMOND & JULIAN**, 37 *Great George Street, Westminster*—Improvers.

Modification of Dr. Arnott's ventilating curtain pump, arranged so as to be worked by a weight and to be portable.

---

125 **MACKENZIE, J. S.**, *Newark-upon-Trent*—Inventor.

The vulcan spring for closing doors, &c.

---

126 **MACKIE, WILLIAM**, 141 *Lower Bagot Street, Dublin*—Inventor.

Patent safety window fittings, which may be applied to old or new sashes.

---

127 **ROBERTS, B. E.**, 2 *Nelson Place, Clifton, near Bristol*—Inventor.

Newly-invented safety window-sash, to obviate the necessity of cleaning or painting the glass or frames, &c., on the outside of the house. The window sash may be taken out and again replaced in its air-tight groove with the usual beadings.

---

128 **WILLIAMS, L.**, 14 *Upper Marylebone Street, Portland Place*—Inventor and Manufacturer.

Man-help, made of iron, to hold a painter's brush to paint ships, houses, &c.

Registered concave-bottom tea-kettle and stand, of tin and copper, to boil water in five minutes.

Improved safety cot for children.

---

129 **BRAMHALL, THOMAS**, 1 *Union Street, St. George's Rd., Southwark*—Inventor and Manufacturer.

Iron and zinc plate machine—"the anti-boreas," an invention to assist the draught, and prevent the downward current in chimneys; intended to cure them of smoke.

---

130 **BROWN, ROGER**, *Sheffield, Yorkshire*—Designer and Manufacturer.

Model of magnetic lightning conductor (scale half size), with weather vane. Mounted upon a sectional model of a church spire, showing an improved mode of securing perfect and continuous insulation of the electric rod, without which a building is endangered.

The conductor at the apex of the spire has twenty-five quadrangular magnetic points, diverging at various angles, by which the sphere of their attractive influence is greatly multiplied; all lateral discharge is prevented, and the conductor prevents any accumulation over a vastly extended circuit, within which it exercises absolute control.

Five-pointed diverging magnetic conductor (full scale detached). Mounted upon an electric rod; intended for mansions, engines, chimneys, and general application.

---

131 **BAYLISS, T.**, 273 *Strand*—Inventor.

Specimens of fire escapes.

---

132 **HOLLAND, THOMAS**, 40 *South Audley Street*—Inventor.

Improved brass cock for kitchen boilers &c., giving out hot and cold water, and filling itself.

Shop front with improved shutters, adapted for sun-blind, sign-board, and other purposes.

Three-wheeled almanack.

---

133 **ENGLISH'S PATENT CAMPHINE COMPANY**, *Hull*—Producer.

Model of an apparatus for generating heat from bituminous substances, and for the prevention of smoke; applicable to furnaces, boilers, &c.: and for enabling railway locomotives to be driven by the use of small coal as well as they are by coke.

---

134 **BOOTH, GEORGE ROBINS**, 9 *Portland Place, Wandsworth Road*—Inventor and Manufacturer.

Vegetable gas apparatus, for lighting private buildings, public halls, &c. The novelty consists in the mode in which the apparatus is made and in the substances used for the production of the gas, in order to ensure greater cheapness and purity. It is stated that an apparatus for affording 50 lights for 24 hours would not require more fuel than a single spadeful of coke or cinders per hour. The gas may be used without injury to furniture, silks, books, pictures, or gilded ornaments.

137 **SAMPSON, THOMAS**, *Landore, near Swansea, Glamorganshire*—Inventor.

A high-pressure steam-boiler, with self-feeding apparatus and still, for generating steam and for chemical purposes in general.

The water is admitted into the boiler without pumping, by simply moving a hand, similar to the hand of a clock, one quarter of a revolution.

A retort for generating gas, or for chemical purposes, with a revolving agitator to keep the charge in motion.

A condenser for gas, so constructed that by opening one joint, the whole of the condensing surface is rendered visible, and is within reach, for the purposes of cleansing: the condensed liquor is discharged at five different pipes, so that five different qualities are produced by the same operation.

139 **VAUGHAN, WILLIAM**, *Maidstone*—Inventor.

Machine to facilitate the construction of marble, stone, slate, or other chimney-pieces by economising labour, and insuring accuracy in the work.

The present mode of adjusting the several pieces of a chimney-piece jamb, is, by the use of wooden gauges, prepared to the various dimensions required, and by squaring up the sides (inside-slip and outground) from the face of the jamb, then temporarily fixing them with square blocks against each outside, till the whole is secured with plaster of Paris and pieces of stone fixed inside the jamb. For every jamb the same operation has to be performed.

In this machine provision is made for constructing jambs, varying from 6 inches to 14½ inches in width, by moveable standards fitted accurately in the grooves of the brass plates which are fixed flush with the face of the slate. These standards render the use of a square unnecessary. The graduated plates supersede the necessity of a rule, and the triangular brass gauge not only dispenses with the use of all other gauges, but ensures great accuracy.

The transverse and longitudinal stops being fixed to the required heights above the top of the front of the jamb, and the ends of the side pieces being placed against them, exact provision is made for the depth of the capping and frieze to be afterwards fixed thereon.

For the construction of the jamb to the opposite hand, it is only necessary that the longitudinal stop should be placed as much below the centre line on the graduated plate as it now is above. The other part of the machine remaining unaltered, both jambs will necessarily have the same form and dimensions.

When several chimney-pieces of the same dimensions are required (a common circumstance), the whole number of jambs may be put together without moving any other part of the machine than the longitudinal stop once; thus ensuring, not only the same form in them all, but effecting an important saving of time.

The box gauge, which may be applied to any width of chimney jamb fitted within the standards, presses the inside-slip and outground against the standards, thus preventing any derangement of the several pieces, whilst they are being fixed together with pieces of stone and plaster of Paris.

140 **FARRELL, ISAAC**, 210 *Great Brunswick Street, Dublin*—Manufacturer.

Model of a registered circular window.

141 **HARPER, THOMAS**, 15 *Upper Seymour Street West*—Inventor.

Model of a window, designed to serve as an entrance to a garden or pleasure ground; presented to the Royal Dublin Society by the exhibitor.

142 **M'NEILL, F., & Co.**, *Bunhill Row, Finsbury*—Manufacturers.

Specimen of the mode of applying waterproof bituminous felt for lining damp walls.

Pattern of a frame and covering of asphalted felt for gardeners' forcing-pits, to protect plants from frost, as a substitute for Russia mats.

Specimen of patent asphalted roofing felt; composed of mixture of flax and hair, saturated with mineral bitumens, and finished by machinery.

Samples of the asphalted felt in various stages of manufacture, and in application to various useful purposes.

Specimens of patent thin ship sheathing felt, for use under copper. Sample of a thicker description used under wood sheathing.

Samples of very thick hair felt, for clothing the boilers, pipes, and cylinders of steam-engines. The same, principally used by builders for deadening sound in thin partitions, under floors, for placing under slate, zinc, or lead flats to top rooms of houses. Section of roof, illustrating the economical construction of wood-work for the application of the asphalte roofing felt.

143 **ROCK, J., jun.**, *Hastings, Sussex*—Inventor.

Model of a street barricade.

144 **ANDERSON, GEORGE**, *Rothbury, Northumberland*—Inventor and Manufacturer.

Model of an improved window. The sashes are so constructed that by lifting the bottom sash up the top one will come down. The outside shutters to slide behind the stone or brickwork, and the inside to slide on the floor, and behind the architrave. The roller for sun-blind to be hid, and work up and down with one cord.

145 **LOWE, GEORGE GREGORY**, 2 *High Street, Portland Town*—Inventor.

Self-cleansing sanitary cistern. By affording facility for the rapid and entire discharge of its contents, this invention proposes to prevent the accumulation of filth and sediment in house cisterns; and, by conducting the waste and discharge pipes into the house drain, both to preclude local dampness arising from overflow, and effectually to cleanse the latter by constant flushing.

Though the cylindrical form of cistern with a conical base is, in all cases, preferable, the principle of this invention is equally applicable to any other form which may be topically convenient, and to any material used in the construction of cisterns.

46 **QUINCEY, HARCOURT**, 82 *Hatton Garden*—Inventor and Patentee.

Working model of two revolving iron safety shutters, with patent convex laths (one fixed above and one under the window), with improved gearing; and of a patent corrugated office blind of perforated metal. Brass model of dwarf Venetian blind, with patent convex perforated laths.

Registered ornamental and self-supplying pedestal coal case, presenting for use only sufficient coals to charge the hand scoop, when a fresh supply is given from the upper chamber. Patent hand lamp, for burning solar or common oil; and table lamp, for burning solar or common oils, with patented folded shade. Plaster model of a fireplace in Buckingham Palace.

147 **THEOBALD, JOHN**, 21 *Brunswick Street, Blackfriars Road*—Inventor.

Improved window-sash, capable of being cleaned from the inside, with prevention against thieves, an alarum, and a fire-escape.

148 **WALBY, JAMES**, 59 *Greek Street, Soho Square*—Inventor.

Universal fire-escape.

The novelty of the plan is stated to be that of passing persons from the window of the house on fire to the near window of the neighbour's house adjoining, in a direct horizontal line, right or left, in lieu of lowering them down as in the ordinary way. This is accomplished by having bracket-hooks of a peculiar construction, projecting about 12 inches from the face of the brickwork, permanently fixed to the front of the house at the uppermost floor, by passing the end or stem of the hook through the brickwork, and screwing it up tight by plates and nuts inside. By the assistance of the neighbour at the adjoining window, a rope is attached to the hooks; a basket or cradle (which traverses upon a friction-roller) is then hung upon the rope, which, by the person therein placed, or by a person at the adjoining window, with the assistance of a hook stick provided for the purpose, may be moved forwards or backwards as the case demands.

150 **IRISH ENGINEERING COMPANY**, *London Office, 11 John Street, Adelphi*—Producer.

Finch and Willey's patent safety railway wheel. The peculiarity of this wheel consists in the rim of the skeleton or inner wheel being firmly imbedded in a dovetailed recess in the tire, throughout its whole circumference, rendering all other fastening, as bolts, &c., unnecessary, and preventing the possibility of accident from the breakage or throwing off of the tire. The tire can also be worn much thinner than ordinary.

151 **ALLEN, T.**, *Clifton, near Bristol*—Inventor and Manufacturer.

Model of registered iron roof, scale of 2 inches to 1 foot, with drawing, showing the principle applied to a roof of 60 feet span, fire proof, with iron battens, and new mode of securing the slates.

152 **BUNNETT, JOSEPH & CO.**, 26 *Lombard Street, City, and Deptford, Kent*—Inventors, Patentees, and Manufacturers.

New patent curvilinear lathe-revolving iron safety-shutters. The same in principle as Bunnett's original patent iron shutters.

Ornamental brass window, formed of patent brass sash bars and mouldings.

Patent ventilating sashes, for admitting fresh air into a room, without creating draughts.

Patent brass and other metal sash-bars and mouldings.

Improved joiners' bench cramp.

Improved flooring cramp.

Patent self-acting doubly-trapped water-closet; which, without cistern, may take its supply of water from any source at a sufficient elevation, or may be laid directly on to the main (if always charged).

Patent improved ship's water-closet, for use below the water line, which may be fixed with or without a cistern.

Patent improved ship's water-closet, for use above the water line, which may draw its supply of water from the sea by a double-action pump, or may be used with a cistern.

Patent self-acting effluvia-traps for sewers, drains, &c.

155 **TROTMAN, SANDERS**, *Clarendon Road, Notting-hill*—Inventor and Manufacturer.

Fountain for drawing and dining rooms, or boudoirs; requiring no supply laid on, or waste carried off, mechanical pressure forcing the water through the jet, which again falls into the reservoir, with the addition of a musical arrangement.

Night dial. A lamp is suspended upon a lever, the light from which is thrown upon each hour as it arrives.

Printing on glass for ornamental purposes, such as glazing conservatories, windows, &c., and for philosophical purposes, such as dissolving views, &c. Coloured printing on glass.

156 **WHYTOCK, ANDREW**, 494 *New Oxford Street*—Manufacturer.

Model of emigrants' house, about one-fourth full size, made of Morewood and Rogers' patent galvanised tinned iron, corrugated.

The full size weighs about half a ton, and can be packed in two cases. When once seen put together, it may be erected by two persons in as many days.

Furniture of the house, made chiefly of the same material.

Table and chairs with camp legs.

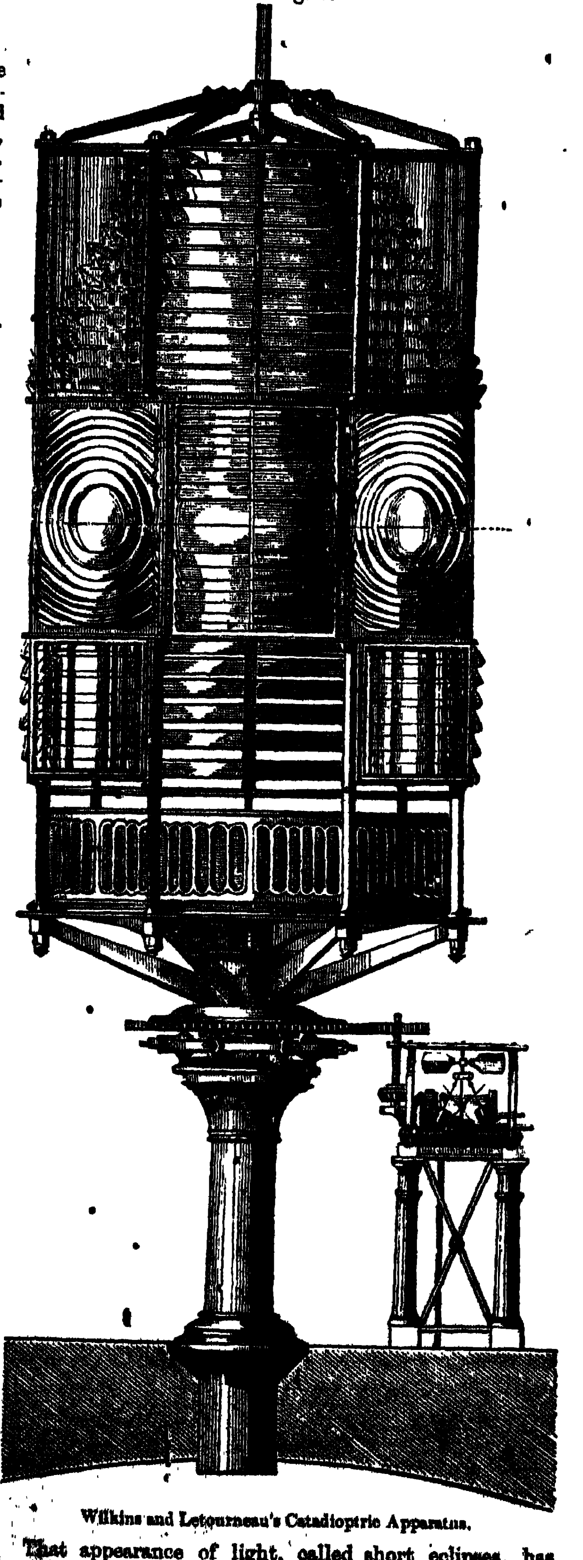
Bath, answering the purpose of a sofa, or a bedstead, which can be solid[illegible]

Stove for warmi[illegible]

157 **WILKINS, WILLIAM CRANE**, 24 *Long Acre, and* **T. LETOURNEAU**, 37 *Allée des Veuves, Paris*—Inventors and Manufacturers.

Improved patent revolving catadioptric apparatus of short eclipses, for a lighthouse of the first class. Represented in fig. 1.

Fig. 1.



Wilkins and Letourneau's Catadioptric Apparatus.

That appearance of light, called short eclipses, has hitherto been obtained by the following arrangements:—

An apparatus for a fixed light being provided, composed of a central cylinder and two zones of catadioptric rings, forming a cupola and lower part, a certain number of lenses are arranged at equal distances from each other, placed upon an exterior moveable frame, making its revolution around the apparatus in a given period. These lenses, composed of vertical prisms, are of the same altitude as the cylinder, and the radius of their curves is in opposite directions to those of the cylinder, in such a manner that at their passing they converge into a parallel pencil of light; all the divergent rays, emitted horizontally from the cylinder, producing a brilliant effect, like that obtained by the use of annular lenses at the revolving lighthouses.

The first improvement exhibited has a special reference to the light, and produces a considerable increase in its power, whilst the simplicity of the optical arrangements is also regarded. It consists, firstly, in completely dispensing with the moveable central cylindrical lenses. Secondly, it replaces these by a single revolving cylinder, composed of four annular lenses, and four lenses of a fixed light introduced between them; but the number of each varying according to the succession of flashes to be produced in the period of revolution.

The second improvement, of which already some applications that have been made serve to show the importance, consists in a new method of arranging the revolving part, experience having shown that the arrangements at present in use are very faulty. A short time is sufficient for the action of the friction rollers, revolving on two parallel planes, to produce, by a succession of cuttings, a sufficiently deep groove to destroy the regularity of the rotatory movement. To obviate this great inconvenience, the friction rollers are so placed and fitted on an iron axis, with regulating screws and traversing between two bevilled surfaces, that when an indentation is made in one place, they can be adjusted to another part of the plates which is not so worn.

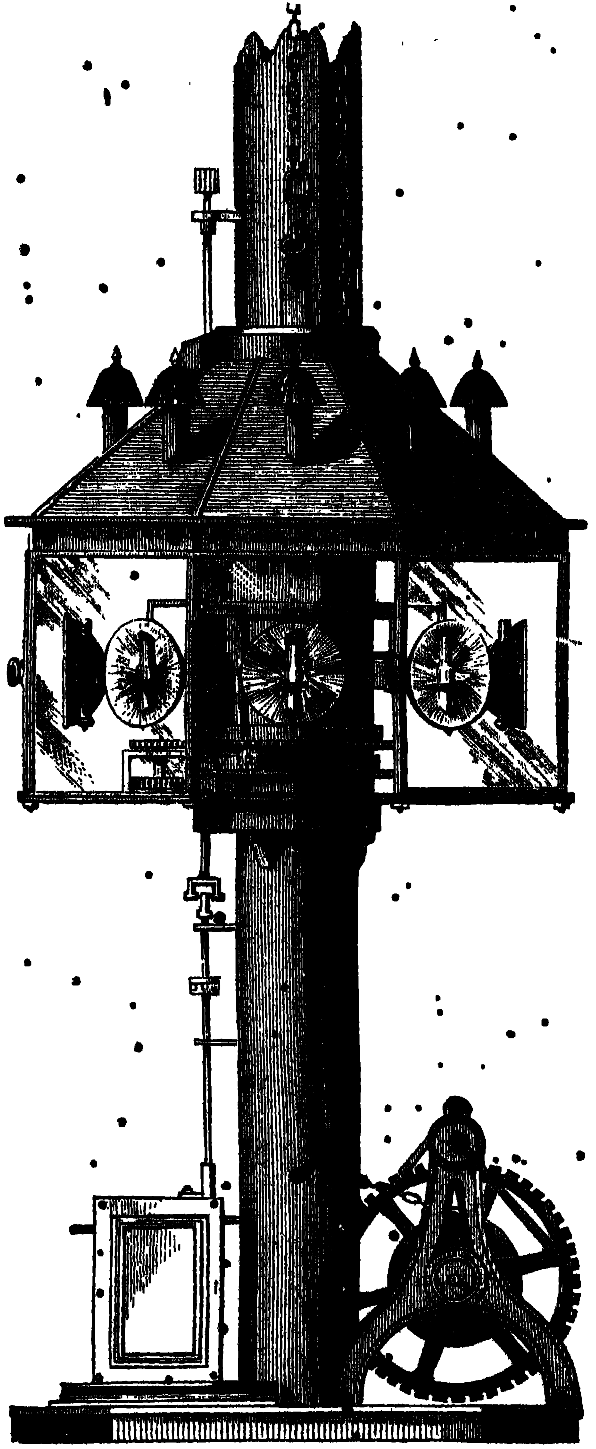
The third improvement produces the result of an increase of the power of the flashes in revolving lighthouse apparatus, to double what has been obtained hitherto. By means of lenses of vertical prisms, placed in the prolongations of the central annular lenses, the divergent rays emerging from the catadioptric zone are brought into a straight line, and a coincidence of the three flashes is obtained.

The whole of the prisms, lenses, and zones are mounted with strength and simplicity, accurately ground and polished to the correct curves, according to their respective positions, so as to properly develop this beautiful system of "Fresnel." The glass of which they are composed is of the clearest crystal colour, and free from that green hue which so materially reduces the power of the light, and is considered objectionable for apparatus of this kind. The lamp, by which the apparatus is to be lighted, consists of a concentric burner with four circular wicks, attached to a lamp of simple construction, the oil being forced up to the burner by atmospheric pressure only, so that there are no delicate pumps or machinery to become deranged.

Improved lantern and revolving apparatus for a light-vessel, represented in fig. 2. The principal improvement consists, in constructing the machinery to work beneath the deck, instead of in the lantern as formerly. A vertical rod, working in metal bearings, is attached to the mast, with a large gun-metal pinion fixed to the top of the rod, at the height to which it is necessary to hoist the lantern, wherein a train of cog-wheels are placed to connect with the pinion, and communicate the motion obtained therefrom to the traversing apparatus that supports the lamps and reflectors. The advantages of this arrangement are, that the lanterns can be made much lighter, the rolling of the vessel caused by so great a weight at the mast-head is greatly diminished, and the machinery being more under control and better protected, works with greater regularity and precision.

An idea of the utility of these improvements may be gained by reflecting that the situations in which the light-vessels are placed, are at all times difficult of access, and in stormy weather, when accidents are most likely to occur, quite unapproachable; so that it will be obvious any alteration which reduces the liability to derangement is greatly to be appreciated.

Fig. 2.



Wilkins and Letourneau's Lantern.

There is also an advantage derived from the novel construction of the lamps and gimbal work which, by a movement, exactly coinciding with the motion of the vessel, causes a perfect level to be always maintained, and ensures the proper flow of oil to the burners, however irregular that motion may be. This improvement is not of so recent an introduction as the former, but when it was first invented by one of the exhibitors it produced a complete revolution in the apparatus for floating lights, and enabled the beautiful Argand lamps, with parabolic reflectors, to be used instead of the old lamps with smoky flat wicks. (*Main Avenue.*)

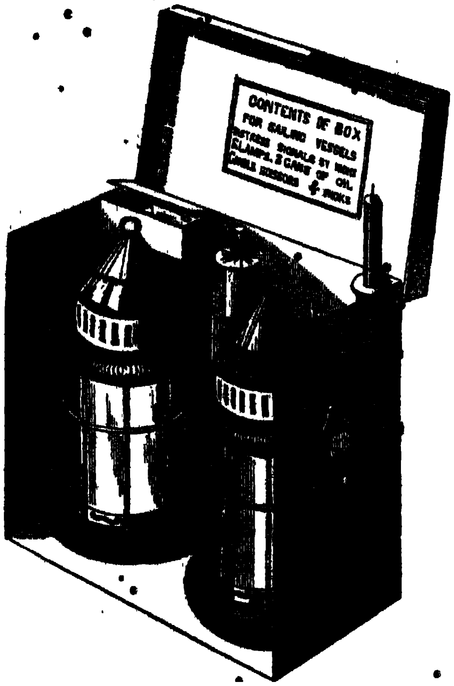
158 **COCHRANE, A.**, 17 *Bryanstone Street, Bryanstone Square*—Inventor.

Patent lock, to be entitled the "Catch-key Lock." When a picklock, or false key, or even when the real key is introduced into the lock, it is immediately caught and cannot be released except by the owner.

Smoke condenser, air conductor, and animal food and vegetable preserver by means of a machine or apparatus.

159 **RETTIE, ROBERT**, *Edinburgh*—Inventor.

Inventions for use at sea, consisting of lamps, lights, lighthouse apparatus, reflectors, signals, life-boats, fire extinguisher, breakwater, &c. The following cut represents the marine signals.



Rettie's Patent Marine Signals, &c.

Inventions for use in mines, railways, towns, and houses, consisting of safety lamps, "corves" or cages, shields, ropes, and traps; signals, fog, day, &c. Ventilating apparatus; sewer and effluvia traps; portable closet, glazed-jointed pipes, &c.

Stoves for heating large buildings, ramoneurs, smoke-preventers, vegetable-steamers, bottling cranes, fire-protectors, &c.

160 **KING, WILLIAM**, *Woodstock Street, Bond Street*—Inventor and Manufacturer.

Section of a model of a floating breakwater for a harbour of refuge. Scale 3-8ths of an inch to the foot.

Section of a model for a foundation of a lighthouse, or place of refuge, on the Goodwin Sands. Scale 3-8ths of an inch to the foot.

162. **PERKES, S., & CO.**, *Emerson Street, Southwark Bridge*—Producers.

Bearers for principal beams in buildings. Models of patent combination bridges, &c.

163 **ROVERE, FELIX PAULIN**, C.E., 2 *New Inn, St. Clement's*—Designer.

Design for a wrought-iron girder bridge at Westminster; consisting of a combination of wrought and cast iron girders, to allow of the maximum water headway, the site of the present bridge being preserved.

164 **MAPLIN, —** Producer.

Model of a lighthouse, from designs by Messrs. Walker and Burgess, founded on Mitchell's screw piles. (In Locomotive Passage.)

165 **SMITH, WILLIAM HENRY**, 1 *Royal Exchange Buildings*—Inventor.

Recoil breakwater, with drawings—the principle of which is applicable to harbours, groynes, coffer-dams, clearing away of shoals, protection of the shore from sea encroachments, piers, landing places, &c.

This breakwater is moored by lewising bolts, mushroom anchors, screw or atmospheric piles, or Smith's anchor pile. If a ship runs foul of any part, she will strike a yielding buttress, the braces of which are equal to a dozen cables: all injurious shock is converted into a steady downward pressure. The structure is in separate lengths, each having an independent spring.

Lighthouse breakwater—applicable to beacons and marine batteries, in all situations.

Tubular suspension girder bridge, designed to prevent vibratory action: adapted for railways.

Plan for a suspension tunnel.

166 **FOX & BARRETT**, *Thames Chambers*, 12 *George Street, Adelphi*—Proprietors.

Specimens of patent fire-proof flooring or roofing.

169 **NASMYTH, G.**, 7 *Park Road, Kensington*—Inventor and Patentee.

Two models of wrought-iron girders; a small quantity of materials being used, combined so as to sustain the greatest weight. (*With Classes* 5 *and* 6.)

170 **NEWNHAM, THOMAS GARRETT**, *Newtown, Montgomeryshire, Wales*—Architect and Inventor.

Model, to a scale of one inch and a half to the foot, of a portion of the roof of a church in course of erection at Dolfor, near Newtown.

Model, to a scale of one inch to the foot, of open roof, constructed with ribs of terra cotta, supporting rafters and slating battens, similar to the former.

Model, to a scale of from one-half to one-third full size, of stone, or of terra cotta, mullioned windows, with sliding sashes.

171 **YOUNG, J.**, *Gas Works, Selkirk, Scotland*—Inventor.

Model of coal-gas apparatus, with set of retorts, washer, purifiers, valves, condenser, and gas-holders, constructed on a new arrangement, and adapted for a provincial town. The condensers and purifier can be cleaned out whilst in operation.

172 **METROPOLITAN ASSOCIATION FOR IMPROVING THE DWELLINGS OF THE INDUSTRIOUS CLASSES. CHARLES GATLIFF**, Sec., 19 *Coleman Street*; **WILLIAM BECK**, Architect, 33 *Finsbury Square*.

Model dwellings for artizans, in Albert Street, Mile End New Town, erected by the exhibitors.

173 **MACKRORY, F.**, 4 *Milton Terrace, Vauxhall Bridge Road, Pimlico*—Inventor and Manufacturer.

Newly-invented window to prevent the entrance of dust and wet, and the noise caused by the wind.

174 **NIXON, THOMAS**, *Kettering*—Inventor, Manufacturer, and Designer.

Registered design for a self-ventilating garden-light, or sky-light, which can be made water-tight.

175 **REMINGTON, ANNE**, 138 *Sloane Street, Chelsea*—Inventor.

Improved roasting apparatus, with self-acting baster and heat reflector.

176 HOLMES, JAMES, *East Ham, Essex*—Designer.

Two cottages in one, designed for the convenience, economy, and comfort of the poorer class of labourers.

177 FREEMAN, J., 19 *Artillery Place, Finsbury*—Producer.

Model of the railway-bridge, crossing Westminster bridge road. (South Western Railway.)

178 MOORSOM, W. S., Captain, 17½ *Great George Street, Westminster*—Designer and Superintendent.

Prize design for the great bridge over the Rhine, proposed by Prussian Government to be erected at Cologne. The Piers are to be of stone, and the arches of wrought iron.

Length of the bridge and approaches	2,015 feet.
Span of each of the large arches	600
Span of the lifting-arch	100
Height from foundation to top of towers	147
Height from water to underside of arches	44
Height from water to underside of lifting-arch when raised	97
Width of the bridge (inside the parapets)	60
Strength of each arch to bear, if distributed over it	5,700 tons.
Cost, if erected by contract at Prussian prices, as arranged with a Prussian manufacturer	£236,000

(If erected at English prices, about one-fifth less).

The principle of this bridge is that of the trellis or lattice beam combined with the arch.

The arrangement of the cross bracing is novel and peculiar, and affords separate spaces for the great highway, the railway, and the footway.

The lifting-arch is to be worked by water power; the water being contained in tanks on the tops of the towers, and being elevated to those positions by tide-wheels of peculiar construction, placed below the possibility of contact with ice, and worked by the river current.

The arches are believed to be the largest in the world, proposed of rigid construction (not suspension), and calculated for the passage of locomotive engines at speed, and of artillery at the gallop.

Railway viaduct over the river Nore, near Kilkenny, Ireland.

The arch is constructed of timber, and the piers of stone.

Length of the bridge and approaches	428 feet.
Span of arch	200 ,,
Height above foundations	85 ,,
Width at the level of the rails	26 ,,
Strength of the arch, to bear, if distributed over it	600 tons.
Cost, complete	£8,100

This is believed to be the largest work of the kind in the United Kingdom.

180 ROSE, JOHN THOMAS, *Regent Street, Leith*—Designer.

Design for a timber viaduct of great span, suitable for railway or other purposes. Its object is to unite great strength with simplicity; the beams forming it, are interwoven like basket-work, and the greater the stress thrown upon it, the more rigid it becomes. The same principle may be adapted to large roofs without the use of cross-ties, since the outward thrust upon the walls would be but small.

Supplementary model illustrating the principle.

181 MACLACHLAN, JOHN, *Douglas, Isle of Man*—Inventor.

Model of a house, and plans for purifying towns, destroying putrescence, affording economical means of removing manures (inoffensively) by rail; and precluding the necessity of cleansing drains, &c.

182 DANIELL, WILLIAM, *Truro*—Inventor.

Fire-escape, consisting of a rope-ladder wound about a reel contained in the window-seat, or in a box fixed inside a window, to be thrown out, and the lower end secured by a bystander.

183 BERGIN, MARMADUKE OSBORN, 8 *George Street, Cork, Ireland*—Inventor.

Working model of a registered self-acting fire extinguisher, applicable to smouldering fires, to machinery liable to ignition by friction, to spontaneous combustibles, and to highly inflammable substances.

184 HENDY, JAMES, 1 *Bouverie Street, Fleet Street*—Inventor.

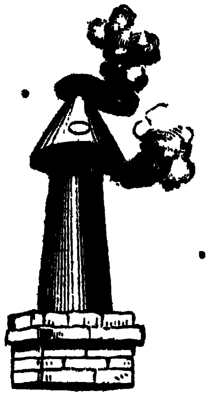
Model for a new national fire-escape; its object is simplicity of arrangement and rapidity of motion.

185 WEBSTER, W. BULLOCK, 2 *St. James's Place, Hampstead Road*—Inventor and Manufacturer.

Model of a fire-escape, available for a long range or block of houses of different heights.

186 GREEN, ISAAC, 3 *Vittoria Place, Euston Square*—Inventor.

Wind-guards for chimney tops, to cure smoke. The following cut represents this apparatus, and is intended to illustrate its method of action:



Green's Wind-guard.

187 NUNN, ALICIA, 2A *Welbeck Street, Cavendish Square*—Producer.

New apparatus and method of diffusing heat and equalising the temperature of apartments, and disseminating the warmth from one ordinary fire into several apartments. Applicable to residences, warehouses, railway and other carriages, and for safety on ship-board.

188 WILSON, THOMAS HOOD, *Twickenham*—Inventor.

Slides on a pair of folding doors, for excluding the wet and the cold from hall doors and shutters; also for hatchways and port-holes of ships.

Invention for securing carriage gates and coach-house doors, being self-acting; stops and bolts for the same.

190 MUDGE, JOHN, 78 *Tottenham Court Road*—Inventor.

Private fire-escape, the machinery so constructed as to be fixed to any part of the house, and worked from the street as well as in the room.

191 BEESTON, J., *Swaile's Cottages, Hammersmith*—Inventor.

Wind-guard for chimney tops.

192 ADCOCK, THOMAS, jun., *Penkridge, Staffordshire*—Inventor.

Simultaneous gates for railway crossings. Exhibited for safety, economy, and despatch. They are intended to supersede the present wood gates, as the ironwork to the heels will show; for new iron gates, the heels would be in one length, everything being in accordance. The posts are intended to be of cast iron, the supports fixed upon blocks of stone 4 feet square, by 12 or 15 inches thick, and set upon a bed of brickwork, as shown. The small iron doors over the same, are intended to be opened occasionally for the purpose of filling the reservoir with oil, and for adjusting the rods by means of the nuts and screws, and also for taking out the wheel if necessary: all this is done in a very short time. The rods are all pulling rods, and the rollers under, revolve; the gate with the bolt attached is the leading one, being nearest the station house. The bolt on this gate is so contrived that it will secure or liberate all the four large gates at once: to open them, the bolt is raised out of the groove of a spindle, to which is attached a wire, running across the road close under the rails, in a groove an inch wide, to the lever on the opposite side, which immediately drops just below the surface of the road, so that there is no stumbling-block. On closing the gates, the bolt slides into the groove of the spindle, and by turning it to its proper position, it raises the bolt on the opposite side, and the self-acting catch secures all the four large gates. This saves time and trouble in crossing the line to unbolt them, and they are more secure. The wheels, &c., are merely cased with rough boarding; or brick on edge may be used. The oak cases to rods are represented as being fixed upon brickwork; the wire may be protected by an iron plate laid over it. The machinery for skew gates would be the same, with the exception of two of the wheels, which would be smaller.

193 **STUCKEY, W.**, *Mitre Chambers, Fenchurch Street*—Inventor.

Four-wheeled carriage crane, for transporting and raising merchandize to a given height; also forming a portable scaffold for decorating the interior and exterior of large buildings; it will also serve for a fire-escape.

---

194 **TAYLOR, HENRY**, 6 *John Street West, Barnsbury Road, Islington*—Inventor.

Machine for sweeping chimneys.

---

195 **WILSON & WOODFIN**, *Hull*—Inventors and Manufacturers.

Various double traps and gratings for drains.

196 **HOOPER, WILLIAM H.**, 12 *Great Cumberland Place, Hyde Park*—Inventor.

Model section of a rotary floating breakwater, formed of a double line of rollers, and a strong centre roller placed horizontally, inserted in an open frame, circular convex ends, the whole revolving upon its axis. The sections are to be moored at each end in a continuous line, so as to form a floating barrier to the force of the waves.

Model of an improved omnibus: the improvement upon those now in use, consisting in a few inches extra width, circular ends, nearly central side doors, set in as far as the width of the seats will admit (to avoid obstructing foot passengers), with fenders on each side the steps; a small umbrella-stand in the centre, with a strong ring top, convenient to hold by getting in; also a raised top to roof for seats, with ventilators let in all round it, and suitable steps and rails to reach the roof seats; a small window or trap at the end to speak to the conductor.

---

197 **BAIN, WILLIAM**, 141 *High Holborn*—Inventor.

A contrivance for rendering buildings fire-proof. A main-pipe, supplied with water on the high pressure system, is carried up one corner of the building, communicating with smaller pipes running between the joists of every floor, the small hose and pipe attached to the main being always ready for use, in case of fire occurring in any part of the building.

[The mains which supply a town with water should be kept constantly full, and under such pressure that, upon opening a cock in the street, the water may be conducted by means of hose over the highest houses, and applied to any fire that may occur. Pipes or hose permanently fixed through a building, from which water may be taken at any time, would probably be advantageous.]

Machine for saving life and property from shipwreck on the coast. The model is on the scale of half an inch to the foot; it represents a platform resting on piles driven into the ground, with the machine and its accompaniments, covered with a tent, which may be closed or open when necessary. The machine is a double lift; the upper drum works a cable to tug any disabled vessel to shore; the lower drum works a constant communication with the wreck. The means of first communication is by firing a shot from the gun, attached to a line, the line being secured to the blocks which are worked by the cables of the machine; the gallery and flag-staff are for observation and signals. The table on which the machine is built may be turned to any point of the compass.

[The first apparatus for saving lives from shipwreck was invented by Captain Manby. A wooden plug, instead of an iron shot, fired from the gun has been found of advantage, as in the case of the schooner "Nanteos," off Carmarthen, 23rd February, 1851, &c. By means of this simple apparatus the safety of the ship was secured together with that of her crew.—S. C.]

Floatable life-preserving cape cloak; blue cloth cloak, braided with the emblematical design of the rose, thistle, and shamrock, and lined with quilted satin; the inner lining is composed of pieces of cork, so arranged that when in the water it forms a floating body of great buoyancy by which the wearer is preserved on the surface.

198 **BOULANGER, CHARLES THOMAS**, *Alice Street, Bermondsey New Road*—Inventor.

A fumigator, with refrigerator or cooler, applicable to the destruction of insects in tender plants, in animals, and in houses; also to bleaching substances requiring the vapours of sulphur, and to administering vapour or aromatic baths at a small cost.

The fumes of tobacco, used in fumigating, are cooled by being passed through the cooler, so that they do not injure the tender plants. Patented.

---

199 **INGLIS, ALEXANDER**, *Park Street, South Shields, Durham*—Inventor.

Model of a ventilating machine.

201 **JACKSON, HENRY**, 62 *Westbourn Street, Pimlico*—Inventor and Manufacturer.

Fire-escape dressing-table, intended to be always ready and in instant motion, without the least preparation, and to be drawn up from above or below as many times as there are persons to be rescued. The first motion of raising the table-top opens the window, and lets down iron blinds to any number of lower windows.

202 **BROWN, JOSEPH**, 71 *Leadenhall Street*—Inventor and Manufacturer.

Model of a navigable balloon, to ascend and descend in the air without the aid of ballast.

203 **FRIARSON, MARK**, 20 *Westbourne Park Road, Paddington*—Inventor.

Registered ventilating shield cowl, for the prevention of smoky chimneys.

204 **DUNN, MATTHIAS**, *Newcastle-upon-Tyne*—Inventor.

Fire-escape, consisting of a web of cloth affixed to a wooden pole, and attached to the window sill.

205 **HEARDER, J. H.**, 34 *George Street, Plymouth*—Inventor.

Rarefying apparatus, for producing a draught in the underground flues of stoves or ventilating shafts, &c.

206 **LAMB, JAMES**, *Nile Street, Sunderland*—Inventor.

Model of a tubular gas apparatus for heating baths. It is stated that by means of this apparatus 32 gallons of water, at 43°, may be heated to 100° in 35 minutes, with the consumption of 25 cubic feet of gas.

215 **TAYLOR, J. W.**, Rear Admiral—Producer.

Models of patent breakwater; life and anchor boats.

216 **STAFFORD, DANIEL**, 3 *Sloane Terrace, Sloane Street, Chelsea.*

Interceptor cowl: an apparatus attached to the cowl of a chimney.

The interceptor is made air-tight at each angle and at the bottom, so as to prevent the cold air, received at the apertures, from entering immediately into the flue or chimney, and from taking a downward or cross direction, instead of being reflected upwards, as is the case from the application and construction of the interceptor.

A second interceptor is placed at a short distance above the one already described, giving the air a more powerful and direct upward current, and at the same time forming an efficient resistance and protection against all descending gusts of wind.

The external form or shape of the cowl may be varied to suit the architectural uniformity of any building.

217 **TEAGLE, R. & W.**, *Chelsea*—Inventors.

Patent chimney-sweeping apparatus.

In Main Avenue West

220 **WYATT & BRANDON.**

Model of the new County Assize Courts, at Cambridge; erected by the exhibitors.

---

221 **SCOTT, G. G.**

Model of St. Nicholas Church, Hamburg.

222 **JEE, A. S.**

Model of the Dinting Vale viaduct, on the Sheffield and Manchester Railway.

223 **WILLOCK, E. P. & Co.**, *Manchester.*

Model of a decorated Gothic church, at Lever Bridge, Bolton, Lancashire; designed by E. Sharpe.

224 **WALKER & BURGESS.**

Railway-bridge across the Ouse.

Also 9, 19, 26, 28, 38, 105, 106, 107, and 157.

334 **BROWN, Sir SAMUEL**, R.N., *Vanbrugh Lodge, Blackheath*—Inventor.

Iron cables invented and introduced into the Royal Navy by Captain Sir Samuel Brown, R.N., K.H., in 1810.

Nos. 1 and 2. Patterns of the twisted and plain parallel-sided chains, the iron 1¼ inch diameter without stay-pins, which was proposed by the exhibitor to the Admiralty as a substitute for hempen cables in 1810. The twisted chain was preferred by the Board for this purpose, by reason of its resemblance to the strands of a rope, and on that account supposed to be more easily managed as a working cable.

No. 3 is a single link of the same dimensions, with a short scarf ready for welding in the end: this, which was practised in all the Royal Dockyards, and by all the chain-makers in the country, was radically bad, because the weld is inevitably the weakest part; was subjected to a transverse strain at the point of resistance, where a small defect was more detrimental than any other part; the inventor therefore adopted the plan of forming the weld in the direction of its length in the side, where the strain is equally divided.

No. 4 is a single link showing the long scarf in the side ready for welding, as above mentioned.

Origin of the Stay-pins.—When the chain-cables were first brought into use (which was in the Navy) there was no means of testing their strength, and two ships, the "Pique," 38-gun frigate, and the "Pylades," sloop-of-war, having both parted their cables in a heavy gale and sea, it was found that the links, in the technical phrase, had drawn in the strain. The inventor of the iron cables thereupon devised a powerful compound lever-machine for testing all cables to a given strain. The first cable to be tested was a twisted cable, welded in the side with long double scarp, but without stay-pins, 2¼ inches diameter, against a piece of new 24-inch cable, which was the largest size made; the cable and the chain were shackled together, so that the strain was reciprocal. The trial took place at the manufactory in Shadwell, in July, 1810, in the presence of Lord Melville, First Lord of the Admiralty; Sir J. B. Thompson, Comptroller of the Navy Board; the Chancellor of the Exchequer, Mr. Vansittart; the Surveyor and Commissioners of the Navy, and several Naval Captains. In the course of the trial, as the hempen cable continued to stretch, and the chain to collapse, the machine was at that time stopped; and then three wrought-iron pins similar to those shown in No. 5 were inserted in the middle of the links: the process recommenced, and the pins were in a short time set fast. Four hours had been occupied in this interesting experiment, when the hempen cable began to give way, and was ultimately broken in the direction of its length with a force of 84 tons; no fracture had taken place in the iron cable, and the links which had been distended with the pins preserved their shape; but all the others had collapsed and become perfectly rigid, and, of course, totally useless. The improvements thus introduced in the construction of the iron cables, and the system of testing, were of infinitely more importance than the original invention, and which were all carried into effect in 1810, two years before any other chain-cable manufactory was in existence.

No. 5. Pattern of the parallel-sided chain, proposed by the inventor to supersede the twisted cables in 1812. The first cable was supplied to His Majesty's frigate "Crescent" in that year, which, being favourably reported on, he received directions from the Admiralty to prepare a schedule, in conjunction with Mr. Goodrich, mechanical engineer at the Royal Dockyard, Portsmouth, of the form and dimensions of chain-cables, which, with very little modification, is at present the standard for all classes. The chain cables, which are of oval shape, are susceptible of still further improvements, for it has been observed, in the course of an extensive practice, that, in testing chains to prove the quality of the iron, links gradually collapse, and that the rupture does not take place till the sides are drawn nearly into contact; it therefore occurred to the inventor that the inverted oval link, No. 7, as approximating in some degree to this ultimate form of resistance, was stronger, inasmuch as the present distended oval link is a departure from it; and there can be no doubt that, as the convex links fit more uniformly to the cylindrical bells or windlass, they would work smooth, and with less jolting in veering.

[It was this invention of Capt. Brown which first rendered the knowledge of the strength of malleable iron indispensable. Chain-cables with the simple oval link resist a strain of 21½ tons per square inch, the mean strength of wrought-iron being 25 tons per square inch. When stays between the sides of the links are introduced, the strength is very nearly equal to that of the iron in the simple bar form, so that a stay may be said to increase the strength by about 1-6th part. The links of Mr. Price's chains are made with parallel sides, so that the fibres of the iron are kept in the direction of the strain; their strength is therefore greater than that of the simple oval links, which have a tendency to alter in form, or elongate.—S. C.]

Picture, in oil, of the Union Suspension Bridge, erected over the Tweed in 1820, connecting England and Scotland, being the first iron bar bridge constructed for carriages, and all the ordinary purposes of the country. Dimensions, 420 feet span between the points of suspension, supported by 12 lines of cylindrical wrought iron bars, containing 24 square inches.

Models.

Fig. 1. Model of an inclined plane, or patent marine slip and cradle-carriage, similar to the "Queen Charlotte Slip," at the Royal Dockyard, Deptford (which may be constructed on the shore of any other river or harbour), on which Her Majesty's frigate "Solebay" was drawn by a single capstan in three-quarters of an hour, and which would have been accomplished with a 20-horse power steam-engine in ten minutes. The cradle-carriage is mounted on the periphery of iron rollers, which circulate over the carriage by an endless chain under the ship's bottom when in motion; and in some situations the cradle-carriage is moved on a continuous line of rollers laid down on the ways. In either case, there is a total absence of friction; and, as a mechanical power, the superiority of the rollers over the multiplicity of small wheels employed for the same purpose exceeds, in some cases, 50 to 1; that is to say, it requires 50 times less force to move a line-of-battle ship laterally on the ways in the Arsenal on a line of connected rollers, than upon truck wheels of the same diameter, and a proportionate diminution of force would take place in drawing ships in the inclined planes. An important feature in the proposed system is, that whatever may be the extent or situation of the arsenal, that only one slip or one cradle carriage, and one sliding-off carriage are required for the whole establishment; that ships intended to be laid up in ordinary, may be disposed of at the more remote part of the yard; that ships could be more expeditiously and economically repaired; that any ships may be selected from the line, and transported fully rigged and equipped, without disturbing any other ship, and launched to be completed afloat for sea.

Fig. 2 is a line-of-battle ship, supposed to be laid up in ordinary, shored up, and the keel resting on the same rollers on which she was drawn up.

Fig. 3 is another line-of-battle ship similarly supported, with her lower mast in, supposed to be under repair, or in the course of fitting for sea.

Fig. 4. Masting shears, to which any ship may be moved, masted, unmasted, and returned to her position. The acquisition of this new motive power, which reduces the propulsive force or traction by 50 to 1 over fixed axles, renders it perfectly practicable to construct railways (except where tunnels are unavoidable) for the conveyance of ships, adapted for all the ordinary purposes of trade and manufacture traffic, with a velocity of 10 to 15 miles an hour, as shown in fig. 5.

Fig 6. Model of a basin or floating dock, containing an invariable depth of water for the largest ships of war, which may be constructed either by excavation or impermeable embankments.

Fig. 7. Shows the inclined plane laid down at low water, extending to and carried over the boundary wall, and ascending with the same gradient into the basin to float the ship off, and no locks or dock gates are required; the evaporation or leakage may be supplied by a sluice at high water, or from any other source inland. The same system, as shown in fig. 8, of raising ships, barges, or other vessels from one level to another, so as to render locks altogether unnecessary, may be applied to all the canals and inland navigation in the country, and our colonies abroad.

Fig. 8. Model of the royal chain pier, Brighton, constructed on a scale of 1½-inch to a foot, a perfect representation in detail of the whole structure. The inner chains supporting the platforms are secured to iron retaining plates in the cliff; the outer chains are supported by diagonal shores in the centre of the outer pier-head; the lower extremities are backed on each side by two 74-gun ship anchors, driven to a considerable depth into the chalk rock. It was begun in November, 1822, and finished in November, 1823.

[The Brighton chain-pier, opened in November 1823, was designed by Capt. Sir Samuel Brown, R.N., who first suggested that the chains should be made of long flat bars with holes drilled in their ends, by which they might be connected together by short links and pins. He patented this invention in 1817.—S. C.]

Fig. 9. Model of the mariners' compass, exhibiting the points on a vertical belt or zone, where they may be seen in all directions, at any desired altitude above the deck.

Fig. 10. Model of a brass columnal bearing and distance revolving light-house, designed for the great Hanois rock, on the south-west coast of the Island of Guernsey. The centre of the light would be 130 feet above high-water mark, spring-tides, and distinctly visible in clear weather, at the distance of 12 miles; the second altitude would be seen at the distance of 10 miles; and the third altitude 8 miles. The metal dome, 10 feet in diameter, would be tempered into a bell the largest and most sonorous in the world, and would be struck at intervals, during fogs or thick weather, to warn against danger.

There would be ample accommodation for the light-keeper; and also, provisions and stores for four months, or longer, if necessary. The total expense of erecting and completing the brass column ready for the reception of the light of the first order would be 10,000*l.*; time of execution not exceeding six months; and its stability would be guaranteed for seven years.

[Sea water has an injurious action upon cast-iron; brass, however, effectually resists its effects, hence its value for the tower of a lighthouse erected in the sea. Double lights are used as distinguishing them from neighbouring lights. Lights are obscured by fog, and therefore a contrivance, such as a fog-bell, by which the seamen can be warned of danger is desirable.—S. C.]

Fig. 11. Model of part of a railway, with a centre guide rail to prevent the engine or carriages from running off the rails. Model of a set of railway carriages; the axles pass between the bodies of two, which places the weight below instead of above the centre of motion and traction, and admits of an increase of the diameter of the wheels in the ratio of five to three, diminishing resistance to the motive power in the same ratio. They may also be adjusted to suit both gauges.

Fig. 12. Model of the main and after body of a ship fitted with submarine steam propellers; applicable also to a life-boat.

Fig. 13. Model of two pair of midship timbers, or ribs, of a line-of-battle ship; the butt end secured with wrought-iron or gun-metal plates, let in flush, which renders the joints nearly as strong as the solid timber.

Fig. 14. Model of an equipoised bed, or sofa, undisturbed by the ship's motion at sea.

SECT. II. CLASS 8.

NAVAL ARCHITECTURE, MILITARY ENGINEERING, GUNS, WEAPONS, ETC.

INTRODUCTION.

THE present Class will be regarded with much interest by those who are concerned in the maritime and military position of this country. The objects it includes, and which are fully exhibited in many instances by models, present a favourable picture of the resources of Great Britain, particularly in her marine. They also represent her means of defence and general military equipment.

The classification of objects here included comprises the following subdivisions:—A. Illustrations by Models of Shipbuilding for the purposes of Commerce, such as Ships, Boats, Brigs, Schooners, Luggers, &c. B. Illustrations by Models of Shipbuilding for the purposes of war, such as Ships of the Line, Frigates, Cor- [illegible] Steamers, Steam Vessels for long passages, Steam Vessels for inland Navigation. D. Vessels used for Amusement, and small Vessels generally, such as Sea-going and River Yachts, Rowing-Boats, Fishing-Boats, Life-Boats, &c. E. Comprises Rigging, Anchors, Windlasses, Capstans, and other articles connected with Practical Seamanship, and saving of Life from Shipwreck. F. and G. relate to Army Clothing and Accoutrements. H. To Camp Equipage. I. Naval Gunnery. J. Artillery Equipments for the Garrison and Field, and Machinery for Transporting Ordnance. K. Includes Ordnance and Projectiles. H. Small Arms; and M. Military Engineering generally.

The Class is not confined in the Building to one locality. Objects comprised by it are found in the South Gallery West, where some models of fortifications, together with a variety of guns, pistols, and swords are dispersed. The interspace between the South and North Galleries contains some costly and beautiful models exhibited by the Lords of the Admiralty. North of the Great Organ, a variety of models illustrating methods of rigging, capstans, windlasses, &c., are placed; and a space extending along the North Gallery eastward, contains models of ships, rafts, &c. On the Ground-floor, at the eastern extremity of the space devoted to machinery in motion, are also some objects related to Class 8. The remainder of this Class is to be sought in the Southern Galleries, on the foreign side of the Building, in Avenues P. and Q., extending from 62 to 70.

The progress of naval architecture forms an interesting study in the objects included in this Class. The transition from the inconvenient and unsightly forms of antiquity to the graceful outlines and imposing contour of a modern first-class ship is no less remarkable as an indication of progress in this science, than instructive as a practical evidence of the consistency of beauty of form with those qualities deemed essential in these structures. The beautiful discoveries of the laws and forms of wave-movement in fluids—a study at first without apparent direct practical application—have been successfully reduced to practice, and have led to the adoption, in a few instances, of that form of construction which theory indicated to be the most suitable. A prolonged experience will probably justify this application. The beautiful models of frigates, and other ships, showing the bow, stern, and transverse section, will receive much attention.

A very large collection of models of boats for saving life at sea is exhibited: so great a number of ingenious methods of constructing life-boats, assumed to be incapable of being upset or swamped, was probably never previously brought together. Some of these are on the twin principle, some are of caoutchouc, and some of gutta-percha.

Ordnance and projectiles for purposes of war are sparingly exhibited. It appears to have been felt that this was an institution of peace. But of small arms, adapted chiefly for field and forest purposes, a great display is made at the end of the South Gallery West. Rifles, fowling-pieces, pistols, swords, &c., some of which exhibit skill in their construction, coupled with elaborateness of ornament. Several of them indicate the application of new principles for prevention of accidental discharge, and some of new propulsive power. The remarkable properties of vulcanized caoutchouc, coupled with the discovery of the cumulating power of bands of this material, have been applied with success to various projectiles, and appear to promise new and important results.

Out of the miscellaneous collection of objects grouped together in this Class, some adapted for recreation—some for utility—some for offence and defence—a selection for particular study may well be made by the visiter to the Building. But probably no part of this Class will be regarded with more interest than that which illustrates the early, progressive, and present application of the steam-engine to navigation. The models illustrative of this subject form a most instructive part of the collection.—R. E.

1 **CLAYTON, RICHARD**, 9 *Gresham Street*—Inventor.

The swimming-glove, designed and formed after the web-foot shape.

2 **CLARKSON, T. C.**, 111 *Strand*—Inventor.

Models of life-boats, formed of cork, &c.

3 **EXALL, W.**, *Reading*—Inventor and Manufacturer.

Anchor without beam or stock, and having three flukes or grapples, all of which will lay hold at the same time.

4 **MURRAY, JAMES**—Inventor.

Model of harpoon gun.

5 **LIGHT, E.**, 216 *High Street, Wapping*—Inventor and Designer.

Models of life belts and buoys.

Model life-boat, 5 feet long, fitted with patent "buoyancy" material, and apparatus, tubes and valves complete.

Model of another, for light transport in exploratory expeditions, and to cross rivers, lakes, &c.

Piece of patent "buoyancy" material, as fitted and adapted in ships, yachts, boats, and belts.

Specimen of ladies' and gentlemen's yachting jacket; its object is to completely support the body in case of accidental immersion in the water.

Model of a yacht's boat with patent "buoyancy" arrangements.

6 **REEKES, T.**, 50 *Hasker Street, Chelsea*—Inventor.

Nautical cap, which can be immediately converted into a safety swimming belt.

7 **FOSTER, J.**, R.N.—Inventor.

Specimen of wood and India-rubber joinings.

8 **VICKERS, WM. RANDALL**, 32 *Baker Street, Portman Sq.*—Designer.

Geometrical floating life-belt, made of sail canvas, and divided into five compartments, stuffed with cork-cuttings. Models of strong sail-canvas, made up for stuffing. Samples of the sail-canvas, and two sample bags of the cork cuttings. The life-belt can be folded up (nearly in the form of a cube) and made to serve as a cushion on board ship. If one of these compartments should be torn, the rest would still form a useful belt. It is made to surround the body of the wearer and leave his arms free.

9 **HOLBROOK, J. N.**, 4 *Remington Street, City Road*—Inventor.

Polar life-preserver.

Wood raft, to be carried on board ships.

Tubular raft for same purpose.

Large round floater, to be thrown out to drowning persons.

Captain's life-preserver.

Gentleman's fishing-stand, for the middle of rivers.

Ladies' bathing machine, by which they may with safety go far out, in fine weather, and obtain the full benefit of the sea, and be brought to shore by a line attached.

Small bottomless life-boat.

The same made of copper, to be placed on the sea shore.

Model of an iron bottomless life-boat, 26 feet long. It is suitable for the roughest sea and actual service, in case of fire or shipwreck. The boat is made entirely of wrought and sheet iron, lined and covered with strong netting. Its dimensions are 26 feet long, 8 feet wide, and 3 feet deep, with iron gunwale 21 inches high; the rod and bar iron is about 800 feet, with 6 floaters made of 105 pieces of sheet iron, filled with 300 feet of tubing formed into 150 air and waterproof barrels, with 15 tanks, holding 222 gallons for fresh water; provisions, warm clothing, compass, alarm apparatus, fuel, fireworks, rockets, with 1,000 feet of line attached. The whole is firmly secured together with about 400 screws and bolts, and riveted with 10,000 rivets. There is in the figure-head a simply constructed kettle, by the same inventor, that will boil in 10 minutes, 8 quarts of coffee. The rudder can be shipped or unshipped in a few seconds, and oars and sail applied if required; the total weight is 20 cwt.

The boat having no bottom renders it almost impossible to capsize, and should its six floaters become punctured, full of holes, and all filled with water, the numerous barrels inside will be amply sufficient to prevent it sinking—such is the buoyancy, that it will carry nearly 150 persons and food for many days.

Model of a life and body preserver.

White glass ginger-beer bottle, and green glass soda-water bottle, in the use of which no cork, string, or wire is required; they are also suitable for ale, porter, wine, &c. The stopper will not give the liquor any unpleasant smell or taste.

10 **LEE, THOMAS**, 4 *Bread Street Hill*—Designer and Manufacturer.

Improved life-preserver, or swimming-belt, to sustain the wearer in an upright position in the water.

11 **SPENCER, EDWARD**, 116 *Fenchurch Street*—Manufacturer.

Patent buoyant and water-tight trunk, capable of sustaining fifteen persons in the water.

13 **HELY, ALFRED AUGUSTUS**, 16 *Manchester Buildings, Westminster*—Inventor.

The catamaran, or life-float, composed of waterproof canvas cylindrical cases, filled with bedding, clothing, provisions, stores, or any matter of less specific gravity than water.

Salvage boat, wholly composed of metallic tubes, forming atmospheric and hydraulic chambers, with loaded keel and self-shifting wheels.

Life-girdle, composed of spherical floats strung upon an endless elastic band.

Patent cork-driving apparatus and vent-bottle.

14 **BELL, HUGH**, *Baltic Wharf, Millbank, Westminster*—Inventor and Manufacturer.

Model of a "water grapnel," or "deep sea anchor."

Model of a "submarine boat," to pass closed under water, scale one inch to the foot.

Model, on the same scale, of a "locomotive diving bell," which may be used as a common diving bell, with the apparatus usually attached for forcing in air.

Life boat, for the beach, on the scale of one inch to the foot.

15 **ROYAL HUMANE SOCIETY**—Proprietors.

Ice-boat, presented to the Royal Humane Society by the society established at Hamburgh, constructed, for lightness, of wicker-work, and covered with raw hides; being placed upon rockers, this boat may be propelled on the ice with great facility, and in cases where a number of skaters break through in one spot, it has proved invaluable for saving lives.

Breaker ladder, a simple ladder with two air-tight barrels fixed at its broad end; being secured upon two wheels it may be used by one man with ease. On the immersion of a skater, the broad end of the ladder is pushed into the hole; the buoyant power of the barrels allows the drowning man to climb on to the machine; and to walk along it to its narrow end, which, resting upon the sound ice, affords the means of escape.

Ice sledge, composed of two canoes united by three thwarts, forming thereby a floating platform. It can be used on the ice with ease; it has great buoyant power (being capable of sustaining as many persons as could cling to it), and cannot be capsized.

Rope drag, used for dragging in deep water with a tide or running stream. When persons fall into the water from vessels or steam-boat piers, this machine can be used with greater certainty and in less time over a given space than any other kind of drag. The above apparatus is provided by the Royal Humane Society at stations on the River Thames, and on canals, docks, and places where they are most needed.

Pole drag, used in shallow water and where there is no stream. To the timely use of this machine many bathers and skaters owe their lives.

A pole drag, with an air-tight cylinder placed in its centre, to render it a floating drag. It is used for rescuing persons who have broken through the ice and have been drawn under its surface.

16 Hatt, C., *Lowestoft, Suffolk*—Inventor.
Model of a life-boat.

17 Sparke, W., *Exeter, Devon*—Inventor.
Model of a life-boat.

18 Robertson, John, *Limehouse Hole, Poplar*—Manufacturer.

Coils of cordage, manufactured from tarred Russian hemp, white Manilla hemp, and tarred New Zealand flax (*Phormium tenax*). (*In Classes 5 and 6.*)

[The valuable and remarkable product, commercially known as New Zealand flax, is the fibre of a plant indigenous in that country and in Norfolk Island. The fibre is obtained from the leaves of this plant, and in many respects rivals that of hemp for toughness. The plant belongs to the natural family *Liliaceæ:* its cultivation in other than its native districts has hitherto been attended with indifferent results.—R. E.]

Patent gun trumpet, for fog or alarm signals.
Models, showing Rapson's patent slide tiller.

19 King, P. H. F., *Sydney Cottage, Hewlett Place, Cheltenham*—Inventor.

Marine table for preventing breakages at sea. The exhibitor states that the top of this table will remain perfectly level without any regard to the rolling of the ship; it is portable, and may be taken apart in nine pieces. Registered.

20 Holtum, William, *Walmer, Deal*—Inventor.

Model of an apparatus for propelling a line to a vessel in distress at a short distance from the shore, intended to supersede the use of gunpowder; with a model of a wicker boat to travel on a hawser from the shore to the vessel.

21 Jerningham, Arthur William, Commander H.M.S. "Excellent," *Portsmouth*—Inventor.

Model of an anchor to be fired from a mortar of 5½ inch bore, with a charge of 10 ounces of powder, to carry a two-inch Manilla line out 200 yards to sea, for the purpose of hauling a life-boat off through the surf when the wind is on shore.

22 Manby, G. W., *Great Yarmouth*—Inventor.
Model of life-boat and mortar apparatus.

23 Ayckbourn, Frederick, 129 *Strand*—Sole Inventor and Manufacturer.

Patent float, or invisible life-preserver, and swimming-belt. This apparatus may be worn without inconvenience, may be instantly rendered available in cases of shipwreck at sea, and may be used as a support in learning to swim. It is portable, easily managed, and will last for years.

Models of life-boats and portable boats, invented by the exhibitor.

25 Offord, D., *Great Yarmouth*—Inventor.

Grapnel shot, to assist the hauling of life-boats, &c., off the beach through heavy surfs.

26 Offord, D. & Bradbeer, S., *Great Yarmouth*—Inventors.
Rock life-preserving apparatus.

27 Leftwich, W. H. 43 *Cumberland Market, Regent's Park*—Inventor.

Model of a heavy-armed cutter, constructed from portions of various old men-of war and of other oak from places of notoriety. On a stand of the surplus wood.

28 Purser, Joseph, 73 *Shaftesbury Street, New North Road, Hoxton*—Inventor.

Self-acting fire-escape, with some useful practical improvements; exhibited for cheapness.
Bomb-shell.

29 Carte, Alexander Gordon, *Citadel, Hull*—Inventor and Manufacturer.

Pocket apparatus for throwing a line to a stranded ship.

Self-acting life-buoy, invented in 1831; by its means, since 1838, the lives of nearly 400 persons have been saved.

Sea-service rocket apparatus, for throwing a line from a vessel to the shore, or to another in distress at sea.

Self-adjusting cork life-belt.

Alarm-signal, for the protection of houses, out-houses, plantations, &c.

30 Ditchburn, Thomas Joseph, *Blackwall*—Designer and Builder.

Models of the following vessels, &c.:—

War steam-vessel of 1,200 tons and 400-horse power, named "Vladimere," built in 1848 for the Emperor of Russia.

Steam-packet, named "Taman," built for the Russian Government.

Screw steam-vessel, for coast defence, named "Sharp-shooter," built for Her Majesty's service.

Steam-packet, named "Wonder" (one of five packets), built for the conveyance of passengers and merchandise between Southampton and the Channel Islands.

Iron cutter yacht "Mystery," built for Lord Alfred Paget, M.P.

The first passenger steam-packet on the river Thames, in the ferry between London and Gravesend, built 1813; of 40 tons burthen, and 9 horse-power.

"Earl Spencer," one of the last passenger sailing packets that plied between London and Gravesend, built 1796.

The "Fairy," screw steam-yacht, built for Her Majesty.

Iron schooner sailing-yacht, named "Volna," built for the Grand Duke Constantine of Russia.

A River Thames passenger steam-boat.

James Watt's experimental steam-boat, "Caledonia," fitted with two 14-horse engines, which made several trips from London to Margate in 1816, and ascended the Rhine to Coblentz in 1817.

A passenger steam-packet, "Favorite," 40-horse power, built 1817, expressly to run between London and Margate.

Wrought-iron caissoon, built to supersede the use of entrance gates to the new stone docks at Woolwich.

31 Lavars, John, *Bridge Street, Bristol*—Inventor.

Models of a floating buoyant settee, for the decks of passenger steamers, resembling in shape, size, and appearance the usual settees, and capable of being converted into a raft. The seat is composed of two boxes, which fold on each other, each box containing an air-tight gutta percha case.

32 Sloggett, Richard, *Devonport*—Designer and Producer.

Specimen of naval architectural drawing, and a new design, representing the profile and bow of a war steam-ship of 500-horse power. The profile of the bow shows all the interior fittings, while the front view exhibits the exterior fittings, anchors, &c., which are transferred from the profile and half-breadth plans.

33 Simons, William, *Greenock, Scotland*—Designer and Manufacturer.

Model of a screw frigate; model of a yacht.

34 Walters, H., *Monmouth Court, Dorset Place, Pall Mall*—Inventor.

Model of fire-escape and scaling-ladder.

35 **MOORE, WILLIAM F.**, *Plymouth, Devon*—Manufacturer.

Half model of the cutter yacht, "Pixey."

Half model of the schooner yacht, "Halcyon." Built at Plymouth by the exhibitor. Exhibited for asserted speed and weatherly qualities of the original.

36 **WHITE, JOSEPH**, *East Cowes, Isle of Wight*—Designer and Manufacturer.

Design for a new 90-gun ship. Models of H.M.S. Victory, Phaeton, 50-gun steam-ship Termagant, and brigs Waterwitch, Daring, and Contest.

Lengthened bow of the Fox frigate.

Old and new bow of the Amphion.

Models of a schooner and a cutter-yacht, and Victoria yacht, built for the Emperor of Russia.

36A **WHITE, T. J. & R.**, *West Cowes, Isle of Wight*—Inventors, Designers, and Manufacturers.

Model of the steam-ship, "Vassitei Tigaret," built for the Turkish Government, 1847.

Designs for a 50-gun frigate, 1838, and for the first transatlantic steam-ship to New York, 1838.

The "Medina" steam-ship, built for the West India Royal Mail Company.

Design for an ocean steam-ship of 3,000 tons.

Steam-ship "Vectis," built for the Peninsular and Oriental Company.

Sixty-gun frigate, designed for Turkish students studying naval architecture at Cowes.

Design for fast-sailing or screw-ships, for the China trade, of 1,600 tons.

Model of the "Samuel Enderby," Southseaman.

Models of life-boats, &c.

Model of a 50-gun frigate.

Model of the "British Queen" steamer.

Screw steam and sailing-ships of 2,500 tons.

Model of the missionary ship, "John Wesley."

Model of clipper barque built for Messrs. C. Ivens & Co., Bristol.

Two China clippers, one of 1,000 tons, and another of 1,475 tons.

37 **TOVELL, GEORGE RANDFIELD**, *Mistley, Manningtree, Essex*—Inventor.

Model of a ship's hull, of parabolical form. The novelty claimed consists in the uniformity of its lines, and the ease with which a ship on this principle can be laid down.

38 **MURRAY, W.**, 20 *John Street, Adelphi*—Manufacturer and Licensee.

Model of a harpoon gun.

Tucker's tapping-up apparatus for propelling.

Normanville's ship-scrubber.

39 **AZULAY, B.** *Rotherhithe*—Inventor.

Model of a sailing vessel, with auxiliary screw-propeller, worked by the men on board. It has also a backward motion.

40 **DEANS, W.**, *America Square*—Inventor.

Two models of triangular-bottomed ships' hulls.

41 **GIBSON, A.**, 2 *Exmouth Place, Cheltenham*—Inventor.

Steam-ship, with improved paddle-wheels, with paddles attached to endless-chains to run over two extra wheels.

Small dragon to drive a gutta percha tail to act as a propeller.

Railway in place of a gunwale and space in front, to carry four guns.

42 **GEORDESON, JAMES**—Inventor.

Method of reefing the sails by lowering the masts.

45 **ERSKINE, DANIEL**, *Clerk Street, Edinburgh*—Inventor and Manufacturer.

Two new life-boats; the one propelled by new pinion wheels and self-acting marine syphon-pump; the other fitted with air-tight cylinders made to revolve on axles; life-protecting rings and other improvements.

46 **RICHARDSON, H. T.**—Inventor.

Model of a life-boat.

47 **ACHESON, J.**, 102 *Leadenhall Street*—Inventor.

Model of a life-boat.

49 **BONNEY, WILLIAM WOLFE**, *Claremont Villa, St. John's, Fulham*—Inventor and Proprietor.

New life-boat, with numerous cells, composed of gutta percha, of peculiar forms, together with gutta percha life-buoys. It is not easily capsized, and when turned bodily over, rights itself immediately. It rows or sails equally well both ways, and steers with oars or rudders.

A life-boat, 30 feet long, 8 feet beam, 3 feet deep, built upon this principle, is said to be capable of saving 300 persons, and to be perfectly manageable when full of water and persons. A boat of gutta percha has lately been employed in the Arctic Seas with advantage.

50 **HODSON, J.**, *Sunderland*—Inventor.

Model of a life-boat.

51 **ALLAN, J. H.**—Inventor.

Model of a life-boat.

52 **WHITE, THOMAS, jun.**, *Cowes, Isle of Wight*—Designer, Inventor, and Manufacturer.

Four models for the entire navy, from one design. 50-gun frigate and corvette upon parabolic sections. Heaving-up slip, with recent improvements in doubling the power with the same machinery. Work on naval architecture illustrative of the whole.

53 **HAWKSWORTH, A.**—Inventor.

Model of a life-boat.

54 **REED, JOHN**, 7 *Silver St., Stockton-on-Tees*—Inventor.

A life-boat, which is said to right itself under any circumstances, without the aid of an iron keel or deadweight. It may be built of any size, and can be constructed of wood or any of the metals at present used in boat or ship-building.

55 **TREDWEN, RICHARD**, *Padstow*—Inventor.

Model of a life-boat.

56 **WIGRAM, MONEY, & SONS**, *Blackwall*—Inventors.

Half-models of ships, &c.

57 **ROBSON, JONATHAN**, *Gateshead, Newcastle*—Proprietor.

Model of an iron steam-tug or passenger steamer, being the first used for towing on the Lower Danube; length of keel 98 feet, and of deck 115 feet. Breadth of beam 17 feet 3 inches. Area of midship section, 62 feet 3 inches. Draught of water 4 feet 1½ inch at each end, with 14 tons of coal on board. Single lever engine of 41 inches cylinder, and 4 feet 3 inches stroke; with the ordinary flue and boilers.

58 **PETLEY, T.**, 7 *Great Hermitage Street*—Inventor.

Model of iron steam-tug.

59 **GREENER, W.**, *Birmingham*—Inventor and Manufacturer.

Pair of double guns in case, 10 gauge, 7¾ lbs. weight each, barrels made of laminated steel. Double rifle in case; barrels of laminated steel.

Patent harpoon gun, as used in the "Arctic Seas," with lines, gun harpoon, and model of the head of a whale-boat ready for use. Harpoon gun, &c., as used in the South Seas, or sperm-whale fishing.

Rocket gun and rocket lines for saving lives from shipwrecks, fixed upon a model of the exhibitor's life-boat. Is calculated to effect communication up to 600 yards with accuracy, and obviate the present defect of the rocket being deflected from the intended aim.

Registered stanchion gun for wild-fowl shooting. Fired by percussion tubes.

Military musket, of a lighter construction, and greater durability and range than those now in use. Double military rifle on a new construction.

Pair of newly-finished gun-barrels in the piston proof frame, prepared for proving. In this process the cylinders of the barrels are closed by steel plungers, and the charge is allowed no vent for escape but through the orifice of the nipples. Thus the capacity of the barrels to resist the confined force of any given quantity of gunpowder is ascertained.

Specimens of laminated steel in various shapes, showing its tenacity, tenuity, and density.

Gun harpoons, lances, rockets, &c., as ornaments.

60 **DYNE, W.**, 17 *Basing Place, Kingsland Road, and Brighton Station, London Bridge*—Inventor and Proprietor.

Model of a patent life-launch, which cannot be stove in, clears itself of surplus water, and is capable of stowing away provisions and water for one month, and of supporting more persons than could attach themselves to it.

Model of an overland or emigration patent life-boat, ten of which can be stowed in the space of a common boat.

Model of a *"stone life-boat."*

Model of a diagonal or lattice-frame registered life-boat.

Model of a patent collapsible life-raft, for pontoons or bridges.

Model of a stone buoy.

Model of a bottomless life-boat, that can be thrown from the deck of a vessel for immediate use.

Model of a patent cattle life-preserver, equipped on a horse, showing a method of buoying up cattle while in the water.

Model of a patent buoyant box, the system being applicable for portmanteaus, mail bags, &c.,

Model of a life-boat comb, or apparatus for the safety of boats when boarding wrecked or distressed vessels in heavy surfs.

Model of a patent life-buoy. While buoying up an individual out of the water it provides him with rockets, blue and other lights, to show what position he is in, should it be in the night; these ignite upon being taken out.

61 **BROWN, LENOX, & CO.**, 8 *Billiter Square*—Inventors and Manufacturers.

Model of an Admiralty regulation anchor—the largest used. Part of the largest chain cable, 2¼ inch diameter of iron, exhibiting a swivel, a joining shackle (with Lenox's plan of fastening the pin), and an anchor shackle.

The smallest anchor and part of the smallest cable used in the Royal Navy.

A patent windlass purchase. The motion is obtained by friction of metal bands upon metal barrels; no wheels, or palls, or other machinery required; cable can be given to the ship at any moment by slackening the bands with the lever in front.

Registered pit chain, used in coal and other balanced pits. The three chains are fastened together by metal plates inserted in the block of wood.

Patent malleable cast-iron blocks or pulleys for ships, engineering, and other purposes, intended as a substitute for wooden blocks and wrought-iron or brass blocks; cast to any shape, and rendered tough or malleable afterwards.

62 **FAWCETT, FRANCIS**, *Mount Pleasant, Douglas, Isle of Man*—Proprietor.

Models of life-boats, on the twin principle, completely decked over, and divided into twenty air-tight compartments, which can neither be swamped nor upset; and as the keel forms both stem and stern-post, they are well adapted for landing in a heavy surf, no point presenting itself as a fulcrum by which they can be capsized.

63 **BETTELEY, J.**, *Liverpool*—Manufacturer.

Model of ship's windlass, with patent propeller.

Patent anti-friction sheaves.

64 **BAILLIE, BENJAMIN**, 118 *Wardour Street, Soho*—Inventor.

Model of a vessel, with improved rigging, mast, and sails. Intended to give to a fore-and-aft rigged vessel, or to a lugger, the advantage over one square-rigged, in working to windward. The sails being bent to booms, which are pivoted or hung by their own leverage, will adjust themselves to the required angle, without the labour required to brace the yards, as in square-rigged vessels; at the same time, being brought up to windward by the booms, will lessen the pressure to leeward incidental to ordinary fore-and-aft rigged vessels.

65 **PEARSON, J. W.**, *Mill Dam, South Shields*—Inventor.

Model of an oar.

66 **THOMPSON, THOMAS**, Commander, R.N., 3 *George Street, Leith*—Inventor.

Safety-plug, for boats and vessels, constructed of gun-metal or brass, for the prevention of casualties arising from the loss or misplacing of the ordinary loose boat-plugs, and for greater security from leakage and facility of adjustment.

67 **PARKER, CHAS.**, *Newark, Notts*—Inventor.

A screw valve, consisting of a circular brass plate, of about three inches diameter and a quarter of an inch thick, having a hole in the centre to admit the valve, which is opened or closed by means of a screw attached to it, the latter works in another screw fixed on the plate, immediately over the valve-hole. Intended to supersede the present plug in ships' boats. Being a fixture it cannot be lost, as the plugs often are.

This screw-valve is large enough for an ordinary-sized boat: it is exhibited in a rough model of a boat, one foot long.

68 **HOPWOOD & ARMSTRONG**, 184 *St. George Street, Wellclose Square*—Inventor.

Registered brass side scuttles, with metal doors, for ships, also for light and ventilation.

68A **ROBINSON, Lieut., W. F.**, R.N.

A self-acting safety plug for life-boats, barges, and other vessels.

69 **GREGORY, ALFRED**, 54 *St. George Street East*—Inventor.

Safety-plate, to cover the aperture of a ship's scuttle, instead of the whole scuttle being covered with lead, copper, or wood. It is an external plate, put on from the inside, making it a solid compact body of brass. It is designed to save expense in the usual way of covering, the nails of which injure the ship's sides; also the multiplied expenses of coverings, this mode lasting until the scuttle is worn out; to make the windows safe in case of storm in the space of one minute, and, being water-tight, to prevent any inrush of water; thus tending to the preservation of human life, &c.—Registered.

71 **LONG, JOSEPH & JAMES, & CO.**, 20 *Little Tower Street*—Inventors and Patentees.

Curvilinear steering apparatus. By the simple action of the hand upon the steering wheel, the curvilinear lever is brought to bear on a convex cogged tiller, fixed to the rudder head. It possesses such leverage, that a boy can steer the ship. As the cogged tiller is always in a parallel line with the centre of the lever, the rudder becomes a fixture when not operated upon by the helmsman; thus securing him from accident or strain.

72 **DENHAM, Captain HENRY MANGLES, R.N., F.R.S.** *United Service Club*—Inventor. **COOPER MACLEAN**, 12 *Billiter Square*, Agents.

Model, with a drawing and descriptions of the registered "jury tiller;" for steering a ship when the usua helm fittings become disabled through fire abaft, the rudder-tree or head being shattered by shot or a wringing strain, the inboard tiller breaking short off, or the wheel gear breaking down suddenly in a gale or a tide-way. It consists of an auxiliary appendage to the rudder at the water-line, and can be thrown into gear in an instant.

73 **HALL, WM. EDWARD**, *Moreton, Bideford*, and 55 *Great Marylebone Street*—Inventor.

Mechanical apparatus for the application of the catenarian curve to the lines of ships, which might advantageously be used by engravers on copper, steel, or wood.

Copper model of an 18-gun brig or corvette.

Series of diagrams, illustrating a theory of naval architecture.

74 **BAIRD, JOHN R.**, 210 *Strand*—Inventor.

Method of lowering a ship's boat when hanging out of the water, with speed and safety, in cases of accident, by preventing one end of the boat going down quicker than the other. A man in the boat can lower her into the water, or raise her to a level with the ship's deck, by pulling a single rope.

75 **ORR, M.**, *Greenock, Scotland*—Inventor.

Model, drawing, and explanation of angulated jibs. Treatise on the area of sails for open boats.

76 **WATSON, T.**, 79 *Provost Street, Hoxton*—Inventor.

Model of a plan for the correct measurement of tonnage in ships, steam-boats, &c.

77 **POOLE, J., jun.**, *Copper House, Cornwall*—Inventor.

Model of an improved paddle-wheel.

78 **SLATER, W.**, 332 *High Street, Wapping*—Proprietor.

Improved patent copper powder-barrel, which preserves gunpowder in perfect safety against fire and damp.

79 **GALE, J. & R.**, *Whitby*—Inventors and Manufacturers.

Model of life-boat, emptying itself, when full of water, in the short space of four seconds, by means of two apertures in the bottom.

80 **LADD, CHAS. P.**, Lieut. R.N., 10 *Walcot Place, Lambeth*—Designer and Inventor.

Marine table to prevent breakage of glass and spilling of liquids at sea in rough weather. The invention consists in its being made to swing freely in the middle of a saloon table, fixed by screws to the cabin floor.

81 **MASON, EDWARD**, *Brompton Post Office*—Inventor, Designer, and Builder.

Model of a steam-boat, "Queen of the Ocean," built of cedar wood out of the old "Gibraltar," Spanish ship of war.

Model of a self-acting life-boat, calculated to right herself immediately, with the crew lashed to her thwarts, in the event of being upset, without the assistance of any additional weight or balance, &c.

Midship section of a ship's deck, with concealed fastenings.

82 **CORYTON, JOHN**, *Erechtheum Club, St. James's Square*—Designer and Inventor.

Model of a sailing-vessel and life-boat, constructed and propelled on new principles.

83 **BREMNER, J.**, *Wick, Scotland*—Inventor.

Model of a life-boat.

84 **FERGUSON, C. A. & T.**, *Poplar*—Inventors.

Model of a gun-carriage.

85 **ALLAN, JOHN H.**, 2 *Leadenhall Street*—Proprietor.

Model of a South Shields coble.

Model of truss-work, introduced by Sir Robert Seppings, for the internal fastening of ships, and on the same principle as the girders of the Exhibition Building. It represents a section of the between-decks of the East India ship "Sir Robert Seppings," built at Moulmein in the Tenasserim provinces, and is made of part of her teak planking.

86 **LYONS, GEORGE**, 8 *Britain Street, Portsea*—Manufacturer and Inventor.

Model of a screw-propelling rudder.

87 **MARGARY, —**, Inventor and Patentee.

Specimens of patent canvas. Upwards of half a million yards have been prepared for the Honourable Board of Ordnance by the process of the exhibitor.

Various pieces of prepared and unprepared canvas in different stages of decay.

The same process is extensively used in the preparation of sleepers and timber for railway and other purposes. Specimens of its application.

88 **PARSEY, WILLIAM**, 455 *Oxford Street*—Inventor.

Working model of a bell-buoy for warning vessels of danger. Motion is obtained by the action of the surface current or tide on a water-wheel, placed between two floats or barges, which is communicated to the hammer for striking the bell and giving the alarum.

89 **KINCAID, T.**, *Greenock, Scotland*—Inventor.

Models of fan propeller, variously applied.

90 **BEADON, GEO.**, Captain, R.N., *Creechbarrow, Taunton, Somersetshire*—Inventor.

Prince Alfred's mirror: a glass mounted upon a nautical adjustment for glasses.

Universal rowlocks, applicable for any description of oar.

Whale gun, for projecting harpoons with precision.

Boat safety reel, to prevent the upsetting of boats in squalls.

Life-raft for ships; a folding catamaran hung at the stern, and occupying little room; the operation of lowering prepares it for use.

Mast clamp, to facilitate stepping or lowering boats' masts.

Gun elevator, for artillery.

Illustrations of a new system of propulsion, upon a scale of ⅛ of an inch to a cubit.

Indicating or filter cock, to draw off liquids without disturbing the sediment.

Phaeton hood-lifter, for raising or lowering heads of phaetons.

Improved door, obviating draughts, &c.

Universal tractor.

Nearly all these inventions comprise certain parts for which patents have been taken.

91 **CLARK, JOSEPH**, 10 *Parliament Street, Westminster*—Inventor.

Model of the bunk life-boat. To be used as a cot, occupying the space of the bunk or berth, and forming a life-boat always ready for use. Model of a flexible life-boat.

92 **YOUNG, DOWSON & Co.**, *Poplar*—Manufacturers.

Ship's improved rudder fastenings, by the use of which, when the old pintles are broken, new pins can be refitted on board, without the necessity of the ship putting into port for that purpose.

93 **GRANTHAM, JOHN**, *Orange Court, Liverpool*—Inventor.

Model of the section of an iron ship, showing an improved method of sheathing the plates with wood, to enable them to be coppered. The sheathing is attached without the use of bolts. The object is to prevent fouling in tropical climates, and to preserve the iron.

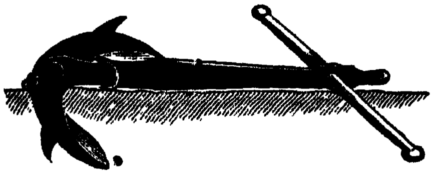
Iron model on a larger scale, showing the mode of construction.

94 **SMALE, WILLIAM**, 13 *Charlton Terrace, Woolwich*—Inventor.

Model of an anchor, which can be taken to pieces and stowed in one-third less room than an ordinary anchor.

95 **HONIBALL, JAMES**, 42 *Cornhill*—Patentee.

Models of Porter's patent anchors, tested by order of the Lords of the Admiralty.



Porter's Patent Anchors.

These anchors (see fig.) are considered to possess superiority in strength and holding power.

The advantages peculiar to their construction are—the protection of ships from accidents common with anchors of fixed arms, viz.: preventing fouling either at single anchor or otherwise; affording quick bite in all kinds of ground, hard or soft, and with short scope of cable will bring the ship up instantly; preventing damage to vessels in overlaying the anchor, or in passing over it in shallow water, as the upper fluke rests on the shank, it cannot enter the ship's bottom; preventing vessels, while in crowded anchorage, from being hooked by the cables of other vessels; convenient for stowing on board, by disconnecting the arms from the shank; easy of transport to or from a vessel in two boats, when the anchor is too heavy for one boat; and as, in proportion to the superior power of these anchors, less weight is required, thereby affording relief to ships' bows, and enabling them to sail with greater speed.

97 **BETTELEY, J. & Co.**, *Brunswick Dock, Liverpool*—Inventor.

Model of a windlass.

98 **COTTEW, J. E.** 19 *South Street, Lambeth*—Inventor.

Model of an improved windlass for raising ships' anchors.

99 **INGLEFIELD, EDWARD AUGUSTUS**, R.N., 9 *Portsea Place, Connaught Square*—Inventor.

Model of H.M. brig "Flying-Fish," fitted with a screw-propeller, to be worked by the capstan; also gearing for connecting the screw-shaft with the chain-pumps. A new application of the capstan, and of the chain-pumps.

A small lever handle throws the screw into gear with the chain-pumps, and the revolution of the screw, consequent on the motion of the ship through the water in a gale, or even at anchor (in a tide-way), will pump the vessel out, without any manual labour.

An anchor without a stock, and both flukes taking the ground, when in use. It is stated that this anchor cannot be fouled, nor can a ship damage herself should she ride over it. It has double the hold of an ordinary anchor; it takes into two pieces; is easily catted and fished, and is simple in manufacture.

100 **ROBINSON, JOHN**, 6 *Pattison Street, Stepney*—Inventor and Proprietor.

Three life-boats, which will free themselves speedily of water, and immediately right themselves in the event of being upset.

Three patent steering machines, for ships or other craft, intended to economise space, with a spring rudder.

Two patent machines, for raising weights, weighing anchor, &c., with facility, giving the ship chain, without surging on the windlass.

Patent new pumping machine, for raising water from the hold of a vessel.

101 **MUNTZ, GEO. FRED.**, M.P., *Limehouse*—Inventor.

Patent ships' sheathing metal; intended to supersede the use of copper for that purpose.

Patent metal rod for ships' fastenings.

102 **WOOD, HENRY & Co.**, *Liverpool*. **WOOD, GEORGE, & Co.**, 275 *Wapping*—Manufacturers.

Models of patent windlass purchase and spindles; Lamport's patent ship's winch; M'Sweny's patent steering barrel; Porter's patent anchor; chain, cable-iron, &c.

103 **BROWNING, SAMUEL J.**, 66 *High Street, Portsmouth*—Manufacturer and Inventor.

Brass urn-shaped binnacle of new construction, with newly-invented compass. The same, bronzed by a new process.

Brass urn-shaped binnacle, ornamented, on a painted and gilt pedestal. Invented by the exhibitor for Her Majesty's steam yacht "Victoria and Albert."

Skeleton compass, with cards to show their application to Mr. Browning's newly-invented compass.

Marine target of new construction.

104 **BERTHON, Rev. E. LYON**, *Fareham, Hants*—Inventor.

Patent perpetual log, for indicating the speed and leeway of ships. Its novelty consists in the compensation, by which disturbing causes are neutralized.

Patent clinometer, for showing the list and trim of ships.

Collapsible life-boat, combining strength and capacity within small limits of stowage. The act of lowering expands, and of raising collapses it; when open it contains a great volume of air in its longitudinal cells.

105 **TAYLOR, JANET**, 104 *Minories*—Manufacturer.

A bronze binnacle, with compass, designed from the water lily.

106 **HEMSLEY, THOMAS**, 11 *King Street, Tower Hill*—Inventor and Manufacturer.

Improved ship's binnacle, containing a compass, fitted with transparent card and reflecting lamp; the lamp can also be used as a signal-light to other vessels, when required.

108 **PARKES, HENRY PERSHOUSE**, *Dudley*—Inventor, Patentee, and Manufacturer.

An anchor-shackle, swivel, and connecting shackles, as used in chain cables.

A wrought-iron stud mooring-chain, made to supersede the chains formerly made with cast-metal stay, for holding the floating light ships off Liverpool.

A patent flat pit chain or band. A solid link flat pit chain, intended to supersede the open link chain.

109 **WEST, Commander**, 1 *James Street, Adelphi*—Inventor.

Marine compass, constructed on a principle which prevents the magnetic needle from oscillating more than one degree. Without this prevention the magnetic needle can oscillate forty-five degrees, viz., till the lower part of the cone touches the pivot, causing continual revolutions and vibrations. On the exhibitor's principle, the magnetic needle is always steady, and in the heaviest weather only vibrates four or five degrees.

110 **SOULBY, JOHN**, 126 *High Street, Wapping*—Manufacturer.

Model of a safety windlass, made of two parts.

CAPTAIN COOK'S QUADRANT AND COMPASS, THE IDENTICAL INSTRUMENT USED BY THAT CELEBRATED MARINER IN HIS VOYAGE ROUND THE WORLD.

111 **JENKINS, JAMES**, 2 *Union Row, Minories*—Manufacturer.

Boat binnacle, containing compass and lamp.

---

112 **FAYRER & ROBINSON**—Manufacturers.

Model of a steering wheel.

113 **SCOULLER, JAMES**, 65 *Argyll Street, Glasgow*—Inventor.

Fog signal-light, for shore and ship signals.

---

114 **HASTINGS, JAMES**, 24 *Billiter Street, City*—Proprietor.

Model of a windlass, employed for raising and lowering ships' anchors, &c., fitted with Johnstone's patent double-action lever purchase, also fitted with Gryll's patent whelps, which adjust the cable as it comes in, causing the turns to shift laterally; thus the leading turn is always in a line with the hawse-pipe, and the necessity of using a forebit stopper, and of fleeting over the cable, is obviated. The whelps being flat upon the face, and the links of the cable dropping into the cavities between, and abutting against the edge of the whelps, the cable is found to hold on, and is not liable to run out, except to the extent of a few links under a very heavy strain. The dangerous and troublesome operation of hooking up the cable, and fleeting it over upon the windlass, being got rid of, much time and labour is saved.

Model of a ship's capstan, for raising anchors, &c., fitted with Johnstone's patent rim or cable-holder, which affords the advantage of being adapted for working chain-cables of various sizes; also fitted with Gryll's patent non-surging whelps.

---

115 **ALLISON, EDWARD WENMAN**, 36 *Nottingham Place, Stepney*—Inventor.

A steering wheel, to prevent accidents at sea. This wheel is entirely under the command of one man; and should any accident happen to him, it will remain without moving until another is sent to take charge of it.

116 **SALTER, JOHN**, *West Street, Commercial Road*—Inventor and Manufacturer.

Model of improved ship's capstan.

117 **SPENCELEY, JOHN**, *Whitstable, near Canterbury*—Inventor and Proprietor.

Patent pillar and screw apparatus, for preventing ships from "hogging," and for restoring hogged ships to their original shear, for taking all strain off the side fastenings, and preventing the butts from working. It can be used at sea, and the ship straightened without going into dock or laid ashore, and is applicable to steam-boats, men-of-war, and merchant vessels of all descriptions.

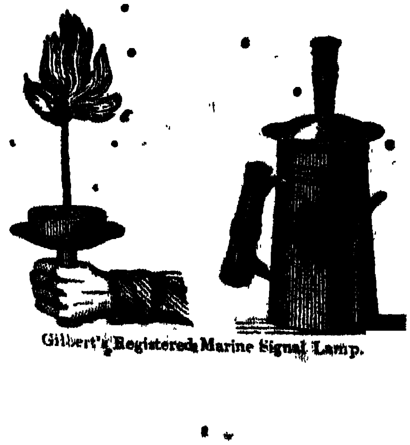
---

119 **MATHEWS, T.**, 83 *Berwick Street, Soho*—Inventors.

Model of a paddle-wheel.

120 **GILBERT, EDWARD**, *Falmouth*—Inventor.

Registered marine signal lamp, which yields a light equal to a blue light. The wick, which is chiefly composed of metal, may be used for a very long period. The lamp and wick represented in the annexed cut.



Gilbert's Registered Marine Signal Lamp.

This lamp consists of a metal vessel of about the size of a two or three pint measure; it may be made of tin-plate or copper. It has a cover to prevent the waste or evaporation of the material used for producing the light, to which the wick is attached. In this vessel is suspended by the cover, a coil of metallic wire, interwoven or coiled with cotton or any other fibrous matter, for the purpose of holding a portion of the inflammable spirit, which may be either turpentine or any other of the well-known inflammable liquids. The metallic wick is held in the hand whilst exhibiting, and may be carried to any part of the ship without injury or danger, or be swung rapidly round with the arm; thus forming a large circle of flame resembling a wheel rocket.

121 **CHAPMAN, J. T.**, 328 *Wapping*—Inventor and Patentee.

Brass models of patent shroud blocks, for setting up ships' rigging, and raising weights, as a substitute for the wooden dead-eye now in use. One man can raise, with a pair of these blocks, a weight of three tons. A patent portable screw winch, for setting up ships' rigging, and for hoisting in cargo or raising great weights on shore.

---

123 **BURGESS, FRANCIS**, 18 *Salisbury Street, Strand*—Proprietor.

Model of main and top masts, formed by splicing small pieces of wood; these may be made at sea should the masts of a ship be carried away, and no spar be on board; they are bound with iron hoops, shown by black stripes in the model. The object of this invention is to give increased strength and elasticity: the step and top being formed alike, should the step give out or decay, the mast may be reversed and so made good.

124 **SIMMENS, J.**—Producer.

Model of Mounts Bay fishing-boat.

125 **SMITH, STEPHEN**, *Ship Yard, Waterford, Ireland*—Inventor.

Spring machine, for modelling ships of any form or dimensions.

126 **ESDAILE & MARGRAVE**, *City Saw Mills, Regent's Canal*—Manufacturers. **BOTHWAY, J., R.N.**—Inventor.

The 20-inch cat and general purpose block, which had its strength proved by the testing-machine in H.M.'s dockyard, at Devonport, Oct., 1848, and bore the strain of 50¼ tons (unhurt); its weight only 2cwt. 1qr. 0lb.

Two models of masts and yards made to scale; one rigged with the old rope-strapped blocks &c., the other with the inventor's internal-strapped blocks, to show the contrast and the superior qualities to all others.

Two models of cat-heads, with the old iron-bound cat-block and inventor's of reduced size, with weights to prove the difference in their comparative power, with a variety of blocks (from two sheaves in the pair up to fifteen).

Models and drawings of lower yards fitted with inventor's slings and portable gear-blocks, which have been so successfully used in the largest ships in H.M.'s Navy so many years—and other inventions.

127 **RUSSELL, T. SCOTT**, 37 *Great George Street, Westminster*—Inventor.

Models of ships constructed on the wave principle:—

1. War steamer, with paddle-wheels, constructed by Messrs. Robinson and Russell, at Millwall, showing the new patent system of armament, which enables a steamer to carry double the usual armament; capable of being fired parallel to the keel. This vessel is 550 tons; has 160-horse power; steams 15¼ miles an hour when light, and 13¼ when at her deepest immersion, with stores, ammunition, water, and provisions, and fuel for 2,500 miles.

2. War steamer, with paddle-wheels, on the same principle, of 1,200 tons, and 400-horse power; armament, twelve 68-pounders.

3. Paddle-wheel frigate, on the wave principle; same class as the "Terrible."

4. Sailing corvette, on the same principle, proposed by Captain Fishbourne, and constructed by Dr. Phipps.

5. Various models of yachts and steamers, on the same principle.

---

128 ORDNANCE SURVEY DEPARTMENT.

By Lieut.-Col. HALL—Producer.

Description of Specimens forwarded by the Ordnance Survey Department:—

I.—The Ordnance map of England and Wales, on the scale of one inch to a mile (equal to $\frac{1}{63360}$th part of the real size) in its present state of progress, consists of 90 sheets, double elephant size, mounted on linen, and forming a connected map 28½ feet by 23 feet 5 inches nearly, the more recently published sheets having, for greater convenience in engraving, been divided into four parts.

The first sheets of part of Essex were published in 1805, and the last sheets included in this map, consisting of parts of Lancashire and Yorkshire, were published in 1844.

The sheets of the north of Lancashire and Yorkshire, now in course of preparation, are obtained by reduction from the six-inch map of those counties; it being intended to publish the remaining portion of the map of England and Wales on the one-inch scale.

The greatest number of impressions from any one plate sold to the public has been 5,500 for sheet No. 7, published in 1822; and on account of the large number of impressions that have been taken from the plates generally, many of them are now in want of extensive repair. This will, however, be avoided in future, by preparing duplicate plates by the electrotype process, as new plates are finished.

II.—The Ordnance map of Lancashire, on the scale of six inches to a mile (equal to $\frac{1}{10560}$th part of the real size), mounted on linen, and forming a connected map 40 feet by 27 feet.

The survey was commenced in 1841, and the engraving of the 112 sheets (each 3 feet by 2 feet), of which it is composed, has just been completed.

The physical relief and features of the ground are exhibited by a series of contour lines, or lines of equal altitude, at every 25 feet vertical distance apart; and these contour lines, together with the altitudes (above the mean level of the sea), of a large number of bench marks made on convenient and permanent sites, are recorded on the map.

A very large proportion of the ornament (woods and hedge-rows), and the whole of the altitude figures, are engraved on the copper-plates by the aid of stamps, and the tinting or shading on noblemen's and gentlemen's parks and demesnes, as well as that of the lands, is performed by steam machinery, recently introduced.

III.—The Ordnance map of the city of Dublin, on the scale of five feet to one mile (equal to $\frac{1}{1056}$ part of the real size), mounted on calico, and forming a connected map 20 feet by 14 feet 6 inches.

The survey was made in 1838, but the principal details have been corrected to 1847. To render it more peculiarly applicable to the purposes of sanitary improvement, the present sewerage and the pipes for the supply of water have been inserted, together with contours at equal intervals of five feet in height. This map is published in 33 sheets, each sheet 3 feet by 2 feet.

IV.—The Ordnance map of the town of Liverpool, on the scale of five feet to one mile (equal to $\frac{1}{1056}$th part of the real size), mounted on linen, and forming a connected map of 26 feet by 15 feet.

It is engraved in outline, and coloured by hand.

The survey was completed in 1849, and the engraving was finished in September, 1850.

It is published in 50 sheets (each sheet 3 feet by 2 feet), and it is considered to be on as large a scale as can be put together for any connected public map. The ornament (trees and shrubs), figures, and small words and initials, are engraved by stamps.

The altitudes are given above the mean level of the sea.

V.—Specimens of hill drawings made by G. W. Carrington, Esq., formerly employed on the Ordnance Survey, prepared for and used by the engraver as a guide in etching the hill features of the one-inch map of England and Wales.

VI.—Specimens of hill engravings of the same sheets, by which the fidelity with which the engravers have followed the drawings may be seen.

VII.—Two engravings of hills, in trio-tinto, by Mr. James Duncan, principal engraver at the Ordnance Survey Office, Dublin.

1. Map on the scale of one inch to a mile of part of the county of Kilkenny, Ireland.

2. Map of the same, on the scale of half an inch to a mile.

The natural features of the country have been engraved on these maps (which have been reduced from the Ordnance Contoured Survey) in a new and peculiar style, which has been named trio-tinto by the inventor, Mr. Duncan, because it combines the effects of mezzotinto, aquatinta, and stippling. It is not a tedious or a costly process, and is applicable to other subjects in art, as well as that of engraving hills upon maps.

VIII.—Contoured index map to the townland survey of the county of Kilkenny, Ireland; mounted on a model of the ground in papier-maché, by Mr. William Dalgleish, engraver at the Ordnance Survey Office, Dublin.

As there is no limit to the number of models which may be cast in a single mould, maps mounted in a similar manner can be produced at a cost very little exceeding that of the same maps unmounted, and such maps will be of essential service in elementary schools, by giving the pupils a more correct knowledge than they would otherwise obtain, of the relief traced out by the contour lines.

IX.—1. Engraved sheets of part of the Ordnance Survey of the county of Kilkenny, on which the hills have been shaded by aid of the contour lines. Scale six inches to one mile.

2. Outline map of the same, reduced from the above. Scale one inch to a mile.

3. Part of the contoured index map of the county of Kilkenny. Scale half-an-inch to one mile (equal to $\frac{1}{720}$th part of the real size).

These specimens are intended to show the facilities afforded by the contours on the Ordnance maps for drawing the hills upon them, and for giving a correct delineation of the features of the country.

X.—1. South-east and north-east quarters of sheet 91, of the one-inch map of England and Wales, showing the physical relief of the country by contour lines, or lines of equal altitude, at equal vertical distances apart; reduced from the six-inch map of Lancashire and Yorkshire.

2. The same sheets shaded as hill drawings for the guidance of the engravers in executing the one-inch map of England and Wales, prepared entirely from the information afforded by the reduction of the contour lines from the six-inch map.

XI.—Small model of a portion of country near Bangor, in North Wales, and corresponding drawing of the same, by G. W. Carrington, Esq., late of the Ordnance Survey.

XII.—Plan of the borough of Southampton, on the scale of six inches to a mile, by Charles Holland, pensioner from the corps of Royal Sappers and Miners. Reduced from the five-feet map of the borough, prepared by the Ordnance Survey Department for the use of the local authorities in 1847.

XIII.—Diagram showing the principal triangulation of the United Kingdom of Great Britain and Ireland, of which an account is now being prepared for publication.

XIV.—Specimens of electrotyping:—

1. A copper-plate of the townland survey of the county of Donegal, engraved in 1837, and an impression from it.

2. An electro-matrix of No. 1, with the details erased, which have undergone alteration since the townland Survey was made.

3. An electro-duplicate from the matrix, No. 2, on which contour lines and other additions and alterations have been engraved, from the Ordnance survey in 1846-8, and two impressions of it, one of them taken immediately after its separation from the matrix, and the other taken from it in its present finished state.

These specimens show more particularly the manner in which the process of electrotyping is applied to the purpose of revising the maps of the Ordnance Survey of the northern counties of Ireland, which must without its aid have been engraved entirely anew, as it would have been impossible to have carried out, on the original copper-plates, the extensive alterations which are necessary.

4. An original copper-plate of the Ordnance Survey of the City of Dublin, and an impression of it.

5. An electro-matrix of No. 4.

6. An electro-duplicate of No. 4, and an impression of it.

7. An unfinished copper-plate (as an index to the 5-feet plans of Manchester and Salford), prepared by electrotyping matrices from three different plates of the Ordnance map of Lancashire, on the scale of 6 inches to a mile = $\frac{1}{10560}$; removing the detail exterior to the town portion from the matrices, filing off the edges of the matrices at the junction lines of the sheets, and then depositing a duplicate plate on the joined matrices.

---

129 **Ellis, F. A.**, Commander R.N., *Great Yarmouth*—Inventor.

Model of a yacht, with a sliding keel, to enable her to go up shallow rivers and over bar-harbours. A method of suddenly lowering the mast to a level with the deck in a gale of wind. A projecting bow, which tends to keep the vessel up in a sea-way.

130 **Macnab, John**, 25 *York Place, Edinburgh*—Inventor.

Model of an improved first-class sea-going steam-ship.

131 **Green, Richard**, *Blackwall*—Owner.

Model of the "Owen Glendower" East Indiaman, built at Blackwall.

132 **Howe, Joseph**, *Newcastle-upon-Tyne*—Maker.

Model of a clipper merchant schooner, complete and in working order.

---

133 **Downs, Henry**, *Mile Town, Sheerness*—Designer.

Model of a corvette of 20 guns, regularly built, fitted, armed, and rigged.

---

134 **Lamport, Charles**, *Workington*—Designer.

Model of one of Messrs. Lindsay & Co.'s line of ships to Calcutta; 800 tons register.

---

135 **Clarke, Joseph Aug.**, 7 *Hamilton Sq., Birkenhead*—Designer.

Model of a steam vessel to a scale of half an inch to the foot; intended to represent a steam vessel of improved construction, and to show how increase of speed may be obtained by using wheels with moveable floats, instead of wheels with fixed floats: wheels with moveable floats are attached to the model.

---

136 **Northumberland Life-boat Committee**, *Somerset House, London*—Producer.

Models of life-boats, sent in to compete for the premium of 100 guineas, offered by the Duke of NORTHUMBERLAND, with the names of the designers or builders. Communicated by Captain WASHINGTON, R.N., F.R.S.

1 **Ainsworth, John**, *Bridlington, Yorkshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 34 feet; breadth, 9 feet; depth, 4½ feet.

2 **Anderson, Thomas**, *North Shields, Northumberland.*
Model of life-boat. Scale, 3 inches to a foot: length, 40 feet; breadth, 11½ feet; depth, 4 feet.

3 **Beeching, James**, *Great Yarmouth, Norfolk.*
Model of life-boat. Scale, 1 inch to a foot: length, 36 feet; breadth, 9½ feet; depth, 3½ feet.

4 **Bertram, James**, 16 *East Street, Manchester Square, London.*
Model of life-boat. Scale, 1 inch to a foot: length, 30½ feet; breadth, 9 feet; depth, 2½ feet.

5 **Blair, Robert**, *South Shields, Northumberland.*
Model of life-boat. Scale, 1 inch to a foot: length, 35 feet; breadth, 12 feet; depth, 4½ feet.

6 **Bosch, P. Van Den**, *Oosterhout, Netherlands.*
Model of life-boat. Scale, 1 inch to a foot: length, 24 feet; breadth, 4½ feet; depth, 2 feet.

7 **Bremner, James**, *Wick, Scotland.*
Model of life-boat. Scale ½ inch to a foot: length, 33 feet; breadth, 12 feet; depth 3½ feet.

8 **Bromley, Gilbee**, *Sheerness, Kent.*
Model of life-boat. Scale, 1 inch to a foot: length, 32 feet; breadth, 7 feet; depth, 3 feet.

9 **Browne, John Harcourt**, *Moorgate Street, London.*
Model of life-boat. Scale, 1½ inches to a foot: length, 23 feet; breadth, 6 feet; depth, 3½ feet.

10 **Costain, Thomas**, *Liverpool.*
Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 9½ feet; depth, 3½ feet.

11 **Edmond, John**, *Scarborough, Yorkshire.*
Model of life-boat (coble.) Scale, 1 inch to a foot: length, 27 feet; breadth, 7½ feet; depth, 2¾ feet.

12 **Falkingbridge, William**, *Whitby, Yorkshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 35½ feet; breadth, 8 feet; depth, 3½ feet.

13 **Farrow, George**, *South Shields.*
Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 10 feet; depth 3¾ feet.

14 **Francis, Joseph**, *New York, United States.*
Model of surf life-boat. Scale, 1 inch to a foot: length, 27 feet; breadth, 7 feet; depth, 2½ feet.
Model of cutter. Scale, 1 inch to a foot: length, 27½ feet; breadth, 6½ feet; depth, 3 feet.
Model of life-car. Scale, 1 inch to a foot: length, 26½ feet; breadth, 7½ feet; depth, 6½ feet.

15 **Gale, John & Robert**, *Whitby, Yorkshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 11 feet; depth, 3½ feet.

16 **Gale, G. Hamlyn**, *Swansea.*
Model of life-boat. Scale, 1 inch to a foot: length, 28½ feet; breadth, 7¾ feet; depth, 2½ feet.

17 **Gaze, Thomas**, *Mundesley, Norfolk.*
Model of life-boat. Scale, 1½ inch to a foot: length 30 feet; breadth, 10 feet; depth, 4¼ feet.

18 **Grant, William**, *Southsea, Hampshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 25 feet; breadth, 7¾ feet; depth 2½ feet.

19 **Greener, William**, *Birmingham.*
Model of life-boat. Scale, 1 inch to a foot: length, 37 feet; breadth 12 feet; depth, 2½ feet.

20 **Gurr, Charles**, *Portsea, Hampshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 7½ feet; depth, 3 feet.

1 **Hall, Messrs.**, *Aberdeen.*
Model of life-boat. Scale, 1 inch to a foot: length, 33½ feet; breadth, 8½ feet; depth, 4 feet.

Harding, J. & J., *Whitby, Yorkshire.*
Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 10½ feet; depth, 3¾ feet.

3 **Harvey, T., & Son**, *Halifax, Ipswich.*
Model of life-boat. Scale, 1½ inches to a foot: length, 1 feet; breadth, 11 feet; depth, 4 feet.

Hatt, Cyprian, *Lowestoft, Suffolk.*
Model of life-boat. Scale, 1 inch to a foot: length, 35 feet; breadth, 12 feet; depth, 4½ feet.

25 **Hay, The Right Hon. Lord John**, *Devonport*—Superintendent of H.M.'s Dockyard.

Model of life-boat. Scale 1½ inches to a foot: length 32 feet; breadth, 7½ feet; depth, 3 ft. 7in.; weight, 32 cwt.

26 **Hinks, Henry**, *Appledore, Devon.*

Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 9 feet; depth, 3½ feet.

27 **Hodgson, Joseph**, *Sunderland.*

Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 9 feet; depth, 2½ feet.

28 **Houten, William Van**, *Rotterdam*, President of the South Holland Shipwreck Institution.

Model of life-boat and carriage. Scale, ¾ inch to a foot: length, 25 feet; breadth, 8 feet; depth, 3 feet.

29 **Jones, Josiah, jun.**, *Liverpool.*

Model of life-boat. Scale, ¾ inch to a foot: length, 30 feet; breadth, 9½ feet; depth, 4½ feet.

30 **Lee, George**, *Tweedmouth, Berwick.*

Model of life-boat (coble). Scale, 1 inch to a foot: length, 39 feet; breadth, 9 feet; depth, 4 feet.

31 **Lyons, George**, *Portsea, Hampshire.*

Model of life-boat. Scale, 1 inch to a foot: length, 24 feet; breadth, 6½ feet; depth, 3¾ feet.

32 **Milburn, George**, *Blyth, Northumberland.*

Model of life-boat (coble). Scale, 2 inches to a foot: length, 37 feet; breadth, 8 feet; depth, 6 feet.

33 **Orton, Reginald**, *Bishopswearmouth, Durham.*

Model of life-boat. Scale, 1 inch to a foot: length, 26 feet; breadth, 6 feet; depth, 2½ feet.

34 **Palmer, George**, *Nazing Park, Essex.*

Model of life-boat. Scale, 1 inch to a foot: length, 26 feet; breadth, 6¾ feet; depth, 3½ feet.

35 **Patterson, William**, *Bristol.*

Model of life-boat. Scale, 1 inch to a foot: length, 35 feet; breadth, 9½ feet; depth, 3¾ feet.

36 **Plenty, James, & Edward Pellew**, *Newbury, Berkshire.*

Model of life-boat and carriage. Scale, 1½ inch to a foot: length, 24 feet; breadth, 8 feet; depth, 4 feet.

37 **Robinson, Alexander**, *Hartlepool.*

Model of life-boat. Scale, 1 inch to a foot: length, 34 feet; breadth, 11 feet; depth, 4 feet.

38 **Robinson, Daniel**, *Gosport.*

Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 7¾ feet; depth, 4 feet.

39 **Robinson, William Wharton**, *Hartlepool.*

Model of life-boat. Scale, 1 inch to a foot: length, 36 feet; breadth, 12 feet; depth, 4 feet.

40 **Saxby & Brain**, *Bonchurch, Isle of Wight.*

Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 7 feet; depth, 4 feet.

41 **Semmens, J., & Thomas W.**, *Penzance.*

Model of life-boat. Scale, 1 inch to a foot: length, 30½ feet; breadth, 7½ feet; depth, 3¾ feet.

42 **Severn, Henry Augustus**, 21 *James Street, Buckingham Gate, London.*

Model of double life-boat. Scale, ½ an inch to a foot: length, 30 feet; breadth, 8 feet; depth, 4½ feet.

43 **Sharpe, Benjamin**, Lieutenant, R.N., *Hanwell Park, Middlesex.*

Model of life-boat. Scale, 1 inch to a foot: length, 30 feet; breadth, 5 feet; depth, 3 feet.

44 **Sinclair, Duncan**, 122 *Oxford Street, London.*

Model of life-boat. Scale, 1 inch to a foot: length, 30¼ feet; breadth, 11 feet; depth, 4¼ feet.

45 **Slater & Wright**, *Whitby, Yorkshire.*

Model of life-boat. Scale, 1 inch to a foot: length, 31 feet; breadth, 9 feet; depth, 3¾.

46 **Sparke, William**, *Exeter, Devon.*

Model of life-boat. Scale, 1 inch to a foot: length, 35 feet; breadth, 7 feet; depth, 4 feet.

47 **Teasdel, William**, *Great Yarmouth, Norfolk.*

Model of life-boat. Scale, 1 inch to a foot: length, 32 feet; breadth, 10½ feet; depth, 3 feet.

Model of life-boat. Scale, 1 inch to a foot: length, 36 feet; breadth, 10½ feet; depth, 3½ feet.

48 **Thompson, John**, *Rotherhithe, London.*

Model of life-boat. Scale, 1 inch to a foot: length, 32 feet; breadth, 10 feet; depth, 3½ feet.

49 **Tredwen, Richard**, *Padstow.*

Model of life-boat. Scale, 1 inch to a foot: length, 32 feet; breadth, 6 feet; depth, 3½ feet.

50 **Turner, George**, *Devonport*, Senior Assistant to Master Shipwright in H.M.'s Dockyard.

Model of a safety gig for the coast guard. Scale 1½ in. to a foot: length, 36 feet; breadth, 5 ft. 10 in.; depth, 2 ft. 7 in.; weight of boat and gear, 18 cwt.

51 **Wake, Thomas, & Son**, *Sunderland.*

Model of life-boat. Scale, 1 inch to a foot: length, 34 feet; breadth, 10¾ feet; depth, 3½ feet.

52 **Wake, W. M., & R. F.**, *Sunderland.*

Model of life-boat. Scale, 1 inch to a foot: length, 36 feet; breadth, 9 feet; depth, 4 feet.

53 **Whettem, James**, *Portsea, Hampshire.*

Model of life-boat. Scale, 1 inch to a foot: length, 26 feet; breadth, 7½ feet; depth, 2½ feet.

54 **White, Thomas & John**, *Cowes, Isle of Wight.*

Model of life-boat. Scale, 1 inch to a foot: length, 32 feet; breadth, 8 feet; depth, 3 feet.

Model of a safety galley. Scale, 1 inch to a foot: length, 25 feet; breadth, 7 feet; depth, 2½ feet.

136A **Hawks, W. R.**, *Plantation House, Robin Hood's Bay, near Whitby*—Inventor and Manufacturer.

Model of life-boat, emptying itself, when full of water, in the short space of four seconds, by means of two apertures in the bottom.

137 **Fawens, George**—Inventor.

A life-boat, of wood and cork. It is provided with 12 air-tight compartments, lined with gutta percha, containing nearly 100 cubic feet of air, and three scuppers on each side of her keel for the egress of water.

138 **Milburn, G.**, *Blyth, Northumberland*—Inventor.

Model of a life-boat.

139 **McLaren, William**, 74 *High Street, Camden Town*—Manufacturer.

Model of an 80-gun line-of-battle ship, fully rigged, sails bent, &c. Built entirely of variegated woods.

140 **Constable, Henry**, 22 *Queen's Gardens, Brighton*—Designer.

Model of Lord Nelson's mode of attack on the combined fleet off the Cape of Trafalgar.

141 **Bilbe, Thomas, & Co.**, *Nelson Dock, Rotherhithe*—Inventor.

Model of a merchant ship. The frame timbers are

as formerly used. This plan

smallness of the bevellings and elongation of the curves.

142 **Colegrave, Francis dward**, *Round Hill House, Brighton*—Inventor.

Model of a brigantine, rigged and fitted with patent anchor, spring cable, and lanyard springs.

The patent spring is intended to diminish the strain on the rigging and anchor cable of vessels.

143 **Brookes, Henry**, 46 *Mornington Pl., Hampstead Road*—Proprietor.

Patent canal and river steam-tug, for hauling vessels on canals or narrow rivers, having neither paddles, wheels, nor screw propeller, with a double keel, and a well or trough between them, which may be closed at top or bottom, or both, to form a hollow chamber or tube, inclined from the centre to the bottom at each end. Across this well at the centre are two wooden wheels, one over the other, which are driven by the steam engine. Along the bottom of the canal or river a flexible iron band or rail is laid about two inches and a half wide by one-eighth of an inch thick. This band being raised up into the well and laid between the two wheels, the upper wheel is screwed down and it becomes tightly compressed between them. As these wheels revolve, the band is drawn rapidly through them from stem to stern, when it again sinks to the bottom.

---

144 **MUMFORD, WILLIAM THOMAS**, 19 *Edward Street, Deptford*—Inventor.

A model of the paddle-box of a steam frigate of 600 horse-power, with wheel and paddle-box boat, illustrating a plan for shipping and unshipping the boat. The machinery consists of two straight davits, 8 feet 6 inches long, and two vertical stanchions, 11 feet 6 inches long, blocks and rigging, by the application of which the boat may be hoisted on or off with facility.

Model of a gun-carriage for working a gun at a bow, broadside, or stern-port; it can be used with ease when the ship's bow or stern flares out at an angle of 25 degrees, and when wanted at a broadside port, the fore trucks can be fixed, and the slides removed immediately.

145 **ADMIRALTY, SOMERSET HOUSE**—Producer.

Series of Half-Models of Ships-of-War, fitted with Screw-Propellers :—

1. St. Jean d'Acre, of 100 guns, building at Devonport.
2. Agamemnon, of 90 guns, building at Woolwich.
3. Impérieuse, of 50 guns, building at Deptford.
4. Arrogant, of 46 guns, at sea.
5. Tribune, of 30 guns, building at Sheerness.
6. Highflyer, of 20 guns, building at Blackwall.
7. Archer, of 12 guns, at sea.
8. Cruizer, of 16 guns, building at Deptford.
9. Reynard, of 10 guns, at sea.

---

146 **ADMIRALTY, SOMERSET HOUSE**—Producer.

Series of Half-Models of Sailing Ships belonging to the Royal Navy :—

1. The Queen, of 116 guns, flag-ship in the Mediterranean.
2. Albion, of 90 guns, employed in the Mediterranean.
3. Hannibal, of 90 guns, building at Deptford.
4. Cæsar, of 90 guns, building at Pembroke.
5. Superb, of 80 guns, employed in the Mediterranean.
6. Cressy, of 80 guns, building at Chatham.
7. Cumberland, of 70 guns, flag-ship in the West Indies.
8. Emerald, 60-gun frigate, building at Deptford.
9. Narcissus, 50-gun frigate, building at Devonport.
10. Diamond, 28-gun frigate, in ordinary at Sheerness.
11. Arachne, 18-gun sloop, at Devonport.
12. Siren, 16-gun brig, at Sheerness.
13. Pilot, 12-gun brig, employed in the East Indies.
14. Britomart, 10-gun brig.

Series of Half-Models of Experimental Frigates of the Royal Navy :—

1. The Arethusa, of 50 guns. 2. Indefatigable, of 50 guns. 3. Leander, of 50 guns. 4. Phaeton, of 50 guns—all of the Experimental Squadron.
5. Raleigh, of 50 guns, in ordinary at Portsmouth.
6. Nankin, of 50 guns, in ordinary at Chatham.
7. San Fiorenzo, of 50 guns, building at Woolwich.
8. Thetis, of 38 guns, employed on south-east coast of America.
9. Inconstant, of 36 guns, in ordinary at Devonport.
10. Eurydice, of 26 guns, in ordinary at Portsmouth.
11. Spartan, of 26 guns, in ordinary at Devonport.

Series of Half-Models of Experimental Brigs in the Royal Navy :—

1. Flying-fish, 12 guns, West Coast of Africa.
2. Espiegle, 12 guns, in ordinary at Sheerness.
3. Daring, 12 guns, in ordinary at Chatham.
4. Osprey, 12 guns, wrecked at New Zealand.
5. Mutine, 12 guns, wrecked in the Mediterranean.
6. Waterwitch, 10 guns, in ordinary at Chatham.
7. Pantaloon, 10 guns, Cape of Good Hope Station.

Whole Models of Ships belonging to the Royal Navy :—

1. Queen, of 116 guns, flag-ship in the Mediterranean.
2. Royal Albert, 120 guns, building at Woolwich.
3. Vanguard, 80 guns, in ordinary at Devonport.
4. Cumberland, 70 guns, flag-ship in the West Indies.
5. Vernon, 50-gun frigate, in ordinary at Chatham.
6. Pique, 40-gun frigate, in ordinary at Portsmouth.
7. Siren, 16-gun brig, in ordinary at Sheerness.

Models of Bows, Sterns, and Transverse Sections of Her Majesty's Ships :—

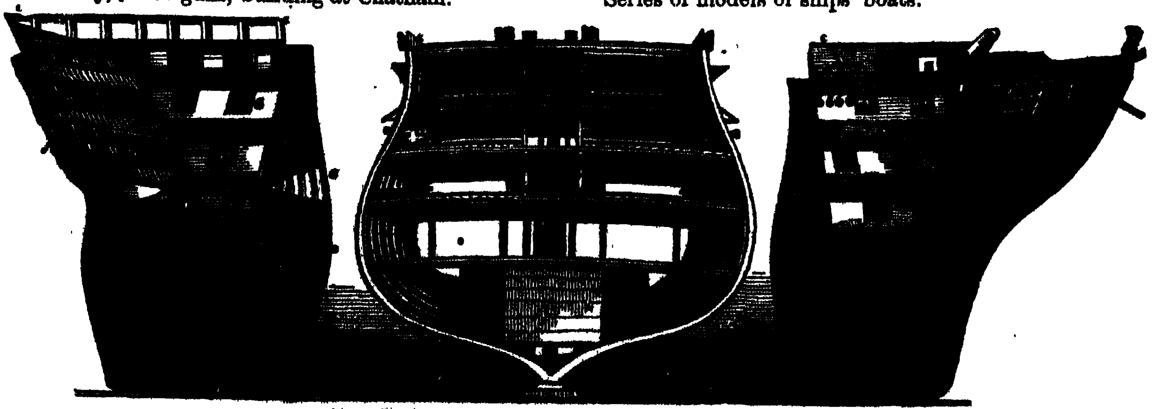
Bow, stern, and transverse sections of H.M.S. Queen. These sections exhibit the most important features in the construction of the ship—the arrangement of her decks and the mould of the bow and stern.

Bow and stern of H.M.S. Albion.

Bow, stern, and transverse section of H.M.S. Vanguard and H.M.S. Pique.

Stern of a 50-gun and a 60-gun frigate.

Series of models of ships' boats.



Bow, Stern, and Transverse Sections of H.M.S. "Queen."

147 **CAMPBELL, ALEXANDER F.**, *Great Plumstead, Norwich*—Inventor and Patentee.

Patent ship propeller in the model of a vessel with steam machinery, two blades revolving.

Model of a screw steamer.

---

148 **TWYMAN, H.**, *Ramsgate*—Manufacturer.

Model of a lugger used on the coast for rendering assistance to vessels in distress.

149 **MARE, C. J. & Co.**, *Orchard Yard, Blackwall*—Designers and Manufacturers.

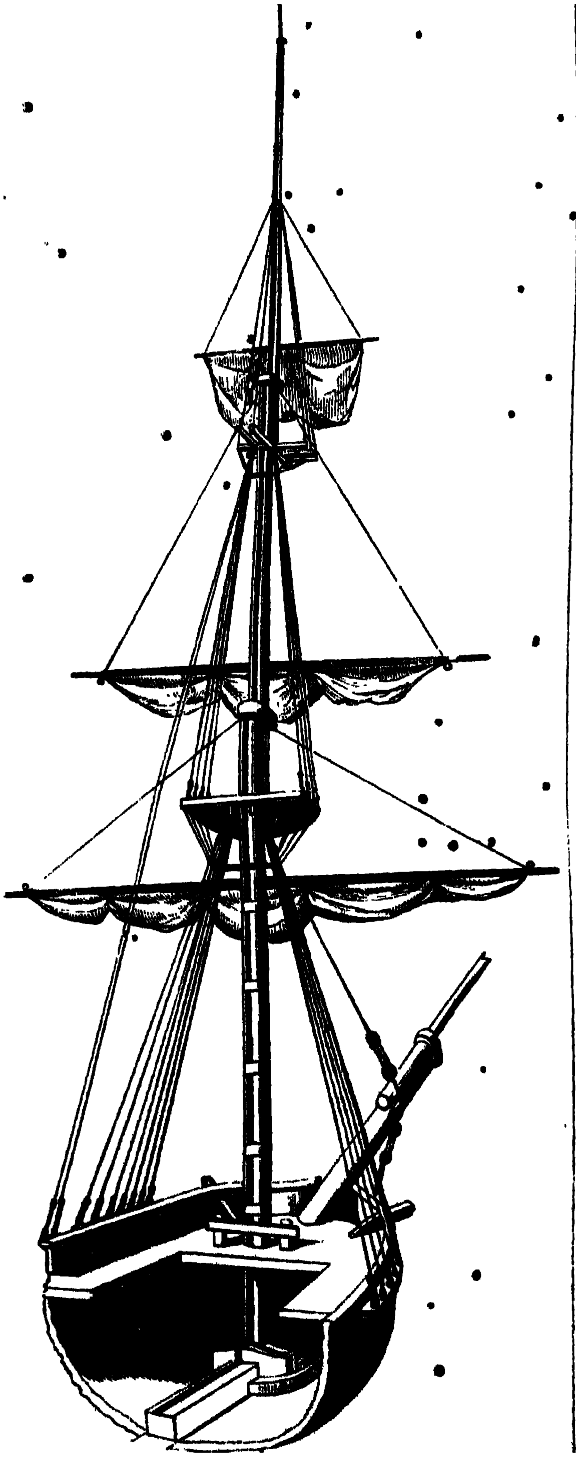
Model of Her Majesty's iron screw steam-yacht, "Fairy."

Model of iron steam-vessels built for the Emperor of Russia, the Viceroy of Egypt, &c.

150 **HARRIS, Sir WILLIAM SNOW**, *Plymouth*—Inventor.

Practical models, illustrative of the system of conductors employed to protect Her Majesty's ships from lightning:—1. General plan and construction of the conducting plates, showing the alternate joining of the plates. 2. Line of conduction on the masts from the vane to the step. 3. The conductor as applied to a topmast. 4. General plan of the hull, with connecting branches and bolts communicating in various points with the sea, viz.: by the keel, at the sides; and at stem and stern. 5. Preparation of the step of the mast, with part of the keelson. This method of preserving ships against the effects of lightning has proved efficacious; and it requires no care or interference on the part of the officers or crew. Since the full employment of this system in the Navy, no damage from lightning has been recorded.

Fig. 1.



Sir W. S. Harris's Lightning Conductors.

Fig. 3.

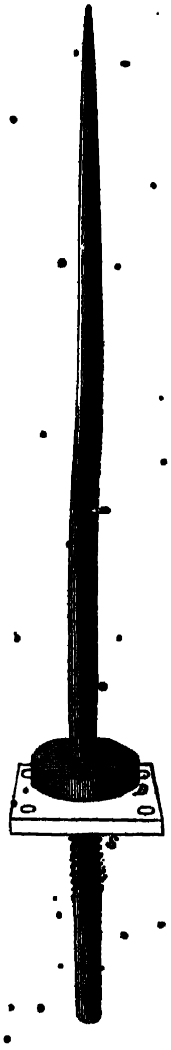


Fig. 2.

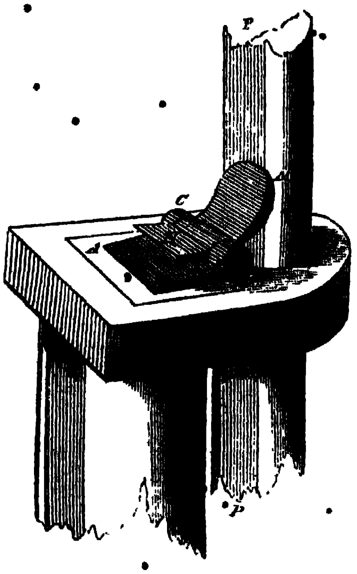

Fig. 4.

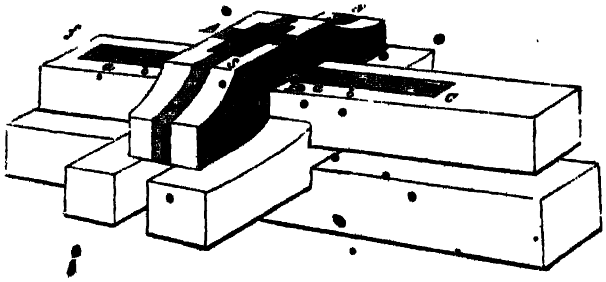

Sir W. S. Harris's Lightning Conductors.

Fig. 1 shows the line of conduction on the masts from the vane spindle to the step.

Fig. 2 represents the moveable tumbler at the junction with the caps, in which A D is a copper plate fixed on the cap, N M an angular plate set on the hinge C D. P the conductor on the mast. This hinge is sometimes covered with a small saddle of wood, to prevent its being damaged.

Fig. 3. The vane spindle; in which *s t* is the portion inserted into the royal mast: *s* the thread of a screw for securing it: D a thick cylindrical base, with a hole at D for a small lever.

Fig. 4. The step of the mast and portion of keelson. A B, M N the transverse and longitudinal branches passing round the step, and through the mortice at S. *f c* the branch over keelson; bolts *a b c*.

[The several nautical and scientific conditions, which this system of lightning-conductors in ships professes to satisfy, are as follow:—

The conductors are capacious, and always in place, consequently ready to meet the most unexpected danger, at all times, and under any circumstances, in which the general fabric in all its casualties may become placed. The system of conductors, whilst being permanently fixed throughout their whole extent, still admit, upon demonstrable principles of electrical action, the perfect motion of the sliding masts one on the other, or of any part of the mast being removed either by accident or design, without for an instant interfering with the protecting power. The conductors are independent of the officers or crew of the ship; so that the sailors are never required to handle or replace them, often a very perilous and annoying service. The conducting plates are quite clear of the standing and running rigging: the whole series is calculated to resist external violence, and at the same time yield to any flexure or strain incidental to the spars to which they are applied. Finally, the whole system is so arranged, that a discharge of lightning falling on any part of the ship could scarcely enter upon any circuit in its course to the sea, of which the conductors did not form a part; hence arises that perfect security which experience has shown to be derived from such a system.

In the original conception of this system, the inventor was led to consider the electrical discharge, as seen in the phenomenon of lightning, to be an explosive form of action of some unknown agency in nature when forcing its way through resisting matter, such as air, all vitreous and resinous bodies, and some other kinds of matter; whilst in traversing other bodies, offering but a very small resistance to its progress, this explosive form of action we call lightning becomes transformed into a sort of comparatively quiescent current. The attempt was, therefore, to bring a ship, as far as possible, into that passive or non-resisting state which she would possess as regards the electrical discharge, supposing the entire mass were metallic throughout, so that, from the instant the agency of lightning struck upon any portion of the masts aloft, the explosive action would vanish, and the electrical discharge be prevented from traversing the vessel under the form of lightning. The following extract from the official journal of H.M.S. Conway, 28, whilst proving, by a great natural experiment, in common with numerous other cases, the truth of this deduction, is of no ordinary interest in practical science:—

"Port Louis, Isle of France, 9th March, 1846, 11.45 A.M. The pendant staff at main-top mast-head was shivered in pieces by lightning, Harris's conductor carrying off the fluid without further damage."

The ship was refitting at this time, and the top-gallant masts on deck, so that a small spar was set up at the top-mast head as a temporary support for the pendant; this spar had not, consequently, any conductor on it. It is seen by the ship's journal, that the spar was shivered in pieces by the explosive action, which became immediately transformed into a comparatively quiescent current on reaching the line of conduction.

The report of the thunder was as if one of the main-deck guns had been fired. The gunner, who was sitting in his berth, immediately under one of the lateral branches of the conductor passing through the ship, saw, through the scuttle port, a brilliant blaze of light from the ship upon the sea, but experienced no inconvenience.]

151 **HUSBAND, J.**, *Mylor, Falmouth*—Inventor and Constructor.

Model of a new life-boat.

Frame of a merchant ship, showing a plan of securing heads and heels of timbers, without chocks or dowells.

152 **ALDEBERT, I.**, 57 *Long Acre*—Inventor.

Model of a first-class frigate.

153 **TURNBULL, ROBERT**, *South Shields*—Designer.

Model of the hull of a merchant ship, of 867 tons O. M., built according to Lloyd's rules, on a scale of a quarter of an inch to the foot.

154 **TURNBULL, EDWIN**, *Whitby, Yorkshire*—Manufacturer.

Models of a 74-gun ship, of the time of Lord Nelson, and of the steam-ship "Phœnix."

156 **HALL, JAMES**, *Bromley, Bow, Middlesex*—Proprietor.

Models of ships' rudders, and a plan for wearing a ship without a rudder.

157 **BELL, HUGH**, *Baltic Wharf, Millbank*—Inventor and Manufacturer.

Life-boat, for the beach, on the scale of 1 inch to the foot. One end of the boat. The lines representing the manner in which the two layers of planks should cross each other, and the keel and keelson in single planks from gunwale to gunwale. It is intended that there should be a waterproof elastic material between the layers of planks, to prevent escapage, and to diminish the effect of concussion.

Gutta-percha canister fitted into the boat. Copper canister, which may fit the same end of the boat. Scoop to bale out the water after the plugholes are stopped. Cradle for transmitting every kind of boat from place to place on land. A set of boats in the position of a ship's long boat, intended for emigrant passenger, troop ships, and men-of-war.

158 **BROWNE, WM. CHESELDEN**, *Totness, Devonshire*—Inventor.

Model of "The Princess Royal," 120-gun ship, made of wood and card-board.

159 **HARVEY, D.**, 3 *Cumming Place, Pentonville Hill*—Inventor.

Model of Her Majesty's royal yacht "The Victoria and Albert," on a scale of one-eighth of an inch to the foot; and of "The Fairy," screw yacht, on a scale of one-eighth of an inch to the foot. A tender to the same. Also of a 46-gun frigate, on a scale of three-eighths of an inch to the foot. It is not modelled in the usual way, but is practically built, with frame timbers, and planked over, having one plank streak left out to show the disposition of the timbers.

160 **GRAY, JOHN**, *Newhaven, Sussex*—Ship-builder.

A mechanical model of a South Sea whale fishery ship, on a scale of ½ inch to the foot, with all the lengths of timbers, plank, &c., properly shifted, butted, and fastened as required by Lloyd's rules to Class 12 A 1 in the registry; as also in every other part of the model as far as it is completed. There are in the frame 611 separate timbers, 19 lower and 22 upper deck beams, 1,844 treenails, 4,710 bolts.

161 **HORN, HENRY**, *Victoria Cottage, Kingston, Portsea*—Manufacturer and Designer.

Model of a 12-gun brig, on a slip for launching; scale a quarter of an inch to a foot.

162 **WHITE, —,** Producer.
Model of the "Samuel Enderby."

163 **MILLER, RAVENHILL, & Co.,** *Ratcliff and Blackwall*—Engineers and Ship-builders.
Model of the "Jupiter" steam-boat, running between Blackwall and Gravesend. Designed by Edward Pasco.

164 **ROSE, JOHN THOMAS,** *Regent Street, Leith*—Designer.
Model, in oak, of a Roman war-galley (Quadrireme), illustrative of Mr. Howell's theory of the Polycrota.

According to this theory, the "banks" were reckoned in the direction of the galley's length, and not from the number of tiers as generally supposed. On the common theory, Ptolemy Philopater's galley, of forty banks of oars, must have been nearly two hundred feet in its height from the water; on the above theory it need not have exceeded ten feet. The oars (40 in number) are put in motion by a handle at the side.

165 **SMITH, HENRY,** 208 *Rotherhithe Street, Rotherhithe*—Manufacturer.
A built model of the barque "Ealing Grove," on a scale of one-third of an inch to a foot, one side left open to show the construction.

166 **HOLL, J. & Co.,** *Vauxhall Wharf*—Inventor.
Model of a barge.

*** From 167 to 180 in East End Prussian Gallery South.*

167 **WENTZELL, A.,** *Lambeth*—Manufacturer.
Light gig, built of mahogany, maple, and chesnut, with carved back and morocco seat. Racing boat, built of mahogany and maple.

Model of a registered life-boat, built with tumblehome sides, the sides and ends divided into compartments, the bottom perforated so that the water finds its level as fast as the sea breaks over it.

168 **FORSTER, JOHN & THOMAS,** *Streatham*—Inventors.
Boat, built of wood coated on both sides with a compound of gutta percha and India rubber. Sections of boats and small cases, of the same. Samples of waterproofing. Accoutrements made of the same. Specimens showing the effect of shot.

169 **SEARLE, GEORGE, & SONS,** *Stangate, Lambeth*—Manufacturers.
Model of the state barge of the Lord Mayor of London—scale, 1 inch to a foot. (*Main Avenue West.*)

Boat, called, on the Thames, a pair-oared gig.

169A **BROWN, JOSEPH,** 71 *Leadenhall Street*—Inventor and Manufacturer.
Registered portable raft for the preservation of life from shipwreck, &c.

Patent double-action sofa bed, intended to prevent sea sickness.

Patent fire-escape; it forms a raised platform, and may be used as a scaffold, for exterior decorations, &c.

170 **LAPTHORN, JAMES,** *Gosport, Hants*—Sailmaker.
Model of a brig yacht, 450 tons, with spars and sails.

171 **RUTHVEN, MORRIS WEST,** *New Street, Edinburgh*—Inventor and Patentee.
Model of a steam-vessel, with improvements in propelling and navigating. To the engine shaft is attached wheel, working in a water-tight case, to which water is supplied, and from which it is allowed to escape by a pipe, terminated by a nozzle on either side the ship, which by universal joints can be raised or, depressed to any angle, directed forwards, backwards, or downwards simultaneously or alternately, thereby giving a greater or less speed to the ship either ahead or astern, or causing her to remain stationary; or by placing one nozzle ahead and the other astern the vessel is made to go about or alter her course, so that if the rudder be carried away those on deck can affect her motion or speed without altering that of the engine.

172 **SHULDHAM, MOLYNEAUX,** *Melton, Woodbridge*—Inventor.
Patent revolving masts, &c. The assumed utility of the invention consists in causing the masts to revolve, by which manual labour in the evolution of "tacking" is avoided.

These masts are adapted to yachts, despatch vessels, and coast cruisers; but more particularly to coasters or vessels voyaging in intricate navigations, or in the Arctic Seas.

Illustrations of a method of ballasting vessels, combined with the revolving rig.

A boat made to show a method of constructing a revolving mast, adapted for small boats, and for two-masted luggers, up to 20 tons, by the aid of a spreader for one, or a pair of shrouds, with an apparatus to show that the plan is also adapted for small pleasure-boats.

173 **PENRICE, Lieut., R.E.,** *Ordnance Survey, Hull*—Inventor and Proprietor.
Model of the stern of a vessel, with a new propeller and machinery, the object being to obtain a more direct reaction, less slip, and greater velocity of stroke. Registered April, 1851.

Fig. 1.

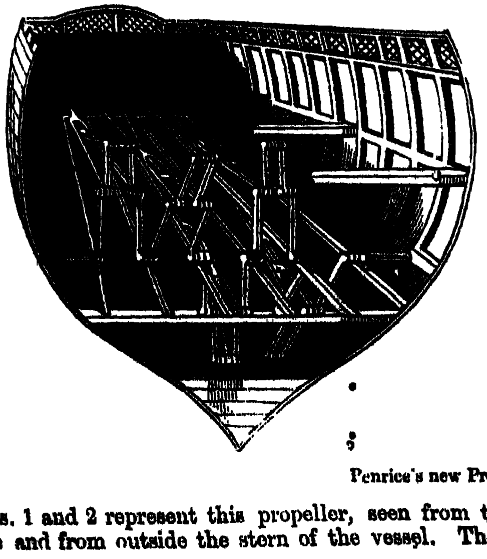

Fig. 2.

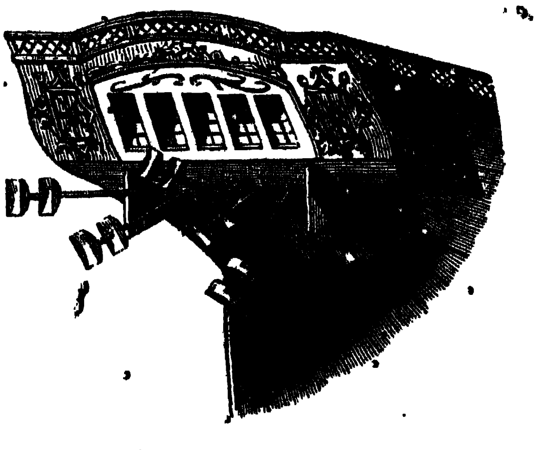


Penrice's new Propeller for Steam vessels.

Figs. 1 and 2 represent this propeller, seen from the inside and from outside the stern of the vessel. These figures also indicate the peculiar mechanical arrangements, giving the propellers their propulsive movement.

174 **DEMPSTER, HENRY**, 1 *Cannon Street, Hamburgh Place, Leith*—Inventor.

Drawing of a simple telegraph, being a system of sea signals, which, by means of colours, indicate the letters of the alphabet, numbers, and the points of the compass.

Mast with model flag of the true size.

---

176 **PILKINGTON, JOHN**, *Goole, Leeds*—Inventor.

A wrought-iron keelson, for wood-built ships. Its object is to give a greater degree of strength and durability, without any additional dead-weight, and to obviate the great difficulty in obtaining suitable lengths and sizes of oak timber. This keelson being tubular and perfectly water-tight, assists in ballasting vessels when clear of cargo, by opening a valve to admit water; it is afterwards let off into the bottom of the ship, and pumped out in the ordinary way. The keelson may be used as a water-tank.

[By lowering the centre of gravity of a ship its stability is increased; the best position for the ballast, therefore, is the lowest, viz., the keelson.—S. C.]

---

177 **CORTE, —**, Inventor.

Model of a rocket apparatus.

178 **NOULTON & WYLD**, *Fore Street, Lambeth*—Manufacturers.

London outrigger sculling boat, for racing; the body of this boat is in one plank, from head to stern, and side to side, without a join or reel, and "is the first boat so built;" by this means a more beautiful mould can be obtained, and less resistance is offered to the water.

Model of an eight-oared shallop, with awnings; with an improved mould of floor and bow.

179 **BIFFEN, WILLIAM**, *Hammersmith*—Inventor and Builder.

A rigged portable boat, the length of which may be reduced from 30 feet to 10. In case of accident to any compartment this boat will still float with her rower.

180 **HUBBARD, CHARLES**, *Dickleburgh, near Scole, Norfolk*—Inventor.

Gutta percha portable boat, for crossing detached inland waters; it carries two persons, and weighs only 30 lbs.

Miniature working model of a portable machine for climbing precipices; illustrated by a model of the crags of the Orkney coast.

Case of ornithological specimens.

⁂ *From 181 to 197 with Class 5, Ground Floor North.*

181 **BROOKER, JAMES**, *Maryport*—Designer.

Figure-head: Ceres picking up the veil of her daughter Proserpine.

---

182 **GLADSTONE, JOHN, jun., & Co.**, *Liverpool*—Manufacturers.

Model of ship's windlass purchase, for raising anchors, chain-cables, and other heavy weights on board ships. Sufficient to ride the ship without the possibility of having the windlass upset. With this machine less than half the usual number of hands are required to weigh the anchor, &c.

[The ordinary ship's windlass is a spindle-shaped beam, polygonal in transverse section, acting horizontally at right angles to a line bisecting the ship from stem to stern, and working in and bearing upon stanchions, called "knight-heads," strongly fixed to the ship's deck and deck timbers, immediately abaft the foremast. The use of the windlass is to raise or weigh the anchor by means of the cable, which is made to take a turn round the windlass beam, whose spindle shape enables it to present itself at right angles to a line drawn from either hawse-hole, under which the anchor may lie, for the ship is hove short upon her anchor by means of the more quickly moving but less powerful capstan, before the windlass is called into action. The "purchase" of a windlass is the power applicable to work it, or rather the means provided, as the handspike levers in ordinary use, of applying the power of the men to turn the beam, and wind or hoist up the anchor by its cable. Nothing can exceed the simplicity or the strength of the ordinary ship's windlass, having regard to the size and strength of the ship herself; but there is room for improvement in the power and in the speed of a windlass, and the means of doing the same work with fewer hands would be a great advantage.—W. H.]

---

184 **FERGUSON, C. A. & T.**, *Mast House, Mill Wall, Poplar*—Inventors and Manufacturers.

Model representing a mast 99 feet long and 33 inches diameter: the principal objects of which are, economy in the first cost of materials, and the practicability of building large masts with small timber.

An improved fid for ships' or steam-vessels' topmasts and topgallantmasts, also for cutters' bowsprits, to facilitate striking the same, without any necessity to ease off lanyards, or heaving on the heel rope.

Also a model of the fid, showing its action.

Two models of sections of deck, stanchions, &c., of a ship of war, with improved gun, for increasing the angle of horizontal pointing, and for projecting outboard at bows, sterns, and quarters, where the rake is so great; fitted with angle-meter, which will show the true position of the gun. (Gun invented by H. R. Caselli.)

Registered gun-carriages and appurtenances, showing the action of the improvements for working them.

Blocks, with sheaves and pins for them, showing the different improvements introduced.

The old principle, wood sheave and pin. The iron-coaked sheave and iron pin. The brass-coaked sheave and turned iron pin. The anti-friction gun-metal roller-coaked sheave and turned iron pin; and the highly compressed leather-coaked sheave, and turned iron pin.

185 **ANSELL, CHARLES**, *Tottenham*—Designer.

Sailing gun-punt on a new plan, with water-tight bulkheads, and the mast so placed as to allow the gun to be fired when under sail. Tackle for the same, capable of being stowed within board. Adapted for wild-fowl shooting on the coast.

Stanchion gun, with stub twist barrel, and improved spring, composed of discs of vulcanized india rubber, to ease the recoil. Range, 150 yards.

186 **WELD, JOSEPH**, *Lulworth Castle, Wareham*—Designer.

Model of a 12-gun brig-of-war, built on scientific principles, calculated to insure fast sailing.

187 **ANDERSON, J.**, *North Shields*—Inventor.

Model of a life-boat.

188 **JEFFERY, WALSH, & Co.**, *Marine Glue Works, Limehouse*—Inventors.

Specimens of patent elastic, adhesive, and insoluble marine glue, showing its utility in naval architecture, and its durability and cleanliness.

Piece of the mast of the "Curaçoa," found inseparable, even by the wedge, on return from South America.

Piece of mast tested by the hydraulic press—22 tons required to remove one splinter—joints remaining perfect, giving an additional strength dispersed over the internal surfaces of a first-rate's main of 3,304 tons.

Section of the same, showing fracture.

Jib tongued and joined with glue.

Block of elm joined with glue and exploded with powder; the joint remaining entire.

Piece of glued deck; the interior of the vessel destroyed by fire.

Oak cannon ball joined and fired with 8 oz. powder at Woolwich, in 1842, at an angle of 45 degrees, at the request of the late Sir I. M. Brunel, to try the effect of concussion on the joint when rebounding on the earth in its fall; the joint remaining entire.

Deal block; square foot of surface glued; wood broke at 4 tons, thus giving, at 3 tons per foot, upwards of 25,000 tons additional strength dispersed over the hull of a first-rate.

Model mast exploded with powder, rending the timber but not the joints; the glue confining the splinters; with section of the same.

Model mast, made of northern seasoned timber; durable and strong; with section of the same.

Circular timber, converted from the straight by means of the glue.

Mahogany deck, payed with marine glue.

Two seams payed with glue, and two with pitch, exposed to the same temperature; showing the effect of the sun on topsides of vessels under the line.

In the construction of made-masts, the marine glue admits of small seasoned Dantzic, or northern timber, being used instead of yellow pine. Upwards of 200*l.* is said to be saved in one mast, in its first construction, and upwards of 25,000 tons additional strength dispersed over the hull, and 6,384 tons over the internal surfaces of the masts of a first-rate ship. This calculation is under the actual strength, being calculated at three tons per square foot instead of four—the timber's breaking strain.

A Commission recently appointed by the Admiralty, to collect evidence and report their opinion on the value of the marine glue, for the use of the invention in Her Majesty's Navy, collected evidence to this effect, viz.:—That out of the 130 vessels which have been glued in the Royal Navy, one caulking and paying with glue has been found equal to three times with pitch; besides other valuable evidence as to its cleanliness, security, and comfort to crews.

At an examination, some months since, in Sheerness yard, of the masts and bowsprits of five line-of-battle ships, all made since 1841-2, of yellow pine timber without marine glue, 16 out of 20 were found rotten and condemned, although the masts of three of the ships had never been in commission; while all the masts and yards made with marine glue, in 1842-3, have been found, on their return from foreign service, inseparable even by the wedge, as testified in official reports.

The rapid rotting of yellow pine masts made on the old method is well known; and it was as a remedy for this that the committee of master shipwrights attached the highest importance to the marine glue; stating—"that should it be found to retain its great adhesive force, after years of trial in a tropical climate, masts for the future might be made of small seasoned timber, and a great saving effected throughout the navy."

[Decks, or rather the joints between the planks which form the floors or decks of ships, are usually caulked with oakum; the joints being merely narrow spaces which the caulking fills up. The joints are made open, that the planks, being of wood, may have room to swell when wetted, and the caulking ought to be so elastic as to yield to compression, and return again upon the shrinking of the planks in dry weather, and capable at the same time of resisting water. These requisites, oakum, with the admixture of a little tar, is found to possess in a great degree, and, aided by a paying of pitch on the surface of the seam, answers very well for the caulking of lower decks. Pitch is useless for this purpose on upper decks. Any substance possessing the qualities above alluded to as requisites, being impervious to the weather, not liable to be destroyed by moisture, as ordinary animal glue is, and yet capable of being used and of acting adhesively, as being durable and cleanly, must be of value.

"Made-masts" are masts not in one tree, log, or spar, as to its transverse section, but made up or built of several pieces fitted together and hooped, as a cask is. It is difficult in practice to fit and bring together the parts of a made-mast so closely as not to require some packing in the joints, to aid the hoops in preventing movement among them, and to keep out water from the body of the mast. The glue referred to is intended to supply the packing, to cause adhesion of the parts of a made-mast, and to exclude the water.—W. H.]

---

189 O'CONNER, HUGH, *Limerick*—Inventor.

Model of a rotatory boat pump.

---

190 ANDERSON, ROBERT, *Westoe, South Shields*—Inventor.

Small pattern life-boat, clinker-built, fitted with air-tight ceiling, feathered and grooved up to her gunwales, forming an air-tight inner skin. This boat has a well or tank in her centre bottom, holding 44 gallons of water, with which it is ballasted when in the water with the crew on board;—and when the well is full, the valves shut down tight by their own weight. The boat is also provided with air-tight compartments in her bottom surrounding the well, to the sides and ends, rising at each end with nearly the same sheer as the gunwale and in other parts. The boat is intended to answer either for beach service or for a passenger ship or steamer; for the latter purpose it is fitted with two small self-working lug-sails, and a jib and a rudder to use when under sail. The well, in this service, can be filled with fresh water, and the air-cases with bread and provisions.

This boat has been severely tested in heavy broken water on the hard sand, and could neither be swamped nor upset.

---

191 TRAIL, ARCHIBALD, 8 *Upper East Smithfield*—Inventor and Patentee.

Patent storm sails: the novelty consists in the application of narrow corded bands of one inch in breadth, with cords wove therein, being sewn in reversed angular directions, on the fore and after part of the sail, the ends of which are spliced into the bolt rope. By this means the destructive effects of the wind are confined within the limit of the diamond (being about 46 inches), and the sail wears much longer, by equalizing the strain over all its parts.

---

192 ADDISON & GILBERT, *Emmett Street, Poplar*—Inventors.

Two models, one of a patent main-topsail, and the other of a patent jib, showing the graduated variation in the width of the seams used in making sails; intended to give greater strength and durability to the sails, with less canvas.

---

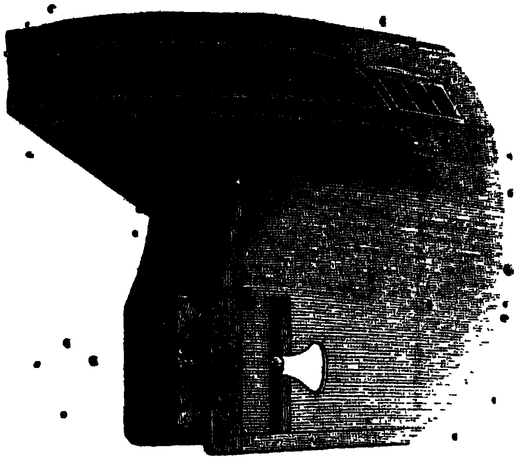
193 ROBINSON & RUSSELL—Builders.

Model of a Prussian war steamer.

---

194 CARPENTER, E. J., Capt., *Senior United Service Club*—Inventor and Patentee.

Duplex rudder and screw propeller.—The engraving represents a stern view of a vessel with two rudders and two screw propellers, fitted in new positions for improved steering and propelling. From the midship section of the vessel to the stern, no alteration is introduced into the form of the hull; but abaft this point they commence. First, the keel, with the dead wood, stern-post, and rudder, are removed, and the flooring above receives a suitable form for strength. Two additional keels lie in a line parallel with the former keel, but placed at a distance of two or more feet, according to the size of the vessel, on either side of it, terminating at the midship section in the fore-part, and in a line with the former stern-post in the after-part. Framework is carried down to these keels, leaving a free channel for the water to run between them in the direction of the midship keel. A stern-post is placed at the end of the additional keels, and upon each of them hangs a rudder.



Carpenter's Duplex Rudder and Screw-propeller.

A screw-propeller works in an orifice in each frame work, on the common arrangement. One of the propellers is a little more aft than the other, to allow full play to both, and yet economise space in the mid channel.

The appearance of the vessel in the water is not altered in the side view, neither is it much changed in the stern view.

The consequence of this new arrangement is, that the rudders and propellers are acting with double effect in each case. The rudders are receiving an increased power, because the impact of the water upon them takes place at an angle which is constrained by the situation of the keels, and which is the most favourable that can be had. The two propellers, also, revolving, as they do in water confined in a limited space, are working to considerable advantage. The effect actually produced is, that, when required, a vessel can be turned about in nearly half the space that a single rudder can turn it, and the two propellers will give a proportionate increase of speed.

The advantages gained by the new construction of the vessel are considerable. There will be more strength, more bearings in the run, and more breadth for cabin room. The rolling and pitching will be reduced very considerably. The vessel will not make lee-way as formerly; the vibration, or tremulous motion, will be lessened. The safety of the vessel will be very much increased, because the duplex rudder will have the effect of instantaneously changing the direction should she be running into some unexpected danger; also, if one rudder should be damaged, the other can be used to steer with. The propellers also can be used separately when required. For river navigation, the advantages obtained by the two rudders and two propellers will jointly enable the screw principle to be applied to steam-boats plying in shallow water, such as the Thames above London Bridge, or to vessels having small draught of water. For Trans-atlantic ships the use of the two rudders and two propellers will jointly ensure their making a passage in less time and at less expense than before, also with more certainty and safety than can possibly be done by a single screw or paddle-wheel.

The duplex rudder is applicable to paddle-wheel as well as screw steam-boats.

195 **LAURIE, R. W.**, 8 *Carlton Place, Lauriston, Glasgow*—Inventor and Patentee.

Various articles for the preservation of life and property at sea. Buoyant mattresses, mattresses forming boats, cushions, pillows, bolsters, and portmanteaus, constructed to support from one to ten persons in water.

Life-floats and belts, self-inflating, without valves.

Model of a life-boat, fitted with self-acting valves, and traversing shot-ballast. Should the boat, by accident, be upset, it will instantly right itself on either side, and empties itself of water in one minute. Constructed by Messrs. Forrester & Co., boat-builders, Limehouse.

Model of an apparatus called the "Otter," for manœuvring vessels at sea.

The two latter inventions are patented by the exhibitor.

197 **TAYLOR, FRANCIS**, 6 *Laurie Street, Leith*—Inventor and Maker.

Marine chair, that will support three persons in the water in case of accidents at sea; it is propelled by two short oars.

Deck seat, capable of supporting two persons in the water.

A portable chair or camp stool, on which two or three persons, each of them having an air-pillow attached to the breast, can propel themselves while in the water.

Model of a seat intended for steam-vessels, to a scale of three inches to a foot; a seat of this construction, eight feet long, will support upwards of twenty persons in the water, seven being placed in the middle compartment and the others holding on by the sides and ends.

The following models are made to a scale of one inch to a foot:—

Models of life-boats, which, if upset, will right themselves again, on carriages for conveyance, and for launching when brought to the sea.

Model of a substitute for a life-boat, seated for sixteen persons, which may be constructed by four or five men in a few hours, if materials be at hand, viz., two logs of light wood, or the yard of a ship cut across the middle, or a few planks of fir, and also timber for seats, &c., two large casks to be fastened at the extreme ends on the upper side. This, if upset, will right itself again; if thick boards can be got, long prismatic boxes may be made for the sides, which are much lighter than the solid sides.

Model of a life-boat, for eleven persons, the framed part considered to be a ship's fender of great length, and carried always with the ship, the tins on the extreme ends representing two water casks emptied and bunged up.

Model of a ship's fender; while used as such, having the gunwale-pieces and foot-board placed temporary on the outside of the frame.

Model of a substitute for a life-boat, supposed to be made of two halves of the yard of a large ship, and with other pieces of light wood, as fir.

Model of a ship's seat, to carry two persons, and having the oars fixed ready for using.

199 **NAYLOR, ISAAC**, *Monk Bretton, near Barnsley*—Inventor.

Patent alarm-gun for the protection of property and game. The number of barrels in the gun may be varied from four to twenty. It will explode at intervals of half a minute, in all kinds of weather.

200 **WILKINSON & SON**, 27 *Pall Mall*—Manufacturers.

1. A large stanchion, or punt gun, with gun-metal stock and spiral recoil spring, for wild-fowl shooting, on improved principles, with loading rods and apparatus, and moveable butt to admit of greater elevation in the boat.

2. A pair of best double-barrel fowling pieces, made to reverse (*i. e.* either pair of barrels to fit either stocks) with case and apparatus complete.

3. A patent rifle with the lock on the under side; the whole mechanism of lock, guard, trigger, and trigger-plate, consisting of only four pieces. Invented and manufactured by the exhibitor.

4. A series of illustrations, showing the different stages of the manufacture of gun-barrels:—

(A.) Horse-shoe nails, or stubs.
(B.) Old coach-springs, cut up by means of shears.
(C.) Scrap stub-iron.

(D.) A gun-barrel in its various stages, made of a mixture of stubs and steel (A. and B.), first twisted into a spiral, then partially welded by jumping, then completely welded, and the figure of the iron brought out by acids.

(E.) A bar of iron made from scrap (C), for Damascus twist.

(F.) A bar of steel, made from scrap (B.), for Damascus twist.

(G.) Twenty-one bars of iron and steel (E. and E.), packed alternately for welding

(H.) Twenty-one bars (G.) welded together.

(I.) A square rod made by drawing out the mass (H.) between rollers.

(J.) The square rod (I.) twisted round its own axis, and then flattened, showing the figure produced.

(K.) Specimen to show the manner in which the figure called Damascus twist is produced; two bars or rods (I.), are first twisted round their axis the whole length, the one to the right and the other to the left, then flattened and welded together, then twisted spirally to form the barrel as in (D.), partially welded by jumping, and the welding completed, filed at the end, and the figure produced.

(L.) A similar specimen, finer; composed of two bars of 48 alternations of iron and steel.

(M.) A similar specimen, composed of three smaller bars of 21 alternations.

(N.) A similar specimen, called "chain twist."

(O.) A similar specimen, called "steel Damascus."

(P.) A finished barrel, composed of seven different kinds of twist.

5. Presentation cimeter, of arabesque pattern, standard silver richly chased and gilt, ornamented with 104 precious stones, consisting of emeralds, rubies, turquoises, jacynths, topazes, amethysts, chrysolites, carbuncles, garnets, moonstones, &c. The blade made of temper equal to those of Damascus or Toledo, combines embossing with engraving on tempered steel, bluing and gilding, so as to form two elevations of ornamental pattern above the dead gold groundwork. Also, a gold sword-knot. The whole in mahogany case, lined with crimson velvet. purple and gold cord waist-belt, of oriental patterns with chased clasp, ornamented with precious stones, emeralds, jacynths, and large amethysts. (See figure.)

6. A series of all the regulation swords in use in the British army and navy, as originally submitted to the Commander-in-Chief and to the Lords Commissioners of the Admiralty, by the exhibitor, and approved and adopted by general orders:—

(*a.*) Regulation Infantry sword, as by general order dated March 10, 1845. (*b.*) Regulation sword for Royal Engineers. (*c.*) Light Cavalry and Royal Artillery sword. (*d.*) Heavy Cavalry sword. (*e.*) 1st Life Guards' sword. (*f.*) 2nd Life Guards' sword. (*g.*) Royal Horse Guards' (Blues) sword. (*h.*) Regulation Highland claymore. (*i.*) General officers' cimeter. (*k.*) Admiral's dress cimeter. (*l.*) Regulation sword for Royal Navy as per Admiralty order, dated November 23, 1847.

7. A sword worn by some of the Irregular Cavalry in India; the hilt of steel, electro-plated with silver; the scabbard of German silver.

8. A coat of chain mail, of tempered steel, electro-plated with silver; also a pair of gauntlets, bridle, &c., of the same material, as worn by some of the Irregular Cavalry in India.

9. Two helmets, covered with electro-plated steel chain mail, in gold and silver, to be used without a plume.

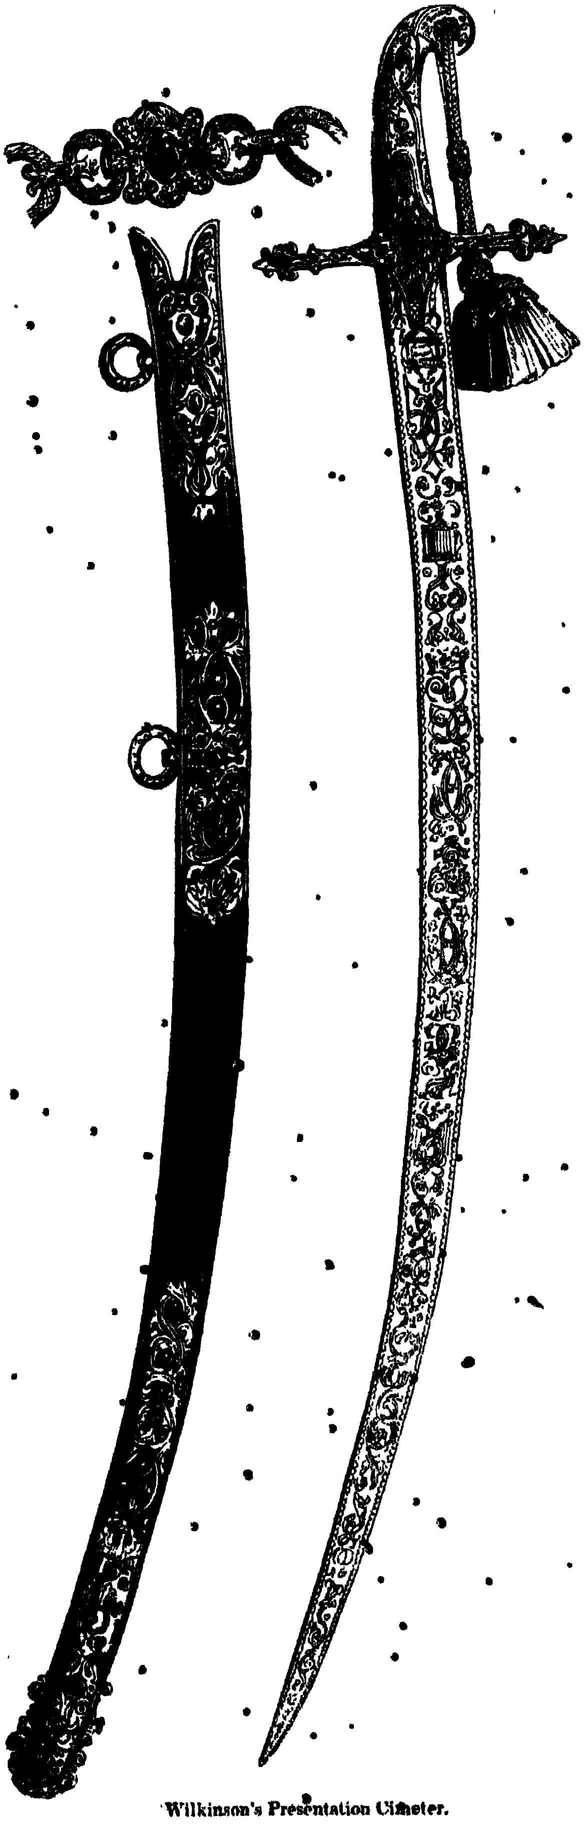
10. A Highland claymore, copied from an old one by Andrea Ferrara.

11. Regulation and other sword belts.

12. A Highland dirk, as designed and manufactured by the exhibitor, for Her Majesty's 74th Highlanders.

13. A series of illustrations, showing the different stages of the manufacture of sword-blades:—

(*a.*) Swedish bar iron. (*b.*) Blistered steel. (*c.*) Ingot of cast-steel. (*d.*) Bar, tilted down from ingot (*c.*) (*e.*) Double sword mould, tilted down from bar (*d.*) (*f.*) One sword mould, or (*e*) broken in two. (*g.*) Sword mould, partly forged and prepared to receive the iron



Wilkinson's Presentation Cimeter.

tang (*h*). (*h.*) Iron tang. (*i.*) Iron tang welded to blade (*g.*) (*k.*) Forging of blade completed. (*l.*) Blade hardened. (*m.*) Blade tempered. (*n.*) Blade ground. (*o.*) Blade polished. (*p.*) Blade embossed and finished. (*q.*) Sword hilts, scabbards, &c., in various stages of manufacture.

[The weapon so long celebrated under the name of Andrea Ferrara, was an excellent description of broad-sword used chiefly in Scotland. This name is found engraved on all the Scottish broadswords considered of peculiar excellence. The name and the works of this celebrated maker form the sole record of his existence. His manufactory, and even the period when he flourished, are buried in oblivion. It has been supposed he was a Spanish or Italian artificer, brought over by James IV. or James V., to instruct the Scots in the manufacture of sword-blades. When genuine, the blades were always marked with a crown.

The material for swords is obtained from Sheffield, in the form of a piece of steel sufficient for two swords, and technically called a "mould." This is first beaten out to the proper length by the forger; it is then hardened and tempered by alternate heating and dipping in cold water; after this the blade is ground by a millstone driven by steam-power. The blade is subsequently proved by striking it on the flat side, with all the force of a powerful man, against a stone, and in other ways. The sword is then polished, ornamented, and mounted.—W. C. A.]

201 **JENNENS & Co.**, 56 *Conduit Street*—Manufacturers.

Specimens of military officers' cap-plates, breast-plates, and buttons; and naval, fancy, and livery buttons.

202 **ALLEN, W. D. & Co.**, 124 *New Bond Street*—Inventors and Manufacturers.

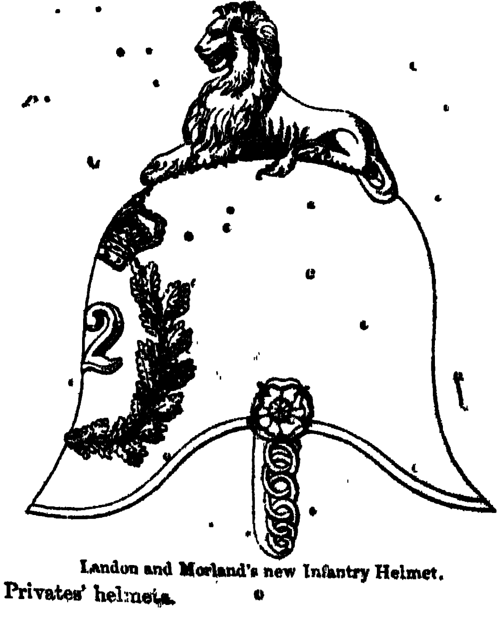
A new ventilating hat; the ventilation is in the lower crown. For hot climates it allows a current of air between the sun and head. For cold climates, it acts as a ventilator without exposing the head to the weather.

203 **WITTON, DAW, & Co.**, 57 *Threadneedle Street*—Manufacturers.

Double rifle, for India. Two-ounce rifle, for Africa. Double fowling piece. Duelling pistols.

204 **LANDON & MORLAND**, 17 *Jermyn Street, St. James's*—Designers and Inventors.

New officers' infantry helmet, manufactured of papier maché. This helmet is shown in the adjoining cut.



Landon and Morland's new Infantry Helmet.

Privates' helmets.

205 **HAWKER, Col. PETER**, *Longparish House, near Whitchurch, Hants*—Inventor.

A stanchion gun, with improved waterproof ignition; forged and stocked on a new principle: intended to supersede patent breechings.

Model of a two-handed punt, containing double stanchion gun, gear, &c., for wild-fowl shooting, and mounted on the carriage to convey it by land.

Model of a two-handed punt for a single gun.

A new double gun, (1851). The novelty of this gun is the self-adjusting primers, without cover or spring, that will not only defy wet weather, but also the saline atmosphere in sea-coast service—in which he has proved the failure of all copper-caps and fine powder. This new gun has conical breechings that will admit, when required—as in wet weather, or at sea—the use of the largest grain cannon-powder. The proportions of this gun are the result of forty years' experience. With the improved ignition—when applied to a single gun,—the patent breeching is wholly superseded by a saucer-plug, that gives a direct and instantaneous communication, and also extra force, by getting rid of the centre-hole—which is as injurious to the shooting of a detonator as it was advantageous to that of a flint-gun. Agents for double guns on the new plan, William Moore and Grey, 78 Edgware Road. For duck-guns and other single guns, Alfred Clayton, Lymington, Hants, who has invented and registered an improved handle for the primers of this ignition.

206 **BRAZIER, J. & R.**, *Wolverhampton*—Manufacturers.

Specimens of gun manufacture.

Double gun-tube locks, with self-acting tube spring. double gun-bar actions.

[The manufacture of guns supplies a recent illustration of the division of labour, and to this, no doubt, is attributable the present reduction of price in those articles. The sphere of usefulness in which the forger moves is a limited one, and consists in hammering into shape, assisted by "swages," the numerous small pieces which make up the lock and breech; even this has been replaced by the introduction of butt plates and guards, cast out of malleable iron, which are, in many instances, ground, instead of being filed.—W. C. A.]

Double rifle-locks, bolt and detant; the same articles in forged state. Musket percussion-locks. Gun cleaning-rod; loading-rod, and nipple-keys and knife-keys, all with apparatus. Patch-cutters, &c.

207 **POTTS, THOMAS HENRY**, *Haydon Square, Minories*—Inventor and Manufacturer.

1. A double-barrel gun (finished), with improved breeches, bolted triggers, &c.
2. Similar gun, in a bright (unfinished) state.
3. An instrument for drawing the breeches, applicable to all sorts of fire-arms.

208 **COX, N. F.**, *Great Peter Street, Westminster*—Manufacturer.

Fencing implements.

209 **MOORE & GREY**, 78 *Edgeware Road*—Manufacturers.

Double fowling-pieces, on the spring tube and copper cap principles. Double and single two-grooved rifle, on the copper cap principle. Two-grooved rifled pistols.

210 **POWELL, ROBERT**, 28 *Poland Street, Oxford Street*—Designer.

Design for a military cloak coat, with sleeves and spring guards, for protecting the epaulettes.

211 **FIRMIN & SONS**, 153 *Strand, and* 13 *Conduit Street, Bond Street*—Manufacturers.

Specimens of buttons worn by military officers; of livery buttons; and of different club and uniform buttons;

some finished in enamel, and gilt in different ways. Fancy buttons, finished in various styles.

The Star of the Order of the Garter, the Thistle, and of St. Patrick, all finished in enamel and bright cut silver.

Plates for shoulder-belts of officers of infantry, new in design, finished in enamel, and chased; and for shakos of officers of infantry.

Swords for officers in the army and navy. Fancy swords for full court dress. Highland dirk.

212 **HAWKES & Co.,** 14 *Piccadilly*—Inventors and Manufacturers.

Specimens of military and other head dresses, and of English military accoutrements and appointments.

Embroidered banner, designed in the style of ancient banners.

213 **BERINGTON, JAMES,** *Hoxton*—Inventor.

Three full-length figures, representing British soldiers in uniform, showing the inventor's improved knapsack, belt, and pouch; and those at present in use.

214 **ROBINSON, A.,** 41 *Whitcomb Street, Haymarket*—Manufacturer.

Best Damascus gun barrels.

215 **GIBBS, GEORGE,** *Clare Street, Bristol*—Inventor and Manufacturer.

Improved registered double-barrel gun, in which missing fire is prevented in wet or damp weather, by the introduction of an iron cover to shut over the cap and nipple; the cover is raised by the action of the hammer falling upon the percussion cap, which it fires in the usual way, and is moveable, so that the gun may be used with or without it.

216 **BEATTIE, J.,** 205 *Regent Street*—Manufacturer.

Two-groove rifle, double guns, duelling pistols, small double holsters, set of best double gun furniture, hog-skin flasks, shot pouches, loading rod, with swivel.

217 **MANTON, J., & SON,** 6 *Dover Street, Piccadilly*—Manufacturers.

Pair of double guns; double rifle; and pair of duelling pistols; all in mahogany cases, and furnished with apparatus.

218 **NEEDHAM, W. & J.,** 26 *Piccadilly*—For S. NEEDHAM, Proprietor.

Patent self-priming gun; in which a lever places the ordinary copper cap on the nipple by the simple action of cocking, the muzzle of the gun being previously lowered to allow a cap to pass from the groove or reservoir (which is formed on each side of the stock from the butt end to the lock, and contains 120 caps) to a recess in the lever.

Patent self-priming gun, with this difference, that the caps are so formed as to allow a closer communication to the charge; and with the addition of an improved safety-apparatus.

Self-priming musket, to use the military flange cap; the construction similar to the preceding, with the exception of the groove or reservoir being down the fore end of the stock, as more suitable for muskets.

Safety stop-lock gun. This invention consists in the introduction of an extra sear to the lock, which acts in unison with the hand-spring of the guard; as soon as the hammer is lifted off the nipple it is caught by the stop or sear in the tumbler of the lock, and the cap cannot be exploded unless the gun is up to the shoulder in the position of firing.

Game registers, double and single guns to load at the breech; intended to combine safety and economy, by improvements in the construction.

Self-loading carbine on the same principle, with the addition of a simple apparatus for self-loading, not liable to get out of order.

219 **BOSS, THOMAS,** 73 *St. James's Street, Pall Mall*—Manufacturer.

Central fire double-gun; sight shields in centre of the breast of hammers. Other single and double guns.

Double gun in an unfinished state. Specimen of the manufacture of a gun-barrel previous to its being welded together. Barrels welded in a black forged state; barrels filed, put together, and "proved." Locks in black forged state, and in bright filed state. Gun furniture in black forged state, and in bright filed state in various forms. Various articles useful in the equipment of fire-arms.

220 **BECKWITH, HENRY,** 58 *Skinner Street, Snow Hill*—Manufacturer.

Fowling-pieces, blunderbusses, and other fire-arms.

221 **BENTLEY, JOSEPH, & SON,** 12 *South Castle Street, Liverpool*—Inventors and Manufacturers.

Patent central double-fire percussion guns.

222 **TRULOCK, E., & SON,** 9 *Dawson Street, Dublin*—Manufacturers.

Double-bar gun, with Damascus and plaited twist barrels. Centripetal double gun, back action. Double gun, with safety guard, and long strap. Double rifle, with shot barrels to fit stock, and with single hair-trigger.

Back-action single and double guns, with cases. Double bar gun.

Back-action single rifle, two grooves. Single rifles. Air gun. Bar-lock double guns, with double-rifle barrels, the barrels and locks to same fit.

Rifle for rook shooting, with barrel drilled from the solid cast-steel bar, and small bore.

Double pistols, with bar locks. Double back-action pistols. Six-shot revolving pistols, with cases, complete. Pair of double and single pistols. Double pistols, one

n barrels in the forged state, and ground and bored.

Gun locks, in the filed state. Rifle-barrel, bored and ground. Pair of rifle barrels. Single barrel rifle, many grooves. Bullet moulds.

223 **DEANE, ADAMS, & DEANE,** 30 *King William Street, London Bridge*—Manufacturer.

Patent spiral raised rib rifles. Patent safety stop-lock guns. Patent gun locks, fowling pieces, Indian and African rifles, pistols, &c.

223A **DEANE, GEORGE & JOHN,** 30 *King William Street, London Bridge*—Manufacturer.

Double guns, in mahogany case complete, and with varied style of engraving. Double and single rifles. Single guns. Specimens of double and single holster pistols. Electro-plated silver revolving pistol, ebony stock, silver studded. Electro-gilt pistol, with ivory stock, gold studded. Small pocket secret pistols, ivory stocks. Officers' double and single belt pistols. Specimens of malleable twisted steel barrels, from the scraps to the finish; and of the new patent rifling, the new patent safety, and the new patent lock. Double gun, in its stripped state. Double trade guns. Single birding gun.

224 **PARKER, FIELD, & SONS,** 233 *Holborn*—Manufacturers.

Double-barrel fowling and rifle guns, in cases, complete. Inlaid and ornamental pistols. Air-gun in case, complete. New spring belt for carrying shot cartridges.

Percussion musket and bayonet, as employed in the Hon. East India Company's service. Percussion fusil. Sapper and Miner's carbine. Cavalry carbine and pistol. Flint and steel single gun, used by the Hudson's Bay Company as a trade gun.

Truncheons, rattles, spring handcuffs, leglocks, and spring-hilted cutlass, used by the metropolitan and city of London police. Brass pocket staff and pistol used by the inspectors and superintendents.

Chain, with wrist shackles and lock, used at prisons for removing prisoners.

[The manufacture of manacles is carried on principally at Birmingham. A recent account states that 4,000 pairs are annually manufactured at that town, of which one-half are for foreign and colonial purposes. Large numbers are exported to the southern states of America for slaves. Manacles for felons are light, and highly polished.]

225 **Eley, Wm. & Charles**, 38 *Broad Street, Golden Square*—Inventors and Manufacturers.

A series of illustrations in the manufacture of patent wire cartridges, for shooting game at long distances; and in the manufacture of percussion caps, rendered thoroughly impervious to water. Varieties of gun wadding.

226 **Lang, Joseph**, 7 *Haymarket*—Manufacturer.

Double gun and rifles of various sizes. Pocket and other pistols of single and double barrels, the turnover 4-shot and 6-shot revolvers of all sizes.

Greyhound starters, a retriever slip, and a gun sling.

A patent walking-stick gun, with rifle and shot barrels.

227 **Inskip, H.**, *Hertford*—Inventor.

United service flask. The novelty of this flask is, that the powder and shot are served from the same head, so that the same measure of each will constitute the load. Provisionally registered.

Improved egg-boiler.

228 **Golding, W.**, 20 *Davies Street, Berkeley Sq.*—Inventor and Manufacturer.

Double gun, for sporting purposes; with several improvements.

229 **Woolfield, Thomas**, *Hertford*—Inventor and Manufacturer.

Single gun of simple construction; of use where a workman is not at hand.

230 **Woodward, James**, 64 *St. James's Street*—Inventor.

Double gun (fowling piece) of a different construction to ordinary guns, possessing detached waterproof lock.

231 **Yeomans, & Sons**, 67 *Chamber Street, Goodman's Fields*—Manufacturer.

An assortment of muskets.

232 **Egg, Henry**, 1 *Piccadilly*—Manufacturer.

Self-priming percussion fowling-piece, very simple.

Double-barrel copper cap fowling-piece, ornamented.

233 **Fairman, James**, 68 *Jermyn Street*—Manufacturer.

Double cross-eyed gun, for gentlemen who have lost their right eye, to be used from the right shoulder and left eye.

Double gun in soft state. Single gun. Single rifle, two grooved.

Improved game markers, used for marking the killed and missed shots.

Caps, and chemically prepared waddings.

234 **Osborne, Charles**, 1 *Lichfield Street, Birmingham*—Manufacturer.

Improved central-fire double gun, with chain-twist barrels, 14 bore; the same, 13 bore, in a soft or unfinished state.

Bar-slide double gun, 16 bore, carved pistol hand-stock; and single gun, 14 bore, with improved safety lock and guard.

Tube single gun, hollow top end to end, cut-up sides, 12 bore.

Large single gun, with Col. Hawker's improved ignition, maple stock, 7-8 inch bore, flat top rib, for wild-fowl shooting; all fitted with fine stub-twist barrels.

Large five-barrel revolving pistol, stock inlaid with silver, and lion's head carved on butt.

Pair fancy pistols, fluted barrels, inlaid with silver. Pair officer's pistols, German silver body, electro-plated, cap-box inlaid with silver. Pair ladies' small pistols (700 balls to the pound), in tortoiseshell case, complete. Double-barrelled pistol, with swivel rod, bolted and bayoneted. Improved alarm gun, for setting in plantations, lawns, gardens, rick-yards, &c.

235 **Goddard, Samuel Aspinal**, *Birmingham*—Manufacturer.

Fowling gun for sportsmen, with barrels of laminated steel.

American ducking gun.

Fowling gun, of good medium quality for the foreign trade.

Fowling gun, with twist patent breech barrels, for the wholesale foreign trade.

Pattern musket, and common African musket.

"California protector" gun, invented by the exhibitor.

Pair of gun barrels in the filed state.

Pair of gun barrels cut open, to show the manner in which the inside of barrels are finished.

236 **Rigby, William & John**, 24 *Suffolk Street, Dublin*—Manufacturers.

Complete Indian or Highland outfit, consisting of a double rifle, double shot gun, and pair of extra barrels, forming, when required, twin double guns, with additional rifle barrels, and the locks, stocks, &c., all adjusted to one fit.

Double rifle with extra shot barrels, back-action locks, and single removable hair trigger, with cases and equipments. Bar-lock double rifle, single trigger, cases and equipments complete, with or without telescope attached. Double-shot gun, with bar locks attached. Double gun, back-action locks, and double rifle on improved plan, with cases complete. All constructed with continuous mountings, lift-out triggers, and solid slide-bolts.

Bar-lock double gun, without ramrod. Bar-lock single rifle and back-action; cases complete.

Double-rifle pistol for bison shooting, with single hair trigger and cases. Small horizontal double pistol and case; and various other pistols. Improved six-shot revolving pistols, with detachable barrels, safety-bolt, and other improvements, in case, &c. Cavalry officer's holster pistols in case.

Bar-lock single rifle, in unfinished state, prepared for adjusting in the field. Different parts of a gun in preparatory states.

Specimens of bullet moulds, with improved mould, in which a solid bullet can be cast. Single gun, back-action locks, in case.

237 **Reilly, Edward M.**, *New Oxford St*—Manufacturer.

An assortment of double guns, rifles, air-canes, pistols, &c.

Double-barrelled rifle, Ordnance bore, the size of Government; compressed ball, and suitable for belted, conical, or plugged bullets. Extra barrels for small shot, fitting in the same stock; being, with case and apparatus, a complete outfit for India, the Colonies, or any service.

Specimens of embossing and chasing, for ornamenting fowling-pieces and pistols.

Improved air-rifle and air-canes, for shooting with ball, shot, and harpoon, in numerous sports and amusements; they are portable, durable, and effective.

Practising pistols of new construction, for ball practice, without noise or report, within-doors, in gardens, &c.

238 **Davidson, David**, Captain, Bombay Army, *per* C. H. Davidson, *Haddington*—Inventor. Manufactured by J. Robertson, *Haddington*.

Double and single barrelled rifles; double and single 10-inch rifled pistols; single 6-inch pistol; all with telescopic sights. These rifles are furnished with grooved bullets.

The telescopic sight can be fixed to the piece in a moment; it in no way interferes with the usual sights. In the use of the common sight the unassisted eye cannot observe with distinctness, at the same instant of time, two or more objects at different distances from it; and as the breech sight, the muzzle sight, and the object aimed at, are necessarily at different distances from the eye, it is difficult to bring them at once into line, and at the same time to give the proper elevation to the piece. This disadvantage is obviated by the use of the telescope, since the lines placed in the focus of the eye-piece, and the object aimed at, as seen through the glass, appear equally distinct to the eye.

The grooved bullet sustains the spinning motion, so that the pointed end goes foremost throughout the longest flight. The groove in the zone reduces the friction, gives the rifling a firmer hold so as to prevent stripping, and secures its longer axis continuing in the axis of the piece. It is less affected by wind, and has greater power of penetration than the round bullet.

The telescopic sight also enables the sportsman to estimate the distance of the deer.

238A **WATKINS & HILL**, 5 *Charing Cross*—Manufacturer.

Rifle fitted with a telescope for taking the sight, attached to the barrel on a principle suggested by Professor Potter.

239 **BULL, JOHN**, *Bedford*—Manufacturer.

Double-barrelled gun, with the modern improvements.

240 **RICHARDS, WESTLEY, & SON**, *Birmingham*—Manufacturers.

Best double and single rifles, of various bores.

Double tiger guns, of different bores, in an unfinished state.

Punt gun, of a new construction.

Best duelling pistols. Double and single holster pistol. Pocket pistols, secret triggers. Pair turn-over double-barrel and bulldog pistols. Revolving six-barrel pistols; revolving rifle. Copper caps; the same, twenty-two years old.

Registered improved corkscrews and carving forks, with improved registered guard.

241 **COOPER, J. R., & Co.**, 24 *Legge Street, Birmingham*—Manufacturers.

Patent self-cocking pocket-pistol. When loaded and capped, it is ready for use, without the preparatory cocking action. Its working parts are seen on the outside. Holster pistol. The ramrod serves as the hammer-spring, by which the cap is fixed. A safety bolt is introduced into the trigger, which prevents the pistol from being fired unless the bolt is released by the finger.

Six-barrel revolving pistol, central fire, with safety bolt.

Twelve-barrel revolving pistol. One side of the stock is removed to show the working parts of the lock.

Pair of ladies' pistols.

---

242 **WALKER, RICHARD**, *Graham Street and Broad Street, Birmingham*—Manufacturer and Patentee.

Specimen of percussion caps (in boxes), gold and silver. Metallic gun-wadding.

[Percussion caps are produced by pressure: the blanks are cut out of thin rolled copper, and are afterwards formed by punches into the required shape. The priming is a work requiring care and attention—they are charged by touching the bottom of the cap with an adhesive substance, into which the fulminating powder is dropped.—W. C. A.]

---

243 **TOWNSEND, JAMES**, 11 *and* 12 *Sand Street, Birmingham*—Manufacturer.

Improved 1¼-inch diameter walking-stick air-gun, with silver steel rifle barrel, fancy twist air receiver, pump, and apparatus complete. Maple-colour walking-stick air-gun, to load at the breech, with stub twist rifle and shot barrels, pump, apparatus, &c. Three-quarter-inch diameter Malacca-colour walking-stick air-gun, with rifle barrel, one hundred and sixty balls to the pound, pump, apparatus, &c. Bar side butt air-gun, with rifle barrel, pump, &c. Stub twist walking-stick air-gun, to load at the breech. Air-rifle, gauge twenty-six balls to the pound, to load at the breech. Improved ⅞-inch diameter black walking-stick air-gun, with rifle barrel, &c.

---

244 **REEVES, GREAVES, & Co.**, 28 *Bartholomew Street, Birmingham*—Manufacturers.

Officer's dress sabre and field-sword. Officer's dress sabre, with scabbard and mounting of the finest cast wrought-steel; and field-sword, blade, scabbard, and hilt of the finest cast steel, wrought; Scotch claymore.

Series illustrative of the manufacture of sword-blades, of cast-steel.

[While Sheffield is the great source of supply for the best cutlery, Birmingham is the place where the great bulk of swords and matchets for home purposes or for exportation are manufactured. The manufacture calls into requisition no small proportion of the industry of the district. Swords are made by hammering out pieces of steel received from Sheffield, and called sword moulds. In each of these there is sufficient steel to form two swords; the flutes or creases on the back of the blade are formed by means of various shaped pieces of steel fastened to the anvil, corresponding to the indentation to be made: they are then curved or fitted, if straight, into a gauge; the process of "hardening" succeeds, which consists simply in heating the steel very regularly, and immersing it in water; it is then tempered (brought back to a straw colour), tested by striking on the back and edge against a wood block, and if it stands this, is passed to the grinder, who, seated before an enormous grindstone, speedily removes all the irregularity of the hammering. To clean the grooves, stones with raised beads are used; glazing follows on bobs of wood with emery attached thereto by glue; and the sword is finally polished on a wheel with fine emery and oil; powdered iron-stone, or crocus, gives the brilliant polish. Where the swords are highly ornamental, the deep rich blue is produced by heat: the gilding of the ornaments on blades, when introduced, is said to be a secret process. Damascening, however, with precious metals, a more intricate mode of ornamentation, is known, and consists in making an incision in the article to be adorned, and introducing by pressure threads of gold or silver. This affords an opportunity for the exercise of taste, and as such it was eagerly embraced by the middle-age artists. Proofs of their excellence therein is testified by numerous specimens in public and private collections. Etching, another mode of ornamentation, is performed by covering the blade to be etched with a ground upon which the design is sketched, and finally cutting through this to the steel. A suitable acid is applied (acetic and nitric); this, after remaining a sufficient time, is removed, the ground cleansed off, and the design is found on the weapon perfect proportion to the skill displayed by the artist. Steel sheaths are made by bending thin plates of steel round suitably formed mandrils; they are soldered at the junctures, are ground, and finally polished by the processes already described as being used in the polishing of swords.—W. C. A.]

---

245 **HART, HENRY**, 54 *New Canal Street, Birmingham*—Manufacturer.

Pair of highly-finished double-barrel guns. Double-barrel gun, pistol hand-stock; gamekeeper's gun. Single gun, pistol hand highly finished, with raised top rib.

Small pistol-hand double gun. Small single gun.—All with stub-twist barrels.

Specimens of gun-barrel manufacture in every state, from the old horse-nail stubs of the earliest period to the latest improvements.

[The serious accidents arising from the bursting of gun-barrels have led manufacturers to seek the means of preventing their recurrence as far as possible; fibres of iron strictly parallel would fail to impart the necessary strength as also would iron if of a uniform crystalline composition. A better construction of material has been found in the welding together portions of iron and steel; these become interlaced in the various processes of hammering from the bundle of iron and steel called the "bloom," until the barrel passes finished from the hands of the forger. The twisted appearance which is observed on the best barrels, even after the rich brown stain is removed, arises from the ribbon-like form which the "bloom," after being drawn into a strip, takes when wound spirally round a mandril previous to welding; these are known as Damascus barrels. Barrels of a more common kind are produced from "blooms" made exclusively of stub-nails; while a more common class still are produced of a cheaper material, not wrapped in a spiral form, but welded in the length by one heat by means of a pair of rollers; they are ultimately extended to their proper length by the same process. Guns are bored out in large manufactories by means of steam or other power, the instrument being a rod of steel, with its cutting portion 8 or 10 inches long, and its square sides made up with pieces of wood. Rifleing, viz., imparting to the interior of the barrel a series of spiral curves, by means of which a perfectly direct motion is given to the bullet, involves care, attention, and skill in its preliminary stages, but is in reality a simple operation. Ordinary gun-barrels are finished by being ground on large grindstones; those of a superior quality are turned. Breeching, or fitting in the plug at the butt which stops the end, and upon which is fitted the nozzle for the percussion cap, requires nicety and careful workmanship. Gun-barrels are coloured by means of acid; repeated coats are given until the deep rich brown is obtained; they are then polished.—W. C. A.]

246 BROOKES & SON, 28 *Russell St.*, *Birmingham*—Manufacturers.

Fowling-piece, double barrel, silver steel twisted. Fowling-piece, with single barrel.

Rifle gun, for shooting long distances, with telescope.

Four-barrel revolving gun (used in India).

Walking-stick gun, to pack in a portmanteau.

Military guns—British, French, and Piedmontese muskets.

South American (Buenos Ayres) and Spanish carbines or cavalry.

African trading guns used in barter, chiefly for palm oil, &c.

Dane guns, black and red stocks, brass and iron mounted.

Buccaneer red stocks, heavy and light mountings. Carolina gun, similarly furnished. Indian pistols, silver handles, rifled barrels. Six-barrel revolving pistol. Safety water-tight nipples.

247 TIPPING & LAWDEN, *Birmingham*—Manufacturers.

Specimens of iron and steel in various stages of preparation, to show the manufacture of gun barrels;—Horse-nail stubs. Scrap steel. A mixture in a partially welded state.

Specimens, showing a twisted stub-barrel in the various stages of manufacture, from the first process. The stubs and scrap-steel are first welded into a rod, which is afterwards rolled out into a flat bar; it is then coiled round a mandril, and welded into a barrel; it is afterwards ground and filed, and finally brought to a finished state.

Lengths, showing the various stages of manufacture of Damascus and laminated steel barrels.

Double gun, the barrels made of twisted stubs.

Several guns, of varied construction, and one entirely in pieces, to show all the parts of a gun separately, especially the internal work of the stock.

Double and single rifle guns.

Single and double guns; varieties both of fowling-pieces and military guns.

Air-gun; barrel of best twisted stubs, with improved roller breech, the butt made of twisted stubs.

Air-cane, twisted stubs, with improved roller action, pump, &c., complete.

Small walking-stick air-cane, with rifled barrel, of improved construction. Air-cane lock.

Six-barrelled revolving pistols, ivory stock, silver inlaid; walnut stock, silver inlaid; and chequered stock. Various pistols.

---

248 MOLE, ROBERT, *Broad Street*, *Birmingham*—Manufacturer.

Gilt-mounted sword, blade of finest cast-steel, richly blued and gilt, the scabbard of crimson velvet, embroidered in gold, with elaborately worked gilt furniture.

Highly-mounted Mamaluke sword, with blade ornamented in dead gold, the scabbard of polished steel, with elegant gilt mountings.

Officers' regulation swords, used in the cavalry, infantry, and naval services.

Two matchets of best cast steel, as exported to America and the West Indies. Patterns of those used in the plantations of South America, the West Indies, and Africa.

[In addition to swords, Birmingham produces an article called a matchet, which in some countries is used to cut down sugar-cane, in others as a weapon of war, or to remove vegetable obstructions which impede the traveller in his progress through "the bush" or the tangled overhead of an American forest. The labour expended upon them is small: a great portion of it is performed by the tilt-hammer; they are hardened and ground, slightly glazed, and handled with common beech timber. Some idea of the consumption may be learned from the fact that one manufacturer has for the last six months been producing at the rate of 500 dozen per week.—W. C. A.]

249 POWELL, WILLIAM, & SON, *Carr's Lane*, *Birmingham*—Manufacturers.

Double-barrel rifle, with apparatus.

Double-barrel gun complete, and in a certain process of finish.

Miniature gun.

Single and double barrel pistols.

Improved safety trigger guard.

Pair of lock actions.

250 WINTON, HARRY, 53 *Cleveland Street*, *Birmingham*—Inventor and Manufacturer.

Improved safety guns.

251 CARRON, WILLIAM, *Birmingham*—Inventor.

Alarm gun.

---

51 BAYLIS & SON, 8 *St. Mary's Row*, *Birmingham*—Manufacturer.

Gun implements.

52 HOSKINS, JOHN, 31 *Frith Street*, *Soho Square*—Inventor and Manufacturer.

Double gun, with safety; on a new and simple principle.

253 **DAVIS, J.**, *1 Duke Street, North Parade, Bath*—Inventor and Manufacturer.

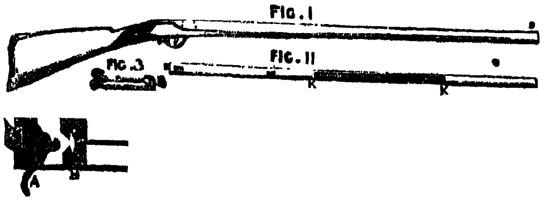
Soldier's musket, substituting the blade of the bayonet for the ramrod.

254 **SHAW, J.**, *Glossop*—Inventor and Patentee.

India-rubber air-gun. The novelty consists in the absence of a reservoir of condensed air, or separate pump, or valve of any kind; the requisite pressure of air for one discharge is instantly obtained from a pull of the trigger, by means of a single stroke of a condensing syringe, which is acted upon by a previously extended India-rubber spring. This gun is represented in the annexed cut.

Flattened bullets, being specimens of its effect on an iron target at 20 yards.

Without any previous pumping, the requisite pressure of air for one discharge is procured instantly at the pull of the trigger, by a single stroke of a condensing syringe, actuated by a previously extended India-rubber spring. There is no separate pump, no reservoir of condensed air, nor valve of any kind.



Shaw's India-rubber Air-gun.

Fig. I. represents the gun complete. Fig. II. is an underneath view of the gun unstocked, showing a slot (K K) in the case, through which are visible the piston-rod and bead, with a portion of the India-rubber hereinafter described, and in the state in which they appear after one discharge, and prior to preparation for another. Fig. IV. represents a longitudinal section of about one half of the breech end of the gun unstocked: A is the trigger; B, the piston; C C, the inside of the pump barrel or condensing syringe; D, the piston-rod; E, the pump top perforated in the centre for the piston-rod to work through, and at the top edge for the reception of the end of the shot barrel, F; G is the bullet, held in its present situation by a slight contraction of that end of the shot barrel. I is one end of the India-rubber spring, attached to the hooked end of the piston-rod and similarly attached by its other end to a hook in the inside of the muzzle-end of case; J J are portions of the case, enclosing the shot-barrel and India-rubber, the lower shaded part being one end of the slot (K K, Fig. IV.) The section, Fig. IV., shows the gun in act of discharge; the trigger being just pulled, releases the piston, which, by the reactive power of the India-rubber spring, rushes to the opposite end of the syringe, condensing the air therein, which air forcibly ejects the bullet.

To prepare the gun for discharge, the ball, if the barrel be a rifled one, must first be rammed down; an adapted hook must then be introduced into the slot (K K), between the bead (H, Fig. IV.) and the hooked end of the piston-rod, as plainly indicated by Fig. 3. The butt-end of the gun must then be placed against the top part of the thigh, and the hook pulled with both hands, in the direction of the breech, until the trigger, by means of the small spring at its back, catches the piston. With a smooth or unrifled barrel, 400 discharges per hour can be made; the bullet in that case requiring no ramming, it being drawn down the barrel by the partial vacuum caused by drawing down the piston. The spring consists of from sixteen to eighteen India-rubber bands.

Patent valve-bugle. The patent valves are applicable to all brass instruments, and are manufactured by Mr. J. Köhler, Henrietta Street, Covent Garden.

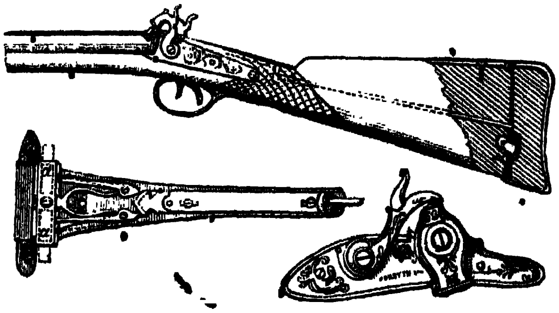
255 **FLETCHER, THOMAS**, *161 Westgate Street, Gloucester*—Inventor and Manufacturer.

Double guns, with improved lock, jointing, and breeching, so as to render them perfectly waterproof.

The improvements consist in the following peculiarities:—1st. The whole of the percussioning is on the breeching, the nipple being placed in the centre, thus avoiding the joints between the breeching and the break-off. 2nd. Peculiar construction of the break-off, giving greater facility for placing the barrels in the stock. 3rd. The closeness of the cocks covering the caps and nipples, confining the gas from the explosion of the caps. 4th. The application of platina in the percussioning of the breeching to prevent corrosion by the copper caps.

256 **FORSYTH & CO.**, *Leicester Street, Leicester Square*—Inventors and Manufacturers.

Patent safety gun, which cannot be discharged either in carrying when loaded, or during the time of loading, until brought up to and placed against the shoulder, and the trigger pulled in the firing position. In its use the chances of the occurrence of an accident, even at full-cock, are entirely obviated, the cock being checked in its descent by the projection of the safety-stop.



Forsyth and Company's Patent Safety Gun.

The preceding cuts represent the apparatus for working the safety stops from the heel-plate of the gun; the safety stops themselves, and the original percussion lock.

Also, an original percussion gun, illustrating the first application of the principle of percussion by the exhibitor to the purposes of fire-arms. This gun contains a reservoir of percussion powder sufficient for a day's shooting.

[Fire-arms have been discharged by three different methods, by the direct application of a lighted match, by the ignited particle of steel produced by the flint lock, and by the ignition of an explosive powder through the heat developed by percussion. This is the exact historical order of these applications. The flint-lock is now passing rapidly into disuse, and the principle of percussion, in various forms, but essentially the same, is obtaining universal application. This principle was first discovered and applied by Mr. Forsyth in 1819, and was then patented. The explosive powder was contained in a small magazine attached to the locks, and by turning it on its axis a few grains of the powder were conveyed beneath a striking pin, and were ignited on the descent of the hammer. The copper cap has now supplied the place of these magazines.]

257 **ERSKINE, JAMES**, *Newton Stewart, Scotland*—Inventor and Manufacturer.

Two guns:—Gun No. 1, newly invented to prevent accidental discharge, combining in the same action a complete waterproof for the cap. Gun No. 2, invented for the same purpose, has been improved and registered.

Erskine's Waterproof Gun

258 **Rippingille, E.**, 81 *King Street, Manchester, and* 87 *Albany Street, Regent's Park.*—Inventor.

An improved gun-lock, with stock.

259 **Haswell, Robert**, 12 *Upper Ashby Street*—Proprietor.

Air-pistol on a new principle.

260 **Needham, Henry**, 4 *Vine Street, Regent Street*—Inventor, Patentee, and Manufacturer.

Self-priming gun and safety lock.

261 **Brider, Joshua**, 4 *Clifton Cottages, Denmark Street, Camberwell*—Inventor and Manufacturer.

German silver telescope loading rod for fire-arms, with knob and forcer, for general use; adapted for the pocket.

262 **Brider, George**, 30 *Bow Street, Covent Garden*—Inventor and Manufacturer.

Rifle-mallet for hot climates, having a head of gun metal, with leather faces, (purple wood handle,) and gun-metal forcer.

263 **Baker, Thomas Kerslake**, 88 *Fleet Street*—Inventor and Manufacturer.

Improved patent gun-lock for preventing accidents from the use of fire-arms.

264 **Golden, W., & Son**, *Huddersfield*—Manufacturers.

Bentley's patent double gun, with improved locks, &c.

265 **Webster, W.**, *Hampstead Road*—Inventor.

Fusee musket.

266 **Shorman, John**, 6 *Great Pulteney Street, Golden Square*—Producer.

Specimens of inlaying with gold, silver, and other substances, and ornamental engraving on the ironwork of guns, &c. Impressions on paper, taken from engraved and inlaid work.

267 **Mortimer, Thomas Elsworth**, 97 *George Street, Edinburgh*—Manufacturer.

Superior finished double rifle, with simple safety and improved conical ball.

Highly finished double fowling-piece (for long shots), with low front sight to give elevation to the shot.

Pair of silver-mounted inlaid Highland pistols.

Specimens of improved conical and other balls.

Specimen gun-case, Edinburgh make, with fittings complete.

268 **Staines, Edward**, 9 *Salisbury Place, New Road*—Proprietor.

Models and plans illustrating a system of Fortification.

269 **Hodges, R. E.**, 44 *Southampton Row, Russell Square*—Inventor.

Patent application of India-rubber to projectile purposes.

270 **Parsons, William**, *Swaffham, Norfolk*—Manufacturer.

Pair of improved double guns, 2 feet 8 inch barrels, 10 bore, central fire, elevated false breech, &c.

Loading rod and socket.

Pair of double guns, 12 bore, 2 feet 8 inch barrels.

Pair of double guns, 20 bore, 2 feet 7 inch barrels.

Wainscoat and leather case for each pair of guns.

271 **Hall, Lieut.-Colonel, R. E.**, *Southampton*—Producer.

Model of the Tower of London, after the destruction of the Armoury at the great fire on the 30th October, 1841. Modelled by R. Davis, under the superintendence of the exhibitor.

272 **Moulin, C.**, 24 *Stanley Street, Chelsea*—Designer.

Model of a fortified town, defended by six fronts of fortification on three different systems; Vauban's, as modified by Cormontaingne; Coehorn's; and Carnot's. The works of attack and defence are moveable.

273 **Lillywhite, John**, *Frederick Street, Portsea*—Manufacturer.

Metal model of a gun of 95 cwt., with carriage and slide, on a scale of 1½ inch to the foot.

274 **Bearfoot, Richard**, 11 *Warwick Street, Woolwich*—Manufacturer.

Two magazines, especially adapted for the safe stowage of powder, wills, documents, &c.; they are also waterproof. The one is made of copper outside and wood inside, and the other, the reverse; with India-rubber joints instead of bees'-wax and tallow, and one lock instead of two.

275 **Tylden, Capt. John**, *R. Artillery, Woolwich*—Maker.

Models of British ordnance; a light 6-pounder field-piece and carriage. A 32-pounder garrison gun, with carriage, on traversing platform. A 10-inch howitzer, on garrison carriage. A 13-inch sea-service mortar and bed.

276 **Fergusson, James**, 20 *Langham Place*—Inventor.

Model, on a scale of 1 inch to 40 feet, showing eight different modes, in which the front of fortification of the usual dimensions may be fortified according to a new system. Its objects are, an immense reduction in the cost of construction, and greater capability of defence.

277 **Joyce, Frederick, & Co.**, 57 *Upper Thames Street*—Inventors and Manufacturers.

Improved anti-corrosive waterproof percussion gun-caps. Military percussion musket-caps. Improved percussion tube primers. Chemically prepared indented cloth and felt gun-waddings. Improved patent wire-cartrid

278 **Grainger, James**, *Wolverhampton*—Manufacturer.

Tube and bar-action gun and rifle gun-locks.

280 **Gardner, W. T.**, 22 *Mead Row, Lambeth*—Inventor and Manufacturer.

Model of a ship's gun, adapted for loading at the breech.

281 **King, Thomas John**, 16 *Whiskin Street*—Designer.

Pistols, inlaid, the iron-work with gold, the stock with silver. Small iron scent-bottle, inlaid with silver.

282 **Munro, James**, jun., 4 *High Street, Lambeth*—Manufacturer.

Model of a nine-pounder brass gun-carriage and limber, scale 1 inch to a foot; and of a twenty-four pounder brass battering gun and carriage, scale ¾ inch to a foot.

283 **Fitz Maurice, The Hon. Wm. Ed.**, *Hamilton Lodge, Prince's Gate*—Producer.

Model of 68-pounder gun-carriage, which, by means of a rack and pinion inserted in the platform at the rear of the gun, can be worked with great accuracy by one man; it now requires six.

Model of a mortar platform, worked upon the same principle, the endless screw being substituted for the rack and pinion.

284 **Walker, Sarah, & Co.**, 12 *Legge Street, Birmingham*—Manufacturers.

Specimens illustrative of the manufacture of percussion-caps for military and sporting purposes: piece of rolled copper from which blanks are cut and caps made. Similar piece of copper, showing perforations out of which blanks have been cut by steam-power.

Blanks for musket-caps, as used in Her Majesty's service and in the Honourable the East India Company's service.

Cap-shells, made from preceding caps when finished.

Blanks to make caps for ordinary sporting guns; cap-shells made from the same.

Caps when finished.

Improved blank to make waterproof caps for wild-fowl and duck-shooting, forming that part of the cap solid which contains the charge caps shells made from the same.

Waterproof caps furnished and lined with metal.

---

285 **RICHARDSON, R.**, 21 *Tonbridge Place, New Road*—Manufacturer.

Models of tents, marquees, and rick cloth.

286 **SYMINGTON, WILLIAM**, 41 *Gracechurch Street*—Inventor and Proprietor.

Gun wads, a substitute for the rope wads at present used in gunnery.

---

287 **SQUIRES, WILLIAM**, *Cottage Grove, Mile End*—Inventor and Manufacturer.

New rifle, calculated to project a ball a great distance with a small charge.

288 **MCGETRICK, FRANCIS**, 82½ *Philip Street, Kingsland Road*—Inventor.

Model of a war-engine. It is stated that this engine will fire 10,000 charges of ball cartridges in ten minutes.

289 **TRUSCOTT, JOSHUA**, 111 *Fore Street, Devonport*—Inventor.

Rotatory sprinkler, for watering roads and streets, or using liquid manure. When the water sinks below the axle, its action is that of a syphon.

Portable life-boat or raft, applicable to vessels which carry many passengers. It occupies a small space when closed; but when opened, it presents a large surface, sufficient to support many persons. In the event of a ship sinking, it could be opened out on the deck and made ready for use in a few minutes.

---

290 **RHIND, WILLIAM GREENE**, *Ross, Herefordshire*—Inventor.

Model of a marine life-preserving deck seat, representing the deck seat of a steam packet or sailing vessel, so constructed that in three minutes it can be changed into a safety raft, capable of sustaining eight people on the water. The back and seat are lined with cork, and joined by hinges, the legs being made moveable.

Model representing the deck seat, as changed into a raft; this change is effected by loosening the elbows, clearing the back and seat together, and putting in the legs at right angles. Four of the seats, when spread out, are adapted for the construction of a great raft, which might be made by putting empty casks underneath, and spars, gratings, &c. as a deck; the raft, also, with a low Bermudian sail, might be used to convey a rope to the lee shore. The deck seat can also be instantly made into a couch, table, or litter, being equally adapted for garden seats in pleasure-grounds or hospitals.

---

291 **RIGMAIDEN, JAMES**, Lieut. R.N., 6 *Harley Place*—Inventor and Manufacturer.

Model of lanyard-plates, to set up standing rigging of ships, in lieu of rope lanyards and dead-eyes; the small space occupied by the plates allowing quarter-deck and forecastle guns to be trained to any angle, and not liable to fire, as with rope lanyards.

---

292 **ALLEN, JAMES**, *Greenock, Scotland*—Inventor and Proprietor.

Model of a new patent safety anchor.

292 **BENNETT, EDWARD**, 2 *Victoria Place, Woolwich*—Inventor.

Universal wedge block, in stone, wood, or brick, applicable for piers, dock and sea-walls, foundations, water-wheel aprons, fire-proof floorings or roofings, and all descriptions of furnace work, &c., or for any situation requiring great resistance to lateral pressure. The principle of these blocks rests upon their pure geometrical construction, for a weight or pressure cannot pass beyond the centre of the stones, and they are better than stone altogether solid.

---

294 **ROYAL YACHT CLUB**—Producer.

Models of yachts belonging to the Royal Thames Yacht Club.

Name of Yacht.		By whom Built.	The Property of
1 Nancy Dawson		R. H. Camper, of Gosport.	The late Robert Shedden, R.N.
2 Cynthia . . .		T. Wanhill, Poole, 1849	John Wicks, Esq.
3 Volante . . .		T. Harvey, Ipswich .	J. L. Craigie, Esq.
4 Avenger . . .		Hanson, Cowes . . .	R. Moseley, Esq.
5 Musquito . . .		C. Mare, Blackwall .	Ld Londesborough.
6 Fleur-de Lis .			W. H. Birch, Esq.
7 Foam .			T. Harvey.
8 Frolic .		T. Harvey, Ipswich	Alfd. Cox, Esq.
9 Esk . .			J. Richardson, Esq.
10 Sam Sly .			T Harvey.
11 Daring.		Moore, Plymouth .	G. Cook, Esq.
12 Jockey .		J. Duthie, jun., Aberdeen.	W. Hogarth, Esq.
13 Lady Louisa	12	W. Smith, London, 1825.	T. Smith, Esq.
14 Brilliant . .	10	W. Smith, London, 1830.	W. Bucknall, Esq.
15 Belvedere .	25	Ditchburn and Mare	Major H Boys.
16 Mystery . .	25	T. Ditchburn	W. Kingsford, Esq.

The first of these yachts has circumnavigated the globe; the third and sixth are new; and the rest are all winners of many prizes.

295 **HAUGHTER, V.**—Inventor.

Model of a traversing gun on platform.

Model of a life-boat.

296 **HITT, T.**, *Bridport*—Inventor and Manufacturer.

Life-boot (one of a pair) for enabling a person to sustain himself in water.

---

297 **CHERRETT, D.** *Grosvenor Mews, Berkeley Square*, Working Gunmaker.

An improved two-groove rifle pistol, with invisible lock, which throws a ball 250 yards, and can be used as a pistol, or from the shoulder.

---

298 **SCAMP, W.**, *Admiralty, Somerset House*—Inventor.

Model of a great preservative dry dock for the reserve of the Royal Navy, designed for laying up ships of war out of commission, or ships "in ordinary," high and dry, thereby preventing their rapid deterioration and premature decay, &c., without dismantling them, or removing the machinery; for examining, repairing, and refitting ships, and selecting from the reserve for commission with certainty, facility, despatch, and economy; for building ships, seasoned and dry; and also for laying up ships in frame for seasoning.

---

299 **WILSON, J.**, *Stratford, Essex*—Inventor.

Models of life-boats.

301 **DUTHOIT & CO.**, 6 *Finsbury Place South*—Designers and Manufacturers.

Aerial tent, about 12 feet by 6. Framework of Malacca canes and mahogany. Covering of Spitalfields silk, suitable for lawns.

Registered umbrella tent, suitable for emigrants, officers and field purposes at home and abroad. Its object is portability, being contained in a bag measuring 7 feet by 1, and easily fixed. (*Cross Gallery, between North and North Central Gallery.*)

302 **EDGINGTON, BENJ.**, 2 *Duke Street, London Bridge*—Inventor and Manufacturer.

A tent, 12 feet by 8 feet, poles with table. Four cots can be hung from the frame-work; it is waterproof, easily erected, and forms a complete room.

Military tent, 12 feet square; peculiar in its construction few lines are used, and the tents can be placed close to each other. Its most important feature is the increased power of ventilation.

Stoves and cooking apparatus for tents.

Trophy of flags.

303 **BLAIR, J.**, *Irvine, Ayrshire*—Inventor.

Portable camp-cot, combining a tent, bedstead, and couch.

304 **CROID, R.**—Inventor.

Model of a life-boat.

305 **SMITH, THOMAS & WILLIAM**, *Newcastle-upon-Tyne*—Proprietors.

Model of the merchant frigate Blenheim, built in July, 1848, at St. Peter's Dockyard, Newcastle-upon-Tyne.

306 **TRIGENZA, R.**—Producer.

Models of two Falmouth fishing-boats.

307 **HEDLEY, GEORGE**, *Yorke Street, Monkwearmouth, Sunderland*—Manufacturer.

Model of a merchant-vessel of the first class, on the scale of a quarter of an inch to the foot. The dimensions are as follow:—Extreme length, 172; length of keel, 161; breadth of beam, 35½; depth of hold, 23; length of poop, 48; length of forecastle, 33 feet. The ship is framed all round, instead of having a separate stern-frame, and is built up in the usual manner. It has five keelsons, one at the bottom of the hold, two on the foothooks, and two on the second foothooks or bilge. It is stated that as jack-screws are used in the building of this ship, she will possess one great advantage over others, whose shores being made in the ordinary way, are liable, when loaded, in a storm, to be thrown out, and cannot be put in again. The screws adopted in this ship, if likely to be thrown out during the working of the vessel in a heavy sea, can be screwed up again from the deck by a brass plate let into a plank of the deck, and applying the key to tighten the screw, without the least injury to the vessel or cargo. The 'twixt-beam staple-knees are made half-circle, so that the two throat-holes go in the upper stroke or plank, and the other three holes in the stroke or plank below. In between decks and lower hold are diagonal straps, 78 feet long. The iron fastenings, hooks, riders, and crutches are all secured the same as forward, across the stern-post; diagonal straps are placed on the hold and deck beams, to prevent the vessel straining, when rolling and labouring athwart in a head sea. There are eight ventilators in the covering-boards, to ventilate the timbers, and she is fitted with Mr. Hughes' new windlass and steering apparatus, a larger model of the latter of which is in the Exhibition.

308 **SWALLOW, J. C.**—Inventor.

Model of a life-boat.

309 **ROYAL NATIONAL INSTITUTION FOR THE PRESERVATION OF LIFE FROM SHIPWRECK.**—Producer.

Model of life-boat.

Specimens of gold and silver medals.

309A **COLLARS, J. B.**—Inventor.

Model of a life-boat.

310 **MARINERS' FRIEND SOCIETY**, 58 *Fenchurch Street*—Inventors.

Model of a station for affording assistance in case of wreck. It provides residence for one man, with whom a brigade is connected for the same purpose, and contains various articles for rescuing life and property, and recovering the apparently drowned.

Model of a village station for similar purposes. The large room, which is intended as a reception room, may also be used for educational purposes, for the benefit of seamen, fishermen, and their families.

Life-belt worn by the brigade.

Wager or racing boat, for one pair of sculls, built of mahogany and maple, with outrigger rowlocks.

312 **SLATER & WRIGHT**, *Whitby*—Inventors.

A life-boat and carriage, not liable to upset on being struck by a sea on one side. An under current or back sweep acting upon the bottom in an opposite direction, would only have the effect of causing the air-box to revolve.

313 **SPARROW, ROBERT**, *Wexford*—Inventor.

Model of a life-boat on an improved principle.

314 **WILLIAMS, WILLIAM**—Inventor.

Model of a life-boat.

315 **LAING, JAMES**, *Sunderland*—Builder.

Model of the ship "Vimiera," 1,020 tons, belonging to Messrs. D. Dunbar & Sons, of London, built by James Laing. Proportion of length to beam 5 to 1: it is said to be remarkable for fast sailing and large capacity.

Principal dimensions—

Length . . .	105 feet.
Breadth . . .	33 ,,
Depth . . .	23 ,,

Length from head to taffrail 196 feet.

One side represents the ship in the finished state, and the fastening applied in securing her; the other side shows the disposition of the framing, and the various descriptions of knees used in connecting the beams to the sides of the ship. This side is so arranged as to open, and show the internal structure of the ship.

The model was made by Thomas Hardy.

316 **HODGSON, MOSES**, 6 *Moor Street, Sunderland*—Manufacturer.

Model of a pilot coble, with its oars, sail, and other appointments. It is similar to those which ply out of the port of Sunderland.

317 **MONTEAGLE, The Right Hon. Lord**, 7 *Park Street, Westminster*—Producer.

Model of a curragh, or light row-boat, portable by one man; used for fishing on the north-west coast of Ireland.

[Off the western coast of Ireland, which to a considerable extent is "iron-bound," the ancient Celtic boat called the curragh (carabus), or nivoque (navicula), has been constructed so late as the present century. It was constructed with a frame of osiers woven in basket-work, and covered over with a hide. It is accurately described by Julius Solinus, as well as in the following passage from Cæsar:—"Imperat militibus Cæsar ut naves faciant cujus grueris eum superioribus annis usus Britanniæ docuerat. Carina primum ac statumina ex levi materia fiebant, reliquam corpus navium viminibus contextam coriis integebantur."—De Bello Civ., lib. i. § 54.

This ancient boat has been superseded within the last 40 years by the modern curragh, or canoe, of which the present model is given on a scale of an inch to a foot. Strained canvas, coated with tar, is now used in preference to horsehide, as less liable to stretch when exposed to sea-water.

These peculiar boats are well adapted to the coasts of Ireland; they are easily hauled up by the fisherman, and carried to his own cottage. Against a heavy sea and wind they possess great superiority over boats built with wood. But they are only suited to line fishing, from the necessity that the men should remain steady to their seats.

When going before the wind, a light lug-sail is some-set, and though apparently unsteady and unsafe, curraghs, when managed with dexterity, bear a ier sea than any other open boat. They are usually manned by four rowers, each using two paddles.

The original curragh, or carabus, as it is called by Latin writers, was well known in ancient times. "Carabus parva Scaplia ex vimine facta, quæ contexta crudo cordio genus navigii præbit."—Isidor. xix. 1.

The Commentator on Cæsar (Notes Var.) observes:—"Non dubito quia vox Carabus vox sit Britannica aut Belgica,"—Anglice, coricle. *See* farther, Charnock's Naval Architecture, vol. i. p. 222.]

317A **WARNER, Captain**—Inventor.

Specimens of bomb-shells, &c.

318 **HUGHES, JOHN**, *Sunderland*—Inventor.

Model of steering apparatus. This consists of two cast-iron standards, with two traverse boxes at the top. These boxes are screwed on to a toothed rack, which has a pinion on the upright shaft to which the steering-wheel is affixed, so that when the steering-wheel is turned either way, motion is given to the rack, and thence communicated to the rudder by means of two connecting rods leading to the tiller, which is placed on the head of the rudder. The apparatus, or steering-machine, is detached altogether, and is placed on the under side of the deck beams of the ship, and is free from any obstruction. When the sea strikes the rudder it runs amidships; the great leverage that the helmsman has gives him a proper command.

Model of masting-shears, capable of lifting a boiler of 20 tons weight, and shears on this principle may be constructed to raise any weight that may be required. They are also adapted to put masts into ships. The model is made on a half-inch scale. The machinery is under cover, to protect it from corrosion, and to keep it in proper order. The middle storey is intended as a warehouse or loft for fitting up the rigging of larger vessels.

320 **ROOK, GEORGE HENRY**, *Landport, Portsmouth*—Working Shipwright.

Model of Her Majesty's steam-yacht tender "Fairy," to the scale of a quarter of an inch to a foot. The yacht, with her entire fittings on the deck, the carving and the gilding, and her masts and rigging, are closely imitated. The model, in a glass case, appears to be floating on water; but the representation of the surface of the water may be withdrawn, and the vessel displayed resting upon blocks similar to those on which ships are built. The screw-propeller is then seen; and its action may be exhibited on turning a little machinery by means of a pipe-key, to be applied on the deck. (*In Class* 6.)

322 **DRUERY, JOHN**, *Hartlepool*—Inventor.

Model and plan of a ship and shore sheet-iron life-boat, intended to recover herself when upset. Provided with a cabin for the better protection of the ship's crew. Fitted with 21 separate air-tight vessels for the purpose of keeping the boat afloat in case of external damage. The valves of the pipes for ventilating the cabin are so constructed as to admit the air when the boat is upright, and to exclude the water when upset.

323 **GALE, GEORGE HAMLYN**, 38 *Wind Street, Swansea*—Inventor.

Hydrostatic apparatus for life-boats, ships, &c., made of gutta-percha; intended to discharge water from life-boats, &c., without manual or mechanical power.

Model of a life or surf-raft or boat, which presents the same form, whichever side is immersed; with life-buoys, jacket, or belt.

324 **BEE, BENJAMIN**—Inventor.

Model of a life-boat.

325 **BOWEN, AUGUSTUS F.**, *Botley*—Inventor.

Clear anchor.

327 **ETRICK, ANTHONY**, *High Barnes, near Sunderland*—Inventor.

Model, to a scale of one inch to a foot, exhibiting a new method of launching the long-boat of a merchant or other vessel; principally adapted for coal vessels. The boat can by this method be launched by one man, without the masts, or removed to the side of the vessel, clear of the hatchway. Transverse wheels are shipped on, so that the boat can be run fore or aft the vessel as required.

Portable punching, slotting, and stamping apparatus, of new construction. The screw being all in one piece does not revolve, but is worked up and down by the collar to which the handle is attached; it is fitted with five punching and two cutting tools, one with edges for cutting out mortise holes, the other for shaping and cutting devices in iron or other metals.

Bogie, or timber-lifting apparatus, exhibiting a new application of the screw.

In descending a hill, the chain is quickly shifted to give greater weight before or behind, so as to act as a drag. The model is made to a scale of one inch to a foot.

Registered travelling-bag or portmanteau, of new construction.

329 **MACDONALD, JOHN**, 13 *Henry Street, Vauxhall*—Inventor.

Binnacle and ship's compass; intended to reduce local attraction; to neutralize the dip of the needle; to give an extraordinary binnacle light; speedy adjustment of the bowl; and to enable an azimuth to be taken at any hour of the day or night.

Engine pump for various important ships' purposes, with double cylinders, worked with new single valve, and parallel motion.

Silent water-closet, and exhauster of effluvia; acting without trap.

Steam chest and valve, applicable to double cylinders.

Lantern and lamp for ship's head, and general purposes. This lamp throws a reflection of light from 180 degrees of its circle.

330 **PEARCE, THOMAS BLEWETT**, 93 *Newman Street*—Inventor.

Railway fog-signal lamp, with red and green lights to be used at pleasure. One small lamp is sufficient on each engine.

Fishing tackle. Improved walking-stick, convertible into a seat, umbrella, and landing-net handle, adapted for the pocket or fishing-basket. Fishing-rod, with winch and running tackle. Self-acting top, which instantly strikes the fish when he bites; to be used with or without a float. Folding live-bait kettle. A gaff, hook-clearing ring, and drag-hook in one. Float made out of elder pith, with newly invented caps, to be instantly detached from the line.

332 **WILLIAMS, THOMAS**, *Red Lion Street, Clerkenwell*—Inventor.

Self-acting machinery for pumping ships by the movement of the vessel, with improved pump.

333 **LONGRIDGE & Co.**, 4 *Mansion House Place*—Manufacturers.

The largest and the smallest anchors used in the British Navy. Manufactured by the Bedlington Iron Company, Northumberland.

The following are exhibited outside the Building, at the West end.

335 **BATEMAN, JONAS**, 101 *Upper Street, Islington*—Inventor and Patentee.

Patent life-boat, constructed for 30 persons. The object of the exhibitor has been to render it incapable of being stove, sunk, or upset by any sea under any circumstances. It has been exposed to the most violent testing on the coast for four months.

Patent life-boat, constructed for six persons, on a precisely similar principle, and having had the same testing.

336 **RODGER, WM.**, Lieut. R. N., 9 *Shawfield Street, King's Road, Chelsea*—Inventor.

Improved patent small palmed anchor, with improved iron stock.

Improved patent small palmed kedge anchor, constructed on the same principle.

Manufactured by Fox, Henderson, & Co.

337 **Sturdee, A. B.,** *Royal Dockyard, Woolwich*—Inventor.

Working model of a twin-stern steam ship, with protected propeller, prepared in 1848 at Bermuda by th inventor, to elucidate the advantages of his plan over the ordinary mode of fitting screw steamers, of which th following are the principal:—

First, as regards safety and speed:—

1. The propeller is entirely protected from accident by shot, floating ice, pieces of wreck, buoys, hawsers, sea-weed, fishing nets, and from a heavy sea. 2. Expense of wear and tear of propeller is reduced. 3. In the case of the ship being driven on shore, the greater portion of the dead wood may be knocked away without injury to the propeller. 4. The fluid thrown off laterally by the propeller being reflected by the tunnel, vents itself aft with considerable force, like the stream of a rotatory pump, and acting against the after draught of the vessel, which flows in the opposite direction, assists in propelling the vessel; while, in the ordinary construction, the power expended in driving the fluid laterally, is wholly lost. 5. However much the form of the screw may be perfected, the fluid thrown off laterally must always be considerable at starting. It will, therefore, be seen that the first revolutions of the screw will be much more effective in the twin-stern steamers than in vessels of the ordinary construction, and a great advantage be thus gained in extricating the ship from difficult situations.

6. A more direct flood, and a more free passage for the water to the propeller, the line of current being direct with the axis of the propeller.

Second, as regards construction:—

1. The stern-frame of the ship is much stronger than that of an ordinary sailing vessel, has additional displacement, and dispenses entirely with ponderous overhanging quarters. 2. The stern-post is not, as now, nearly severed by an enormous hole being bored through it and the sternson knee, for the screw shafts. 3. Greater stability is obtained, and the heavy rolling so much complained of in the present screw ships greatly reduced. 4. Vibration of stern, when under steam, is nearly removed. 5. The twin-rudder, which can be worked by a single tiller, acts with increased effect; but in case of accident to one, the remaining one will be found sufficient for ordinary work, enabling the carpenter's crew to effect a proper repair of the injured one, or to fit a temporary rudder to the sister stern-post. A single rudder can, however, be adopted, if preferred. 6. On a foreign station, or in the absence of a dock or slip, the ship may be grounded abaft to effect any slight repairs to the propeller shaft, &c.

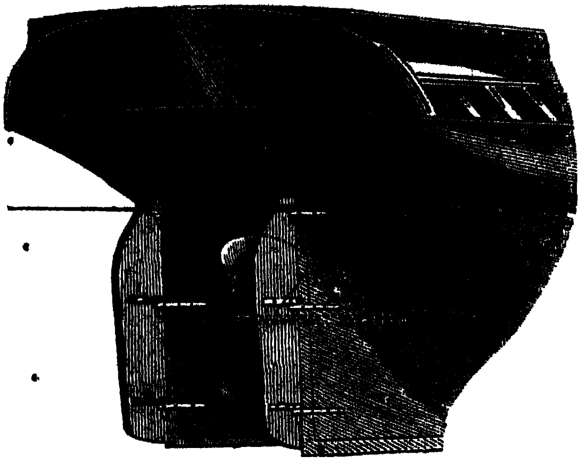
Third, as regards the application of sails:—

1. The propeller can be housed without incommoding the working of the ship or guns. 2. The lateral resistance is increased on the inclination of the ship, by the leeward keel having more immersion than when the ship is upright, thereby adding to her weatherly qualities. 3. The form of the water sections being preserved before each rudder, they have more power than that of the present screw ships, where the water from the leeward side of the vessel passes through the cavity for the screw to the weather side of the rudder. 4. In the case of the ship getting on shore or striking abaft, and having an inclination or list at the time, by tacking or wearing, as the case may require, she will immediately be brought upright, and in many instances free herself, when in that position, as her draught of water abaft will then be less than at the moment she struck.

Lastly, as regards armament:—

1. The propeller, and well for raising it when under canvas, can be fitted clear of the pivot gun, both when housed and in action. 2. The additional strength and support to the stern-frame, already alluded to, and the absence of quarters overhanging by many yards the section of load displacement, as in the case of the ordinary screw ships, render the stern capable of sustaining much heavier metal, and which can be better handled or worked from the increased dimensions of the after part of the quarter-deck.

The illustration represents a quarter view of the ship, with two stern-posts and two rudders to work simultaneously. The space between the stern posts, regulated by the diameter of the screw, forms a tunnel for the propeller to work in, which tunnel, extending towards the fore part of the ship, gradually resolves itself into the ordinary form of the vessel near the mainmast, from whence the original model is preserved.



Sturdee's Working Model of a Twin-stern Steam Ship.

The sister keels which are substituted for the dispensed-with midship one abaft, are fixed at equal distances from the middle line, parallel to each other, forming bilge keels amidships, and the foundation of the arched roof of the tunnel abaft.

To the roof of the tunnel is given that form which will nsure the most effective delivery of that portion admitted of the displaced fluid, and the most free access of the water to the screw.

The engines are placed and fitted in the ordinary way, and the ship may be built of either wood or iron.

In the event of a screw steamer fitted in the ordinary manner being driven on shore, the first two or three hocks would render the ship unmanageable, upon getting ff again, both under steam and canvas, with the loss of rudder and propeller, as in the case of a corvette on the North American coast, in 1850. It is also said of the Great Britain," that, immediately after the first shock he received on going on shore, the screw was jammed or locked, thereby preventing any hope of assistance from er engine of 1,000 horse power, which was thereby rendered useless at the time it was perhaps most required or the safety of the ship.

The experience of nautical men and others connected with the screw proves, that from its present exposed osition many instances have occurred of hawsers being taken up by, and coiled around, the propeller, completely hoking it, and endangering the engines as well as the hip, causing a detention of many days to cut them off iecemeal; in some cases it is not accomplished effectually ithout placing the vessel on shore, or in a dry dock.

The eddy formed on starting the engines, before the hip gathers way, has, in more than one instance, drawn ne boats made fast astern into the propeller, which as literally smashed and sunk them.

The blades of the screw have also been knocked off by striking against projecting shelves of rock, buoys, &c. &c.]

Drawings of the "Balsa" life-boat, in two positions, lso the mode of launching in a heavy surf, with the carriage used for that purpose and transporting alonghore. Provisionally registered.

Sketches of a paddle-box boat, constructed on the Balsa" principle, showing her both under sail and towed in place.

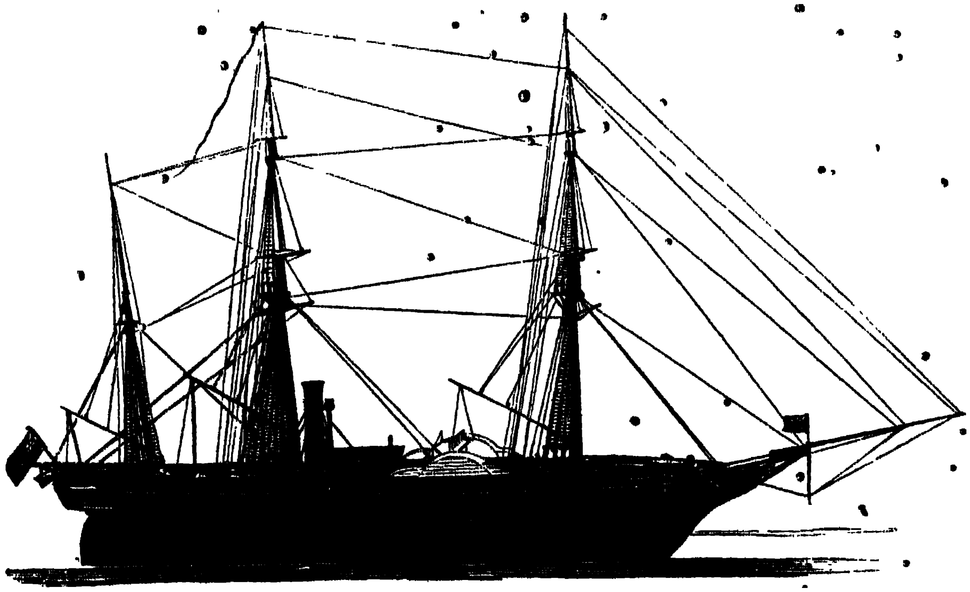
The principles on which the "Balsa" life-boat have been constructed are those of the twin-stern steamer, with protected propeller, exhibited in Class 5, so applied as to combine the qualities recommended by the Committee appointed to examine the plans which competed for the Northumberland premium.

The term "Balsa" is taken from the name of the boats of "South America," famed for their qualities as surf-boats, &c. The boats so styled are each propelled by one man using a double paddle through the heavy breakers and surf on the coast of South America, frequently carrying a cargo of a ton weight.

338 **HUDSON, J.**, jun., 12 *Hanover Square*—Producer.

Model of H.M. steam-ship "Medea," on the scale of ¼-inch to a foot. This splendid war-steamer has the reputation of being one of the fastest paddle steamers under canvas in the Royal Navy; and was designed and built by Oliver Lang, Esq., master shipwright in the Royal dockyard at Woolwich; last year she was the bearer to this country of the celebrated Koh-i-noor diamond, on which occasion she performed the quickest passage on record from the Cape of Good Hope to England.

This model is represented in the annexed illustration.



Hudson's Model of H.M. Steam Ship "Medea."

339 **FARLEY, HENRY W. A.**—Inventor.
Method of raising a stranded vessel.

340 **WARD, —**, Inventor.
Model of a steam-vessel. (In class 5).

341 **M'CRAE, J.**—Inventor.
Model of a life-boat.

342 **RICKARDS, C.**—Inventor.
Steersman's indicator.

343 **MARCUARD, C. R.**—Inventor.
Model of an 18-gun brig.

344 **JONES, T.**—Inventor.
Model of a propeller for canal navigation.

345 **EGG, D.**—Inventor.
Pistols, inlaid with gold and silver.

346 **LANCASTER, C.**—Inventor.
Guns and rifles, smooth-bored.

347
Admiralty compass.

348 **SEARS, M. W.**—Inventor.
Patent needle-gun.

349 **HALL, H. W.**, Lieut, R.N.—Inventor.
Model of an anchor.

350 **REID, Captain, J. H.**—Inventor.
Model of a fan-propeller.

351 **RANKINE, ADAM**, *Lancefield Foundry, Kirkcudbright*—Inventor.

Working model of an iron planked war steam-ship, with screw motion, and propelled by a pair of direct oscillating engines; showing the principle of the ball passing through the ship, with improved tubular boilers.

352 **BAILY, J.**, *Middle Street, Deal*—Inventor.

Model of a Deal lugger of 20 tons. Exhibited for lightness of construction, and sufficiency of strength to stand in a storm.

353 **PUGH, EDWIN**, *Whitstable, Kent*—Inventor.

New ballast, called "water ballast," possessing the following advantages over the present mode of ballasting: No delay in taking in ballast; a sufficient quantity at all times; any quantity can be discharged when requisite; no choking of the pumps; no shifting of the ballast; a greater choice of freights; greater security from leakage; greater security from fire; a saving of labour, and rest to the crew; a greater number of voyages; a greater saving to the vessel, wear and tear of ropes, &c.; strengthening of the vessel when in ballast; saving in provisions, &c.; prevention of the vessel foundering; and saving the expense of ballast.

This apparatus is constructed to last for years, at a trifling annual cost. It is simple in its arrangement, so that a sailor can easily understand it. It requires no alteration after it is fixed, and if by accident it should be damaged, it is soon repaired. The expense of the purchase is liquidated in the first twelve months.

354 Captain **DWYER**, *Woolwich Dockyard.*
Model of life-boats and anchors.

355 Mr. **LANG**, *Woolwich Dockyard.*
Various methods of steering vessels.
New plan for dead-eyes, and system of ventilating ships.

356 **PEAK, JAMES**, *Woolwich Dockyard.*
Model of a brig, on slip.

358
Model of a 78-gun war-ship, in a small decanter.

SECT. II. CLASS 9.

AGRICULTURAL AND HORTICULTURAL MACHINES AND IMPLEMENTS.

INTRODUCTION.

THE application of the mechanical genius of this country to Agriculture is illustrated by the present Class. In respect of the space occupied by it, it may be considered the largest Class in the Exhibition; but in the number of exhibitors it does not equal many other Classes. In consequence of the annual exhibitions of agricultural implements held in different towns, the exhibitors in this Class have had a degree of experience in their preparations for exhibiting, not enjoyed by those in other Classes, to whom a public display of their productions has presented itself as a new undertaking.

This Class divides itself into the following sub-classes:—A. Implements for Tillage, such as Ploughs, Harrows, Scarifiers, Clod-crushers, &c.; B. Drilling, Sowing, Manuring, and Hoeing Machines, such as Drills, Dibblers, Hoes, &c.; C. Harvesting Machines, as machines for cutting corn, &c., Rakes, Tedding, and other machines; D. Barn Machinery, as Steam-engines, Horse-works, Thrashing-machines, Winnowing, Hummelling, and other machines; E. Field, Fold, and Yard machinery, as Turnip-cutters, steaming, feeding, weighing, and watering machinery; F. Agricultural Carriages, Harness, and Gear, such as Waggons, Carts, &c.; G. Drainage Implements, as Pipe, Tile, and Brick-making machines, Irrigators, &c.; H. Dairy Implements, as Churns, Presses, &c.; I. Miscellaneous Implements used in Agriculture; and J. Garden-engines and Tools.

In the Building the implements and other apparatus of this Class will be found in Avenues P. Q. and R., extending from the Western wall of the Building to the Sculpture Court. Some of the machines in motion, such as mills for farm produce, together with some of the steam-engines adapted for agricultural purposes, are found in the space generally occupied by Classes 5, 6. Outside the Building, also, at its western end, are gates, hurdles, &c., which properly belong to this Class.

The results of much effort, in calling in the powers of the steam-engine to the aid of agriculture as to that of manufacture, are evident in this Class. The agricultural steam-engine is itself an interesting object. For its practical application, great simplicity, combined with efficiency and strength in the working parts, is absolutely necessary. The mechanism requires to be such as shall not be easily deranged, or if deranged to be capable of easy adjustment. The elements of lightness and portability, with simple but efficient working power, naturally offer themselves, as of the first moment, in the construction of an engine to be managed by agricultural labourers, to be dragged into the fields, and often over bad ground and roads.

The oscillating cylinder-engine is used in some of the instances exhibited, and in others the cylinder is placed horizontally, and is fixed, the slide-valves being acted on by an eccentric in the usual manner. These engines have been put to actual service, together with the other machines in this Class; having been tested in the trial-yard on their way to the Building. Upon the result of these experiments will principally depend the report of the Jury for this Class.

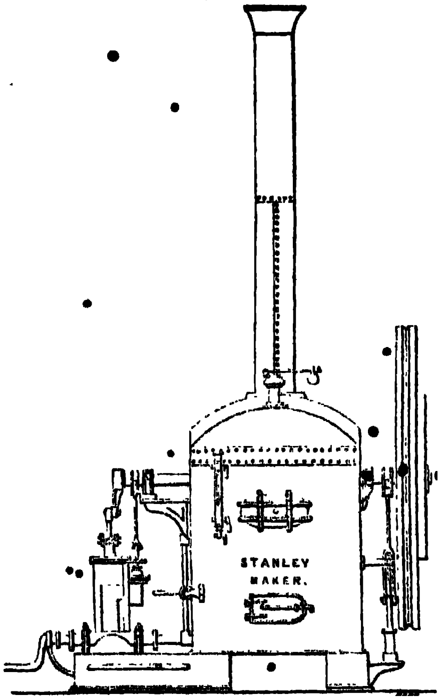
A variety of ploughs and pulverizers are shown, the peculiar form and construction of which are submitted to practical agriculturists for their approbation. A large amount of attention has been given to the form of the share and furrow-turner, with a view to their adaptation to soils of varying tenacities and degrees of resistance. Many of the iron ploughs are deserving of notice from their compactness and lightness of construction. Some are made especially for convenience of stowage for emigrants. The drilling, sowing, and manuring machines exhibit features of interest. In many of these, vulcanized caoutchouc has been serviceably applied for conducting the seed, manure, &c., to the coulters. The steerage of many of these machines exhibits ingenious arrangements. Attempts have frequently been made to substitute mechanical for hand-labour in harvesting operations. Some curiously-contrived forms of apparatus are found in this Class adapted for cutting corn and grass, and thus in a degree dispensing with the labours of the reaper and the mower. Barn machinery is also well represented in a variety of chaff-cutters, winnowing, thrashing, and other machines and mills, which afford an instructive view of the present extensive applications of machinery to agricultural uses. The implements connected with the all-important subject of drainage are specimens exhibiting much inventive skill. The pipe, brick, and tile machines are highly interesting, and some are exhibited in operation, automatically producing, from well-kneaded clay, those various articles, the ordinary manufacture of which requires the labours of several individuals. The pipe-making machines present a singular aspect when in work, discharging an endless row of pipes of wet clay, which are divided by the alternate rise and fall of horizontal wire. By a simple arrangement the length of these pipes can be adjusted to any required extent.

In no other country, of late years, has agriculture been rendered so largely an object of experiment as in the United Kingdom, and in none other do the requisite amount of capital, and the supply of means for such experiments, proportionately to the area of the soil occupied, exist. Perhaps it may be added, that in no other country does there exist the same absolute necessity for the complete development of the productive capabilities of the soil. The application of philosophy to this art is recent, but promises favourable results. Chemistry has been applied to, for the knowledge of the properties of various earths, and Mechanics become the next object of study with a view to reduce the soil to the conditions required by the cultivator.—R. E.

1 **STANLEY, WILLIAM PROCTOR**, *Market Place, Peterborough*—Manufacturer.

1. A two-horse portable steam-engine, with an improved boiler, invented by John Medworth, of Nottingham. The fire is surrounded by water; in and across the fire-box, is a circulating chamber or water bridge, in the form of a square box, with about two inches inside water space. It has inlet pipes at bottom, and outlet pipes at top, into the body of the boiler. The water circulates through this box, and its violent ebullition liberates the steam as rapidly as it is generated. The cut, fig. 1, represents this steam-engine.

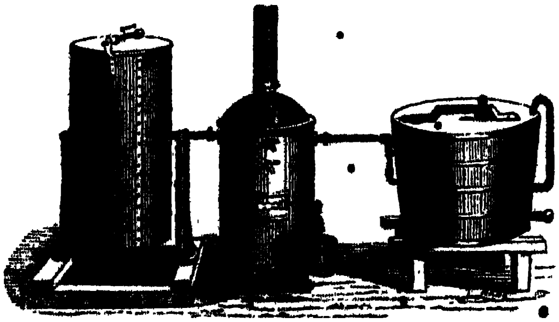
Fig. 1.



Stanley's Two-horse Portable Steam-engine. (End Elevation.)

2. The farmers' registered steam-cooking apparatus. This apparatus is shown in the adjoining cut, fig. 2.

Fig. 2.



Stanley's Registered Steam-cooking Apparatus (for Farmers).

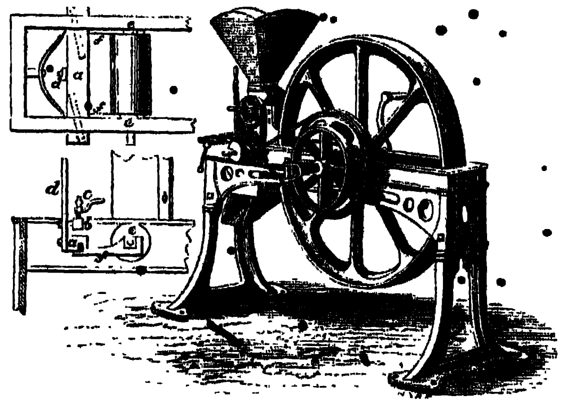
3. Rape and linseed cake-breaker, for breaking cakes for sheep, cattle, and manure.

4. Registered roller mill, or corn and seed crusher, for crushing linseed, oats, barley, malt, beans, and Indian corn.

5. Chaff engine, with safety lever, and apparatus for stopping or reversing the motion in case of accident, to cut chaff from ⅜ths of an inch to 5 inches long. This engine is represented in the annexed cut, fig. 3.

6. A machine for cutting roots for sheep and cattle, and known as the Royal Albert turnip-cutter: this, as also Nos. 2, 3, 4, and 5, are intended to work, at the same time, from the two-horse engine.

Fig. 3.



Stanley's Chaff Engine.

The side cuts represent the safety lever seen from above and at the side; *d* is the lever acting through the pieces *a* and *f*, *f*, on the roller *e*, *e*; *c* is a tightening screw.

7. Drawings of windmills for grinding corn.

8. Drawings of a roller mill, and of a steam generator.

---

3 **GUEST, JOHN**, *Bedford*—Inventor and Manufacturer.

Three-row steerage drill on the flat, or two rows on the ridge, for turnips or mangel-wurzel, with manure.

Eight-row cup drill, for corn and seed, with self-acting box, and independent steerage, by which the drill-man is enabled to steer it perfectly straight, independently of the horses, and thus to facilitate the use of the horse-hoe between the rows.

4 **DEAN, THOMAS**, *Wishaw, Scotland*—Inventor.

Cutlery apparatus attached to a tile and pipe machine, for forming overlaps in tiles and pipes as they come through the die; intended to prevent the tiles or pipes from sinking in soft lands, and to keep them in one continuous line, so as to supersede collars. Two men and a boy can cut and make an average of 4,000 daily. The one pipe is cut out of the other, so that the overlaps are very complete in the fitting. The machine will be worked to exhibit the process.

4A **SMITH, ALEXANDER KENNEDY**, *Exminster*—Inventor and Maker.

Rotary screening machine, for screening earths, manures, coke, coal, stamped ores, &c., having a rotary motion, constantly changing the position of the article to be screened.

11 **CROSSKILL, E.**, *Liverpool*—Manufacturer.

Cart, waggon, and patent wheels.

13 **HARDING, EGERTON**, *Oldsprings, Market Drayton*—Inventor.

One-horse cart, the wheels running vertically, and the axle revolving as well as the wheels.

Set of whippletrees.

15 **BUSBY, WILLIAM**, *Newton-le-Willows, Bedale*—Manufacturer.

Single-horse cart, and light single-horse cart, for farming purposes.

A light horse-hoe, for ridge work, improved by the exhibitor. Strong horse-hoe for ridge work, with five tines.

Horse-hoe, with expanding motion.

Deep plough. Plough for general purposes. Light two-wheeled plough. Swing plough. Ribbing drill.

16 **HARVEYS & TAIT**, *Strathaven, Scotland*—Inventors and Manufacturers.

Clydesdale tilt-cart, in working order, with concealed fastening; intended for farm work, and adapted for jobbing on parks, lawns, or ornamental grounds.

Farm kitchen fire-place crane, with improved machinery for adjusting cooking vessels.

---

17 **CAMPBELL, A. F.**, *Great Plumstead, Norfolk*—Manufacturer.

Patent four-wheel parallel-motion harrow.

17A **GREGORY, RICHARD**, *Beverley*—Inventor and Manufacturer.

Model of a draining-machine.

18 **STENT, WILLIAM**, *Stockwith, Gainsborough*—Inventor and Manufacturer.

New supporter for peas, intended to supersede the common sticks, and calculated to last, with care, for a considerable time. This supporter is neat, and can be obtained in lengths of 23 yards.

20 **NICHOLLS, R. H.**, 11 *Elizabeth Street, Eaton Square*—Inventor.

Patent dibble, with locomotive machine attached, for planting corn; and so constructed as to work upon any description of land without choking; progression is obtained by a new arrangement of mechanical powers.

Machine for giving motion with power to all rotatory machinery.

---

21 **WILKIE, J., & Co.**, *Uddingston, near Glasgow*—Manufacturer.

Parallel drill grubber, made of wrought-iron, and adapted for cleaning and loosening the earth between the rows of mangel-wurzel, potatoes, and turnips sown on the ridge, having two wheels, one in front and one behind, and regulated to the required depth by a lever.

Turn-wrist plough, made wholly of malleable iron, and adapted to lay the furrow to the right or left at pleasure; the mould boards and coulter are shifted by a simultaneous motion; the bridle is self-acting, and adjusts itself in the turning of the horses, having two wheels in front to regulate the depth.

Two-horse sowing plough, adapted for general purposes. It is greatly improved by welding the left handle, beam, sheath, and heel in one solid body, thus dispensing with joints and mortices.

Subsoil plough, invented by Mr. Smith, and improved by the exhibitor, with frame-work and land-breakers, and a leading wheel to regulate the depth, which, running in the bottom of the furrow previously made by the common plough, makes it work more evenly and easily.

Friction-wheel plough, having a friction-wheel in the sole for ease of draught.

21A **REVIS, THOMAS**, 8 *Cleave Place, Larkhall Lane, Stockwell, Surrey*—Inventor.

Single-seed planter.

Single-seed dibbler.

22 **EATON, JOHN**, *Woodford, near Thrapstone*—Inventor and Manufacturer.

A patent seed-dibbler, adapted for hand or horse power.

Registered ornamental sheep-crib, for hay, roots, cake, &c. Invented by William Knight, Esq., of Titchmarsh.

23 **HARKES, DAVID**, *Mere, near Knutsford*—Inventor and Manufacturer.

Plough, with the joints welded instead of being connected by bolts and screws, and improved mould-board; it can be used with or without wheels.

Parallel expanding horse-hoe, for hoeing between turnips, potatoes, &c.; it can be set to any required width by a lever fixed between the handles, without stopping the horses.

Cheese and cider press, operating on the principle of a steelyard, which can be regulated to any pressure.

Hay-cutter.

Machine for screening clay for bricks, tiles, pipes, &c.

---

24 **BRABY, JAMES, & SON**, *Duke Street, Stamford Street, Lambeth*—Inventors and Manufacturers.

New application of springs to a caravan, or waggon, in which the perch bolt is placed behind the centre of the axletree, to allow a higher fore wheel, and give a greater amount of lock.

Machine for weighing coals, attached to the hind part of the caravan or waggon.

25 **WINDSOR, JOHN**, *Oswestry*—Manufacturer & Improver.

Winnowing machine, for wheat, barley, oats, beans, peas, &c. The improvements claimed are the peculiar construction of the riddle-case, and the placing of a fly-wheel on the fan spindle to regulate the speed, and produce an under-current of wind at the bottom of the cylinder to blow off any light substances.

Clover seed drill, for sowing all grass seeds and turnips on the flat. The bottom of the box is formed so as to cause the seed to fall to the brush until empty, and there is a movement for throwing the connecting spindle out of gear.

25A **ALSOP, DANIEL**, 6 *Boone Street, Lee, Kent*—Inventor and Manufacturer.

Sulphurator and fumigator, to diffuse powdered sulphur for destroying mildew; with a tobacco-chamber.

25B **KINGSWELL, FREDERICK**, *Upper St. Martin's Lane*—Inventor.

Model waggon.

25C **GINGELL, W. J.**, *Nelson Street, Bristol*—Inventor.

Model uniform corn and seed meter, producing a uniformity of weight and measure of corn or seed at the same time.

---

26 **ROBERTSON, GEORGE**, *Allardice Street, Stonehaven, Scotland*—Inventor.

One-horse cart for agricultural purposes; with a sliding axle, by which the weight on the horse's back is regulated in going up or down hill; it has the advantage of keeping the cart always on a level. This invention is intended to prevent horses being at one time crushed with too much weight, and choked at another with too little.

---

27 **ALCOCK, THOMAS**, *Radcliffe, near Nottingham*—Inventor and Manufacturer.

Chaff-cutter, with improved rising roller.

Improved two-wheeled iron plough.

Improved swing iron plough.

---

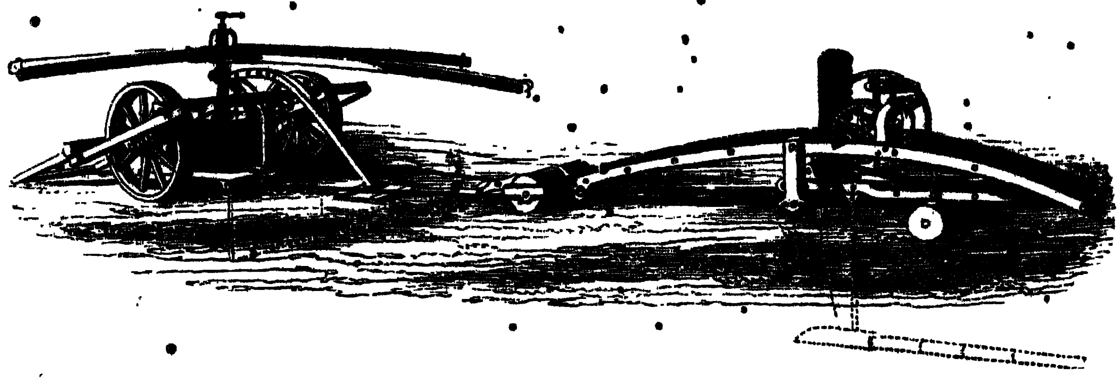
3 **LOWCOCK, HENRY**, *St. Peter's Street, Tiverton*—Inventor and Patentee.

Patent turn-wrist plough (invented by the exhibitor, and manufactured by R. Adams, of Marldon, Devon), for turning furrows in one line of direction, and parallel to each other. With this implement the whole under surface of the furrow-slice is clean cut out at each ploughing; the weeds are clean cut; and the upper surface of the soil, especially when brought into tilth, is kept more level, and is less trodden.

28A **FOWLER, JOHN, jun.**, *Temple Gate Implement Factory, Bristol*—Inventor and Proprietor.

Improved draining plough, (patented for the United Kingdom, France and Belgium) capable of effectually executing any drainage that may be required above the depth of 4 feet, at less than half the cost of the present system, and without disturbing the surface soil.

The following engraving shows the machine just as it is finishing the drain. When commencing work, the plough is taken to one end of the field, and the capstan is moored at the other; the wire rope being run off the drum of the capstan and attached to the plough (either singly in shallow draining or soft soils, or returned round a single sheave when greater power is required), as shown in the cut. The plug and coulter are then dropped into a hole prepared for them, and the pipes threaded on a rope are attached to the back of the plug, the hole being sloped off backwards to allow them to enter easily. The horses are attached to the horse levers of the capstan, and by walking in a circular course, wind the wire rope on to the drum, and pull the plough forward with the pipes attached. When the required length of drain is completed (which may be any length under 225 yards), the plough is run into another hole, and the rope on which the pipes are strung, being unhooked, is pulled out backwards, and the drain is complete. As it would be inconvenient to have the pipe-rope in one length, it is made pieces of 50 feet each and by a simple contrivance, as one rope enters, the other is attached to the end. It does not occupy more than one quarter of an hour from the time of finishing one drain to commencing another. The accuracy with which the clay pipes are laid cannot, it is said, be equalled by any hand work; and from the bottom being undisturbed, they are not liable to sink, as is sometimes the case even in the best-executed hand draining.



Fowler's Improved Draining Plough and Windlass.

By this process, not only is the cost of burying the tiles reduced in many cases 50 per cent., but from the quickness and neatness of the operation it can be done at any season of the year, without injury to any short crop or interfering with the common farm operations, the surface soil being untouched, except at the headlands; and where the hedges are low, the capstan can often be fixed in the next field. In undulating or flat lands, the levels are kept, or a fall insured, by working the coulter up and down in the body of the plough, by means of the worm and worm-wheel, shown in the cut, the ploughman's eye being guided by a try-sight balanced on the plough, and a cross staff erected at the end of the field.

Several of these ploughs are now in constant work, and though great lengths of the drains have been opened in the presence of large numbers of agriculturists, in no instance have tiles been found incorrectly laid.

The quantity of draining that can be done per day will vary with each particular field, but in common clay land when the depth does not exceed three feet, between 6,000 and 7,000 feet will be completed with four horses in the common working day; but when the depth exceeds three feet, from two to three horses will not do more than half that quantity. Where it is possible, this draining would be much more cheaply done in summer; as twice the quantity of work may be done by having two teams of horses out, and the other expenses would not be increased in proportion.

28B **FOWLER & FRY**, *Temple Gate Implement Factory, Bristol*—Designers and Manufacturers.

Registered farm cart, adapted for harvest and winter purposes. The shafts are adjusted with bent iron stays, so as to keep the body low and the wood shafts straight the tipping apparatus is also adapted for rapid and easy delivery.

29 **ELLS**, 3 & 6 *Tottenham Court Road*—Inventor.
Wheelbarrow on an improved principle.

30 **CARPENTER, W.**, *Banbury*—Inventor.
Anti-attrition thrashing machine.

---

31 **SAWNEY, WILLIAM**, *Beverley*—Inventor.
Winnowing-machine.
Iron model bridge.

32 **BENDALL, JAMES**, *Woodbridge*—Manufacturer.

Patent self-adjusting cultivator, for skimming, cleaning, pulverizing, or subsoiling land, with a double-action lever on the axle, and crescent plate, to regulate its depth; improved key mortice, for prongs; new arrangement of shares, and new mode of regulating front wheels.

Patent crushing machine for corn, beans, peas, barley, &c.

---

33 **BLACKHALL, JAMES**, 22 *Upper Gray Street, Edinburgh*—Inventor.

Model of high-pressure boiler, for steaming bones for manure; with additional tanks for rotting flax; also, for steaming straw, turnips, and other food for cattle.

Specimen of steamed bone-manure, prepared at Blackfaulds, Linlithgowshire; containing, for its preservation, 5 per cent. of salt and 5 per cent of gypsum.

The process of steaming bones, and afterwards dissolving them in sulphuric acid, is intended to supersede the usual method of crushing them by expensive machinery.

---

34 **BEART, R.**, *Godmanchester, near Huntingdon*—Inventor.

Patent land cultivator or scarifier, having traction wheels, to prevent the implement, when paring hard land, from moving out of the line of the draught of the horses.

---

35 **MARSHALL, Lieut.-Col. WILLIAM**, *Newfield Cottage, Craigellachie, Scotland*—Inventor.

Cereal seed-planting and simultaneously-operating machine, constructed to show the advantage of thin seeding.

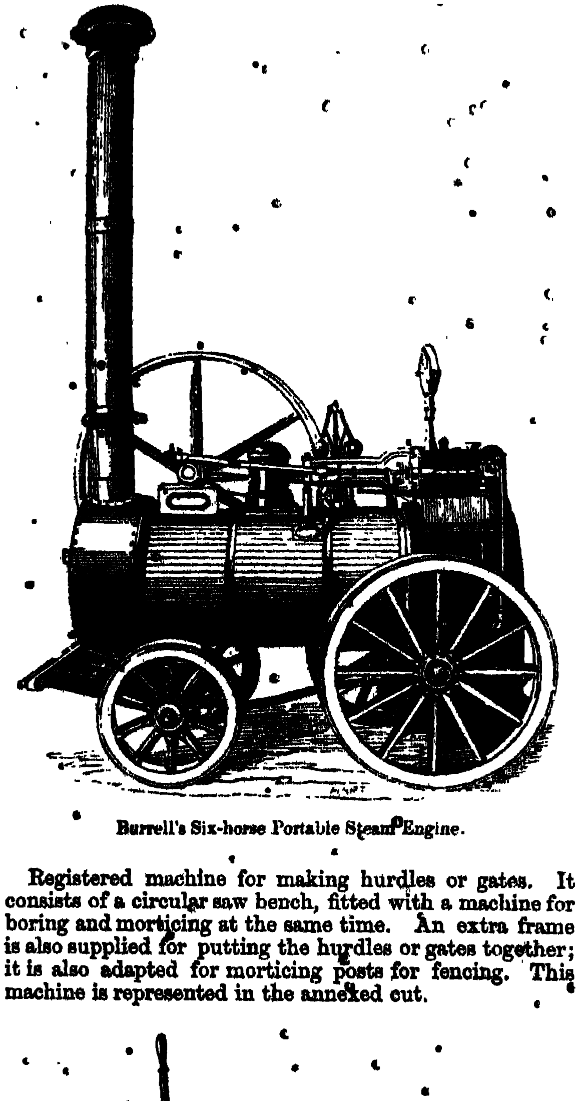
---

36 **WINDUS, T.**, F.S.A., *Stamford Hill*—Inventor.
(J. Rendall, Maker, Stamford Hill.)
Two centripetal barrows.

---

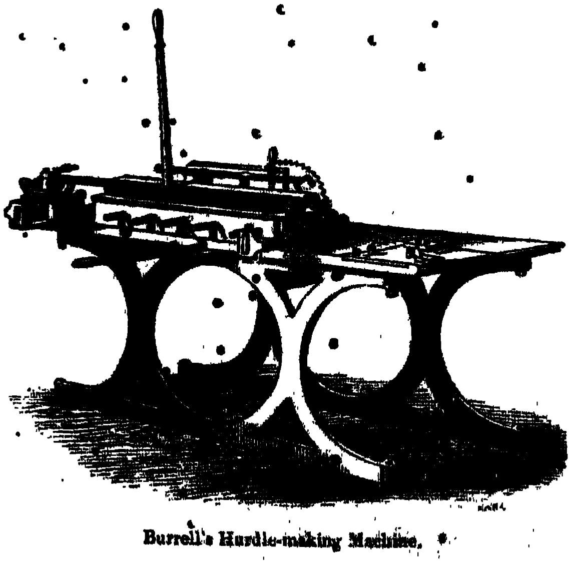
37 **BURRELL, CHARLES**, *Thetford, Norfolk*—Designer and Manufacturer.

A six-horse power portable steam-engine, adapted for driving a thrashing-machine, saw-mill, &c. It has an improved tubular boiler and reversible motion. The speed can be varied from 90 to 110 revolutions per minute, without stopping the engine. The following cut represents this engine.



Burrell's Six-horse Portable Steam Engine.

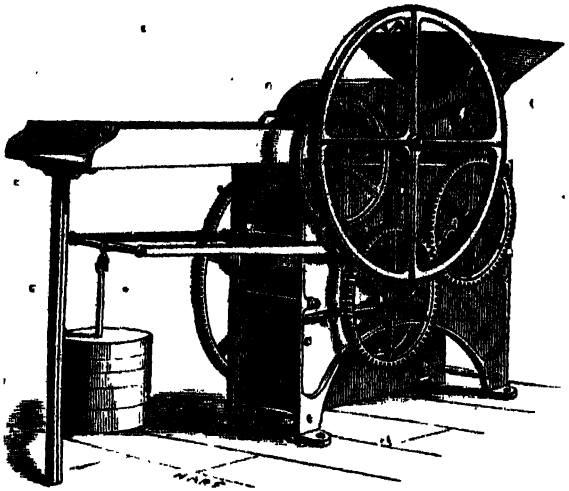
Registered machine for making hurdles or gates. It consists of a circular saw bench, fitted with a machine for boring and morticing at the same time. An extra frame is also supplied for putting the hurdles or gates together; it is also adapted for morticing posts for fencing. This machine is represented in the annexed cut.



Burrell's Hurdle-making Machine.

Registered gorse-cutting and bruising machine. It first cuts the gorse as chaff, and then passes it through one pair of rollers, one of which has a pressure, by means of a leverage, of four tons weight. It is also fitted with an extra hopper when used for crushing. This apparatus is shown in the cut.

A thrashing-machine, with straw-shaker attached, invented, improved, and manufactured by the exhibitor. This machine is upon double carriages, and is well adapted for a portable steam-engine.



Burrell's Registered Gorse-cutting and Bruising Machine.

A spirit-level, for laying draining-pipes or tiles, invented by John Matthews, and improved by the exhibitor.

38 **STEEVENS, WM. DAN.**, 157 *High Holborn*.—Inventor.
Model of a new plan for an agricultural railway, with a new engine for the same, without steam or horse power, and carriages, trucks, &c., for farming purposes.

38A **ARMITAGE & COMPANY**, *Mousehole Forge*—
An improved plough.

38B **MURPHY, D. J.**, *Chamber of Commerce, Cork*—Inventor.
Model of the Archimedean agricultural machine for cutting, turning up, and pulverising the soil, so as to prepare it in the one operation for receiving the seed, and thereby economising much of the time, labour, and expense heretofore incurred. It can be worked either by steam or horse power, and even, on a reduced scale, by manual, for horticultural purposes.

41 **ELLIOTT, JOHN**, *Southampton*—Inventor.
Deodorizing water-closet.
Model of farm buildings.
Model of cottages for labourers.
Portable draining level.
Specimens of clay tubes, for building roofs and walls of cottages, farm buildings, &c. Manufactured in 1848, at the brick and tile works of the Duke of Richmond.

41A **FYFE, WILLIAM WALLACE**, 30 *Hamilton Place, Edinburgh*—Inventor.
Syphon apparatus, for the washing of sheep, and for improving the growth of wool by the copious application of pure water.

[Though employed in a rude form in the case of Canadian sheep or store farming, the use of the syphon in this country is unknown in sheep-washing, a process which is performed either by "leaping" or "rough-handling" the animals, to their great injury and that of the wool. There is reason to believe that the free application of water, promoted by the use of this apparatus, will improve the woolly fibre, by precluding irregular growth, and the formation of knots or joints, besides conducing to the health of the sheep. A prejudice exists against giving water to sheep, yet the necessity of washing is admitted.]

42 **Slight, J.**, 34 *Leith Walk, Edinburgh*—Manufacturer.

A Tweeddale subsoil trench plough; an improvement on Read's by the Marquis of Tweeddale.

The Tweeddale trench plough, invented by the same, for the purpose of taking a furrow slice fourteen inches deep as a precursor to the former.

Model of Henderson's patent Derrick crane.

43 **Starkey, Thomas**, *Farthinghoe, Brackley, Northamptonshire*—Inventor, Designer, and Maker.

Clod-crusher, on travelling wheels, shifting into a plain roller.

Telescope ladder, extending from six feet, to 26 feet, shifting into one, two, three or four ladders, and forming a single or double flight of steps.

Ship-propeller, exhibited for simplicity and power.

Table, convertible into a bed or wardrobe, a suite of drawers, a seat, a closet, &c.

Two tables, as specimens of British woods.

Seat, to shut-up, for the pocket.

44 **Race, Edward**, *Beverley*—Inventor and Manufacturer.

Model of a new tipping waggon. This waggon has a screw in the middle pole acting upon the fore-end of the waggon, so that one man can tip the body, and discharge a load of four tons weight.

45 **Golding, Robert**, *Hunton, Maidstone*—Manufacturer.

"Improved Grecian" beehive: constructed with bars or slips of wood, to which the combs are suspended, so as to allow of their being extracted and returned uninjured. Adapted either for making observations, or for taking the honey without destroying the bees. A portion of the hive, consisting of three bars, is removed, and a similar piece, with combs attached, from another hive, substituted to show the arrangement of the comb and mode of action.

"Improved Huber's leaf-hive," which opens in the manner of a book, and admits of particular examination, for the purpose of observing the proceedings of the bees.

45a **Golding, Edward**, *Hurstbourne Priors, Andover Road*—Inventor and Manufacturer.

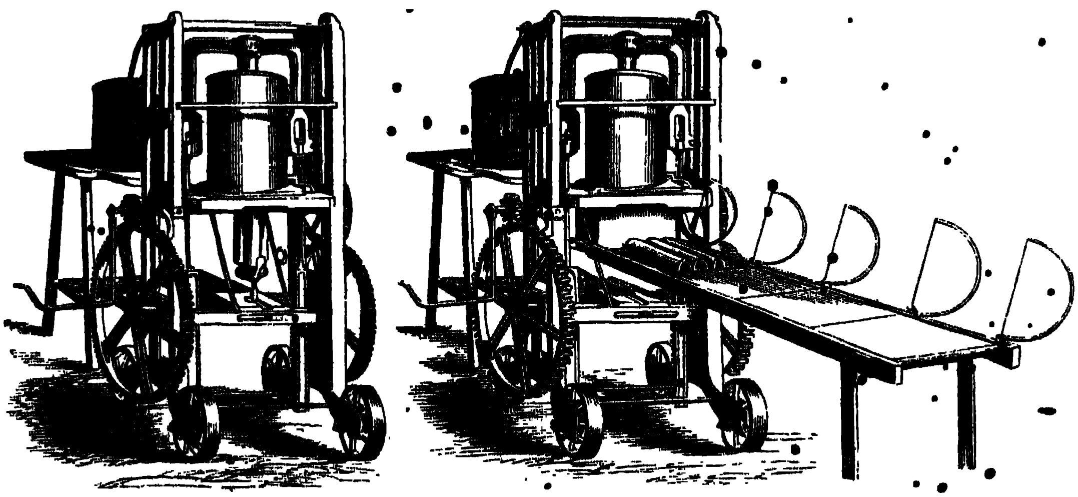
Improved rolling barley chumper, to break the beard from the grain by rolling it backwards and forwards over the barley when spread on the floor. Its effects are doubled by inserting wires between and underneath the bars.

46 **Davis, Thomas**, *Guy St. Nicholas, Warwick*—Inventor.

The drum part of a registered thrashing-machine, worked by steam or horse, adapted to thrash all kinds of grain (leaving the straw for boltings or otherwise), with revolving drum, the circumference of which is formed of a series of flutes or concave plates, and the beaters attached to the said drum and concave fixed in the interior of the same cylinder in which the drum works. These plates have teeth or sharp-edged flutes on their faces. The said teeth are not concentric with the axis of the drum, but (regarded in the direction in which the drum revolves) the second of each set advances on the first, and the third on the second.

47 **Clayton, Henry**, *Atlas Works, near Dorset Square*—Inventor and Manufacturer.

Patent double action machine for screening the clay for the manufacture of all kinds of drainage pipes and tiles, roofing and paving tiles, and hollow or solid bricks; it combines the vertical and horizontal plans of working. This double-action machine is illustrated in the annexed cut.



Clayton's Brick, Tile, and Pipe-making Machine.

Patent gratings and dies for cleansing clay, being perforated metal plates instead of wires or bars.

Cycloidal shape and other various improved draining tools, for cutting the drains in every description of soils. Patent drain consolidater and chaser, adjustable to every depth of drain, for the tiles to be laid in.

Working drawings (to scale), for the erection of kilns, drying sheds, &c. Improved plan for drying shelves, for drainage tiles, pipes, hollow and solid bricks. Specimens of common and other tiles, and of Roberts' patent bonded hollow bricks.

48 **Morrison, John, & Son**, *Banff, Scotland*—Producers.

Four bulbs of golden yellow turnip, and sample of seed, which have been cultivated in Banffshire and Aberdeenshire for several years. Four bulbs Aberdeenshire, or Gordon yellow turnip, and sample seed. Four bulbs of Williamson's Swedish turnip, and sample of seed. Four bulbs of Birchromb yellow turnip, and sample of seed, which produces heavy crops on poor soils.

48a **Palmer, Richard**, *Bideford, Devon*—Inventor and Manufacturer.

Machine for cutting, and reducing to a pulp, turnips, carrots, mangold-wurzel, potatoes, &c., and mixing meal, if required. This machine may also be applied to grinding apples for cyder.

49 **Drummond & Sons**, *Stirling*—Proprietors.

A grubber or cultivator, made by Mr. Lewis Potter, Bothkennar, near Stirling. The principal improvement consists in the easy adjustment of the tine frame, by means of lever and pulley.

A two-horse iron swing-plough, made by Mr. John Barrowman, of Saline, Fifeshire; with long handles and short beam.

50 NICHOLSON, W. N., *Newark-on-Trent*—Inventor and Manufacturer.

Oil-cake breaking machines.

Mill for grinding barley, beans, &c.

Improved double blast corn-dressing or winnowing machine.

51 SEAWARD, WILLIAM, *Oulton, Wakefield*—Designer.

Tree remover, for transplanting large shrubs and trees.

[When the earth has been removed round the root of the tree, so that a large and compact ball remains the plate is placed as far under the ball as it will admit the longest rope is then crooked on to the ring at th corner of the plate at the furthest distance from the ball and passed round the under part of it, until it returns t the opposite corner; the power is then applied to the en of the rope, by which means the tree is easily removed t the centre of the plate in its erect position, and therefor conveyed to its intended place.]

Tree supporter, to support cypresses, arbor-vitæ, an shrubs, the branches of which are liable to be bent an broken down by snow, &c.

52 JONES, EDWARD, 138 *Leadenhall Street*—Inventor

"Airish mow," adapted to the preservation of corn i the harvest-time of rainy seasons.

In Cornwall and Devonshire the farmers, when cutting their crops in unfavourable weather, commence early i the morning and have the produce of whole fields stacke on the spot, in "airish mows," before the evening, where it remains for months, free from heat and injury, until i suits the grower to house or otherwise dispose of it Each mow contains generally about 400 sheaves.

[In wet harvests it is desirable to adopt some metho for keeping the cut corn as dry as possible, in order t avoid sprouting and other injury. In the north of Europe light frames are erected in the field, on which the sheaves are placed with their heads downwards, and the top ridge is then lightly thatched; or hurdles may be set up, inclined towards each other at any desired angle, and the sheaves placed on them in layers and then thatched. In many counties in England the practice is to set up a certain number of sheaves to form a stack, which is "capped" or "headed" by other sheaves placed on it with their heads downwards. In Northumberland a practice still exists called "gaiting."—A single sheaf is taken; the band is tied higher up than usual; the butt, by a peculiar movement of the workman, is spread out, and the sheaf is then set up by itself. By thus separating the straw the wet does not lodge so much as it otherwise would do. The practice of making "airish mows" has generally declined, even in Cornwall and Devon:—smaller mows are now made in the form of a conical heap, and containing about a load of sheaves.—J. W.]

53 COUCH, JOSHUA, *Harleston, near Northampton*—Inventor and Manufacturer.

Patent machine for winnowing or dressing corn and seeds.

Barley hummeller, for breaking off the haulm or beard of barley, without injury to the corn. It is also made with a self-acting apparatus for feeding the hopper.

Patent sack-holder, invented by Henry Gilbert, of St. Leonard's-on-Sea, for opening the mouth of a sack while being filled; with improvements by the exhibitor.

55 ABBOTT, WM., *Bideford, Devon*—Inventor.

Common plough, diminished in weight and friction, by the introduction of a wheel behind, and improved by raising the share, and continuing the iron-work of the handles to the spill.

Machine or apparatus for drying malt.

56 CHENERY, S., *March Cambs*—Inventor.

Land-presser, particularly adapted for fen-land.

56A EBBS, BENJAMIN, 9 *Lower Terrace, Islington*—Designer.

Lady's garden rake, consisting of a hoe, spud, and rake, all in one, by which weeds may be extracted from between closely-planted flowers, and the necessity of treading on the flower-beds or stooping to pull them up with the hand prevented.

57 NEWBERRY, W., *Hooknorton, Chippingnorton*—Inventor.

Five-row dibbling machine.

58 ROYCE, GEORGE, *Fletland, Market Deeping*—Inventor.

Patent self-acting reeing-sieve, which takes out of corn all sprouted, damaged, and mouldy kernels; and dirt from oats, wheat, or barley.

Patent smut-machine, and general corn-cleaner. The cleaning power of this machine is due to the operation of the revolving cylinder, which carries away dirt as soon as it is detached from the grain.

59 WHISHAW, F., *John Street, Adelphi*—Inventor

A self-acting feeding-trough for poultry.

60 BECKFORD, T., & GOSLING, W., *Highfield Farm, Wargrave, Henley-on-Thames*—Inventor and Manufacturer.

Model of a circular mowing and tedding machine, drawn on three wheels, by one horse, regulated with a lever by the driver, according to the nature of the land. The mowing machine can be used with or without the tedder.

61 RODENHURST, W. & J., *Market Drayton*—Manufacturers.

Compound screw and lever cheese-press, having more power than the ordinary rack and pinion press, and therefore requiring a less weight and a shorter lever.

Hay or straw cutting machine.

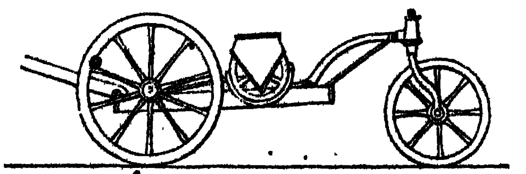
62 GILL & WARD, *Oxford*—Manufacturers.

Improved portable copper steam generator, with force-pump and supply-cistern, complete.

Two iron vessels for boiling or steaming food.

63 WATT, JAMES, *Biggar, Scotland*—Improver and Manufacturer.

Improved broad-cast sowing-machine, for grain and grass seeds, having jointed seed-chests, adapted for passing gates, and the small wheel behind for ease in working, and saving of the grain. Drawn by one horse, and sowing from 30 to 35 acres per day. This machine is represented by a side elevation in the annexed cut.



Watt's Broad-cast Sowing Machine.

5 BIGG, THOMAS, *Leicester House, Great Dover Street, Southwark*—Inventor and Manufacturer.

Improved apparatus for sheep-dipping, which, with the assistance of five men, is capable of dipping 500 sheep per day. The annexed cut represents this apparatus.

Bigg's Sheep-dipping Apparatus.

66 **GREEN, T.**, 97 *North Street, Leeds*—Manufacturer.

Wire aviary and ornamental seat.

66A **AMOS, JOSEPH**, *King Street, Bristol*—Manufacturer.

Barrel-churn and stand of English oak, with improvements in the bung, vent-peg, whey-tap, and gudgeons.

67 **SHANKS & SON**, *Arbroath, Forfar*—Inventor.

Grass and hay-cutting machines.

68 **WHITFIELD, JAMES ALEXANDER**, *Pelaw Staith, near Gateshead*—Inventor.

Improved grappling or dredging-iron, for drawing from the water the bodies of persons apparently drowned.

The improvement consists in its passing over in the same time, four times the space which the present irons pass over. Should the hooks become fastened at the bottom of the river, they will straighten. The hanging-chain with the hooks will detect a body lying behind a rock or large stone. It is made to take into pieces, so that it can be easily repaired.

69 **JOLLY, JOSEPH**, *Vale of Aylesbury*—Manufacturer.

Churn and stand; large and small milk-pails; oval butter-tub; butter prints and boards; milk-strainer.

70 **JENNISON, JOHN**, *Frodingham, Duffield, Yorkshire*—Inventor.

Yorkshire corn stacks, showing the position in which sheaves are laid.

Stack level, to assist the stack-builder.

Hedge models, &c.

72 **HART, CHARLES**, *Wantage*—Inventor.

A registered universal portable grinding-mill. The first part consists of two plates, with steel cutters, the bottom one running horizontally; the grain, in passing through which, is split into small pieces; it is then conveyed between two stones, one stationary and the other running vertically, where it is reduced to fine meal.

72A **PHILLIPS, G.**, *Harrow-on-the-Hill*—Manufacturer.

Improved collateral beehive, made of wood, glass, and zinc. In this hive, the bees do not swarm, nor require to be destroyed to take the honey; and the progress of their work can at any time be ascertained withou danger.

73 **FRANCE, ARCHIBALD**, *Stirling*—Manufacturer and Designer.

A drill-plough for green crops. A green-crop grubber.

74 **SHERRIFF, T.**, *West Carns, near Dunbar*—Inventor.

1. A machine for sowing grain, being an improved drill.
2. A machine for dressing grain, being an improved winnowing machine.

75 **BENNETT, HENRY**, *Liverpool*—Manufacturer.

Model of a self-cleaning roller, for crushing clods, rolling growing crops, and freeing land infested with wire-worm. The rings, of which the roller is composed, are fastened by bolts running through bored bosses into the solid ends. The contrivance for self-cleaning is effected by having two of the holes in each alternate ring larger than the other, so as to allow half the roller parts to rise twice in the revolution, sufficiently to cut out all clods which may rise between them. The rings are also tapered from the outer to the inner edge, so that a clod, being squeezed in, will necessarily fall into the interior, and be broken.

Mill for mixing provender, and preparing manures for drill-sowing. The rollers are composed of double-toothed rings, working into each other; with strong gearing, heavy fly-wheel, with brass bushes, and hard-wood frame.

Gorse-cutting machine, with eight knives, fixed on a cylinder, which revolves in brass bearings, with fluted rising feed rollers, and case-hardened cutting plate.

Mill for kibbling or crushing beans, oats, &c., on hard-wood frame, with case-hardened diagonally machine-fluted rollers, working in brass bushes. The feed apparatus is regulated by a screw from behind.

Oilcake crusher, for crushing oil or rape cake. The rollers are composed of double-toothed rings, bored out, and fitted with a key on a round shaft. It has double pickers for cleaning the rollers, and sliding bars, with regulating screw in the centre, giving a parallel motion to the roller.

76 **WOODBOURNE, JAMES**, *Kingsley, near Alton*—Manufacturer.

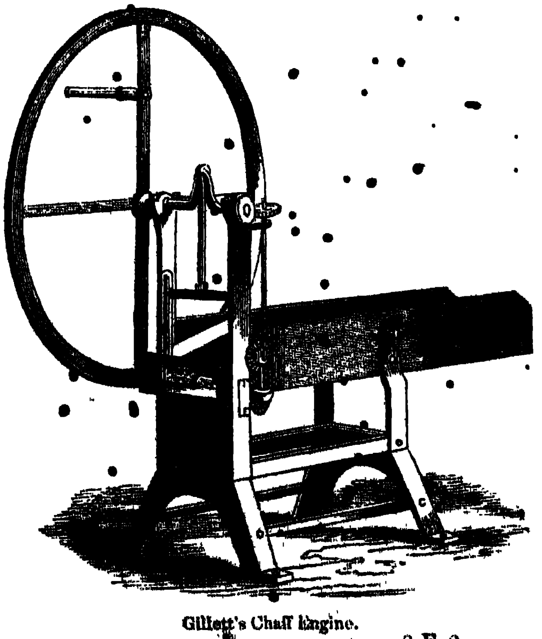
Iron machine for bagging hops by pressure. The power is obtained by one pair of wheels, rack, pinion, and lever; and it is provided with an iron case, screw, and step, for the reception of the bag, to prevent its being torn by the pressure.

77 **PEARCE, W.**, *Poole, Dorset*—Inventor.

Clod-crusher, cider-mill, gorse-cutting and bruising machine, ploughs, &c.

78 **GILLETT, JOHN**, *Brailes, near Shipston-on-Stour*—Inventor and Manufacturer.

1. Chaff engine, for cutting hay and straw with double-action knife, having two edges, cutting in its ascent and



Gillett's Chaff Engine.

descent; the apparatus which regulates the length of the cut, and stops the feed during the action of the knife; and the double mouth-piece, by which the feed gets a bearing on both sides, prevents the corners from being left uncut. The preceding cut represents this chaff engine.

2. Patent chaff engine, with lever beam for horse power.

3. Model of a patent rick ventilator, for ventilating hay and corn ricks.

4. Mill for splitting, bruising, and grinding beans, oats, and barley. In this mill there is but one roller which has a double-action flute: by simply reversing the fly-wheel, the different operations of splitting beans, and bruising or grinding oats and barley, are performed.

5. Patent self-acting alarum gun, for preserving corn, fruit, and seeds from the depredations of birds or game. This machine consists of a barrel with twelve holes, to contain as many charges of powder; one of which, by means of clock-work, is discharged every hour, giving a report as loud as a gun.

80 **Swan, Robert Francis**, *Boxford, Suffolk*
Inventor and Manufacturer.

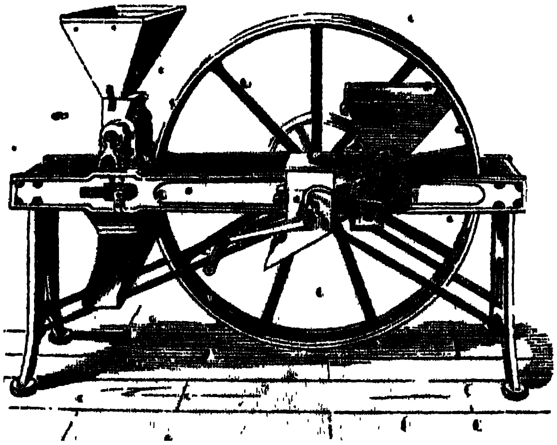
Model of a tipping waggon (on a reduced scale). The novelty consists in the three wheels, the locking, the manner of tipping, the form, the concentration of the weight or load upon one axletree near to the horses' shoulders, and its adaptation to single or double shafts. It may be used as a two-wheel cart, by removing the hind carriage-work.

81 **Mackay, Wm. Henry**, *Swansea*—Inventor.

Machine for mowing hay or cutting corn.

82 **Woods, James**, *Stowmarket, Suffolk*—Inventor and Manufacturer.

Registered iron-crushing and grinding mill, for linseed, oats, barley, Indian corn, rice, lentils, malt, &c. It crushes and grinds separately, or does both at the same time, as two distinct hoppers are provided, and no alteration of machinery is required. The crushing is performed on the surface of a large wheel, 4 feet diameter, in conjunction with a small roller, 7 inches diameter. A steel roller is attached to the axis of the large wheel for grinding beans and peas, so that friction from increased bearings is avoided. The annexed cut shows the form of this mill.

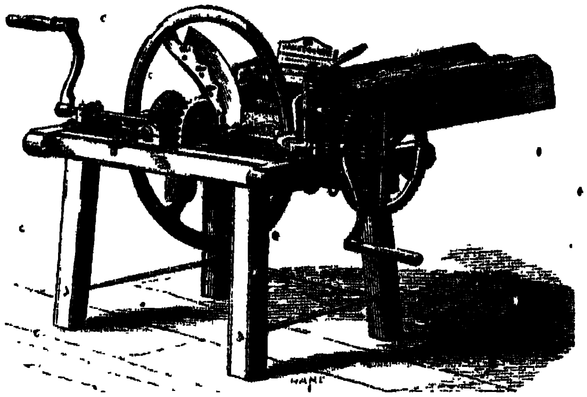


Woods' Registered Crushing and Grinding Mill.

83 **Cornes, James**, *Burbridge, near Nantwich, Chester*
—Inventor and Manufacturer.

Registered chaff-cutting machine, with three knives: invented, and manufactured by the exhibiter. It is applicable to hand, horse, or steam power, and cuts five different lengths of chaff; one length of 4 inches for litter. The annexed cut represents this machine.

A chaff-cutting machine, with two knives.



Cornes' Registered Chaff-cutting Machine.

84 **Roe, Freeman**, 70 *Strand*—Manufacturer.

Four-horse portable steam-engine, for agricultural and other purposes.

85 **Sellar, George, & Son**, *Huntly, near Aberdeen*—
Inventors and Manufacturers.

Double mould, or drill plough, with improved mould-boards. Swing plough.

86 **James, John & Co.**, 24 *Leadenhall Street*—
Manufacturers.

Patent weighing-machine, without loose weights; the weights by which the goods are weighed being attached to, and forming part of, the machine itself.

Three ton machine, or small patent weigh-bridge, for weighing carts, live cattle, and farm produce generally.

Six hundred-weight patent machine, for weighing sheep, pigs, &c.

Three hundred-weight machine, for weighing sacks of corn, &c.

Machine for weighing potatoes, turnips, and other root-crops in the field.

87 **Rowley, John J.**, *Rowthorne, near Chesterfield*—
Inventor.

Patent improved machine for dropping or depositing pulverized substances, such as peat, charcoal, bone-dust, &c., at any required distance from 8 to 18 inches. Turnip, rape, or mangold seed can be deposited with the manure.

Registered corn-dressing machine, with new motion in separating corn from the chaff and short straw, as delivered from the thrashing-machine.

88 **Drummond, Peter Robert**, *Perth*—Inventor and Manufacturer.

Anti-metallic table churns, with six actions. The base is a box for containing hot or cold water. Atmospheric air is carried down through the plunger staff. To the larger size, any kind of animal power can be applied.

89 **Read, Richard**, 35 *Regent Circus*—Inventor and Manufacturer.

New patent garden watering engine, fitted with an improved metallic (jointed) tube. (*See Engraving* on p. 373.) Horticultural machine, with metal tube, &c.; and syringe, with angle branch. Stomach pump, in case, new patent. Aperitive fountain, with reservoir, and metal tube. Injecting instruments for removing obstructions in the bowels of horses and other animals.

Improved hollow probangs for relieving hoven or choked bullocks, calves, sheep, &c.

Read's Patent Garden Watering Engine.

89a **Blaikie, J.**, 71 *Stockwell Street, Glasgow*—Inventor.
Model reaping and mowing machine.

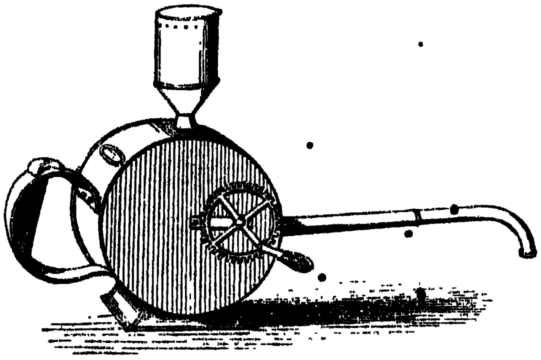
---

90 **Wood, G.**, *Alnwick, Northumberland*—Inventor.
Improved cottage beehive.

90a **Holmes, J.**, 1 *Wellington Terrace, Newcastle-on-Tyne*—Inventor.
Garden-seat and plant stands.

91 **Brown, David Stephens**, 2 *Alexandrian Lodge, Old Kent Road*—Improver.

Patent instrument for fumigating plants, to destroy insects, &c. Tobacco is placed in the magazine at top, and lighted, in the same manner as an ordinary smoking pipe. A draught of air is produced for its combustion by the revolutions of a fan, which draws the smoke in at one part of the cylinder, and drives it forcibly out at another, in a cool state, concentrated, and in any direction. In fumigating turnips, orchards, &c., other moistened substances may be substituted for tobacco. The annexed cut shows the form of this apparatus.



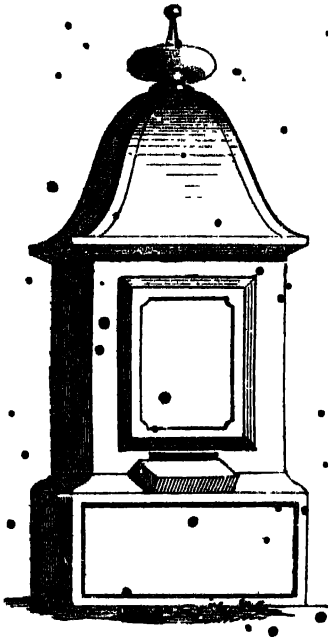
Brown's Patent Fumigator.

91a **Jordan, Thomas**, *Billericay, Essex*—Inventor and Manufacturer.
Improved plough.

---

92 **Pettit, Wyatt John**, *Sudbury, Suffolk*—Inventor and Manufacturer.

Temple beehive, from which the honey may be taken without destroying the bees. This beehive is represented in the annexed cut.



Pettit's Temple Beehive.

The construction is intended to effect the total exclusion of drone bees from the surplus, or glass hives; to give convenience for ventilation; to supply a simple method of taking glass hives when filled, together with convenience for observation; and to prevent the necessity of swarming.

Collateral beehive, possessing all the advantages of the temple hive, with the addition of a surplus-box placed collaterally, and intended for the inside of an apiary.

92a **Nunn, Alicia**, 2a *Welbeck Street, Cavendish Square*—Inventor.

A new self-cleaning solid pulp-blotting roller; a hand instrument for drying ink or colour writings.

New chemical churn, and apparatus for churning butter; a new process by which butter is preserved from becoming rancid.

93 **MARYCHURCH, JOSEPH**, *Haverfordwest, South Wales*—Manufacturer.

Winnowing-machine. The blast is concentrated, and the machine occupies but little space. The riddles may be placed in various positions, to suit different qualities of grain; they rise and fall independently of the case, which moves only in a lateral direction.

Chaff-cutter, having the fly-wheel placed on a transverse spindle on one side of the trough, and giving at the cutting end a circular motion to the knives; it has three rollers, all worked by one compound-wheel. The mouth-piece is serrated above and below, and its lower jaw is moveable, being acted upon by a flexible lever, working from the fly-wheel shaft. In consequence of the knives being placed on a spindle, instead of being thrown round within the area of the fly-wheel, they are reduced in size, and less power is required to work them. The fly-wheel is also situated alongside of the trough, and a case is fitted over the knives and gearwork.

Turnip-cutter, formed of a cylindrical barrel, on which the large knives for slicing are placed in a diagonal position. The small knives for cutting strips (which are also diagonal) are fixed upon moveable segments, and attached to the barrel directly under the large knives.

94 **LAW, R.**, *Shettleston, Glasgow*—Inventor.

A farm cart, iron plough, and model turn-wrist plough.

96 **CROWLEY & SONS**, *Newport Pagnell, Bucks*—Inventors and Manufacturers.

One-horse cart, with new tipping apparatus. Hames. One-horse universal hoe.

98 **BRODIE, WILLIAM**, *Airdrie, Scotland.*

A registered drain-tile and pipe-machine. This machine is driven by steam or horse-power, and when wrought at a speed by which two women take away the pipes, makes from 10,000 to 12,000 two-inch pipes per day. By putting the rope which is attached to the driving-power on a smaller pulley, to bring up the speed, the produce is from 12,000 to 18,000 pipes in 10 hours. Various sizes of tiles and pipes, for leading drains, can also be made when required. By putting on a set of grating dies, this machine is capable of cleaning the stones from clay, after passing through a pug-mill, sufficient to make from 16,000 to 20,000 two-inch pipes per day.

99 **CLARK, JOHN**, *Kirkton Blantyre, by Hamilton, Scotland*—Manufacturer.

Plough.

100 **ISTANCE, R.**, *Carmarthen*—Inventor.

Beehive ventilator.

101 **EPPS, WM. JAMES**, *Maidstone*—Inventor.

Machine for throwing flour of sulphur upon horticultural and agricultural crops, for the purpose of destroying the mould or mildew.

The hopper contains the sulphur, and at the bottom is placed a box containing a sieve; through the box is a spindle, attached to a spring and lever outside the hopper, and the whole is fixed before a fan-blower: the brass wheel (which moves the latter) catches the lever attached to the box in the hopper, and causes an oscillating and tapping motion, which sifts the sulphur into the air-chamber of the blower, whence it is blown in one continued cloud with great force.

103 **BRIGGS, T.**, *Denby Pottery, Derbyshire*—Manufacturer.

Improved beehive.

104 **PONTON, GEORGE**, *Grangefoot, Linlithgow, Scotland*—Manufacturer.

Improved two-horse swing-plough, for lea and general purposes.

Two-horse plough, for forming drills; reduced in draught, and adapted for any soil.

New one-row bean-sowing machine, which can be thrown out of gear at the turnings, to save labour.

All invented, or improved and made by the exhibitor.

105 **THOMPSON, GEORGE**, 18 *Great George St., Westminster*—Inventor.

Patent machine for digging and turning over earth, which may also be used as a cultivator or scarifier, by substituting one or more hoes or coulters, in place of each spade.

Working model of part of another digging-machine, of a lighter construction; to be worked in a similar manner, but having only one row of spades; for use on light soils, and adapted for forming broad or narrow ridges.

106 **HALSTEAD, CHARLES, & SONS**, *Chichester*—Inventors and Manufacturers.

Improved iron ploughs, either for light or heavy soils.
Improved oil-cake breaker, made entirely of iron.

107 **SEWELL & CO.**, *Longtown, Cumberland*, and 30 *Spring Street, Hyde Park*—Manufacturers.

Netherby plough, designed to cut, displace, and leave in a proper position, furrows of various widths and depths on moderately stiff soils, where the more "springy" action of a lighter plough increases the traction, and deteriorates the appearance of the work done.

It is sufficiently strong for almost any soil, but for very stiff clays, it requires another form of mould plate.

The principal resistances in ploughing are, the quiescent tenacity of the soil, and its rubbing friction along the mould-plate. The first is the most important; for since the friction of a body at rest is much greater than its moving friction, it follows, that in a well-formed mould-plate, the rubbing friction of the soil can only be limited. To start, displace, and replace the soil with least power, are therefore the requisites of a good plough.

These qualities obtained, a few pounds more or less weight in the implement itself could make no material difference; as the actual weight should depend upon the nature of the soil to be removed. The attachment of the tractive power, however, is of importance; since it should be in, or as near to the direct line of the greatest resistance, as is practicable. The greatest resistance will be between the cutting edge of the coulter and that of the share which fairly starts the soil into motion, as is testified by the greater wear of these parts. Since this point is near the land side, it is evident that horses walking in the previously displaced furrow are pulling at an angle of several inches from the land, requiring some compensating resistance to keep the plough to the land.

When one horse, however, is attached on each side, and as near to the line of resistance as they can be, their angular traction balances each other, and results in their combined force forming a diagonal line of traction in the direct line of resistance, requiring less power and less guidance to produce straight uniform furrows.

The Netherby plough seeks to lessen resistance by the anti-frictional curvature of the mould plate, allowing the displaced soil to press with less intensity over a larger surface, thereby preventing abrasion; and by the attachment of one horse on each side of the line of resistance, as sufficient power for all ordinary surface work.

108 **REEVES, THOMAS, ROBERT, & JOHN**, *Bratton, Westbury, Wilts*—Manufacturers.

Patent liquid manure-distributing cart. The liquid is distributed by means of revolving troughs, which throws it on two sloping boards or aprons, whence it falls on the land in a thin or thick sheet, as may be required; the cistern may also be turned up to empty itself, by turning handle.

Patent liquid manure drop-drill; it works on the same principle as the preceding, by means of a succession of small buckets, which throws the liquid into tubes, into which the seed is conveyed from a seed-box. It drills the seed and liquid, either at intervals or continuous, as may be required.

These machines were invented by Mr. Thomas Chandler Aldbourne, Hungerford, Berks; and were improved and manufactured by the exhibitor.

---

109 **MAYNARD, ROBERT,** *Whittlesford, near Cambridge*—Inventor and Manufacturer.

Universal oil-cake crusher; exhibited for new arrangement of gear, combining strength and simplicity of working parts. Recent improvements have reduced the friction, and rendered the machine better adapted for preparing the cake for feeding purposes.

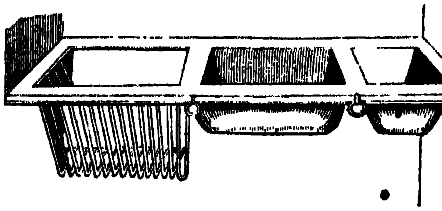
Engine for drawing clover and trefoil seeds, invented by Mr. Constable, of Cambridge, and manufactured by the exhibitor. This machine is for separating the husk or hull from the seed, which it does at the rate of about two or three bushels of clover seed, and about double that quantity of trefoil seed, per hour, when worked by four horses.

Weighing-machine, for ascertaining the weight of any article from a quarter of a pound up to twenty stone.

109A **COTTAM & HALLEN,** *Winsley Street*—Inventors and Manufacturers.

Pipe-tile machine. Winnowing machine. Litter and chaffcutter. Subsoil plough. Two-wheel or swing plough. Skim or paring plough. Universal plough. One-row seed and manure drill. Oat bruiser. Liquid manure pump. Hand-power gauge. Odometer. Ornamental cast-iron vases.

Set of stable fittings, viz., rack, manger, and water-trough, enamelled. The annexed cut represents these fittings.



Cottam and Hallen's Enamelled Stable Fittings.

Wrought-iron basins, enamelled. Cast-iron ventilators. Improved horse-pot for stables. Cast-iron dog trough. Wrought-iron circular and corner hay-racks. Cast-iron mangers for centre and corner of stall. Set of draining tools. Cast-iron rick stand. Stand of patent metallic churns.

Lawn mowing machine. Level for agricultural draining. Circular saw-table for agricultural purposes. Serrated chain harrow. Well-boring tools. Indian corn thrashing-machine.

---

110 **CARSON, H.,** *Warminster, Wilts*—Manufacturer.

Scarifier, invented and manufactured by the exhibitor. This implement has seven shares or tines, of which there are two sets, broad steel shares and couching tines, for cutting, breaking, and pulverizing the soil. The shares are easily fixed into the frame by means of a wedge. The frame containing the shares is raised or lowered by means of a lever, at a single operation; and by the stop for regulating the lever, uniform depth of work is obtained.

Patent turnip-cutter, by Edmund Moody, of Maiden Bradley.

Cheese press, with double lever; constructed with a compound lever and screws. The screw, which is of wrought-iron, can be easily adapted to any depth of cheese.

A set of six harrows, adapted for wet lands, which can be adjusted to the width of any ridge, whilst the horses walk in the furrow. Their form is peculiar, the frame of each being forged into one piece, and the tines are so arranged that each follows in a distinct track.

---

112 **PARSONS, JAMES,** *Craven Farm, Stamford Hill*—Inventor and Maker.

Model of a digging-machine, for breaking up the ground in an efficient manner, and at a small expense.

114 **HAYWARD, GILES,** *Crewkerne, Somerset*—Inventor and Manufacturer.

Plough, with drilling-machine attached, adapted for sowing all kinds of corn and turnip-seed, particularly in a dry season, with or without dry manure.

---

115 **BUTLIN, WILLIAM,** *Northampton*—Designer and Manufacturer.

Four-horse power portable steam-engine.

---

116 **HODGES, JOHN, & SONS,** 16 *Westmoreland Street, Dublin*—Manufacturers.

Improved safety kettles, with valves on the spouts, to prevent scalding.

Improved steaming apparatus, for dressing food for cattle.

---

117 **HAYES, JAMES,** *Elton, Huntingdonshire*—Designer, Inventor, and Manufacturer.

Grinding-mill, adapted to steam or horse power, which makes 120 revolutions per minute, and requires three horses to draw it; adapted to grind barley into soft meal for pigs, and to split beans.

---

119 **HUNTER, W. & J.,** *Samuelston, Haddington, Scotland*—Inventors and Manufacturers.

Lever grain drilling-machine, having the gauge separate from the shut, or stopping of the seed; also having a horizontal marker.

120 **SHORL, JAMES,** 33 *Lamb Street, Spital Square*—Inventor.

Castle beehive, as in use at the royal farm, Windsor. Observatory beehive, on the principle of taking pure surplus honey without destroying the bees. Glasses of honey taken from one observatory hive last season.

---

121 **GLOVER, WILLIAM,** *Warwick*—Manufacturer.

One-horse cart for general purposes.

---

22 **MAYNARD, JOHN, & SON,** *Bedford*—Designers and Manufacturers.

Improved Bedfordshire one-horse cart, having the body ithout either slot or mortice; mounted on an improved ron axle. The wheels are made with an improved iron hub, oak spokes, and ash felloes, patent half-round hoop tire. The side and front raves are fixtures, broad, and set nearly flat, so that the load may be carried up wide and square; the side raves, being arched over the wheels, admit of the body lying direct on the axle, bringing the floor of the cart near the ground, which is an advantage draught and loading. The shafts, being bent, bring the body level when at work. It is furnished with an iron regulator, of simple construction, which is used when emptying manure in small heaps upon the land, or, hen descending steep hills, it is fitted with hind and ront ladders. Constructed to carry 30 cwt. with one horse.

122A **SERVICE, W.,** 8 *Rutland Terrace, Hornsey Road, Holloway*—Inventor.

Archimedean sifting machine. The filling and discharging apparatus consists of a spiral passage formed throughout the length of a wire cylinder, and revolving with the cylinder; and an arrangement for varying the action of the sifter.

---

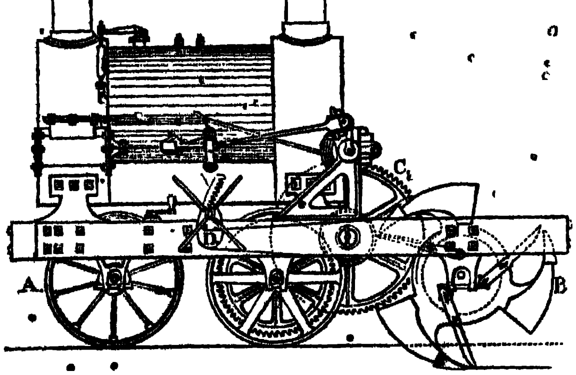
123 **WEIR, EDWARD,** 351 *Oxford Street*—Inventor and Manufacturer.

Irrigator liquid manure pump, fire, and garden-engine, with hose and hose reel. As a fire-engine it will throw 20 gallons of water per minute to a height of 40 feet from the end of the nozzle.

Improved draining level; the level is found by means of the spirit tube. It stands on three legs, requiring no driving into the ground or fixing, and when once adjusted to its level by means of the regulating screws, it may be turned in any direction; the most convenient fall or outlet for the drain may then be easily found, without the instrument requiring any re-adjustment. The index tells off immediately the rise or fall in inches, in every yard.

123a. **Usher, James**, *Edinburgh*—Inventor.

Model of patent locomotive steam-plough. The novelty consists in reversing the action of the ploughs, and making them rotatory. The ploughs revolving behind the carriage act as propellers. This model is represented in the annexed cut.



Usher's Patent Locomotive Steam Plough.

A *b* are the front wheels, which are turned on a pivot by a rack and screw; B *e* are a series of revolving ploughs behind the engine, which, while at work, propel the carriage; C *g* is a spur-wheel, driven by pinion P, which gives motion to the ploughs; D *i* is a frame which is moved up and down by the rack, *l m*, by means of which the ploughs are elevated or depressed at pleasure.

123b **Jones P.**, *High Street, Fulham*—Proprietor.

Portable hand garden-engine, with the cylinder so constructed that it forms an air-vessel, and forces the water in a continuous stream upwards of forty feet.

124 **Ransomes & May**, *Ipswich*—Inventors and Manufacturers.

Patent iron ploughs; double breast or moulding ploughs; West Indian, double furrow, universal, broad share, and subsoil ploughs; trussed whippletrees; Biddell's scarifier; Indian cultivator; corn and seed-dropping machine; portable steam-engine; fixed steam-engine; thrashing-machines; cane-top cutter; crushing-mill; oil-cake breaker; barley awner; chicory cutter; Scotch cart, &c.

124a **Dufaur, Harry, & Co.**, 21 *Red Lion Square*—Proprietors. **Dr. S. Newington**, Inventor & Patentee.

Agricultural implements.—Eight depositor hand-dibble, for all kinds of corn, pulse, &c. The cups drop any required number of grains in each hole. The same, on wheels; each box will shift to any required distance.

Hand-cultivator and drill-hoe, which, by adjusting long or short slots, can be used between rows of any width; for stirring or cultivating the land, the tines only are used; for hoeing, shares suited to the width of each row are fitted on the tines. To the frame can also be adjusted coulters for drawing furrows for different depths; also potato-moulder with expanding wings.

Single-horse subsoil plough and pulverizer, with shares for paring and hoeing, either on the ridge or flat. When used as a subsoil pulverizer, three strong chisel-shaped tines adjustable to any depth, are fitted behind one another in the wrought-iron beam in such a way as to pulverize the whole space, after the furrow slice has been removed. When used as a hoe, a slot is attached to the beam, to which two of the tines are fitted, shifting in the slot to any required width. To these tines shares of any width can be adjusted. By removing the shares, a cultivator or stirrer is formed. By removing the slot and shares, and adjusting to the beam a strong coulter with expanding wings, the implement forms a moulding-plough for striking out furrows; also for earthing up potatoes, &c.

Hand dibble-drill with three shifting boxes, fitted with cups suited for all seeds.

Hand implement for distributing pulverized artificial manures, intended to supersede the broad-casting by hand, of guano, soot, nitrate of soda, &c.; also useful for dusting with lime, wheat infested with slug, or turnip infested with the flea or fly; it is also made for horse-power of any width.

[The refreshment of autumn-sown wheat in spring, by the application of artificial manures in powder over the surface of the field, is an improvement extending among good farmers. The principle of Dr. Newington's machine for this purpose was approved at the Exeter meeting of the Royal Agricultural Society.—Ph. P.]

Horse dibble-drill, with six shifting boxes and manure distributor attached; it deposits any kind of seed at defined distances in the furrows, and any required quantity per acre according to the size of the cups used; and any number of grains can be deposited at each drop; with an apparatus for distributing artificial manures beneath the seed in any required quantity.

Single-horse cultivator, with fittings for hoeing.

124b **Cowan, Hugh**, *Corstorphine, Edinburgh*—Inventor and Manufacturer.

Self-cleansing two-horse grubber.

125 **Paxton, J.**, *Ealing, near Brentford*—Inventor.

A registered improvement on water-power, for grinding corn, &c.

126 **Robinson, William**, *Halsham*—Inventor and Manufacturer.

Corn-dressing machine, for dressing, blowing, hariffing, and blowing and hariffing combined, for the use of millers or farmers.

Hariff machine, for cleaning wheat.

Patent straw-shaker, for separating corn from straw; consisting of a series of flaps, or flys, that revolve and keep parallel to each other; it beats and propels the straw, and turns the corn to the floor.

127 **Wedlake, Mary, & Co.**, *Fairkytes Works*, and 118 *Fenchurch Street, City*—Manufacturers.

A furze or gorse-bruising machine for hand or horse-power.

A new machine, called the Utilitarian, properly registered, for cutting straw into chaff, and for bruising oats, peas, lentils, barley, and linseed; both operations at once, or alternately, for hand-power, represented in the annexed cut.

A fixed steam-engine, for farming operations, complete, with boiler, occupying but the space of two square feet.

A simple and effective chaff-cutter, for hand-power. A smaller one.

A simple and effective chaff-cutter, for horse-power.

A small oat, pea, barley, and linseed crusher.

A double and single-action turnip-cutter, invented by the late Mr. Thomas Wedlake, which, by reversing the action of the wheel, cuts for either beast or sheep, viz., large slices, or small pieces for sheep.

An improved Scotch cart, particularly light and handsome, with ladders complete, so as to be used as a dung or harvest cart.

An improved haymaking-machine, with double action, for throwing up the hay and then tedding or spreading it about.

A general mill, bruising all kinds of grain or pulse.

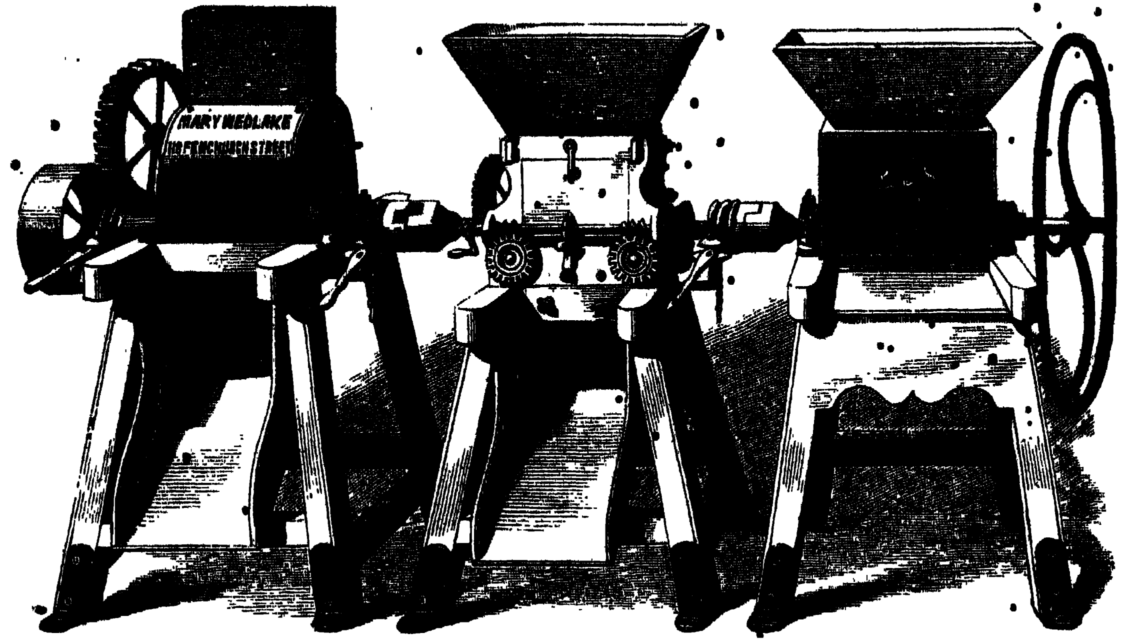
A very powerful oil-cake breaker.

Light and heavy wood and iron harrows, differently constructed.

An excellent ten-coulter drill, for sowing all kinds of seeds.

A three-hoed scarifier. Five-hoed scarifier.

A set of three machines, to be worked by the same power, either man, horse, or steam, singly, or the three together, or alternately: a piece of machinery much approved of by good judges of agricultural machinery.



Wedlake's Union Mill for Splitting and Bruising Seeds.

A simple and cheap winnowing machine for cleaning all kinds of grain, also currants; very extensively used in Greece for the latter purpose.

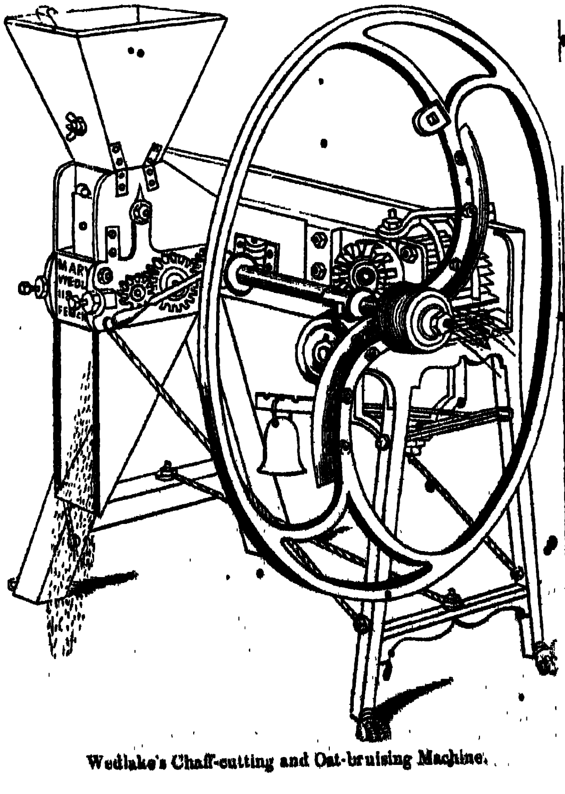
A scarifier for hop-grounds.

A surface or skim-plough, for destroying weeds after a crop.

A mould-up plough.

A simple and most effective subsoil plough.

The Essex light two-horse plough, effecting a great saving in the expenditure of that operation.

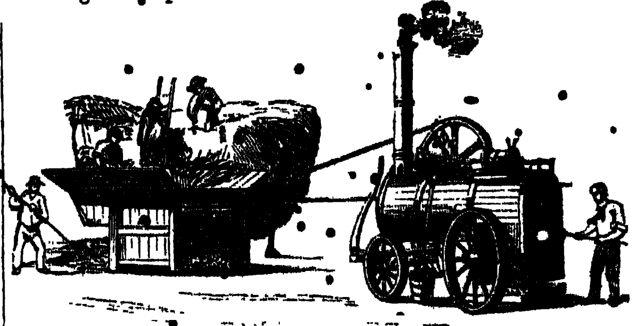


Wedlake's Chaff-cutting and Oat-bruising Machine.

128 **Barrett, Exall & Andrews**, *Katesgrove Iron Works, Reading*—Manufs. and Inventors.

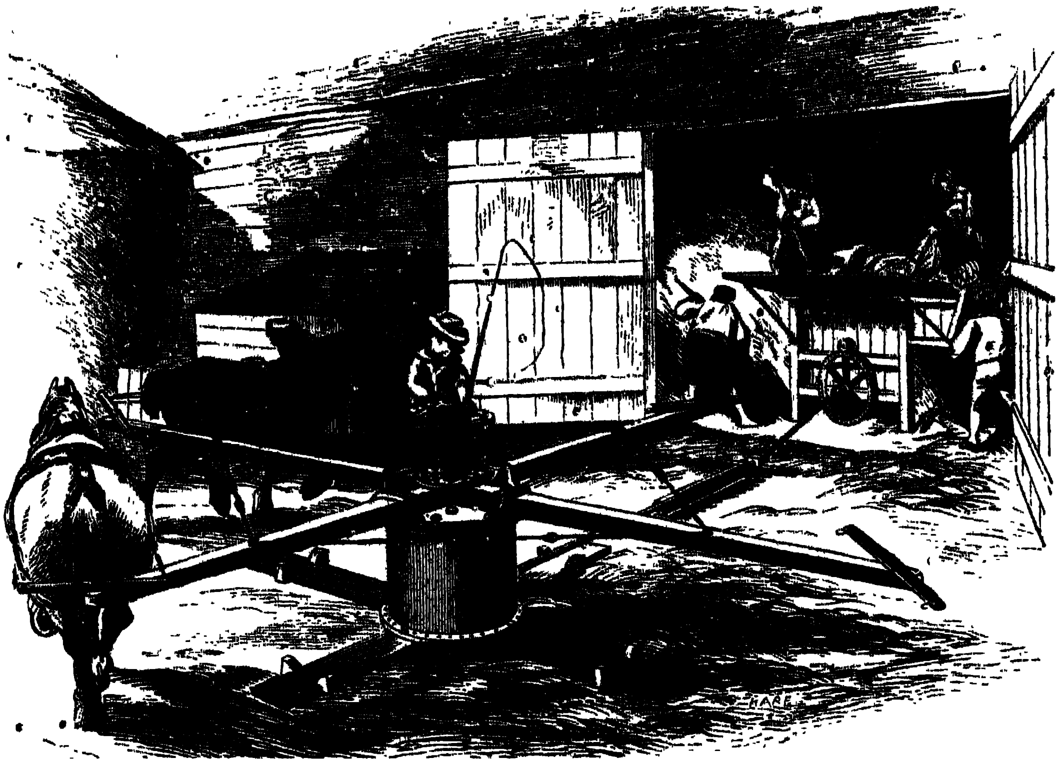
A model of a machine-house with models of steam-engine and thrashing, cutting, and crushing-machinery; with steaming apparatus, pumps, &c., complete, as required for a farm of about 400 acres, with plans for an entire model farm-yard and buildings.

A four-horse power high-pressure portable steam-engine. It is fitted to work expansively from one-third to full steam. The engine is fitted and fixed to a separate cast frame, relieving the boiler from all vibration or strain. The boiler takes about 40 minutes to get up the steam to the working pressure, and requires about 36 lbs. of coals to generate the steam, the water being at 60° to steam at 45 lbs. pressure, and is said to consume about 8 lbs. of coal per horse per hour to keep up the steam. This engine is represented in the annexed cut.



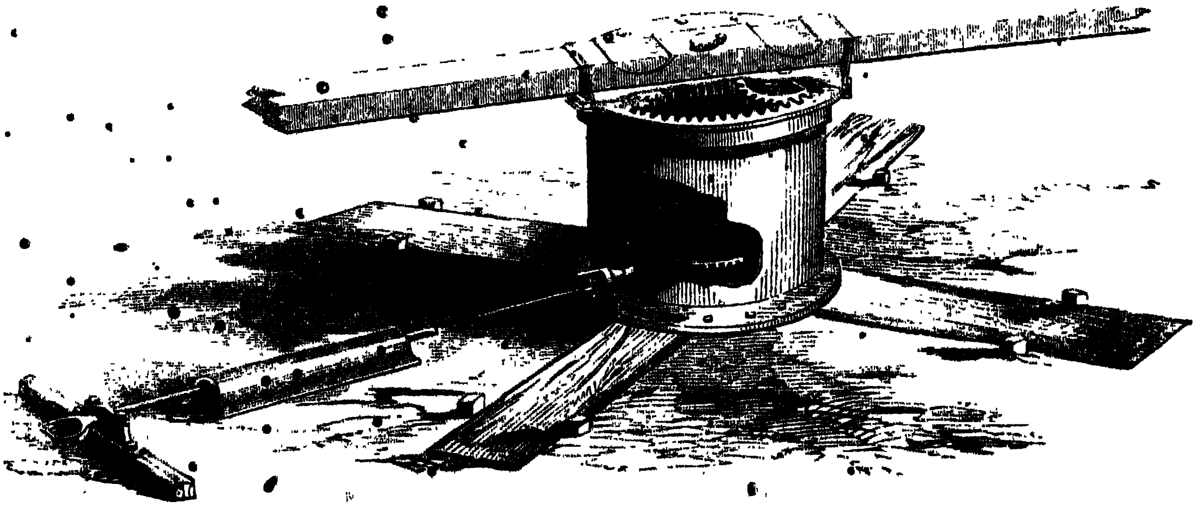
Barrett and Co.'s Four-horse power Portable Steam-engine.

Six-horse power patent bolting and thrashing-machine with shaking apparatus; mounted upon four travelling wheels. The frame of this machine is of wood. The breasting is in a complete iron frame, and bolted to the sides of the machine. The patent consists in the method of altering the breastwork, which is accomplished in one minute. In front of and partly underneath the machine is attached a shaking apparatus which passes the straw from the machine, and at the same time separates all the corn from it. Intended to thrash from 30 to 50 quarters of wheat per day.



Barrett and Co.'s Four-horse power Thrashing Machine.

Four-horse power thrashing-machine with four-horse power patent gear attached. The preceding cuts represent this machine and the patent horse-gear. The thrashing-machine consists of a wooden frame with wire breastings and open beater drum. The patent safety gear-work consists of a moveable cap working upon an upright cylinder, and carrying three idle wheels, equidistant from the common centre round which they revolve. These wheels are put in motion by a rack on the inner edge of the cylinder, and they communicate motion to an upright shaft, on which are fixed the necessary wheels for getting up a speed of 3 to 11, or any other speed. The upright cylinder contains all the gear-work within itself, so as to equalise the strain and to exclude everything calculated to injure it; by the position of the three loose wheels friction is removed from the bearings.

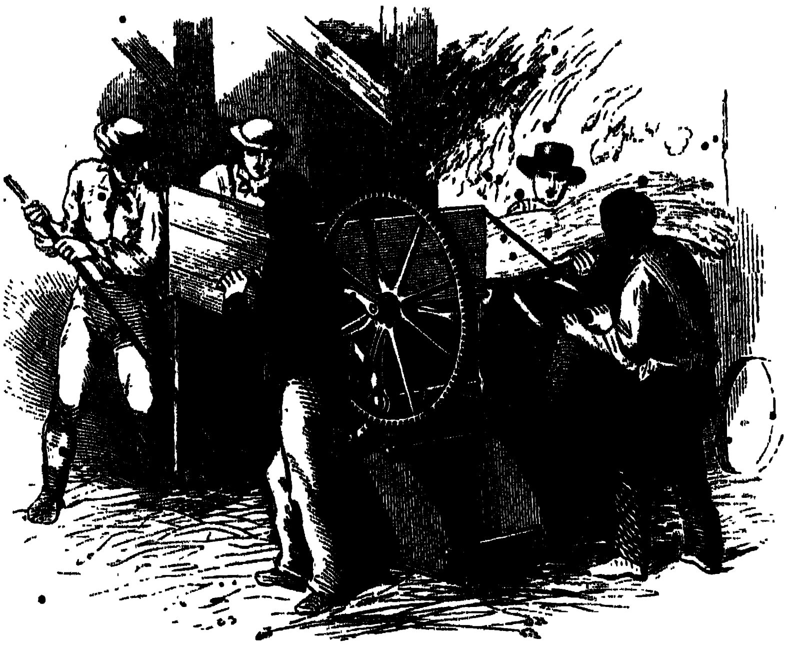


Barrett and Co.'s Patent Horse-gear.

Two-horse power patent thrashing-machine, with two-horse power patent gear. The machine is constructed entirely of iron. The machine and gear-work are made portable upon a pair of iron wheels, and can be unloaded and set to work by two or three men in a quarter of an hour—intended to thrash from 12 to 15 quarters of wheat per day.

One-horse power patent thrashing-machine with patent safety horse-gear. Will thrash by horse-power from 6 to 8 quarters, and by hand-power from 4 to 6 quarters of wheat per day.

Hand-power patent thrashing-machine, made entirely of iron, with the exhibitors' new patent breasting. Intended to be worked by manual power. Claiming simplicity of construction, and not being liable to get out of order, and intended to thrash all kinds of grain and seeds with less injury than the common flail. This machine is represented in the annexed cut.

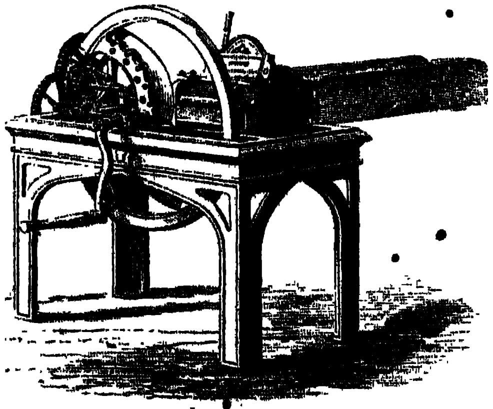


Barrett and Co.'s Patent Iron Thrashing Machine.

Furze or gorse-cutting and bruising-machine, with three horse-power patent safety gear attached. The gorse, in passing through, is very finely cut by means of knives revolving on a cylinder acting against a mouth-piece with feed-rollers, and then passes through two pairs of rollers, by which it is effectually crushed. The machine is made of iron, and may be applied to either horse, steam, or water power.

Barley aveller or hummeller. This machine is for the purpose of breaking off the haulm, which, with the light corn, falls through the wires of a wire cylinder. The good sample is carried through the cylinder, and delivered by a shute at the end of the machine.

Registered cam chaff-cutter, No. 2. This machine is nine inches wide in the mouth, and is made entirely of iron. The straw or hay is drawn to the mouth-piece to be cut by means of two grooved rollers. The mouth-piece is case-hardened, and the machine cuts any length of chaff under 1½ inches. The annexed cut represents this machine.



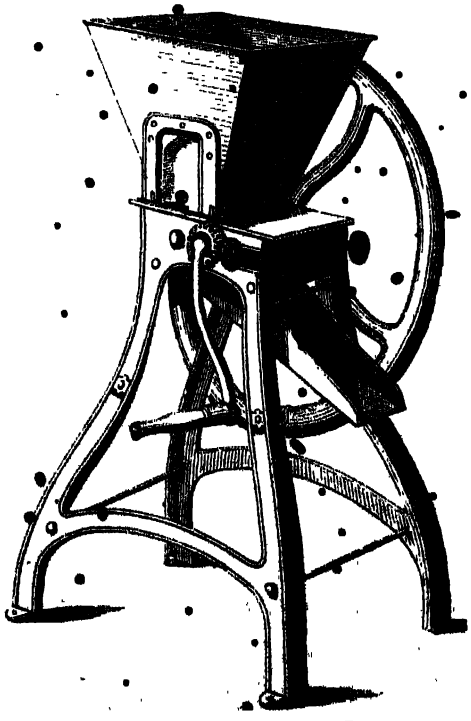
Barrett and Co.'s Cam Chaff-cutter.

Cornes' pattern chaff-cutter, No. 1. This machine is twelve inches wide in the mouth, with an anti-choking top roller, and mouth-piece. It has three knives on the fly-wheel, and cuts five different lengths of chaff, viz., four for horses, cattle, and sheep, and one four inches long for litter. By the addition of a clutch, the feed rollers can be reversed to withdraw the feed, should any accident happen or any substance injurious to the knives be introduced with the hay or straw.

Cornes' pattern chaff-cutter, No. 2. The mouth-piece of this machine is ten and a half inches wide. The fly-wheel has two knives, and it cuts four lengths of chaff. The gearing is so arranged that it may be worked by one or two men or by horse-power.

Universal crushing-mill for hand-power, fixed in an iron frame, for crushing malt, oats, &c., or for splitting beans or peas. The inside of the mill may be easily inspected should any derangement take place.

Universal crushing-mill for one-horse power, to crush all kinds of grain, adapted for either manual or horse power. Requires two men or one horse to work it.



Barrett and Co.'s Universal Crushing Mill.

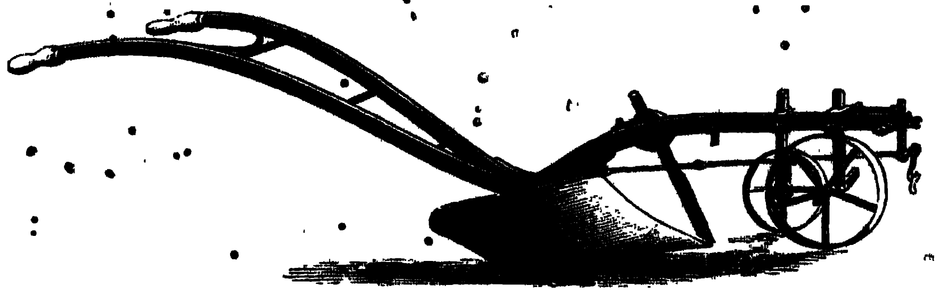
The universal crushing-mill for hand-power, for crushing malt, oats, barley, and linseed, or for beans, shown in the preceding cut. The capabilities of this mill are, oats or barley, 4 bushels per hour; linseed, 1 bushel; beans, 6 bushels. Barley by being passed twice through this mill is sufficiently mealed for cattle feed, and if mashed in hot water, for pigs.

The universal crushing-mill, of one-horse power, to crush all kinds of grain, and adapted for either manual or horse power.

Two-horse power universal crushing-machine.

Oil-cake mill, No. 2. For the purpose of crushing oil-cake for sheep or cattle. Fitted with sliding bearings to regulate the breaking of the cake to different degrees of fineness.

Two-wheel plough, marked A G A B, shown in the annexed cut. Made entirely of iron, and workable either as a swing or two-wheel plough, the horses going either abreast or in a line. The turn-furrow is made in the shape of a coarse screw, is fitted with the patent round coulter, and with skim coulter to take off the surface and weeds when working in low grounds and stubbles. The draft chain is fitted to the body of the plough. The wearing parts can be easily removed and new ones attached by the ploughman.



Barrett and Co.'s Iron Two-wheel Plough.

One-wheel plough marked D. P. Light in draft.

Swing plough, marked G. A. B. Made entirely of iron, and adapted to work in woodland countries and upon foul land.

Universal plough. It is a D.P. one-wheel plough, and by the application of a right-handed mould-board, it forms an expanding earthing-up plough. By removing both mould-boards and attaching a bar to the beam, and two hoes which are fitted and supplied with it, it forms a horse-hoe, and thus makes the three implements of one.

Read's patent sub-pulverizer, of which the exhibitors are the proprietors. This plough is readily converted into a mole-plough or paring-plough, by the addition of the requisite shares.

Two-share subsoil plough. The mechanical construction of this plough is simple and light. The under share, which can be shaped as a D or an O, leaves a drain to carry off the water to the main drains.

The Ducie cultivator, constructed entirely of iron, and fitted with either five or seven tines, which are set so as to draw lines eight inches apart; their curved shape and length prevent their clogging in the foulest land. The frame and tines are raised, and lowered by turning a handle.

Set of registered circular harrows. In these harrows the tines follow a different course, and yet all combine in covering the ground at exact equal distances.

Set of patent iron harrows.

Norwegian harrow, four feet wide.

Registered hay-making machine, composed of two drums with rakeheads attached, revolving upon a spindle, which is supported by two carrying-wheels.

Portable cavalry forge, constructed entirely of iron, with coal and water trough of the same material, fitted with a fan placed horizontally, out of the reach of injury or inconvenience; it is worked either by the foot or hand.

Grist or corn mill, of two-horse power, adapted for general use. It is enclosed in a cast-iron frame. The stones are of French burr, and the mill is furnished with a cast-metal plate turned up perfectly true for proving the stones, enabling a workman to dress them as well as an experienced millwright, by the old process of wooden staves.

Specimens of improved Scotch cart. The body of this cart is made to hold exactly a one-horse load. It combines great strength with lightness.

---

129 Gibson, Matthew, *Newcastle*—Inventor and Manufacturer.

Northumberland clod-crusher: for working on land when wet as well as dry, it is not liable to become clogged, and it makes the land much finer. Also used on young wheat for the wireworm, as well as for making drills for the reception of clover and other seeds.

130 Lampitt, Charles, *Banbury*—Inventor and Manufacturer.

A horse seed-dibbler, patented. The peculiarities consist of a tumbril for depositing the seed in the earth, an eccentric motion for closing the tumbril, a motion for working the revolving scraper, independently of its action on the dibbles, and a break to aid in lowering the dibble-wheels to the earth.

131 Mapplebeck & Lowe, *Birmingham*—Manufacturers.

Weighing machines, mills, and draining tools.

132 Ball, W., *Rothwell, near Kettering, Northamptonshire*—Inventor and Manufacturer.

Criterion plough, made of iron, with steel or cast-iron turn-furrow.

Criterion plough, without wheels.

Two-horse waggon, either with pole or shafts, with patent axles and perpendicular wheels.

133 Jones, Edward, *Great College Street, Camden Town*—Inventor.

Machine for moulding bricks and tiles, with pug-mill attached for tempering the clay by the same operation, worked by one horse or steam power.

Model of the exhibitor's patent, with important additions and improvements, which can be adapted to heavy drain tiles and blocks, or moulded bricks of large dimensions.

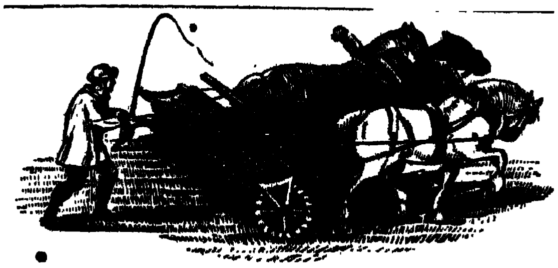
---

134 Laycock, J., *Winlaton, Newcastle-upon-Tyne.*

Subsoiler and plough.

135 Crosskill, W., *Iron Works, Beverley*—Patentee and Manufacturer.

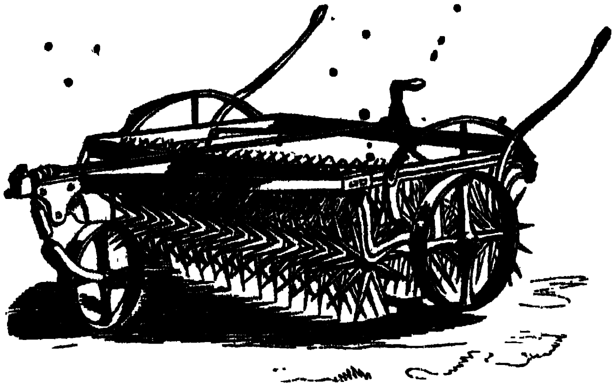
Patent serrated roller or clod-crusher; for crushing clods, compressing soft or fenny soils. This roller consists of cast-metal discs or roller parts, placed loosely upon a round axle so as to revolve independently of each other. The outer surface of each roller part is serrated and has a series of sideway projecting teeth, which act perpendicularly in breaking clods. This machine is represented in the annexed cut.



Crosskill's Clod-crusher.

Improved Norwegian harrow; for pulverising without consolidating the soil. When used immediately after ploughing, it breaks and pulverises the furrows, leaving from three to four inches depth of fine mould properly prepared for seed; and will work moist land without clogging. The annexed cut represents this harrow.

The frame and side levers are made stronger, with a new-invented horizontal regulator. The true incline of the harrow spikelets or rowel parts, when working in the soil, is by this regulator so exactly adjusted as to work with best effect, and saves a horse-power in draught.



Crosskill's Norwegian Harrow.

Earl Ducie's drag harrow, or Uley cultivator and scarifier. For paring the land, cleaning out roots and weeds, and effectively stirring the land.

Yorkshire wold swing or two-wheel plough. For working light or heavy land.

Patent diagonal iron harrows. The teeth are so constructed that each tine cuts a separate track; and the draught is from the centre.

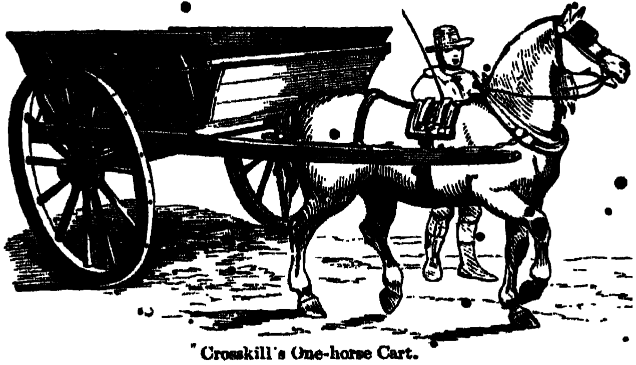
Emigrants' implement box. This box measures 11 feet long, two feet wide, and one foot deep.

Yorkshire wold corn, turnip, and manure drill, to saw six rows of corn or three rows of turnips.

Road Implements.

Patent wheels and axles in sets; for farm, road, or street work.

Model one-horse cart. Exhibited for workmanship, economy, and lightness of draught. Represented in the annexed cut.



Crosskill's One-horse Cart.

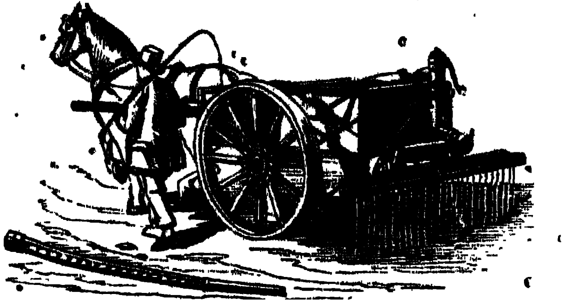
"Norwich and Exeter" cylindrical wheel prize one-horse cart. Fitted with harvest raves complete, for general farm work.

Improved "Norwich and Exeter" one-horse cart; with new front tipper, loose raves, &c.

"Norwich and Exeter" prize pair-horse waggon, with double break. Two horses will draw and run easy with three-ton loads. Fitted with a double break, acted upon by a hand-wheel in front of the waggon. Also, fitted with a pole and pair of shafts. See annexed cut.

Crosskill's Pair-horse Waggon.

Improved liquid manure cart and pump. Fitted with pendulum watering apparatus for six feet broadcast; or with box-trough and flexible tubes for four rows of turnips, &c. See the following cut:—



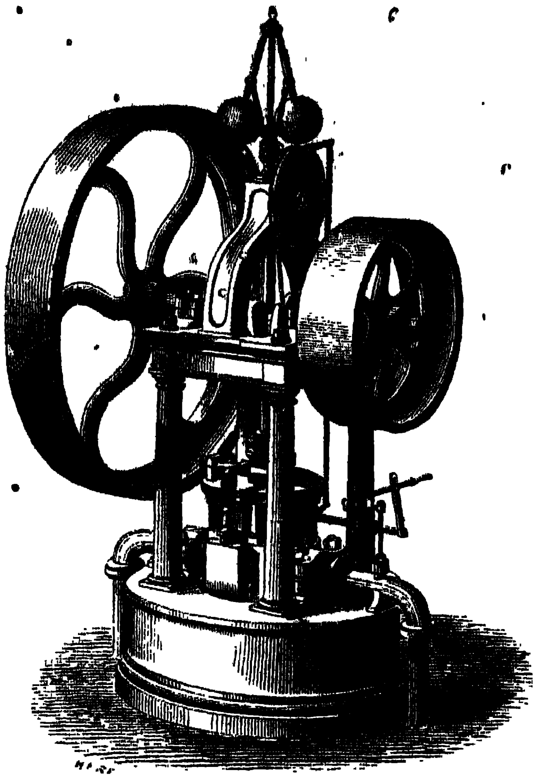
Crosskill's Liquid Manure Cart.

The tank body is made of iron plates securely cemented and belted together, and fitted with a brass outlet valve acted upon by an iron lever rod, with which the driver opens and closes the valve while walking by the side of the horse.

Portable farm railway, with trucks, turn-tables, &c. This railway will convey, over the land, manure, marl, lime, &c.; and take off the land all kinds of green crops, as turnips, potatoes, and other produce. It is also useful for removing earth—to level, excavate, and embank. It will compete with carts, and prove far more expeditious and less expensive, especially in wet weather, when the land is so heavy as to become almost impassable for carts. The rails, manufactured in parts or lengths, are 15 feet long by 2 feet 11 inches wide, and 2 feet 6 inches in gauge: the ends fit into iron sockets. The wood rails are made of red deal, strongly put together and edged with iron. The rails when packed for delivery are four lengths in one package 15 feet long, 12 inches square, weighing about four hundred weight and a half only.

Permanent farm railway. To carry 40 cwt. loads. The permanent rails are made in 15 feet lengths, three feet in gauge; and for the portable rails 12 feet in length; with sets of ironwork with dognails, also sets of wheels and axles for trucks.

Fixture or portable steam-engine, for agricultural and manufacturing purposes. Exhibited as combining simplicity with security, cheapness, and effective power, represented in the annexed cut:—

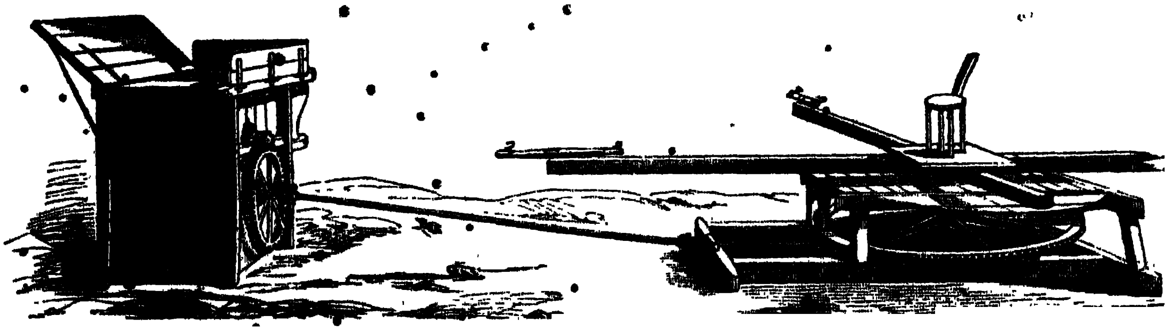


Crosskill's Steam-engine.

Bolting or thrashing machine. For thrashing the corn without bending, bruising, or breaking the straw.

Four-horse driving part. For driving a thrashing machine, patent mill, or other machinery.

Two-horse colonial thrashing part. Exhibited as a simple, powerful, and cheap machine, well adapted for small farms, or for colonists, and easily moved from one farm to another, represented in the annexed cut:—



Crosskill's Beater Machine.

New patent two-horse driving part. Fitted with an upright shaft, and exhibited ready for working upon a stage, overhead a thrashing machine, universal power mill, and straw cutter.

Patent two-horse universal mill. For grinding, cutting, and hulling purposes; will grind every kind of farm produce.

New patent four-horse mill. For reducing coprolites to fine dust, and broken bones to bone-dust.

Two-horse power straw cutters. To cut five sizes; with fly-wheel and feeding apparatus.

Beverley corn-dressing machine and blower. With two screens and six riddles for winnowing corn, beans, peas, &c. By removing the screen and riddles it may be used as a blower. It is improved in the fan and made larger inside.

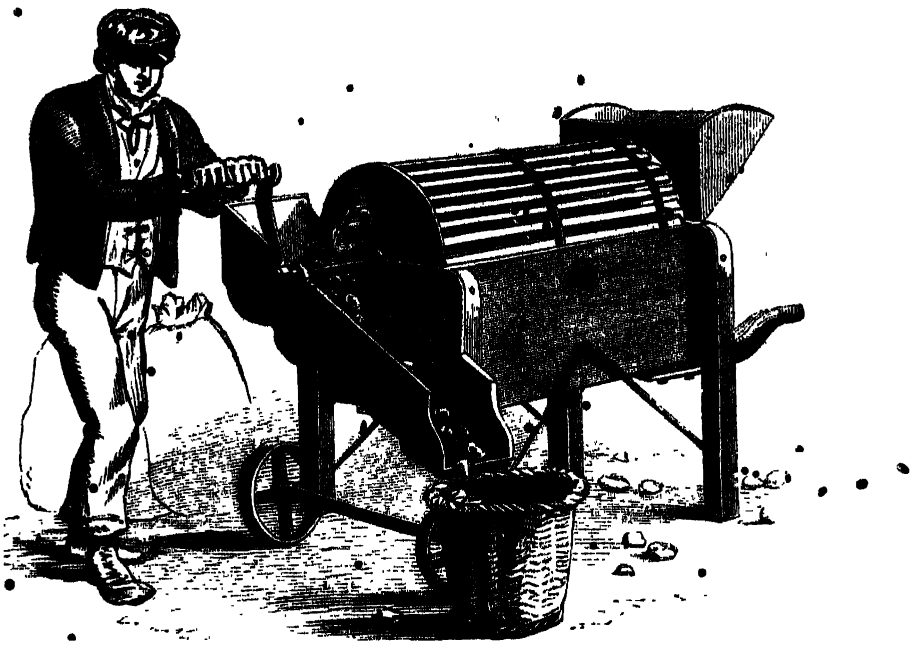
Archimedean root-washer. For washing potatoes, turnips, carrots, &c. The roots are delivered into a hopper, and pass thence into an inclined cylinder having two chambers, in the first of which they are confined and washed by turning the handle in one direction; and when thoroughly cleaned, by turning the handle the other way round, they pass into the second chamber, which is constructed in the form of a spiral, along which they pass until they drop into a spout outside. The following cut represents this machine.

Archimedean Egyptian bean and wheat washer. Fitted with a zinc cylinder and perforated holes, and constructed on the same principle as the root washer.

Improved liquid manure fixture pumps.

Improved portable pump and tripod stand.

Farr's patent fixture iron pig trough.



Crosskill's Archimedean Root-washer.

136 **Grimsley, T.**, *of Oxford*, and **Randall & Saunders**, *of Bath*—Inventors.

Patent inventions:—Brick and tile press, with corrugated rollers, and perpetual cutter attached. The rollers gearing into one another, crush all stones or other substances as the clay passes through, tempering and compressing it so as to produce ware of very firm and regular texture. The press can be constantly refilled, and the goods cut off to any required length, without arresting its operations.

Brick and tile screw press, with perpetual cutter attached. Right and left handed screws working into each other. Perpetual cutter.

Model of nest of brick or tile kilns, with drying-room over.

Patent draining brick or tile, giving a drain either egg-shape or circular, to any size required; are concave on their upper surface, and rebate into one another.

Hollow bricks and tiles, for walls and flues.

Bricks and tiles for fire-proof roofs, floors, and walls.

Wall-coping bricks.

Model of fire-proof cottages, constructed of hollow brick, with provision for heating, ventilation, and drainage.

---

137 **Richmond & Chandler**, *Manchester*—Inventors and Manufacturers.

Corn-crusher, applicable for hand-power; another, for horse, water, or steam power.

Two-knife chaff-cutting machine, combining self-adjusting feed, with Richmond's tooth rollers.

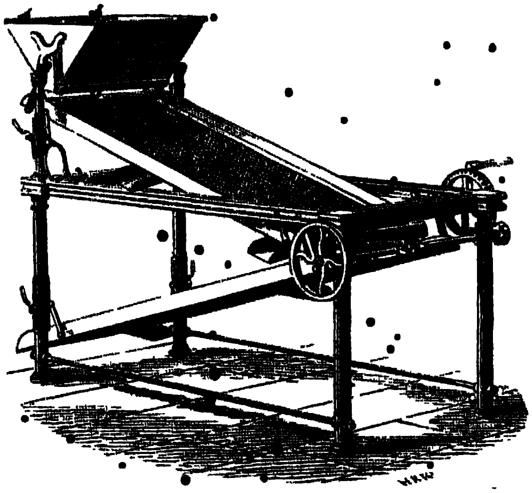
Grain-crusher, for crushing malt, barley, oats, &c., with fine machine-fluted rollers.

Chaff-machines: the feed is brought forward by the tooth-rollers, and pressed into a compact body by a weight suspended upon the rising lever.

Chaff-machine, the mouth of which is made to adjust itself to any given feed by a weight appended to the extremity of the lever.

138 **Gillam, John**, *Woodstock*—Inventor.

Registered seed-cleaner and separator. This machine is adapted for separating the various kinds of grass, sainfoin, and other seeds, and for correcting their samples, wheat, barley, &c. The annexed cut represents this machine.



Gillam's Seed-cleaner and Separator.

The machine consists of two sieves worked by means of cranks and driven by gearing, over which the seed or corn is passed, dividing the samples which pass out at spouts fixed under the bottom of the sieves.

The sieves may be arranged at any suitable angle according to the condition of the seed.

The hopper is supplied with a shaking apparatus, and with slide to regulate the quantity passing on to the sieves. The whole of the work is fitted in a cast-iron frame, and bolted in wrought iron.

139 **Taylor, G.**, *Bury, Lancashire*—Inventor.

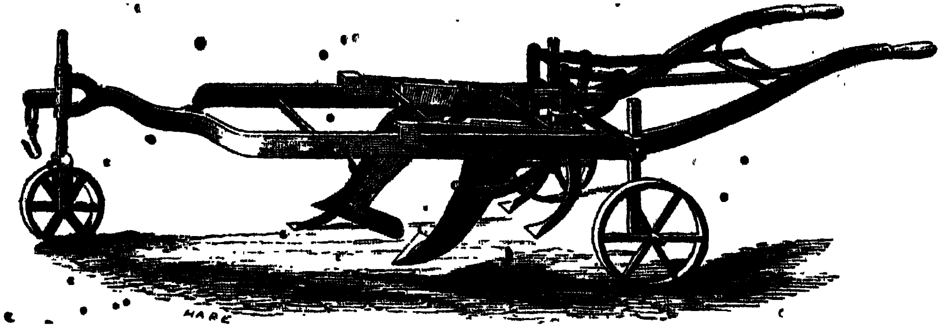
Locomotive shearing and mowing machine, to be worked by hand; it cuts and lays a sheaf at every stroke, ready to bind. With this machine, it is stated that one man cutting, and two binding, will do as much as six or seven in the ordinary way.

139a **Robinson & Son**, *Coventry*—Manufacturers.

Model churn.

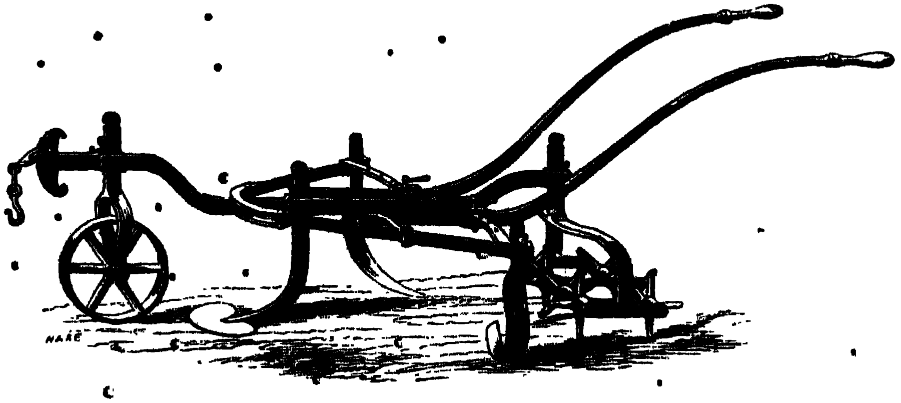
140 **Hill, Edward, & Co.**, *Brierley Hill Works, Dudley*—Inventors and Manufacturers.

A wrought-iron skim. This implement, of which a woodcut is annexed, is generally used for paring or skimming stubbles, immediately after harvest; it may also be used for paring turf, as a pair-horse scarifier, for working fallow ground, and for many other purposes. It has the great advantage of simplicity of construction, and will work easily three acres per day with a pair of horses. The handles act as a lever, by bearing on which (see engraving) the implement can be instantaneously thrown out of work; the coulters following the knives are very useful for dividing into smaller portions, or "harrowing the surface pared by the knives, which precede them. This operation has the effect of exposing the roots of weeds, &c., more perfectly to the action of the sun; thus preventing the possibility of their growing again, even though the land should be left in this state for several days.



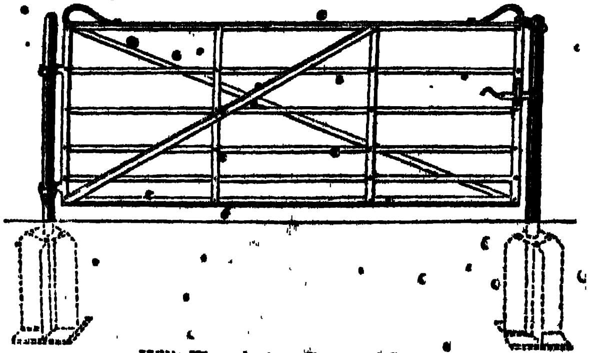
Hill's Wrought-iron Skim.

A wrought-iron expanding horse-hoe. This implement is intended for hoeing turnips, potatoes, &c., and is constructed on an entirely new system of expansion, which enables the workman to alter the width of the knives without stopping the hoe. This is effected instantaneously without the adjustment of any screw or pin, by simply opening or drawing together the handles of the implement (see annexed engraving). The perfect command over the cutting part of the hoe, which this new expansion movement affords the workman, will enable him to avoid any sudden irregularity in the ridge or drill, or in the track of the horse, as readily as he would if hoeing by hand. It is furnished with a small Norwegian harrow behind, for the purpose of throwing to the surface the weeds removed by the hoes; but it may be used with or without this, as may be required.



Hill's Expanding Horse-hoe.

An iron field-gate and posts. It is made entirely of wrought iron; the hangings are made to slide over the top of a hanging-post, resting upon a collar (as represented by the annexed woodcut), which renders it difficult for any one to unhang the gate. It is furnished with catch complete. The posts, when well set in stiff soil, are quite sufficient to carry the gate, the bases of them being specially constructed to accomplish this, and therefore no brickwork or concrete is required for this purpose. It is cheaper and neater in appearance than a wooden gate and posts, besides being so much more durable; and it can be fixed in one fourth the time.

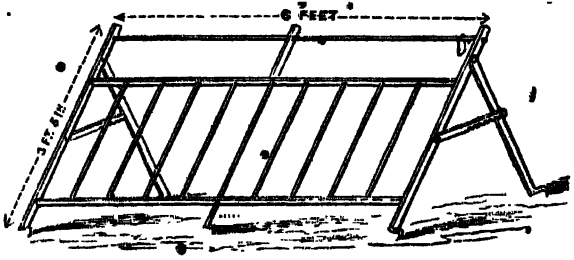


Hill's Wrought-iron Gates and Posts.

A wrought-iron entrance or field-gate and posts. This gate is so constructed as to combine great strength and neatness of appearance with a lightness of material, which admit of its being sold at a low price. It is hung on neat round cast-iron posts, and is fitted with a revolving or quadrant hinge, so that the gate will always shut itself. The dimensions are about 9 feet 6 inches by 4 feet high.

Two specimens of continuous iron fencing. This fencing is well adapted for the enclosing and subdividing of parks, pleasure grounds, common land, and all places where fencing may be required. From its peculiar construction it possesses great advantage over iron hurdles, or other kinds of fencing, as regards economy, strength, lightness of appearance, and general efficiency; it packs up into bundles for the convenience of carriage, and is conveyed across the country at a trifling expense. The facility with which it can be erected, and adapted to any irregulasity in the surface of the ground, and its cheapness, are two of its greatest advantages.

Two specimens of wrought-iron hurdles. These are intended for feeding sheep on turnips, or for eating off green crops. Annexed is a woodcut, representing the form of the hurdle when placed for use, from which it will be seen that the bars are vertitical, and placed so far apart as to allow the sheep to eat through them without treading on the food, like eating through a rack. This is considered a great advantage in eating off turnips or other green crops, as it enables the farmer to have them eaten without any of the food being spoiled by the treading of the sheep; it is consequently eaten much closer, and with greater advantage to the sheep; and the ground is more regularly trodden and manured. It does not require setting *in* the ground, but *on* it, resting upon stays in a leaning position, as represented in the cut, so that they are easily placed and removed. These stays are fixed to the hurdle, and when taken up fall to its side, so as to occupy little room.



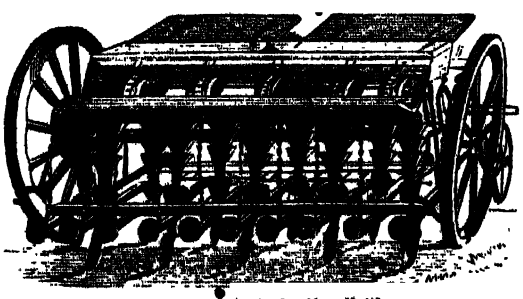
Hill's Wrought-iron Hurdles.

141 **Lydes, —, Inventor.**

Improved mode of boxing horses for conveying them by railway.

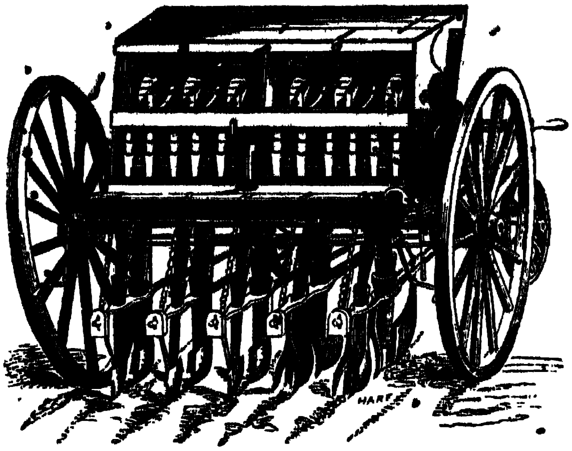
142 **Garrett & Son,** *Leiston Works, Saxmundham, Suffolk*—Inventors and Manufacturers.

1. Drill for seeding and manuring land. All kinds of grain and seeds may be deposited by this machine at any required intervals apart, and at any depth, either with or without compost or artificial manures. They are constructed of various sizes and widths, to suit lands ploughed on the flat or in ridges, and suited for all descriptions of soil. The corn or seeds may be deposited down the same conductors with the manure if required; but separate coulters are provided for each, by means of which the manure may be buried 2 or 3 inches deeper than the seed, and 10 to 12 inches in advance of it, and a portion of mould placed between them. The jointed levers are especially adapted for this purpose, the coulters for seed acting independently of those for manure, and being pressed into the ground by separate weights, allow both seed and manure to be deposited regularly any depth, on all descriptions of land, however hilly or uneven. The improvements claimed consist, first—in constructing the boxes in which the manure and seed are contained, so as to be equally suitable for drilling on side hills as on level ground. Secondly—in the application of separate slides to each department of the manure box. Thirdly—in fixing the slides which regulate the seed to a horizontal bar, extending the width of the drill. This machine is represented in the annexed cut.



Garrett and Son's Seeding Drill.

2. Drill for turnips and manure on the flat. This drill is made to deposit two, three, or four rows of turnips or other seeds with compost, or artificial fertilisers, on either flat or ridged ploughed lands. It is fitted with separate seed boxes for each row, which are fixed to a horizontal bar, and may be shifted to suit the varied intervals between the rows, so as to come directly under the delivering spouts, and allow them to work freely. These small boxes are partitioned off into two departments, one larger than the other, that when drilling beet and turnip seeds together, sufficient of each to last an equal time may be put into the boxes at once. This drill is also adapted for side hills, like No. 1, and is shown in the annexed cut.



Garrett and Son's Turnip Drill.

3. A lever corn and seed drill. This drill is for the purpose of drilling in rows, at any distance apart, wheat, barley, beans, peas, oats, and other grain, and by changing the cup barrel, turnips or mangold-wurzel seeds without manure. It is fitted with a swing steerage, that when drilling lands or ridges of twice the width of the drill, the two rows where the drill joins on the top, may be kept equidistant with the rest.

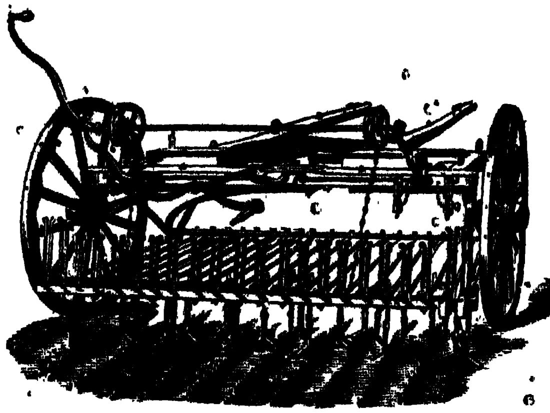
4. Drill for small farms—adapted for drilling all kinds of grain, turnips, and other seeds: the quantities may be regulated by means of cog wheels, to deposit from 2 to 12 pecks of grain, or from 1 to 6 lbs. of seed per acre. The distance of the rows apart may be varied as required, from 6 inches upwards, to suit different crops; and the whole arrangement of the working parts is completely within the management of the attendant. The drill is especially made for lands ploughed on the flat, and to the draught of one horse.

5. Barrow hand seed-drill, for sowing grass seeds broadcast. The box is made in two departments, one for heavy seeds, such as clover, trefoil, &c.; the other for lighter seeds, such as rye grass: the former being delivered from cups, and the latter by means of revolving brushes, down the same conductors with it.

6. Hand lever seed-drill, for sowing turnips, and other seeds, on ridge or flat ploughed lands, without manure. It is constructed with two small levers, working independently of each other, which may be varied in distance from 16 to 30 inches apart, and will deposit from 2 to 6 pints of turnip, and 2 to 6 lbs. of beet seed per acre.

7. Garrett's patent horse-hoe—adapted to all the prevailing methods of drill culture, either for cleansing crops drilled on the level surface, or on ridges, the axletrees of the wheels being moveable at both ends to suit the varied intervals between the rows of plants. The steerage is considered an improvement on account of its precision in guiding the hoes without injury to the corn or plants. From 10 to 15 acres per day may be hoed with one horse, and a man and boy. Represented in the following cut.

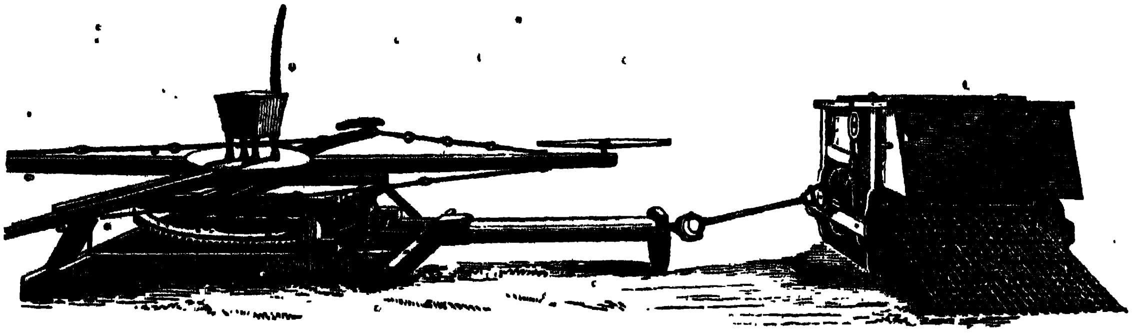
8. Bolting thrashing-machine, for thrashing grain of all descriptions, without injury to the same, or bruising the straw, like the flail. It is fed lengthways instead of vertically, as in other machines; and the straw is delivered on to a lattice platform, ready to be tied up in trusses or bolts for sale, or other particular purposes.



Garrett and Son's Patent Horse-hoe.

9. Patent thrashing machine for barn work; adapted for thrashing all kinds of grain without damaging the corn or straw, thrashing from 60 to 70 bushels of wheat per hour when applied to steam power.

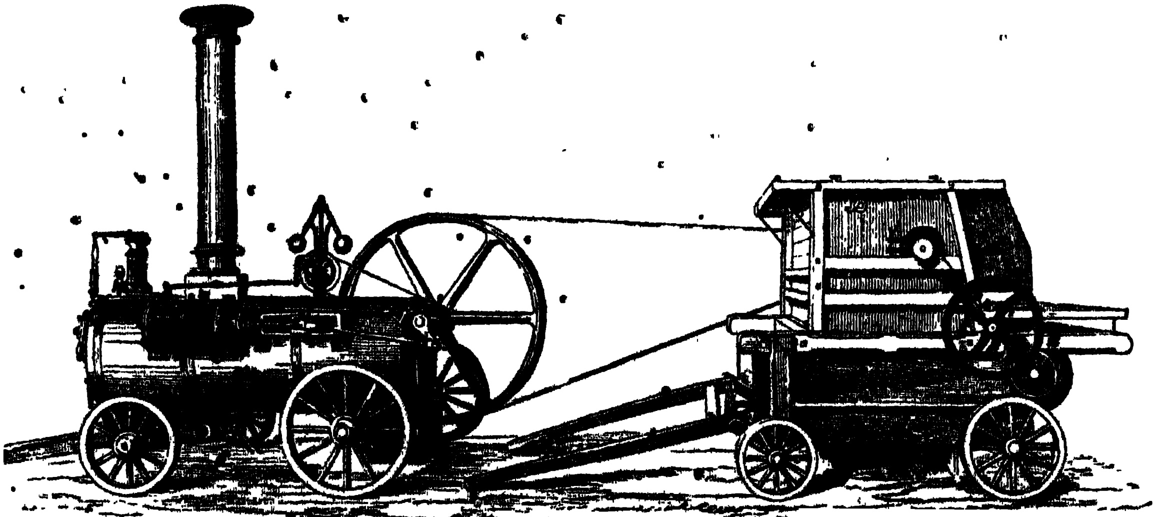
10. Patent thrashing machine, with registered straw shaker and riddle. This machine is adapted for thrashing grain of all descriptions in large quantities, and may be applied to steam, water, or horse power; it is fitted with a screen for the purpose of riddling away all loose ears, short straws, rubbish, leaf, and calder, leaving the corn ready for the dressing machine, without further preparation; and with a registered straw shaker, for separating the corn from the straw, which is by this means done much more effectually than by the usual process by hand. Barley may also be thrashed for malting purposes with these machines, and in many cases is preferred by maltsters to that thrashed by hand. The whole of the machine may be mounted on travelling wheels and conveyed from place to place with two horses. This machine is represented in the annexed cut.



Garrett and Son's Patent Thrashing Machine.

11. Horse-power driving machinery for thrashing machines. This machinery is adapted to the power of six horses, for driving the thrashing machine barn works, Nos. 8 & 9.

12. A portable steam-engine for agricultural purposes. Exhibited for simplicity of construction, economy in fuel, and portability. It is fitted with governors, hair, felt, and iron jacket, steam and water gauges, and other necessary apparatus, mounted on four strong carriage-wheels, with shafts; and is adapted for driving machinery, for the purposes of thrashing, dressing, grinding, and cutting agricultural produce, pumping water, sawing timber, and other stationary labour on a farm or estate. This machine is represented in the annexed cut.



Garrett and Son's Portable Steam-engine.

13. A barley aveller or hummelling machine. This machine is fitted for horse or steam power, but may be used by hand if required. It is for the purpose of rubbing the horns or avels off barley (which it performs in an expeditious manner), and screening away all loose rubbish from the corn, leaving the kernels clean and the sample perfect.

14. A corn-dressing machine, worked by steam, horse, or hand power. It is particularly suited for receiving the corn from the thrashing machine, No. 10, which it will dress in one operation at the rate of 12 to 15 quarters per hour.

15. Patent chaff-cutter, adapted for horse or steam power. It may be altered by means of toothed wheels to

cut chaff ⅜, ½, or ¾ inch long. The rollers are so constructed as to adjust themselves to any thickness of feed, and act independently of the mouthpiece or pressure plate, so as always to keep a uniform pressure on the hay or straw, and prevent the machine from choking.

16. Portable stone mill for grinding wheat and other farm produce: the stones are 32 inches diameter, and enclosed in a metal and wood framing; the top stone is hung on an upright shaft, and worked by a pair of bevel wheels, from which the attachment may be made to either steam, water, or horse power: its construction admits of the stones being adjusted for grinding wheat, barley, beans, and peas. A late improvement consists in the application of a clutch box to the small feed roller, which affords great facility in starting the machine, by allowing this roller to be taken out of work, and admits of the process of crushing being instantly discontinued without stopping the mill.

17. A linseed, malt, and oat mill, fitted in an iron frame, and is for the purposes above mentioned; the crushing being performed between the smooth surface of a large wheel, 4 feet diameter, and a small smooth roller.

18. A rape and linseed cake crusher, for the purpose of breaking cakes of any size and thickness. It is fitted with two sets of barrels which may be adjusted, as required, to break cake into different-sized pieces for bullocks or sheep, or powder for manure: a screen is fixed between these barrels, through which as much of the cake as is sufficiently broken in passing through the first is sifted, to insure uniformity of size, and to avoid the unnecessary labour occasioned by that which is sufficiently broken passing through the bottom rollers with that which is not.

19. Iron plough for general purposes, made with wrought-iron beam and handles, and cast-iron body, and may be adapted for all descriptions of soil, by having suitable mould-boards or breasts. It is fitted with improved coulter and fastening, and case-hardened shares.

20. Hand-power chaff-cutter, for small occupations, to be worked by one or two boys or men. It is made with a 12-inch box and 10-inch mouthpiece, and will cut 30 to 40 bushels an hour.

21. Corn-dressing machine, intended for all kinds of grain and seeds, and is adapted for hand labour: a man and a boy will dress from 6 to 8 quarters of wheat per hour, depending on its quality and condition. This machine may also be used as a blower when required, for separating all light kernels, dirt, &c., from the corn.

22. Corn-reaping machine, of new construction, adapted for reaping wheat and other grain by horse power: the operation is performed by a series of angular knives, intersecting a like series of stationary iron tines or points: a vibrating horizontal motion is communicated to these knives by means of a crank shaft, and as the corn is driven by the motion of the machine between the tines, it is cut with cleanness and regularity. As much as 20 acres per day may be reaped with one horse and a man.

23. Models of agricultural machinery. Specimens of coprolite and grass seeds.

24. Set of iron harrows. These harrows are constructed with wrought iron, with the ends of the balks turned round to prevent injury to the horses.

---

143 COMINS, JAMES, *South Molton*—Inventor and Manufacturer.

A small wrought-iron horse-hoe for hoeing turnips, mangold-wurzel, &c.

A wrought-iron horse-hoe for working, both on the ridge and flat.

One-way turn-over, or turn-wrist plough, for hilly land. The share turns over at each end of the furrows, and the coulter and mould-plates are changed at the same time by means of a lever between the handles.

One-way turn-over, or turn-wrist plough, made of iron

Subsoil pulveriser.

Horse-hoe on the flat, for hoeing from two to six drills at a time.

Set of light harrows.

144 SQUIRES, WILLIAM, *March, Cambridgeshire*—Manufacturer.

Road waggon for conveying agricultural produce to market, &c.

Improved plough.

144A ELLIOTT, GEORGE, *Farnham*—Inventor and Manufacturer.

Machine, of new construction, for bagging hops when dried, constructed to bag two tons of hops a day.

145 TROTTER, WILLIAM, *Bywell, Stocksfield, near Gateshead*—Inventor.

Model of reaping machine for cutting corn with revolving knives. The knives being attached to two separate sets of arms, which revolve on different centres, are kept parallel to each other, in consequence of which their action closely resembles that of the scythe of the mower. The angle at which the knives strike or cut the corn is at the command of the attendant. The knives cut at the side of the machine, the motion being reversed to make them cut either to the right or to the left.

---

146 PONDER, WILLIAM RICHARD, *Goldhanger, near Maldon, Essex*—Inventor.

Bee-house, or hive.

148 GROUNSELL, WILLIAM, *Louth, Lincolnshire*—Manufacturer.

Improved patent drop drill, to deposit seed and manure at intervals, delivering the manure only where the seed is intended to remain for a crop.

Self-feeding registered corn-dressing machine, to dress corn taken from the thrashing machine.

Registered corn and turnip hoe, worked by horse, to hoe five rows of corn at once, and three rows of turnips.

149 HENSMAN, WILLIAM, & SON, *Castle Works, Woburn*—Inventors and Manufacturers.

Four-horse power portable steam-engine; with a tubular boiler. It may be driven either from the fly-wheel by band, or from the crank-shaft by spindle. It is furnished with an improved governor, spring balance, whistle, gauge cocks, water gauge, &c.

Four-horse power patent bolting thrashing-machine, complete; the straw being admitted into it lengthways, is delivered from the machine straight and unbroken as from the sheaf. Adapted for thrashing barley for malting.

Eight-row patent cup-drill, to be worked by a pair of horses, and fitted with an improved swing steerage, by which it can be guided independently of the horses. The axletrees are made to slide, so that the wheels can be set to any width. The coulters are fixed upon separate levers, to adapt them to the surface of the land; the corn box, being self-acting, always finds its level, deposits the corn, &c., on any ground.

Patent hand thrashing-machine. The drum-beaters are of a Vandyke, or tooth shape, and revolve through similar notches in the concave; it is adapted for thrashing all descriptions of corn and seeds.

Patent plough, with two wheels, made principally of wrought iron. It may be worked with either one or two wheels, or as a swing; it is adapted for one or two pair of horses; and is fitted with round coulter, and patent coulter fixing. The skim-coulter is fitted with round stem, and is also secured by patent fixing. The wearing parts are made of cast-iron.

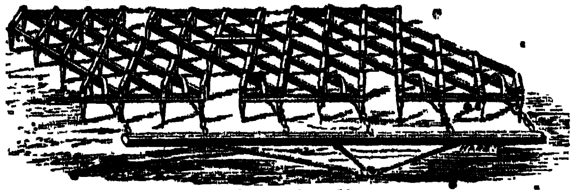
Patent iron plough, with two wheels, similar to the preceding, but fitted with high wheels, deep turn-furrow, &c., and made stronger for deep ploughing.

150 GRAY, R., & SONS, *Uddingston*—Manufacturers.

One-horse farm cart. Two-horse and four-horse ploughs. Subsoil pulveriser. Five-tined drill grubber. Parallel horse shoe. Canadian chaff cutter. Equalising three-horse yoke. One way, or turn-wrist plough. Scotch thrashing-machine.

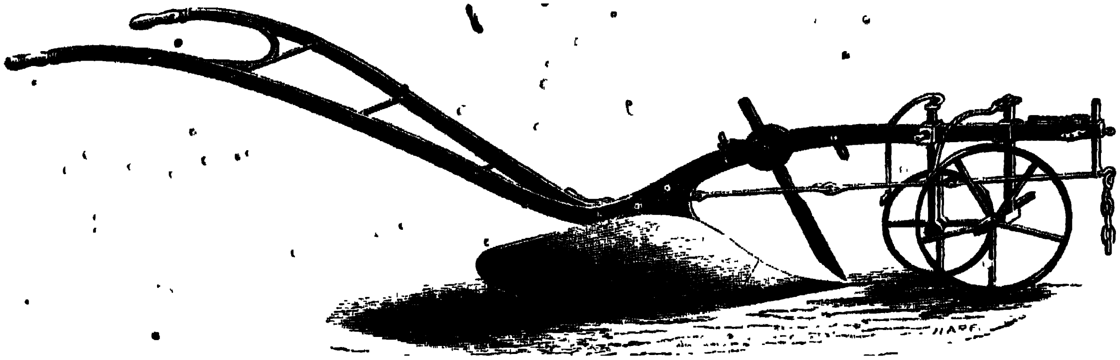
151 **WILLIAMS, W.**, *Bedford*—Inventor & Manufacturer.

Set of patent 4-beam iron harrows, for general purposes. Their form is diagonal, and the set consists of three, drawn by two horses. The teeth are so constructed that each cuts a separate track. These harrows are shown in the adjoining cut.



Williams' Patent Iron Harrows.

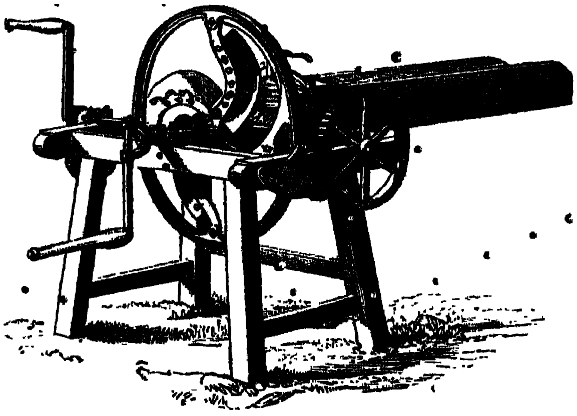
Patent wrought-iron plough, with two wheels, for general purposes, marked G. V. The plough is fitted as a swing or wheel plough, for two or three horses. The mould-board or furrow-turner is new, the bearings of which have an equal pressure from the point of the share to the heel of the breast, which gives lightness of draught, and also causes the furrow-slice to turn over without breaking. This plough is represented in the annexed cut.



Williams' Patent Wrought-iron Plough.

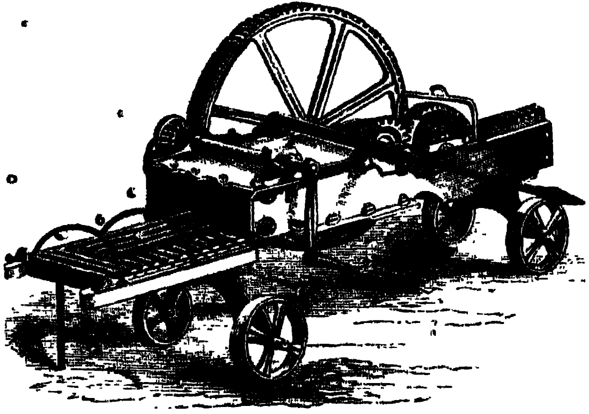
Patent wrought-iron plough, with two wheels, for strong land and deep ploughing. A skim coulter may be fitted to it.

Chaff-engine, with two knives, and 10-inch mouthpiece. Top and sides of iron, and legs of wood. Calculated to be worked by two men. This engine is shown in the cut.



Williams' Chaff-engine.

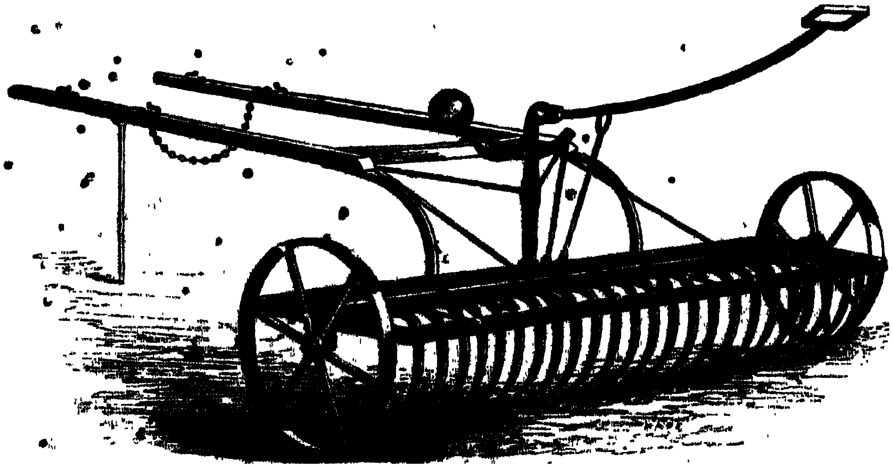
A machine for making drain pipes and tiles. This machine is represented in the annexed cut.



Williams' Drain-Pipe and Tile Machine.

It is calculated to be worked by one man and a boy. The box contains 1,450 square inches of clay.

A patent horse-drag rake, invented by Samuel Taylor, of Cotton End, improved by the exhibitors. It is shown in the annexed cut.



Williams' Patent Improved Taylor's Horse-drag Rake.

The improvement in this implement consists, first, in the construction of the teeth fitting into iron sockets and working on the front rod, so that one or more teeth can be removed at pleasure; secondly, the teeth, acting on a bar running parallel underneath the frame, gives it greater facility in relieving it of its load; thirdly, the ball, acting upon the leverage of the handle, keeps the teeth in their work, so that they cannot lose their yealm. It is simple in construction and cannot get out of order.

The preceding figure represents this rake.

152 **Rome, Robert M.**, *Langholm, Dumfries*—Designer and Manufacturer.

Sheep-dipping machine, for applying sheep-washing compositions, to improve the wool and destroy vermin in sheep.

It consists of a trough, in which the sheep are dipped, and a platform forming the body of the carriage for them to stand on, while the superfluous liquid drips off them and flows back into the trough. With this machine, three men can dip or wash 800 sheep in a day.

[It has become a common practice thus to dip half-grown lambs in a solution of corrosive sublimate, which poisons the ticks that burrow in the skin without injury to the animals themselves.—PH. P.]

152A **Morewood & Rogers**, *Steel Yard Wharf, Upper Thames Street*—Inventors.

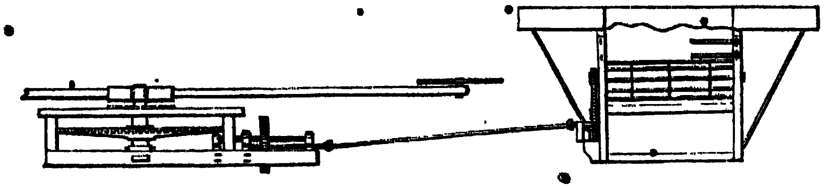
Model of farm-yard and buildings, constructed chiefly of patent galvanised tinned iron, surrounded by a fence of the same material.

Models of galvanised agricultural implements, including barrows, sieves, &c.

154 **Blyth, R. J.**, *Norwich*—Inventor and Manufacturer.

Four-horse power portable horse works.

Four-horse power registered portable bolting thrashing machine, for steam or horse power; with light spindle flanges, and round hollow beaters, so formed as to meet small resistance from the atmosphere, and having little friction; it will thrash about 70 quarters of wheat per day, with four horses. The annexed cut represents this machine.



Blyth's Four-horse Bolting Thrashing Machine.

154A **Coode, George**, 473 *Oxford Street, Bloomsbury*—Inventor.

Patent irrigator for grass land, or low crops; applicable also to watering roads. It may be worked by two boys, and it distributes water or liquid manure with great regularity: from 10 to 20 acres may be done in a day.

Patent irrigator for high-standing crops, of a similar description, except that it requires more power.

155 **Fairless, Thomas**, *Corbridge, near Hexham, Northumberland*—Inventor.

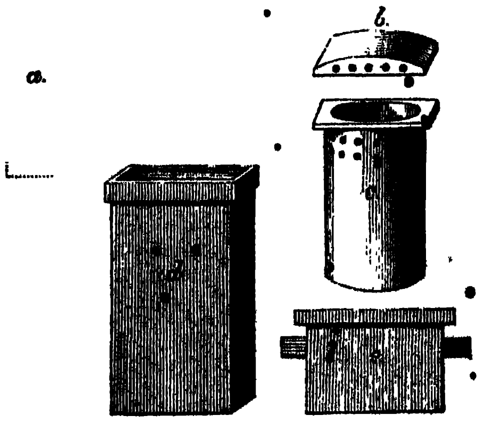
Reaping machine for cutting corn and hay.

Improved pump.

156 **Sadler, William James**, *Bentham Purton, near Swindon, Wilts*—Inventor.

Agricultural chimney filter drain. The portions exhibited, represent the external filter pipes, *a*, *b*, and *c*, to slide in the chimney, *d*, *c*, for conveying to the drain any surface water which may accumulate in low places on stiff clay soils, through which it cannot penetrate to the drain, till it has considerably injured the crop. The pipes act as filters, retaining in the bottom the mud or other matter which might choke the drain. The pipes are lifted out of the chimney to unfit them, and may be left out when sufficient water has accumulated to flush the drain, if it should be required. These drains are shown in the preceding cut.

Draining tools:—Paring knife; spade for surface; top bit; crummer for the same; pick and tomahawk; bottom bit; crummer for the same; rammer for levelling bed for pipes; tool for placing pipes, *g*, in the preceding cut, and drag for filling in.



Sadler's Agricultural Chimney Filter Drain.

157 **Rudd, T.**, 16 *Ebury Square, Pimlico*—Inventor and Manufacturer.

Improved patent hand-thrashing machine; mounted upon carriage wheels, and remaining so when at work.

Working model of improved machinery, for working marble, stone, &c.

158 **Hall, R.**, *Bank Buildings, Manchester*—Inventor.

Garden net, a substitute for glass in hot-houses, &c.

160 **Crump, Thomas**, *Derby*—Inventor and Manufacturer.

Garden-engine, or portable fire-engine, two sizes, with jet and spreader, for watering plants, greenhouses, &c.; the hose-pipe will discharge 18 gallons of water per minute, at 60 feet distance, or 50 feet altitude.

Liquid manure pump, made of galvanized sheet-iron.

Instrument for singeing horses with gas.

161 **Nixon, T.**, *Kettering*—Inventor and Manufacturer.

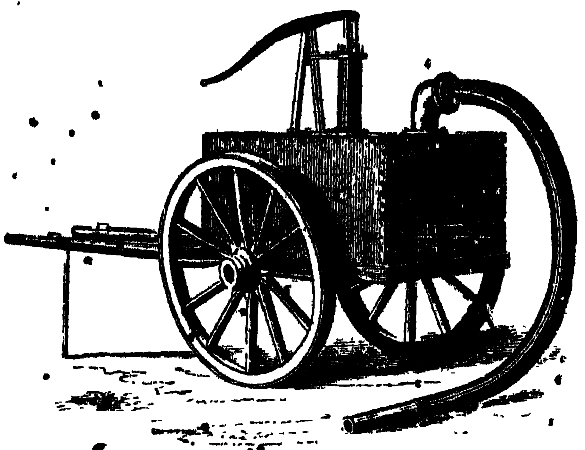
A garden light or skylight.

170 **Wilmot, Edw. W.**, *Congleton*—Designer.

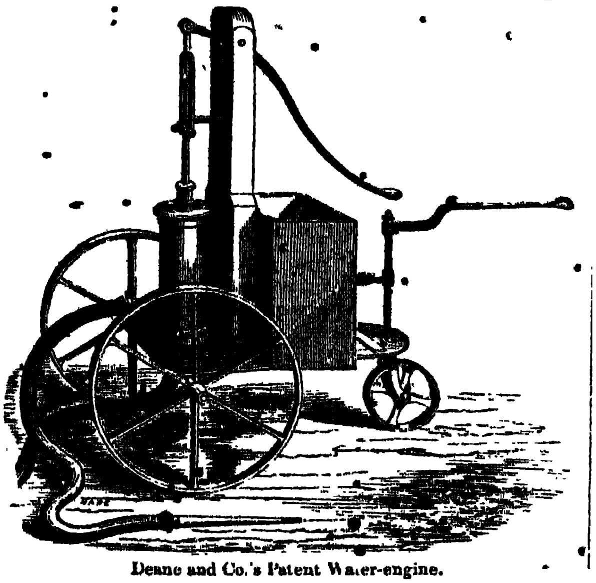
Model of farm buildings for a farm of about 300 acres, with plans of farm-house, labourers' cottages, and explanatory drawings.

180 **Deane, Dray, & Deane**, *Swan Lane, Upper Thames Street, London Bridge*—Manufacturers.

Patent cesspool and tank cleanser, for the speedy and innoxious removal of stagnant water, &c. The following cut represents this machine.



Deane and Co.'s Patent Tank-cleaner.



Deane and Co.'s Patent Water-engine.

Patent engine for raising water. The annexed cut represents one of these machines, for the purpose of throwing to a considerable height a volume of water. This form of engine is provided with a tank.

Force and other pumps. The force-pump has the advantage of a double action, drawing the water from any depth, and forcing it fifty feet at the same operation; so that while it is well adapted for general domestic purposes, it is equally so for other applications.

Patent portable forge, which may be worked in a barn, or removed into the open air. It is compact, cheap, and strongly made. There are various sizes of these forges, all of which are equally portable.

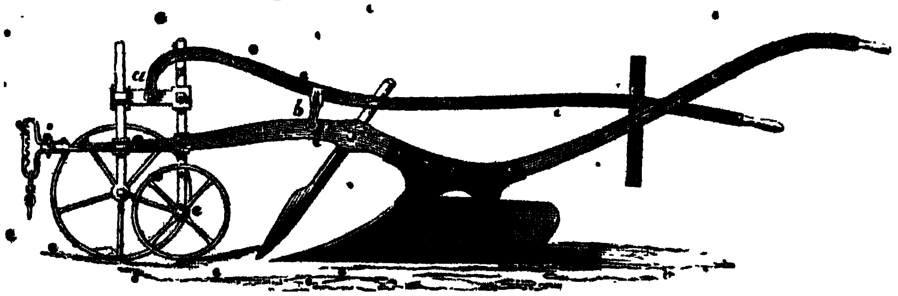
Patent plate glass lantern, combining safety and economy.

Iron pig-troughs. Enamelled milk pans.

Patent enamelled mangers, of various descriptions.

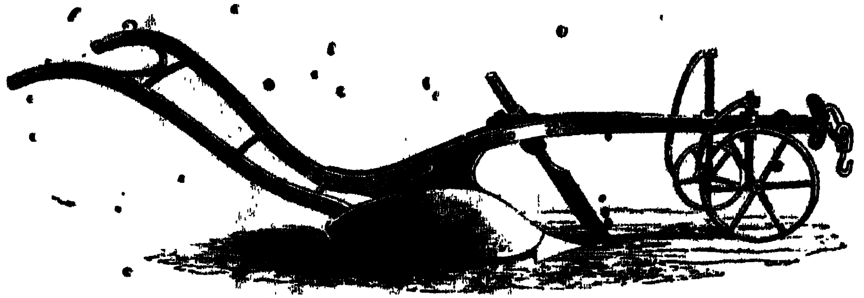
Double weighing-machines, adapted for commercial and agricultural purposes.

Howard's J K plough. This plough is intended as a substitute for the large four-horse Kentish plough, and fitted with mould boards or breasts, which turn the furrow over round, leaving a perfect seam, in the same manner as the Kentish turn-wrist plough. It is used with a pair of horses, but occasionally with three or four. It is capable of ploughing any land, however dry and hard. It may be fitted with an extra large breast or furrow-turner, for very deep ploughing. The skim coulter, shown in the following cut, is a most useful appendage. It is of great importance when ploughing ley ground and stubbles; it precedes the common coulter, paring and turning into the furrow the herbage upon the surface, so that when the soil is turned over by the plough, nothing of grass or weeds is left to grow out between the furrow; consequently the vegetable matter thus buried, instead of living upon the soil, decomposes, and serves to enrich the land. It will also be found most useful when ploughing in dung, mustard, tares, &c., for with the addition of "a drag-chain," all may be turned in completely. With a new registered lever, for regulating the wheels. The cut represents this plough, and the wheel having its fulcrum at *b*, and its point of action at *a*.



Deane and Co.'s Howard's J K Plough.

Howard's J A plough. The annexed cut represents this plough, which is adapted for heavy land.



Deane and Co.'s Howard's J A Plough.

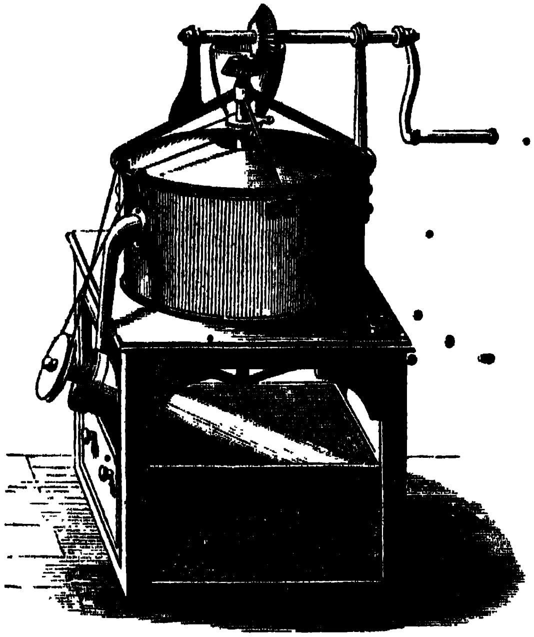
Improved horse-rakes. The horse-rake is adapted for raking barley and other corn stubbles; also cut grass after it is strewn in the process of making hay. Each tooth works independently on a separate lever, so as to fall to the irregularities of the surface, and the oblique direction of the teeth is altered by raising or lowering the ends of the levers, so that the teeth may rake lightly or heavily, as the quality of work or nature of the surface may require. There is also attached a simple lever-purchase, so as to enable a lad to raise the teeth without stopping the progress of the implement, to relieve them of their load, and leave it neatly raked up in rows.

The hay-making machines are made with iron wheels. The rake-cylinders are in two lengths, which eases the working of the machine; and, as they have a double motion, it is immaterial which way they are turned.

Hay-making machines, with reversing motion. In the first process of tedding or making hay, it goes across the swarths, throwing the grass in the usual manner; when, having laid for a short period, the motion can be reversed, and it will throw it out loosely, so that the air can operate on it much more speedily than when heavily laid down.

Mills, of various descriptions, for agricultural produce.

Patent economic corn-mill, effecting a saving of time and labour. This machine is shown in the annexed cut.



Deane and Company's Patent Corn Mill.

A vegetable washer, constructed with a rack and pinion, so that the cylinder enclosing the vegetables, may be raised out of the water, and emptied into a trough or barrow, with the greatest ease.

A chaff-engine, applicable for hand, water, or steam power. It is constructed to cut various lengths. This machine is used in the West Indies, for cutting cane tops.

Sussex butter-churn, of block-tin.

Patent American butter-churn.

One row turnip-drill.

Gardner's patent turnip-cutting machine.

Liquid manure pumps.

181 WHITE, JAMES, 266 *High Holborn*—Inventor and Manufacturer.

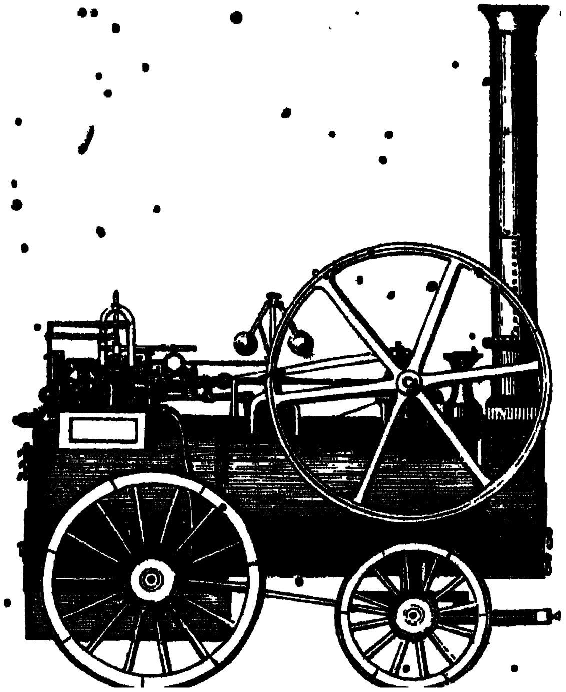
Gorse reducer, for converting gorse into nutritious food for cattle, crushing corn and linseed, and rasping beet root for sugar making.

Patent cider mill, which cuts the pips, improves the flavour of the cider, and makes it keep longer.

Wheat mill and dressing machine, to enable families to grind and dress their own wheat.

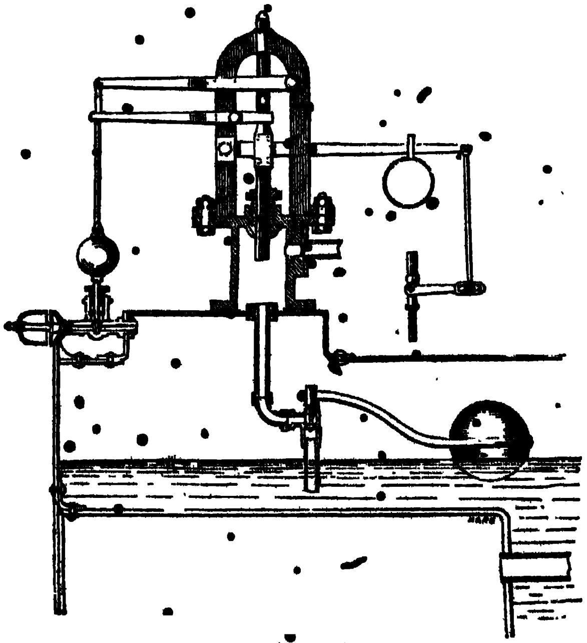
182 TURNER, E. R., *Ipswich*—Inventor and Manufacturer.

Four-horse power portable steam-engine, for agricultural purposes. This engine is shown in the annexed cut.



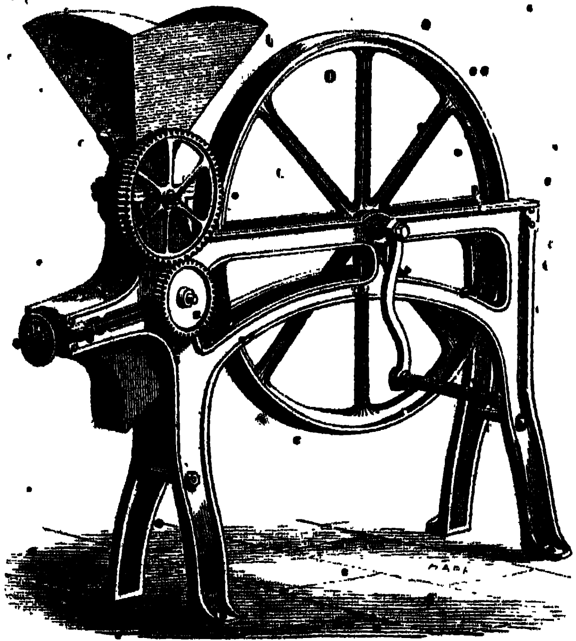
Turner's Four-horse Portable Steam-engine.

Apparatus for regulating the supply of water to a high-pressure steam-boiler whilst the engine is at work, consisting of a small vessel into which the force-pump discharges, and from which the boiler takes its supply by means of a ball valve. Adapted for stationary engines. This apparatus is shown in the annexed cut. By the arrangements represented, a deficiency of supply is indicated by the steam whistle.



Turner's Steam-boiler Feeding Apparatus.

Mill, composed of two smooth rollers, for crushing corn and seeds; it also grinds beans, peas, maize, &c., by a serrated roll at the bottom of the hopper, which acts as a feed-roller when the mill is used for crushing purposes. This engine is represented in the annexed cut.



Turner's Crushing Mill.

183 **ROGERS, JASPER W.**, 88 *St. James's Street*—Inventor and Patentee.

A deodorizing chamber, intended for use in public places and establishments: the receptacles being partly filled with peat charcoal. The animal matter is deodorized, and entirely absorbed by the charcoal, the combination producing a valuable manure.

185 **SAMUELSON, B.**, *Banbury*—Manufacturer.

Patent double-action turnip-cutter, for cattle and sheep, on a wrought-iron or wooden frame; the slicer-knife for cattle may be dropped when the seed-knives are in action; the hopper is on a hinge to facilitate the cleaning of the barrel.

[The turnip-cutter is one of the most valuable improvements in English farming: for fattening flocks it is indispensable. By thus sparing the animal the labour of chewing its food, their condition is improved 20 per cent.—PH. P.]

Chaff-cutter for hand or horse power, on an angle iron frame; cuts two lengths. Universal mill, adapted to crush all kinds of grain except linseed. Improved bean mill. Small oil-cake breaker. Registered atmospheric churn. General purpose plough, but especially suited to heavy clay soils. Horse-hoe, with three tires, which may be set and firmly secured at a variable distance; also two sets of revolving rowels. Skim and paring plough, &c.

186 **BATES, F.**, *Summertown, Oxford*—Inventor.

Implement to facilitate the removal of plants in pots.

190 **WINDER, RICHARD**, 2 *Ingram Court, Fenchurch Street*—Inventor.

Model of a machine for mowing corn or grass by rotary horizontal knives, having a considerable velocity; proposed to be worked by one or two horses, according to the size the machine is required to be made. It is suggested, that two shafts (as in the model) are an improvement, by offering no impediment to the falling corn in the centre space, in allowing the machine to turn within its own length, and allowing free action to the knives while the machine is turning. Also, the means of throwing the machine in or out of gear are considered as economical and effective, as well as the means of sharpening the knives, and the distribution of the falling corn.

191 **HENTON, JOHN**—Inventor.

Hand roller. The object of this roller is to combine efficiency with lightness of draught.

192 **SMITH, HENRY**, 12 *Rufford's Row, near the Church, Islington*—Inventor and Manufacturer.

Registered horticultural hot-water gas stove; consisting of two cylinders, the external 18 inches diameter, internal 5 inches diameter, with top and bottom containing water; and internal pipes. The gas is lighted at the lower end.

193 **KEENE, W.**, 24 *Great Queen Street, Lincoln's Inn*—Engineer.

The multiple box hive, invented by the exhibitor. One of the objects of this hive is to permit the bees to have access at the points most convenient for their work, which always begins from the top of the hive, and proceeds downwards; the natural hives chosen by them having generally access from the top, and not from below. The common cottage hive admits the bees at the bottom, and gives them much additional labour to carry their load upwards, instead of relieving them by taking it in with their descent. It is found by experience that when the bee is admitted at the top, the hive fills much more rapidly with comb and honey. In the multiple hive every box is formed exactly alike; they may be placed one on the other, and their order inverted at pleasure, in such way as may be best suitable for the operations of the bee-keeper. Any single box will form a sufficient hive for any swarm during the first season; but when this box is filled, a second is added, presenting to the bees additional room, of the same form and size as that to which they have been accustomed; they take to it at once; swarming is prevented; and without loss of time the new box is filled with comb and honey. The bees rarely deposit any larvæ in this box. The colony chiefly retires to the lower one, keeping guard on the contents of the upper, and ample provision against "a rainy day," in the lower box. When the upper one is filled, and a fine box of pure clean honey in the comb is wanted, it may be removed, and replaced by an empty one, which in due season they will also fill; the hive below remaining an undisturbed domicile.

In course of time the combs in which the larvæ have been deposited become uncomfortably dirty; these boxes then offer the greatest facility for shifting the family into clean quarters. Suppose an upper box is full, or partially full, of comb and honey, the lower one may be made so uncomfortable as to oblige the colony to mount into the upper, and then the lower may be removed, putting what was the upper box into its place. If the queen or any bees have remained in the box taken away, by upsetting it, and putting a piece of plank on an inclined plane, so as to form a bridge from it to the box which remains on the stand, they will not only all go into it, but very quickly carry away the honey from the dirty comb into the clean hive, and be soon ready to begin to fill another box. The bee-keeper can thus multiply his colonies of bees without permitting them to swarm; or he can produce off-casts, if he prefer to multiply his hives.

The covered way by which the bees enter is pierced with openings both downwards and upwards, so that the bee, once alighted, is free to choose either direction. When the hives are in position, one on the other, a bell glass may be placed over the upward opening, if it be desired to have honey in such a receptacle. A feeding-box may be put over it, if it be needful to give them food; and either the glass or the feeding-box may be covered by a common straw cap, or by an additional box.

New mode of preparing seed for sowing, consisting of wadding-rope and manured seed-wadding for inclosing the seed previous to its being laid in the ground. Adapted for poor and generally unproductive soils. In the article exhibited, there are seven different kinds of manure; that from the farm-yard or stable being in the greater proportion. Guano, bones, peat, charcoal, sulphate of lime, urate, and fecal manure, may all be inclosed in just such quantities as shall be found sufficient for the benefit of the plant. The advantages are—saving of manure, increase of crop, regularity of growth, and saving of seed;—sufficient to outbalance the cost of material when manufactured by machinery on a large scale, and enable about half the quantity of manure to produce crops equal to those obtained in the ordinary way of using it.

195 WILLOUGHBY DE ERESBY, Lord, 142 *Piccadilly*—Inventor.

Machinery to plough land, having a moderately-even surface. The heavy engine is not required to move up and down the field with the ploughs, but is stationary whilst they are working from the hedge on each side up to the engine, when it is advanced the width of the part ploughed each trip. These ploughs are made to travel at five miles per hour.

196 TEBBUTT, CHARLES PRENTICE, *Bluntisham, near St. Ives, Huntingdonshire*—Designer.

Model farmstead, for 250 or 300 acres; containing stabling for 10 horses, well-sheltered yards for about 40 beasts; cattle-boxes for 16 fatting cattle; cow-house for six cows; pigsties, &c.

197 BELL, FREDERICK & Co., 7 *Noble Street, City*—Inventors and Manufacturers.

Patent ventilating waterproof cloth for stack, rick, waggon, and cart covers, tents, marquees, sail-cloths, &c., of extreme lightness and pliability, prepared without oil, paint, grease, or tar.

198 ALEXANDER, E., *Taylorton, Stirling*—Inventor and Manufacturer.

Models of draining ploughs:—

First furrow plough, drawn by from ten to twelve horses, which cuts a depth of from fifteen to eighteen inches, width at top sixteen inches, and at bottom seven inches.

Second, or finishing plough, which cuts a further depth of from ten to twelve inches, finishing the drain to the exact breadth of the tiles, and which, after pulling the cleaner along, shows a flat smooth bottom to lay the soles upon; performing at the rate of about one acre per hour; distance of drains sixteen feet apart.

199 BOYD, JAMES E., 70 *Lower Thames Street*—Inventor and Manufacturer.

Patent self-adjusting scythe; can be put together without the assistance of a blacksmith, and shuts up like a knife.

200 CABORN, JOHN, *Denton, near Grantham*—Inventor.

Portable seven-horse power steam-engine, with governors and tubular boiler, for thrashing corn, &c.

Portable thrashing machine, with straw shaker to attach to the portable steam engine, upon four wheels.

A corn-dressing machine.

202 DE PORQUET, FENWICK, 11 *Tavistock Street, Covent Garden.*

Models:—Haymaker's horse hay rake, skim plough, dressing machine, turnip cutters, light ploughs, &c.

Improved machine for bruising oats, &c.

Mill for splitting beans, &c.

204 PANNELL, JOHN, *Feltham, Hounslow*—Inventor.

Working model of registered heating apparatus, for heating hothouses, pineries, &c., by hot water; whereby a moist bottom heat and a dry top heat can be obtained at the same time from the same boiler; and the circulation round the pipes, for top heat, can be turned off or on at pleasure.

205 BLAND, JOHN GEORGE, *Market Harborough*—Inventor and Designer.

A two-knife hand-power chaff-cutter, made by Cornes of Barbridge, with multiplying power, so as to increase the speed of the knives.

Model of a farmstead, adapted for a farm of from six to seven hundred acres. The buildings are so arranged that by the aid of a two-horse power steam-engine the whole of the usual operations required on such a farmstead may be performed.

208 RESTELL, RICHARD, 35 *High Street, Croydon*—Inventor and Manufacturer.

Metallic flexible garden and conservatory labels.

Metallic flexible wall and standard tree-holders.

208 HAYES, M., *Enfield Highway*—Inventor and Manufacturer.

Beehive.

208B BEADON, Capt. R.N., *Taunton*—Inventor.

Model cart. Improved apparatus for drawing off liquor from casks. Frame for tilting casks.

208C KENNEDY, Dr., *Dublin*—Inventor.

Machine for watering plants.

210 TOBY, HENRY, & SON, *King's Road, Chelsea*—Inventor.

Model of a green-house, with potting shed and fruit-room, showing the boiler and hot-water pipes, with improved ventilation, &c., on a scale of 1 inch to the foot.

211 THORNTON, DAVID, *Ratho, by Edinburgh*—Designer.

Design for an arrangement of farm building, in which accommodation is provided for storing the grain crops under cover, in order to protect them from the weather, incendiaries, or thieves.

Model of a cheap form of field-drain, adapted for districts where neither tiles nor stones are available.

212 TYTHERLEIGH, WILLIAM, 350 *Coventry Road, Birmingham*—Inventor and Manufacturer.

Winter and summer, or self-temperature butter churn.

213 STEWART, CHARLES, & Co., 22 *Charing Cross*—Proprietors.

Patent potato germ extractor. Anti-putrescent preparation, into which the germs extracted, day by day, may be immersed, until the proper season for planting. Potato-germs modelled in wax, exhibiting the mode of extracting the eye.

214 FERGUSON, J., *Bridge of Allan, Stirling*—Inventor.

Model of a draining plough.

215 PADWICK, WILLIAM FREDERICK, *Manor House, Hayling Island, Hampshire*—Inventor.

Hand-drill for depositing garden and other seeds; adapted for patching where seed has failed, for allotments or for rough uneven ground.

Improved planting line, for the purpose of obviating the necessity of setting the ordinary garden-line used in planting at the end of every row. By merely releasing a pin, it changes the position of the line to any required distance.

Improved dibbler, or transplanter, by which seeds may be dibbled or roots transplanted in the driest soil.

215A TYSON, ISAAC, *Selby, Yorkshire*—Designer.

Model of farmstead and buildings where steam power is used for thrashing, grinding, cutting, and steaming, or cooking food for cattle, pigs, &c.

216 **COLEMAN, RICHARD**, *Chelmsford*—Inventor and Manufacturer.

Patent drag harrow and scarifier, for breaking up, clearing, and pulverising land. The frame at the top is suspended about six inches above the lower frame, parallel with which, by means of a lever, it is moved backwards or forwards; it is made with five or seven prongs, according to the width of land intended to be cut.

Patent drag-harrow and scarifier, on the same principle, with the addition of side levers, by which it is regulated when used on furrow land.

Patent subsoil harrow, for drawing out furrows, and grubbing or raising the subsoil after the plough.

Patent expanding lever-harrow. This implement is made in four compartments, each three feet, and being constructed on the principle of a parallel ruler, it may be expanded or contracted at pleasure: it is drawn by five chains attached to double hooks which move on the long whippletree.

Patent expanding harrow, constructed on the same principle, but without wheels and levers.

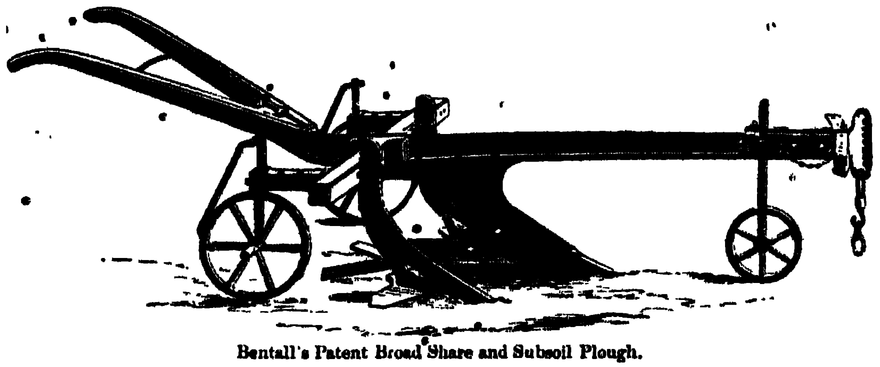
216A **WHEELER, E.**, 16 *Faulkner Street, Manchester*—INV.

Portable machine for bagging hops, wool, or cotton; pressing the hops without breaking the leaf.

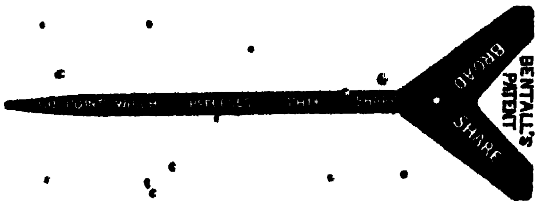
Hand machine for bagging hops, with rack to rise and fall by pinion and double-purchase wheels.

217 **BENTALL, EDWARD HAMMOND**, *Heybridge, near Maldon, Essex*—Inventor and Manufacturer.

Patent broad-share and subsoil plough, combined in one implement, with beam of wrought T iron. By divesting it of its side-arms, hind-wheels, and tines, it becomes a subsoil and root plough. It can be adjusted according to circumstances, by moving the tranverse cutters inserted in the frame. A point, three feet long, precedes the share on the same frame for loosening the ground. This machine is represented in the annexed cut.



Bentall's Patent Broad Share and Subsoil Plough.



Patent mangold, or ridge hoe, on the same principle, with a pair of breasts, for moulding up root crops.

Patent double tom, with wrought-iron beam; having a double breast or mould-board cast in one piece of metal.

Patent N G H plough. A moveable lever, with a share attached in a way which renders it adjustable, and prevents any wear on the sole of the plough.

The original goldhanger plough, called the "Essex plough."

Round-hogs' troughs. Stack pillar.

Patent dynamometer, for the purpose of ascertaining the draft of implements presenting irregular resistance. The arrangement of the parts prevents the vibration of the index without diminishing the accuracy of the instrument.

218 **NUNN, J. P. & E. B.**, 17 *Stratford Place, Oxford Street*—Inventors.

Instrument for elevating and holding a beehive immediately under a swarm of bees hanging from a bough; and instrument for grasping and shaking the bough, which, if the hive be held in a proper position, will cause the bees to fall into it, when they may be easily secured.

219 **SMITH, GEORGE**, 3 *Francis Court, Berkeley Street, Clerkenwell*—Producer.

Registered enamelled garden labels.

220 **WILKINSON, THOMAS**, 309 *Oxford Street*—Improver and Manufacturer.

Improved Baker's patent mangle; having three rollers, two of which revolve with the linen rolled upon them under the heavily-leaded box, while a third is being prepared with other linen to replace the first and continue the process.

Improved patent box churn. The top or cover has perforations for admitting atmospheric air, and the beater is of the form found by experience to be best calculated for agitating the cream, and forcing the air through it, so as to improve the quality and increase the quantity of butter.

221 **FARLOW, J. K.**, 5 *Crooked Lane, London Bridge*—Inventor.

Netting for protecting fruit and flowers.

222 **SMITH, THOMAS**, 1 *Hamor Cottages, Hornsey Road, Islington*—Inventor.

Hyacinth glass, and glass support fixed by glass eyes.

Circular earthenware enclosure, and support for the fruit and foliage of the strawberry plant, by which the blossoms and fruit are protected from slugs, and kept free from grit caused by rain. Provisionally registered.

224 **RITCHIE, W. & J.**, *Ardee, Ireland*—Manufacturers.

Improved drill plough. Improved subsoil plough, furnished with two wheels.

226 **ROBERTS, JOHN**, 34 *Eastcheap*—Manufacturer.

Strawberry tiles. Melon tiles. Grape tiles. Celery sockets. Ventilating flower-pot. Transplanting flower-pot. Flower supporters. Cylindrical brick.

227 **VIVIAN, —**, Inventor.

Model machine for drying corn.

228 **SCRAGG, THOMAS**, *Tarporley, Cheshire*—Inventor and Manufacturer.

A double-action machine for making draining-tiles and pipes. It has, as a substitute for racks and pinions, a chain which winds round a roller, and presses the clay through the dies.

230 **BARKER, JOHN**, *Dunnington, near York*—Inventor and Manufacturer.

Iron wheel-plough and wood swing-plough.

Expanding parallel horse-hoe, with a Norwegian harrow attached, and two sets of coulters; made to expand and contract, so as to suit either curved or straight ridges.

Iron sliding horse-hoe, with shares; adapted for different soils; with wheels and Norwegian harrow attached.

One-horse Yorkshire cart, with a tipping apparatus; side-boards, as a manure cart; and a set of shelvings, for harvest work; the spring end door secures the shelvings.

Set of box whipple-trees, or two-horse draughts.

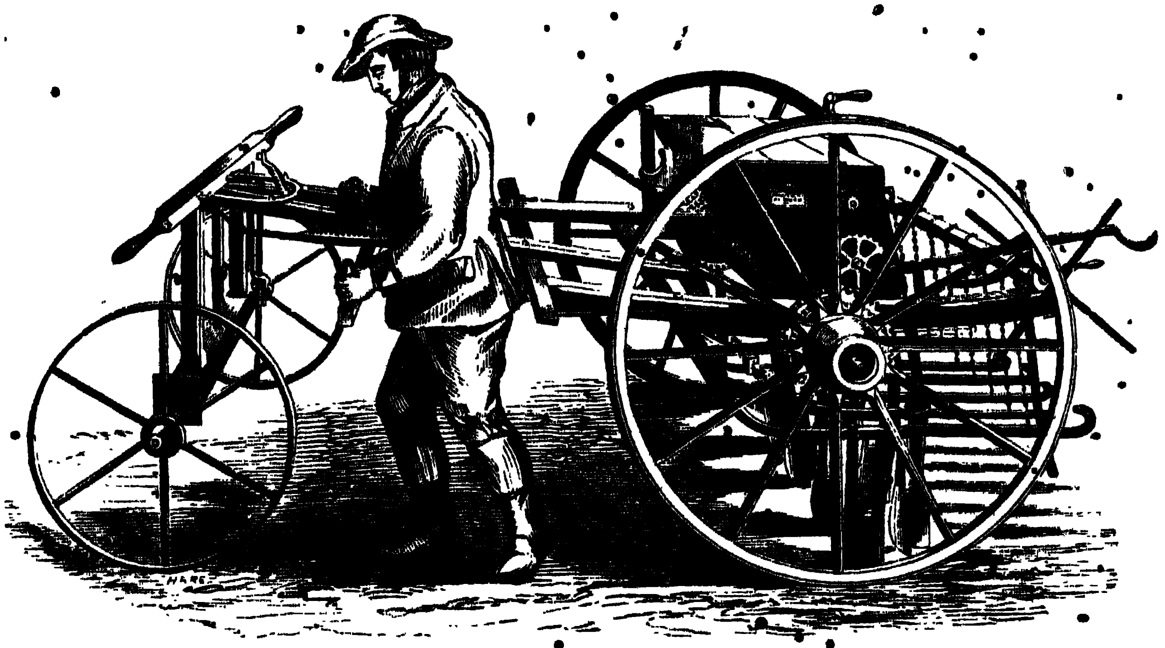
232 **Enniskillen, Earl of**—Manufacturer.

Draining pipes and collars. Draining tiles. Water pipes. Roofing tiles. Flooring tiles.

233 **Hornsby, Richard, & Son**, *Spittlegate Iron Works, near Grantham*—Manufacturers, Designers, & Inventors.

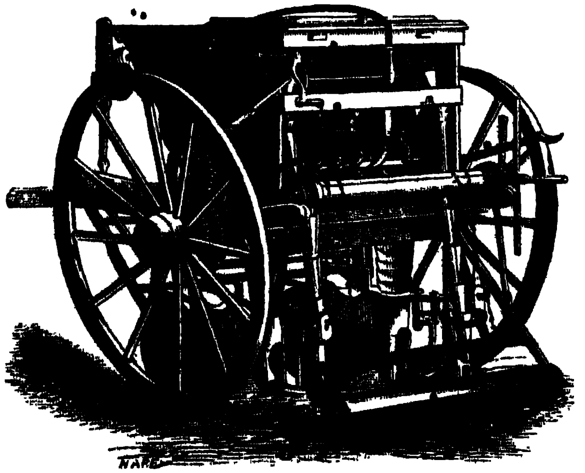
Patent drill-machine, for corn, &c., adapted for hilly ground, and fitted as a ten-row corn and seed drill, and nine-row corn, seed, and manure drill.

Ten-row patent corn and seed drill, fitted with the patent India-rubber tubes for conducting the seed to the coulters; improved slides for regulating the quantity of seed to the delivering barrel; two coulter-bars to equalise the pressure upon each coulter; and patent independent fore-carriage steerage, represented in the annexed cut.



Hornsby's Patent Seed Drill.

Four-row patent drill, to deposit turnip or mangold-wurzel seed, with bones, compost, and manures, with double-action levers, represented in the annexed cut.

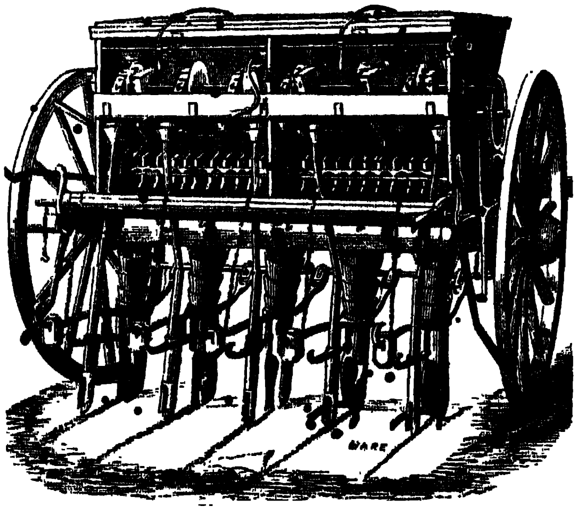


Hornsby's Patent Manure Drill.

Two-row patent ridge drill, with patent India-rubber tubes, and various improvements for regularly delivering both seeds and manure.

Three-row patent drop drilling-machine, for depositing turnips or mangold-wurzel seed and manure upon flat ground or ridges.

Patent drill-machine, for distributing pulverised manures broadcast on the land, represented in the annexed cut.

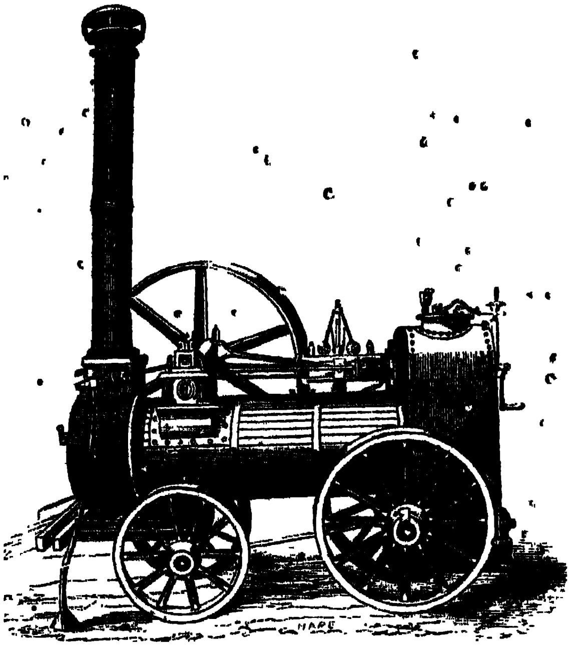


Hornsby's Patent Drill Machine.

Six-horse power patent portable steam-engine, adapted for thrashing, grinding, sawing, pumping, &c.; mounted upon four carriage-wheels, with shafts complete for travelling. The cylinder, and pipes connected therewith, being placed inside the boiler, or steam-chamber, are protected from the weather; represented in the following cut.

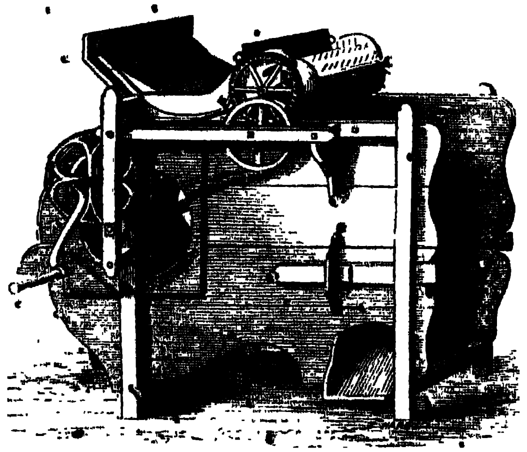
Four-horse power improved portable thrashing-machine, with travelling apparatus complete.

Patent corn-dressing or winnowing machine, fitted with a spike-roller working through a grating, so arranged as to form a hopper. It may be used for separating the corn



Hornsby's Patent Six-horse Power Portable Steam-engine.

from the chaff, in the rough pulsy state, as it comes from the thrashing-machine, without having been previously riddled. It is fitted with a double-shaking screen at the bottom, &c., for cleaning the corn from all kinds of small seeds, and preparing it for market. Represented in the annexed cut.



Hornsby's Patent Corn-dressing Machine.

Double crushing machine, for breaking oil-cake for beasts or sheep, and rape-cake for manure; fitted with two sets of cutters, with hardened points.

Single crushing machine, fitted with one set of cutters.

---

234 **SMITH & CO.**, *Stamford, Lincolnshire*—Inventors and Manufacturers.

1. Double-action wrought-iron hay-making machine, for spreading and turning hay; fitted with wrought-iron wheels.
2. Two-knife cane-top fitter and chaff-cutting machine, for hand, horse, or steam power.
3. Iron balance-lever horse-rake, for hay, corn, &c.
4. Lever hand-rake, in iron frame, and mounted on very light wheels; the teeth, made of spring steel, act independently of each other.
5. Three-knife gorse and chaff-cutting machine, for hand, horse, or steam power.
6. Improved lever cultivator or scarifier.
7. Fat-cutting machine, for tallow-melters.
8. Park or luggage cart, mounted on springs, with patent tail-board, tip movement, and wrought-iron wheels.
9. Wrought-iron wheels and axles for light and heavy carriages.
10. Set of machine models.

Patents have been taken by the exhibitors for Nos. 1, 2, 3, 4, 5, 8, and 9.

235 **CHARD & MUNRO**, *Bristol*—Manufacturers.

Light one-horse harvest cart, of an improved construction. The advantage consists in its being kept low, for the diminution of labour in loading.

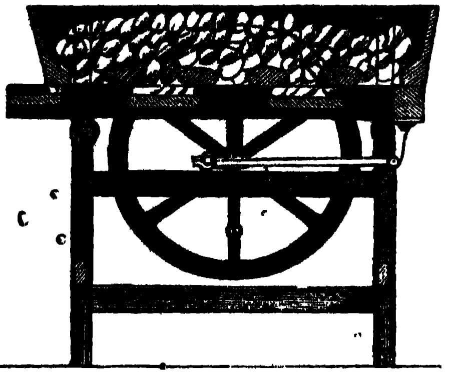
Light cart, for pony or small horse, adapted for an errand or market cart. Light Cobourg.

237 **KEY & MITCHEL**, 103 *Newgate Street*—Proprietors or Agents.

Patent American churn (English) by Charles James Anthony, of Pittsburgh, U. S.; the improvement consists in the arrangement of apparatus so as to introduce a larger quantity of air into the cream or milk.

Käse's force and suction pumps. The valves are so arranged, as to prevent them from being choked; and, if occasion should require, a common blacksmith could replace them.

Patent double-acting turnip-cutter, for cutting turnips, mangold wurzel, &c., as food for cattle or sheep; also applicable for cutting chicory; the knives with the greatest cutting surface, represented in the annexed cut.



Messrs. Key and Mitchell's Patent Double-acting Turnip-cutter.

Hose for liquid manure, fire-engines, and shipping purposes, made of canvas, lined and coated with gutta percha.

Registered union joint, for connecting lengths of hose, made of gutta percha.

Lift pump, made entirely of gutta percha, for acids, liquid manure, &c.; manufactured by the Gutta Percha Company.

Davy's patent India-rubber elastic and water-proof saddles and collars; the former affording a firm seat to the rider on an elastic material; the latter, as well as the former, protecting horses from being wrung in the shoulders, back, withers, &c.

---

238 **CAMBRIDGE, WILLIAM**, *Temple Gate, Bristol*—Inventor and Patentee.

Patent press-wheel roller, or clod-crusher, composed of wheels with thin cutting edges, revolving separately on a round spindle; used for lands affected with wire-worm or slug, leaving the land so firm that they cannot work through.

---

239 **WHITEHEAD, JOHN**, *Preston, Lancashire*—Inventor and Manufacturer.

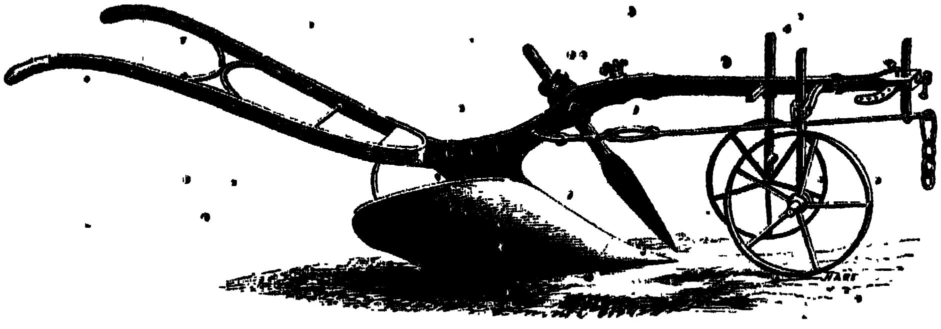
A machine for the manufacture of draining-pipes and tiles, with screening apparatus for separating stones and roots from the clay. It will make pipes or tiles of any form or size, from 1 to 15 inches in diameter, and of any length to 27 inches.

New machine for making and pressing bricks.

Drain-pipe and tile-machine, with a clay-box at each end, so that tiles may be made at one end, and clay screened at the other, or *vice versâ.*

240 HOWARD, THOMAS & FREDERICK, *Bedford*—
Inventors and Manufacturers.

Patent iron plough, with two wheels, marked X, of a small size, made principally of wrought-iron, and intended for ordinary ploughing, to be used with a pair of horses. The annexed cut represents this plough.



Howard's Patent Iron Plough.

Patent iron plough, with two wheels, marked XX. The moving and cutting parts of this are the same in principle as the former, but fitted for deeper cultivation and for stronger lands.

Patent iron plough, marked XXX. This plough is of large size, and intended for extra deep ploughing. Every part is made so strong as to resist large stones or roots. It is also fitted with mould boards or breasts, which turn the furrows over round in the same manner as the Kentish turn-wrist plough.

Patent iron plough, with two wheels, marked J. A. fitted with a furrow-turner, and a novel appliance to the wheels, by which the depth of furrow may be regulated whilst the horses are in motion.

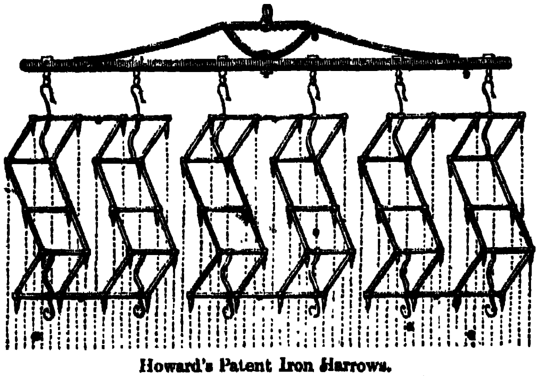
Patent iron swing-plough. Intended to be used without wheels, made with wrought-iron framework, &c.

Patent iron double breast or moulding-plough. Intended for earthing up or forming ridges or bouts, for turnips or other roots, or for striking water furrows.

Patent subsoil-plough.

Patent double-furrow plough. This plough is like two ploughs made into one, for the purpose of ploughing two furrows at one time, and is used upon light land with three horses abreast, and one man.

Set of patent iron harrows. This set consists of three 4-beam harrows with whippletree; covers 9½ feet of ground, and is intended for two horses. The annexed cut represents these harrows.



Howard's Patent Iron Harrows.

Set of patent iron harrows. This set consists of three 3-beam harrows with whippletree, covers 8 feet of ground, and is intended for two horses.

Set of patent jointed harrows. Pair of patent drag harrows. These are used on rough fallows, and are made to draw backward and forward: the latter way to answer the purpose of a scarifier; the former for breaking clods.

Patent horse rake, intended for raking hay, corn, stubble, or twitch grass. The draft irons are furnished with a joint and quadrant, by which the teeth may readily be altered, so to rake upon their points, or set more or less off the ground.

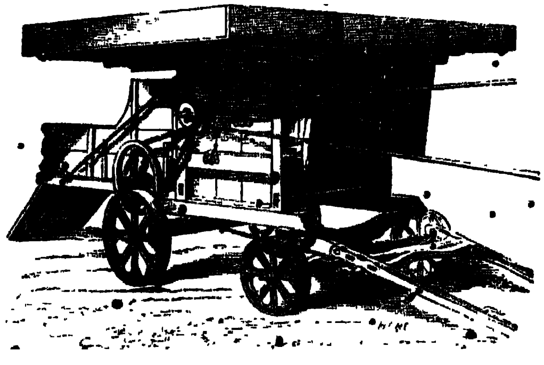
Improved double-action corn-mill, intended for kibbling or grinding into fine meal, barley, oats, malt, &c., and by simply reversing the motion of the fly-wheel, it will split beans or peas at a rapid rate. It is fitted to be driven by horse or steam power, but it can be worked by hand.

Improved horse-power gear-work, intended for driving the corn-mill and other machines requiring horse power.

Set of trussed whippletrees, intended for ploughs, harrows, &c., where draught bars are required. Sundry fittings for the plough, &c., and models of implements.

241 HOLMES & SONS, *Prospect Place, Norwich*—
Inventors and Manufacturers.

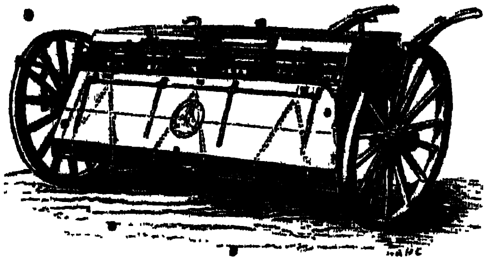
Machine for thrashing grain, and shaking the straw after it is thrashed; the concaves can be adjusted to any width parallel, and at three different points, by a new arrangement of eccentrics; the drum and concaves are made so as not to injure any grain. Represented in the annexed cut.



Holmes's Thrashing Machine.

Machine for all purposes of drilling.

Machine for the purpose of sowing broadcast or in rows, any kind of artificial manures, as top-dressing, either in a moist or dry state, such as guano, nitrate of soda, salt, soot, &c.; fitted with the registered wheels, slides, &c., by which a sliding motion as well as rotary is given to the stirrers: with other improvements. Represented in the annexed cut.



Holmes's Manure Sowing Machine.

Registered horse-lever rake for gathering hay and corn; it may likewise be used for couch or stubbles.

Machine for drilling turnips and mangelwurzel seeds, with or without manure, either on the ridge or flat.

Barley aveller, or hummelling machine, for taking off the haulms of barley. The spindles are made to work quite through, admitting an extra crank at the lower end, which, running in half boxes, can be screwed down as it wears, with other improvements.

Corn-dressing, or winnowing machine. The spindles are made to work in half brasses, which are placed in a strong iron frame.

Hand-barrow drill, for depositing two rows of turnips, mangelwurzel, and carrot seeds, on the ridge or flat, and at any required distance.

Newly invented machine for sowing grass seeds, to be worked by hand.

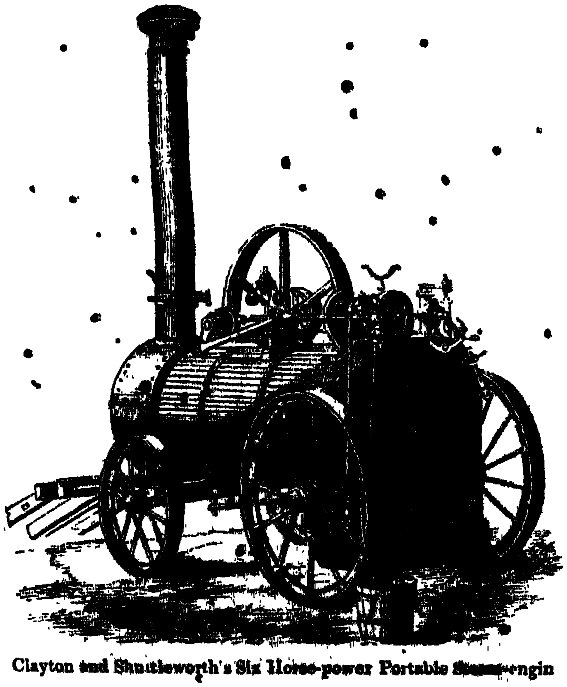
Turnip and mangelwurzel, and manure drilling machine, with one lever, fitted with two boxes, one for manure and the other for turnips and mangelwurzel seeds, &c.

One-row lever drill for turnips and mangelwurzel seeds, adapted for ridge ploughed lands or flat work.

Turnip and mangelwurzel cutter, which can be altered in a few minutes to cutting for beasts or sheep.

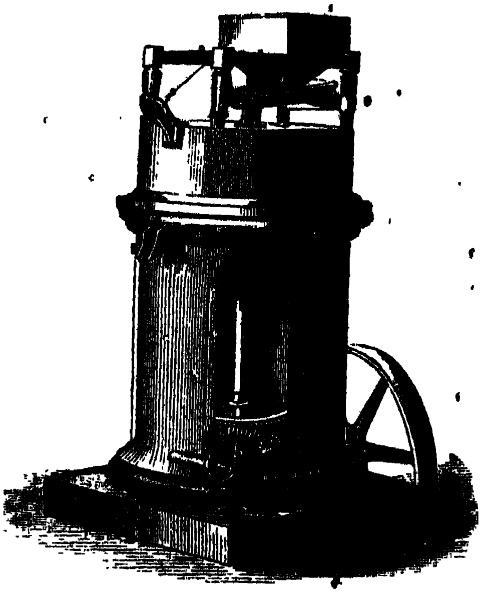
242 **Clayton, Shuttleworth, & Co.**, *Lincoln*—Manufacturers.

Six horse-power portable steam-engine, of an improved and simple construction, mounted upon four wheels, which, from its extreme lightness, is easily moved from place to place; the whole arrangement is simple and compact. It has a starting lever and safety valve (which are acted upon by Salter's spring balance), a water and steam gauge-cock, feed-pump, and steam whistle, all within reach of the driver, and is well adapted for agricultural, builders', and contractors' purposes, such as threshing, grinding, sawing, pumping, &c. The annexed cut represents this steam-engine in the state in which it is ready for use. Power is communicated by a leather band round the fly-wheel, or the pulley on the other side of the fly-wheel.



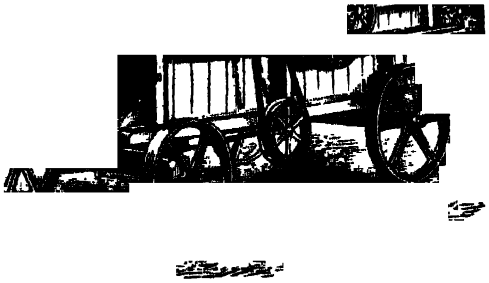
Clayton and Shuttleworth's Six Horse-power Portable Steam-engin

Improved registered grinding-mill, suitable for all grain, consisting of a pair of portable registered French mill-stones, 2 feet 8 inches in diameter, adapted for steam or for water-power, and are fixed in a metal cylindrical frame. This arrangement is represented in the annexed cut.



Clayton and Shuttleworth's Mill.

Improved registered combined thrashing, shaking, riddling, and blowing-machine. The annexed cut represents this machine.



Clayton and Shuttleworth's Thrashing Machine.

The chief novelty in this machine is the registered vibrating trough, which is suspended by four links, and extends the whole length of the machine and straw-shaker, having a reciprocating motion given to it by means of a crank. But by means of the vibrating trough, the whole quantity of the pulse, as it drops from the thrashing-drum and straw-shaker, is caught and passed over a riddle under which the blast is directed; thereby effectually separating the corn, chaff, and pulse from each other, each being discharged into the places assigned for them.

243 **Marriott, Joseph**, 74 *Gracechurch Street*—Designer and Manufacturer.

New cottage beehive, for obtaining honey without destroying the bees. Bell glasses of honeycomb, as worked by the bees from the same. Glass box of honey, as specimen of finished and unfinished comb. Glass jars of pure run honey granulated. Clarified honey. Specimens of queen and other bees. Improved beehives, &c.

246 **West, William**, *Leicester*—Inventor and Manufacturer.

Drill, for sowing corn and turnips. Hand seed-drill, to work with cups; and for sowing turnips, mangelwurzel, onions, or grain, peas, &c., either on the ridge or on the flat, and in any given quantity.

248 M'CARTNEY & DRUMMOND, *Cumnock*—Designers and Manufacturers.

Thrashing-machine, in cast-iron framing, with riddles, fans, and elevators. The riddle is placed under the machine. The grain is raised by elevators to the fans placed on the top of the machine for dressing the grain. It has an improvement for shifting the rollers and drum-cover, by a hand-wheel and levers in front, to suit the different kinds of grain.

Improved construction of horse-wheel, and other parts of gearing, for safety to machinery from a sudden start of the horses; also for preventing the drawing shafts from coming on the horse, when stopped, by the velocity of inside machinery.

A peg-hummeller, for thrashing barley.

The fans, though placed on the top of the machine, can be placed in the granary above, or under it, when more convenient.

248A WEEKS, J., & CO., *King's Road, Chelsea*—Inventors and Manufacturers.

Cylindrical revolving furnace bars, consuming the smoke, and diminishing the consumption of fuel. A slow rotary movement is given to each of the cylinders, which presents cool bars to the heat of the fire about every fifteen minutes, and equally distributes the fire throughout the furnace.

Model of an ornamental conservatory, with improvements in ventilation. This conservatory is represented in the annexed cut.

Weeks and Co.'s Conservatory.

Boiler, for rapidly heating water.

Glazed light, for a common forcing-house or pit; of new construction, with improvements in ventilation.

Pedestal; for warming buildings by hot water, exposing a heating surface of 70 superficial feet.

Stack of pipes for warming buildings by hot water, exposing a heating surface of 50 superficial feet.

248B THOMPSON, HENRY A., *Lewes*—Manufacturer.

Set of improved entrance gates, with cast-iron piers, constructed upon improved principles: they are composed of iron and wood, without mortice, mitre, dovetail, nail, screw, cement, or glue, and combining strength with durability. They are trussed-braced with saltier crosses between uprights, with bevelled abutments, similar to the king-post which supports a barn roof.

The plan of these gates prevents their dropping from long wear or ill usage; and their power of resistance is very great. They are hung to, close by themselves, and the mountings are of peculiar construction; the upper ride hook oscillates to adapt itself to the position of the gate, and the lower joint is a combination of levers to produce an elliptical and eccentric motion, necessary to make the gate shut itself: in the latch, is a friction roller, and a secret fastening to enable it to be locked with a key. These improvements enable them to swing without sustaining that severe shock in their oscillating motion, when they arrive at the centre, as in gates hung on the common method.

Portable steam cooking apparatus, for cooking all kinds of vegetables, linseed compounds, cut-stuff hay, &c. It consists of a cylindrical steam-generating boiler, with dome top, supported on iron legs, between which is an iron ash-pan, containing water to prevent danger from sparks, &c. On one side of the boiler is placed an iron cooking vessel, with perforated double bottom, for steaming vegetables, which is supported on centre gudgeons, so that the contents may be tipped into a wheelbarrow or other receptacle without dismounting the vessel. There is also attached to the boiler, a patent compound tube for cooking linseed, compost, or for boiling water. On the opposite side is a syphon pipe, dipping near to the bottom of cooking compost in the tub, through which the waste steam passes; the agitation occasioned by this supersedes the necessity of stirring.

Set of cast-steel measures for corn, seeds, &c., from a quart to a bushel; intended to supersede wooden measures. The top of each is strengthened by a steel hoop, which is hardened, to prevent wear; enclosed by this hoop, and visible on the inside, is a copper medallion, to receive the inspector's stamp.

Portable liquid manure-forcing pump, agricultural fire-engine, and irrigating machine, with an air-vessel upon a peculiar principle, and arranged on an iron wheelbarrow.

Portable pump or tripod-stand, adapted for raising liquid manure or water out of tanks, ponds, &c. The hose-pipe is made of patent vulcanised India-rubber: it has a helical wire-spring running through its entire length, to prevent it from collapsing; and at the end is a strong copper strainer. The pump has a metallic bucket, and metal seats to all the valves. The valves are all formed of vulcanised India-rubber, with metal tops; and the bucket packing of gutta percha.

249 WILSON, JAMES, *Kelso, Roxburghshire*—Designer.

Model of an improved seed-box for a turnip-sowing machine.

250 BROWN & ARCHBOLD, *Horsley, Tyne Side, Newcastle-upon-Tyne*—Inventors and Manufacturers.

Miniature model machine for cleaning corn and grain.

252 PHILLIPS, CHARLES, & CO., *Baptist Mills Foundry, Bristol*—Manufacturers.

Patent turnip-cutter, to cut for sheep by turning it one way, and, by reversal of motion, to cut for other purposes. In this machine the knives that cut for sheep have an oblique edge; there is a grating under the barrel of the machine, by which the last piece of each turnip is prevented from escaping unslit; and the hopper has a rocking motion, by which the wedging-up of the turnips is prevented.

253 FLEMING, GEORGE, *Trentham, Newcastle-under-Lyme*—Inventor.

Machine for destroying weeds, moss, lichens, &c., on gravel-walks, court-yards, &c., it consists of a boiler, holding 30 gallons of water, with a furnace and iron-pipe chimney, and moves upon three broad wheels. In every gallon of water about 2 lbs. of common salt are dissolved; the mixture, when in a boiling state, is applied to the walks, &c., through a horizontal tube fixed behind the machine, under the furnace door.

254 RALSTON, W., *Malletsheugh, Newton, Renfrewshire*—Inventor and Manufacturer.

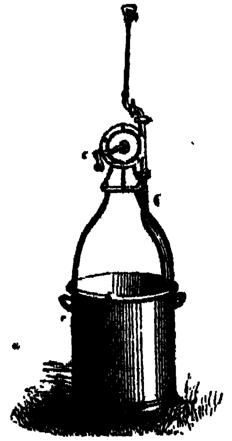
Machine for winnowing all kinds of grain; with a cloth and revolving brush, for separating the grain from burrs.

255 STOKES, WILLIAM, *Dean, near Shepton Mallet, Somerset*—Inventor.

Treble cheese-press, and curd-mill.

255A SIEBE, AUGUSTUS, 5 *Denmark Street, Soho*—Inventor and Manufacturer.

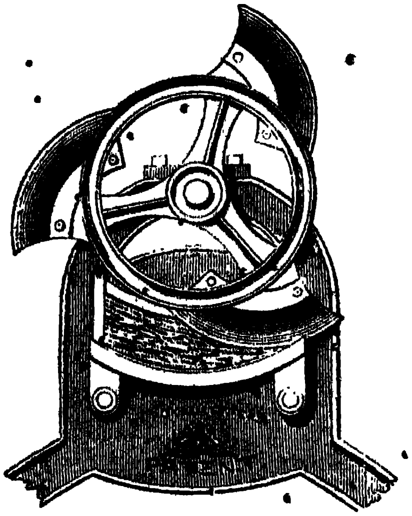
Patent rotatory garden and house fire-engine pump, with improved hose and jet. This apparatus is shown in the following cut.



Siebe's Patent Rotatory Garden Pump.

256 **SMITH, JOHN**, *Albert Iron Works, Uxbridge*—Inventor.

Patent chaff-cutter, cylindrical iron sifter, thrashing-machine, barley hummeller, oat and bean mill, iron skim plough, winnowing machine, turnip-cutter, &c. This machine is represented in the annexed cut.



Mr. J. Smith's Patent Chaff-cutter.

The novelty claimed for this machine consists in placing the axle upon which the knives are fastened within the range of the long way of the mouth-piece, instead of the short way, as in others; thereby placing the shaft directly over the work, and having the weight of the fly-wheel upon the stuff. The friction on the bearings is thus reduced, and the active power of the knife is increased.

257 **WARREN, JOSEPH**, *Heybridge, near Maldon, Essex*—Inventor and Manufacturer.

Novel regulation ploughs.

Turn-wrist or perpetual furrow plough, to turn the land or furrows all in one direction, and dispense with all waste of open furrow.

Adjustable screw plough. Revolving calendar roll.

Hand machine adapted for hoeing all kinds of corn and root plants, mounted on wheels.

Broad share or triangle plough, for top cleaning and paring off the weeds, and general cultivation.

Alarm gun, giving four distinct reports, which may be heard at a considerable distance.

Spring alarm. When placed in a box, it works a rack wheel, and communicates with a bell, on which is fixed a wire, that causes it to ring by the lightest touch.

Skim plough for hoeing and cleaning land.

257A **JOHNSON, THOS.** (with Mr. KINNEAR) *Newcastle-upon-Tyne*—Inventor.

Model of a machine for sowing wheat and barley, with a harrow attached.

258 **MCPHERSON, P.**, *Norton Place, Edinburgh*—Importer.

Improved mill for breaking, skutching, and preparing flax, and adapting it for hackling.

259 **SPURGIN, JOHN, M.D.** *Guildford St., Russell Square.*

Double hoe. Shark's-tooth-shaped hoe and spud.

259A **WINTON, H.**, *Birmingham*—Manufacturer.

Spades and other agricultural implements.

259B **BURCHAM, CHARLES**, *Heacham, near Lynn*—Inventor and Manufacturer.

Model of a steam and hand-power tillage machine and irrigator.

259C **HAY, JAMES**, *Florabank, Haddington*—Inventor.

Implement for cutting turnips for sheep and cattle.

262 **SEAL, S.**, *Wakefield*—Manufacturer.

Scythe-stones. Grindstones.

262A **CRAIG, JAMES, & Co.**, *Paisley*—Manufacturers.

Various sizes of drain pipes and tiles, for field drainage, manufactured from common clay.

262B **ROWBOTTOM, JOHN**, *Halifax*—Inventor.

Beehive, or beeskip, with ornamental embellished pedestal, for taking honey without destroying the hive or bees.

263 **DIGGES LA TOUCHE, REV. THOMAS**, *Killenaule, Ireland*—Inventor.

1. Model of a cart, made without mortices.
2. Model of a carriage, which admits of high fore-wheels, turning on their own centre; and requires no private bolt.
3. Model of a grubber, pulverising to the depth of 15 inches.
4. Model of a harrow, on wheels, intended to clear the ground of weeds.
5. Model of a scuffler, of light draught, for cleaning between green crops.
6. Model of a turnip-dibbler.
7. Apparatus for making butter without handling.
8. A ball-iron, which leaves the ball at the root of the tongue, without startling the horse.

264 **LOW, ALEXANDER**, 72 *Overgate, Dundee*—Inventor.

A mouth-bag for horses; the front being made of net or gauze-wire.

Double water-furrow roller plough, having the roller placed on the bottom of the stilts behind the double mould boards, and a bulge on the centre to form the water furrow, and also to press down the sides of the furrow, making the ridge broad, and the water furrow narrow.

265 **DANIELL, J. C.**, *Simpley Stoke, near Bath*—Producer.

Samples of manure and food for cattle.

266 **SMITH, ALEXANDER & WILLIAM, & Co.**, *Woodside Works, Paisley*—Inventors and Manufacturers.

Registered centrifugal churn for making butter. The novelty consists in the milk being drawn up from the bottom by the velocity of the cone or disc, and thrown out at the top, in broken portions, with great force, so that none of the milk escapes thorough agitation. These machines are constructed to churn from 5 to 100 gallons.

New steaming apparatus, for preparing food for horses, cattle, &c. The boiler and vessels are of malleable iron.

Corn and bean-bruising machine.

Hay and straw cutting-machine.

Cart and cattle weighing-machine; showing the weight of cattle and sheep, and farm produce, from 1 lb. to two tons. It is contained in a cast-iron case.

Jack weighing-machine, for barn purposes, to weigh from 1 lb. to three cwt.

Model of water-wheel and sugar-mill.

267 GRANT, JOSEPH COOKE, *Stamford*—Inventor and Manufacturer.

Patent lever horse-rake, for collecting hay, corn, stubble, twitch, &c.

Patent lever pony-rake.

Pair of patent lever self-cleaning harrows.

Lever horse-hoe.

Implements with improvements:—

Haymaking machine.
Three-knife chaff machine.
Two-knife chaff machine.
Weighing-machine, with wrought-iron beam.
Iron ploughs for heavy and light land.
Iron tube whippletrees for four horses.
Light-iron tube whippletrees.
Wooden whippletrees.
New garden drill for sowing garden seeds.
Mill for grinding beans.
Uley cultivator, with wrought-iron frame.
Norfolk dock or thistle extractor, in iron and wood.
Linseed corn and bean mill.
Norfolk hand-drill, for sowing turnips when the crop has partially failed.
Sundry models.

268 STUART, J., *Aberdeen*—Designer and Manufacturer.

Two-horse plough, adapted for either double or single mould-board, with shifting coulter.

Two or three horse double or single mould-board plough, convertible into a subsoil plough.

269 JONES, C. E., B.A., *Birk House, Huddersfield*—Co-inventor.

Double cottage beehive, with regulating doorway in the floor-board, invented by the exhibitor.

Specimen of the adaptation of the common cottage straw hive to certain improvements, made also by the exhibitor.

Double rim for enlarging the double cottage beehive previous to swarming; with an improved method of obtaining virgin honey in the comb without disturbing the bees in the parent hive; invented by J. Beaumont, Netherton, near Huddersfield.

269A FORBES, R. B., *Glasgow*.

A Scotch farm cart.

269B SANDERS, S., *Birmingham*—Manufacturer.

Improved garden spades, draining tools, and shovels.

270 SMITH, WILLIAM, *Kettering, Northamptonshire*—Inventor and Manufacturer.

Improved double-blast winnowing machine, for dressing corn and seeds. A portable board is turned back in the hopper, so that it gives the rollers the power of pulling the corn in a rough state through from the thrashing machine, without stoppage.

New horse-hoe, simple in construction, and principally formed of wrought iron. It is drawn with shafts; and the wheels may be expanded or contracted, so as to be kept between the rows of the plants.

A similar machine for hoeing on the ridge or on the flat.

271 TUXFORD & SONS—*Boston and Shirbeck Iron Works, Boston, Lincolnshire*—Manufacturers.

Patent six-horse power portable housed steam-engine, for thrashing, grinding, sawing, pumping, and general agricultural purposes. The improvement consists in arranging the working parts, and enclosing them in a box or house, to protect them from the grit and dirt of farm work, from the weather, and from all improper interference, by being locked. The cylinder being upright, it will not wear oval as when placed horizontally.

Four-horse power engine, on the same principle as the preceding.

272 PLENTY, J. & E. PELLEW, *Newbury, Berks*—Inventors and Manufacturers.

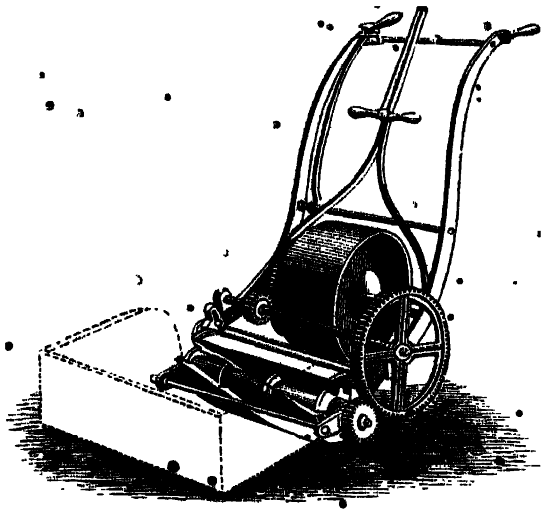
Four-horse power portable thrashing machine to thrash on its wheels.

Machine for pressing or bagging hops.

274 FERRABEE, JOHN, & SONS, *Phœnix Iron Works, Stroud*—Manufacturers.

Chaff-cutter, with the knives set obliquely, and having serrated edges; also, for cutting hay, straw, &c.

Patent grass-cutter, for cutting the grass on lawns, pleasure-grounds, &c., represented in the annexed cut.



Ferrabee's Patent Grass-cutter.

Set of registered screw-wrenches.

275 LOMAX, WILLIAM ROTHWELL, *Birmingham*—Inventor and Patentee.

Patent chaff-cutter. The novelty of this machine consists in the position of the shaft or axis upon which the knives are fastened; this being within the range of the long way of the mouth-piece, gives the knives about six times the usual amount of draught, and causes them to cut, instead of chopping. The weight of the fly-wheel is directly upon the stuff, which reduces the friction upon the bearing, and renders the cut lighter. The shaft has a bearing on both sides of the knives, so that they cut clear.

Patent turnip-cutter.

277 UPHILL, E., *Birmingham, Warwick*.

Wrought-iron sheep-fold.

Hay-rack for feeding sheep.

Improved apparatus for melting pitch and tar.

Tree guard.

278 RICKMAN, W. C., 21 *Park Side, Hyde Park Corner*—Inventor.

Farmer's level.

(*In North Transept Gallery.*)

290 NEIGHBOUR, GEORGE & SON, 127 *High Holborn*,—Inventors and Manufacturers.

The improved cottage beehive working bell-glasses, from which a glass of the purest honey may be taken during the most vigorous period of the gathering season without injury to the bees. It consists of a stock-hive, having three windows, with a thermometer affixed across the centre one.

The ladies' observatory hive, made of stout glass, with a cover neatly made of straw; adapted for advancing and perfecting the knowledge of the habits and economy of the honey-bee.

The improved single-box hive, constructed on similar principles to the former; furnished with a ventilator between the stock-hive and the glass above; thus effectually preventing any impurity of the honey deposited therein.

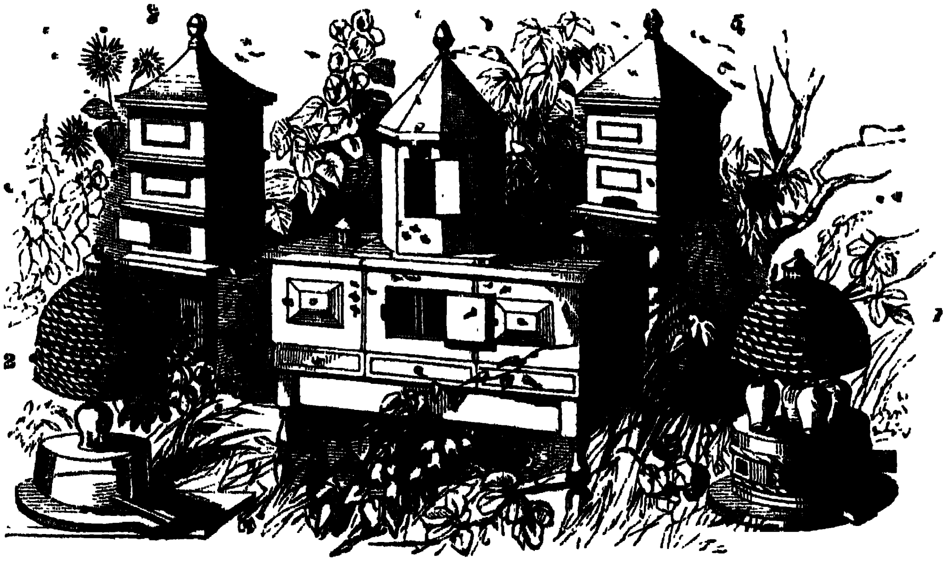
Natt's collateral hive, for the humane management of honey-bees, and from its construction obviating the necessity of swarming.

Taylor's amateur's beehive, consisting of three boxes, with bars fitted at proper intervals, thus rendering available each comb for separate extraction.

Specimens of honey and honey-comb taken from the above in 1850.

Newly-invented bee-feeders, made of zinc, glass (with a supply fountain), wood, &c.

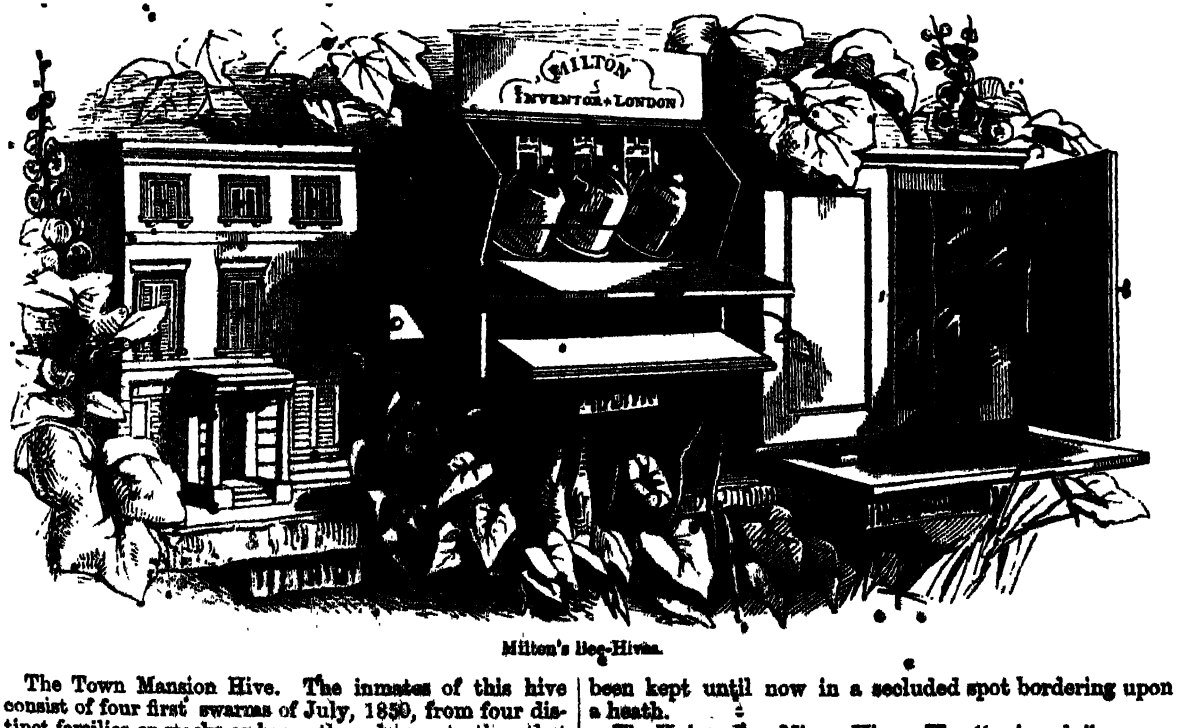
Honey-cutters or bee-knives, &c. Also, closely adjoining the group of untenanted beehives are three *living* hives, with the bees industriously at work.



Neighbour's Cottage, Observatory, and other Beehives.

291 **MILTON, JOHN**, 10 *Great Mary-le-bone Street*—Producer.

The "Royal Alfred Hive." This is the centre hive in the annexed illustrations. This hive is conveniently adapted for the purpose of taking the honey without destroying the bees; and is suitable for the conservatory, library, or any room where the sun's rays come during some portion of the day.



Milton's Bee-Hives.

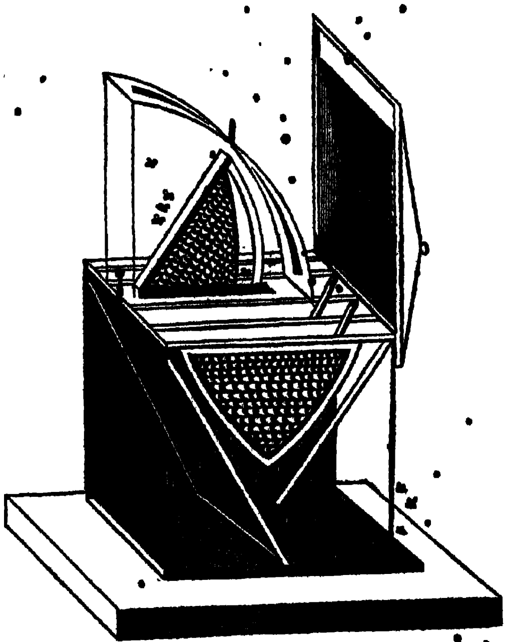
The Town Mansion Hive. The inmates of this hive consist of four first swarms of July, 1850, from four distinct families or stocks or bees; thus demonstrating that a very considerable number of bees from various queens will work together in perfect harmony. They have been kept until now in a secluded spot bordering upon a heath.

The Unicomb or Mirror Hive. The "unicomb," or one-comb hive, is so constructed that the movements of every bee can be observed.

In addition to the bees contained in the glass case, are various beehives made of cork, wood, and straw. There are also models of beehives and apiaries, and a glass of honey gathered in the year 1837. This specimen is exhibited to prove the extraordinary length of time pure honey can be preserved. It weighs 26 lbs.

Bar and frame hive, invented by William Augustus Munn; Esq., Throwley House, near Feversham, Kent.

The advantages claimed consists in the whole of the interior of the hive being open to inspection at any moment, and a choice can be made of the combs containing the most honey, &c., and this without the assistance of smoke, as each bee-frame, and the bees and combs contained in it, can be drawn up and examined in the observation frame (as shown in the adjoining sketch) without interfering with any other part of the hive, or occasioning the loss, or even escape of a single bee. The hive is shown in operation, with the comb brought into the observation frame; one frame is also seen through the side of the box, to show how it is suspended in the triangular case.



Munn's Bar and Frame Beehive.

SECT. II. CLASS 10.

PHILOSOPHICAL, MUSICAL, HOROLOGICAL, AND SURGICAL INSTRUMENTS.

INTRODUCTION.

THE advance of physical science receives its illustration in a variety of directions among the objects collected together under this Class. The progress of experimental philosophy may be gathered, in a degree, from the perfection of the instruments it employs; for while it is certain that in some sciences much has been accomplished by the aid of rude and imperfect means, it is equally true that in others the perfection of the apparatus is essential to that of the knowledge sought to be established by deductions drawn from its indications. The delicacy of a balance is necessary to the accuracy of a chemical experiment, and therefore to that of the facts it is used to develop, as also is the achromatism of a microscope, or a photographic lens to the development of the optical images, and to the results sought to be obtained therefrom: chemistry, microscopical sciences, and photography, are consequently largely dependent for their progress upon the instruments by the use of which they are to proceed. The same cannot be said of surgical instruments, for in their use the operator may command success by his skill, notwithstanding the imperfections of his apparatus. Nevertheless, the present state of surgery, and the attention bestowed upon it, may be gathered from the inspection of the refined and complicated apparatus offered for its advancement. As one of the results of the splendid and enduring system of knowledge, and of its pursuits—promulgated by Bacon in the "Novum Organon," the system since called Experimental Philosophy—objects in this Class wear a peculiar interest, representing the means employed by man for the establishment and development of inductive science.

This Class includes instruments employed for a variety of philosophical purposes; it also comprises musical, horological, and surgical instruments and apparatus. It may consequently be considered under three Sub-Classes. The first comprehends—A. Instruments for the measurement of space, such as Transit Instruments, Quadrants, Sextants, Telescopes, Microscopes, Theodolites, &c.; B. Instruments to measure the effects of mechanical and physical forces, as Dynamometers, Balances, Thermometers, &c.; C. Instruments to illustrate the Laws of Mechanical and Physical Science; D. Application of mechanical and physical science to useful purposes not included in any of the preceding or subsequent sections, such as instruments connected with Mechanics, Sound, Light, Heat, Magnetism, and Electricity; E. Comprehends Chemical and Pharmaceutical Apparatus. The Sub-Class, Musical Instruments, comprises—A. Wind Instruments, in wood and metal, as Flutes, Bassoons, Horns, Trumpets, &c.; B. Stringed Instruments, as Harps, Guitars, &c.; C. Keyed Instruments, with fixed tones, such as Organs, Pianofortes, Accordions; D. Instruments of percussion, as Drums and Cymbals; E. Automatic Instruments; and F. Miscellaneous articles in connexion with musical instruments. The Sub-Class, Horology, contains—A. Great Clocks for Churches and Public Buildings in general, including Electric or Magneto-Electric Clocks; B. Astronomical Clocks; C. Clocks applied in registration. D. Clocks showing different phenomena; E. Clocks for ordinary purposes; F. Clocks of an ornamental description; G. Sundries applicable to clocks; H. Marine Chronometers; I. Pocket watches of various descriptions; J. Watches for different markets. The remaining Sub-Class, Surgical Instruments, includes a variety of apparatus adapted to the performance of operations in different parts of the human body, together with the philosophical apparatus employed by the surgeon in the investigation and treatment of disease. It also embraces the instruments employed in Veterinary Surgery.

The large astronomical telescope in the Nave, mounted upon a stand, having equatorial movements and complete adjustments, is an interesting member of this Class. It is a refracting instrument, and possesses an object-glass nearly 12 inches in diameter. Telescopes of a smaller calibre, and adapted for different purposes, are also exhibited near it. But the general arrangement of the objects representative of this Class is to be sought in the Central North Gallery. This gallery is reached by ascending the stairs near the North Transept. On entering it, and proceeding past the articles in glass, which are also placed here, the commencement of this Class is met with at Area I. 22. From this point it extends to the western termination of this gallery. The interspace between the North and South Central Galleries is also devoted to it, and a portion of the South Central Gallery, from M. 3 to M. 8, contains various articles included in this Class. Proceeding westward, in the Central North Gallery, musical instruments are first encountered, including a variety of organs, harps, pianos, &c. Succeeding to these are philosophical instruments, electric telegraphs, daguerreotype apparatus, and specimens of photography: beyond are globes and astronomical apparatus. In the South Central Gallery are watches and clocks. A part of the North Gallery, devoted to surgical instruments, and occupying the space between F. 15 and F. 21, also belongs to this Class.

The science of horology is illustrated on the great as well as on the small scale in the large clocks and the minute chronometers exhibited in this Class. The large electric clock, the hands of which are seen projecting over the south entrance of the Transept, is an interesting example of the application of the force of electro-magnetism to move mechanical arrangements for the measurement of time. A small galvanic battery keeps this large instrument, and several other clocks in the Building, in regular movement. The ribs of the Transept have been made to represent the dial, and show the hours from 6 A.M. to 6 P.M. Other electric clocks on a smaller scale are shown, and exhibit various ingenious arrangements intended to effect the same end. Self-registering, astronomical, and other clocks are likewise exhibited. In some of the large clocks for churches and public buildings, one of which is in the Nave, and others are at the termination of the Galleries, new principles of suspension and compensation of the pendulum and of escapement are introduced. Much ingenuity has often been expended upon clocks with a view of communicating to them the power of indicating, in addition to ordinary time, that of different places, and of different periodical occurrences, as the rise and fall of the tide, the day of the month, &c. Several of these clocks are shown, and particularly one which occupied its patient constructor thirty-four years in its manufacture. The watches and chronometers exhibited have also their peculiar claims to attention. The escapements of some of the latter are in part new, and appear to promise favourable results. Several different specimens of watches, adapted for different markets, afford a curious illustration of the variation of natural tastes—the variety of methods in which compensation for the changes resulting from variations of temperature is obtained both in chronometers and in astronomical and other clocks. Extremely small watches, as specimens of minute workmanship, are exhibited. The parts of watches and clocks are likewise included in this Class.

The philosophical instruments exhibited comprise a large number connected with the display of the phenomena of heat and electricity: the aneroid barometer, in which the mercurial column is dispensed with, and various forms of the ordinary barometer are among them. Electric communications are now effected by a variety of apparatus of greater or less facility of application. Printing electric telegraphs, in which a message is recorded by this agency, upon a chemically-prepared paper, appear in various forms with the ordinary needle telegraph. The methods of electric insulation for telegraph uses are also exhibited. Among these will be regarded with interest the wires adapted for submarine communication between this country and the Continent. The magnetic and electric machines, with electro-magnets of great power, are also interesting.

British manufacturers have for some time been making great efforts with a view of producing good optical glass, and a skilful method of working it into the forms desired for optical purposes. These efforts have been so highly successful that the glass produced in England is not unfrequently exported and again re-imported as foreign glass at a much higher price. The production of lenses has also greatly improved; and achromatic glasses of considerable size, as well as of a smaller kind, are made with success in this country. Microscopes, telescopes, and the minor philosophical instruments, are now of excellent quality and highly-wrought character.

Photography is included in this Class, both on plates of silver and glass, and on paper. The most beautiful specimens of sun-drawn pictures are exhibited. Daguerreotypes of every kind, plain and coloured, "enamelled," and "crayon,"—improvements of recent introduction, and applied to a variety of purposes,—are found here. The largest daguerreotype probably yet produced, a group of sculpture, is placed in this Class. The talbotypes are also very beautiful, and present a charming evidence of the fidelity and artistic effects capable of being produced by the pencil of Nature. Photographic apparatus of various kinds, together with the results of curious photographic experiments, illustrative of the distinct existence of luminous and actinic rays in the solar beam, are also represented.

A great variety of miscellaneous philosophical apparatus, for popular illustration, and for the purposes of the experimentalist, is also displayed, and must attract notice. The musical instruments exhibited include several powerful organs. That over the West Entrance possesses 80 stops. The organ over the Eastern Entrance exhibits a new and pleasing arrangement of pipes, and possesses a powerful set of stops. The organ over the South Transept Entrance is devoid of a case, and exhibits the internal mechanism; it possesses a powerful reed stop, and other stops. Pianos, harps, seraphines, of new modes of construction, and decorated in a remarkable manner, are likewise found here. The instruments of the surgeon have a purely professional value, and will be sought by those interested in that pursuit.

Regarding this Class as representing the culminating point of mechanical skill, it forms an appropriate conclusion to those devoted to machinery generally. Delicacy and precision of workmanship are absolutely requisite in the industry occupied in producing philosophical apparatus. It will be found, on inspection, that the genius of this country, so remarkably developed in mechanics applied to commercial purposes, is not less successful in its application to the higher pursuits of experimental and practical philosophy.—R. E.

1 **BENNETT, JOHN**, 65 *Cheapside*—Inventor and Manufacturer.

A regulator, which beats half-seconds, with merqurial pendulum; adapted for reading-rooms, railway stations, and other places where an exact time-keeper is required at a small expense, and where economy of space is an object.

Hall clock—in a carved oak case, of new design; chiming the quarters, and striking the hours on a gong.

Finished specimen of marine chronometer.

Model watch, on a magnified scale; constructed to show the most compact form of the modern watch, with all the recent improvements; to which is attached a peculiar mode of regulation, by which the wearer, with one touch of the regulator (fixed on an endless screw) can correct any variation of time.

Model watches in gold cases for pocket use; jewelled in thirteen holes. Comprising, in a simple form, essentials for its correct performance in all climates; with a gold chain of new design. Exhibited to show the introduction of a variety of ornamental detail, coloured by means of different bases of alloy, without the aid of either enamel or precious stones.

Time-keeper, for railway guards, constructed to combine cheapness, strength, and exact performance.

Specimens of standard thermometers, with ivory and box-wood scales.

Bennett's registered illuminated night timepiece, attached to a Palmer's candle lamp, by the burning of which a spring gives motion to the hands of the dial with great exactness.

Carriage clock, in rosewood case, with detached lever escapements and compensation balance.

A regulator, beating dead seconds, with mercurial pendulum, in the simplest form of case and movement compatible with strict nicety of performance.

Cathedral clock dial of plate-glass, and of new design; weather-proof; with a movement in action.

A wind dial in action from a vane above the roof of the Exhibition Building, with a self-recording machine for registering the wind's force.

2 **ADAMS, F. B., & SONS**, 21 *St. John's Square, Clerkenwell*—Manufacturers.

No. 1. Gold open-face, double-back, cased watch; enamel dial, first class, full plate movement, lever escapement, capped, eight holes jewelled, and compensated balance, &c. This description of watch is used in the northern states of America.

No. 2. Similar watch, with gold dial. This is made at one-third the cost of Nos. 1, 3, or 8.

No. 3. Gold watch; enamel dial, first class, three-quarter plate movement, duplex escapement, 10 holes jewelled, compensated balance, &c.

No. 4. Watch like the preceding; three-quarter plate movement, lever escapement, five holes jewelled, and gold balance.

Nos. 5, 6, 7, 8. Gold watches; first class, three-quarter plate movement, lever escapement, full jewelled, compensated balance, &c.

Nos. 9, 10. Gold watches; gold dial, full plate movement, lever escapement, jewelled, plain balance (for ladies).

Nos. 11, 12. Gold watches; first class, three-quarter plate movements, lever escapement, eight holes jewelled, compensated balance, cases enamelled and ornamented with diamonds.

No. 13. Gold watch; enamel dial, showing seconds from the centre, without additional train.

No. 14. Gold, engraved, double-back, hunter-cased watch; first class, three-quarter plate movement, duplex escapement, 12 holes jewelled, compensated balance. This description of watch is used in the East Indies, Persia, Spain, and South America.

No. 15. Silver, open face, double-back, cased watch; lever escapement, capped, and four holes jewelled.

No. 16. Silver hunter engine-turned watch, vertical escapement.

No. 17. Silver pair of case watch; vertical escapement.

Nos. 15, 16, and 17, are used by artizans and labourers.

No. 18. A three-quarter plate finished movement lever escapement; eight holes jewelled, gold balance. This description of movement is adopted for the purpose of obtaining a thin watch.

No. 19. A full plate finished movement, lever escapement, eight holes jewelled, compensation balance, &c.

No. 20. A finished movement, vertical escapement.

The same workmen, in their various branches, were employed upon No. 1, the largest, and No. 11, the smallest of these watches.

3 **OLORENSHAW, JOSEPH, & Co.**, 8 *Charles Street, Northampton Sq. and Oxford Terrace, Coventry*—Manufacturers.

Two-day marine chronometer.

Specimens of gold and silver watches and watch movements in three-quarter and full plates, with duplex, patent diamonds, and detached lever escapements. Var

4 **ORDNANCE SURVEY DEPARTMENT.**—Lieut.-Col. **HALL**—Producer.

Base-measuring Apparatus.—Two compensation bars, and one connecting compensation microscope.

These compensation bars and microscope form part of a base-measuring apparatus, invented by Major-General Colby, Royal Engineers, formerly Superintendent of the Ordnance Survey.

Description of Compensation Bar.—1. The compensation bar consists of two bars of brass and iron, 10 feet 1·5 inch long, 0·5 inch broad, and 1·5 inch deep, placed 1·125 inch apart, supported on brass rollers, at one-fourth and three-fourths of their length, and firmly fixed together at their centres by transverse steel cylinders 1·5 inch in diameter, and being free to expand from or contract towards their centres independently of each other. At the extremity of, and at right angles to, each of these bars is a flat steel tongue, 6·2 inches long, 1·1 inch broad, and 0·25 inch thick; projecting 3·25 inches on the side of the iron bar, and moving freely on conical brass pivots, rivetted into the brass and iron bars, each axis being perpendicular to the surface of the tongue, allowing it to be inclined at slightly different angles to these bars, according to their expansion from, or contraction to, their centres. The centres of the two axes are at 0·5 inch and 2·3 inches from the end of the tongue next the brass bar. On the tongue, and flush with its upper surface, near the extremity, is inserted a silver pin, with a dot marked on it, as the compensation point.

The bars are placed in wooden boxes (made of well-seasoned straight-grained deal), to the bottoms of which are fixed the plates that hold the brass rollers on which they are supported, and having in the middle a vertical brass stay, screwed to the box, and passing upwards between two steel cylinders, to prevent the bars being moved longitudinally in their casing. To protect the tongue carrying the compensated point (which projects beyond the wooden box) from injury, nozzles are fixed to the boxes, having a small circular orifice with a lid on the upper side to allow the dot, or compensation point, to be seen.

On one side of the connecting steel cylinders, and attached to the brass bar only, is placed the longitudinal level, the lid of the box being furnished with a glass window and shutter, to enable it to be observed. Over the rollers which support the bars are two pieces of metal, for preventing any sudden jar from striking the bars against the lid of the box. At each end, on the outside of the bar-box a thick metal plate is screwed, for the purpose of firmly fixing a three-armed groove-stand, intended to support the tripod of the compensation microscope; and at each end of the box are two vane sights (which shut down with hinges into grooves), used for placing the bars approximately in line.

On both sides, at one-fourth and three-fourths of the length, are brass plates, with holes for receiving the screw which clamps the plate of the tripod-stand (technically called a *camel*) to the box, for the purpose of adjusting the bar in a longitudinal direction. The compensation bars are six in number; the weight of each bar, with its two brass ends, is 136 lbs.

Description of Compensation Microscope.—2. The compensation microscope consists of three microscopes, placed three inches from centre to centre, connected by two bars of brass and iron, 7 inches long, 0·6 inch broad, and 0·375 inch thick, 2·5 inches apart, firmly secured together by means of a brass collar and cylinder, forming part of the tube of the centre or telescopic microscope.

The two bars, carrying with them the outer microscopes, of two inches focal distance, being free to expand from, and contract towards, the central microscope, independently of each other; and thereby forming with it small angles of inclination similar to the steel tongues of the compensation bars. The compensated point of each is so adjusted as to be in the outer focus of its object glass. The microscopes revolve on the axis of the telescopic microscope in a tube fastened to a horizontal plate attached to a tripod-stand with levelling screws, and furnished with longitudinal and lateral adjusting screws. On one side, secured to the brass bar, is the spirit-level, for levelling the microscopes, and on the other, firmly fixed to the centres of the bars by a brass plate, is a telescope, embraced by a brass collar, with a small cylinder projecting from one side, which turns in a socket attached to the plate; thus affording it a vertical motion, allowing objects to be seen in opposite directions. The telescopic microscope is provided with an adjusting screw, for altering the focal distance within certain limits, as well as moveable object glasses of different focal lengths fitting into the lower end of the tube. The compensation microscopes are seven in number, the weight of each being 7 lbs.

[All the methods adopted in the measurement of base lines in trigonometrical surveys which had been in use previous to the survey of Ireland, depended more or less for their accuracy on the knowledge of the temperature of the bars, &c., used in measuring; but as the time which substances occupy in heating or cooling is dependent upon their nature, mass, &c., it did not appear that any application of thermometers would give the true temperature of a bar throughout its whole length, particularly when the temperature of the air itself was undergoing constant change.

This circumstance led to the application of the principle of compensation used in gridiron pendulums, to devising an apparatus for measuring a base line. As metals have different capacities for heat, and their surfaces have different powers of radiation, experiments were made to equalize the effects of varying temperature in the brass and iron bars; and for this purpose the brass bars were bronzed and varnished; and the iron bars were browned, lacquered, and smoked, and the amount of lamp-black so produced was gradually removed, on successive experiments, till the desired effect was obtained. —J. G.]

---

5 **AIREY, THOMAS,** 67 *Dale Street, Liverpool.*

Two gold centre seconds with compound independent seconds, and only one train of wheels.

6 **VEITCH, JAMES,** 6 *Ovington Square, Brompton*—Inventor.

An invention denominated the medico-chirurgical ambulance, for surgical use on the field of battle, with an operating table attached thereto. The solid structure is 3 feet 4 inches in length, 2 feet in breadth, to which there is affixed an inclined plane to raise the shoulders when required. The flap is 2 feet 6 inches in length, and of the same breadth as the solid structure, and is supported when necessary by a moveable beam that can be promptly projected from under the table, which is 2 feet 11 inches in height. Under the body of the table and in the centre there is a square box of 16 inches in all directions, with 4 exterior and lateral divisions of 2 inches in breadth each, 16 inches in length, and 8 in depth, for receiving the cases of amputating, trepanning, miscellaneous, and cupping instruments, and they are exteriorly so marked. When amputation of the thigh, or any other extremity is required, the necessary instruments are laid out on the inside of the cover of the box just adverted to, beginning with the letter nearest to the limb to be removed, the first instrument wanted to be placed opposite A, and the second opposite B, and so on, according to the order in which they are required during the operation. If a shoulder is to be removed, the same arrangements are to be adopted as in the amputation of a thigh, with the difference of placing the instruments at the head instead of the lower extremity of the table. The divisions in the centre are intended to receive bandages of 6, of 5, of 4, and 3 yards in length, and 3 inches in breadth, and they are capable of giving accommodation to 200 of the description noticed. The drawers in front marked ligatures are intended to keep these essential agents of surgery in constant readiness. The drawers marked slips of adhesive plaster indicate the propriety of their being at all times in readiness for operations and wounds. The compartment marked fractures is for keeping the splints and bandages necessary for the treatment of such accidents. The department marked dislocations indicates that all instruments required for the reduction of such dislocations are there to be found.

HUTTON, JOHN, 9 *Lucas Place, Commercial Road East*—Inventor and Manufacturer.

Lady's gold watch, with patent single compensation stud. Gold watch, and silver lever and silver hunting-watches, with the same improvement.

Clock, with patent compensation pendulum and barometric contrivance, to prevent the variation of rate arising from the changes in the density of the atmosphere.

Marine chronometer, with patent pneumatic auxiliary compensation, for obviating errors in extremes of temperatures; this is effected by means of a metallic thermometer, which varies the air space in which the balance oscillates.

Gold first class watch (called Hutton's patent lever chronometer).

Patent lever escapement, showing the parts separately.

Silver pocket chronometer, with improved adjustments.

Gold first class watch, with patent escapement and spiral spring.

Gold watch, with patent double compensation spring, stud and patent escapement; adapted for riding, &c.

CRAGG, JOHN, 8 *Northampton Square, Clerkenwell*—Manufacturer.

Varieties of gold and silver watches, and a model of lever movement.

YATES, THOMAS, *Preston*—Inventor, Patentee, and Manufacturer.

Patent clock, on the detached dead-beat principle. The wheel-work is so arranged that each vibration of the balance measures half a second, while in the ordinary detached lever each vibration measures a quarter of a second. The teeth of the escape-wheel are not so much undercut as in the ordinary lever. The pallets from the point of rest are drawn a complete circle to the escape-wheel teeth; so that when the balance returns and unlocks the escapement, there is no recoil. This escapement will carry a heavier balance with less motive power, and consequently will require a stronger balance-spring.

Gold watch, beating dead half-seconds.

10 **LOWRY, S.**, 3 *Lower Charles Street, Northampton Square, Clerkenwell*—Inventor and Manufacturer.

Lever watch, to show dead seconds on the one train only, with the usual number of vibrations or beats. Invented and registered by the exhibitor.

Gold chronometer, with compensation balance, isochronal spiral, spring rated, and adjusted with other modern improvements.

Model of the chronometer, or detached escapement, on an enlarged scale.

Small watch, with compensation balance, hard pendulum spring, &c. Plain lever watch.

Movements of different watches in their rough and finished state.

Marine chronometers, &c., to show dead and complete seconds on the ordinary train.

11 **CONNELL, WILLIAM**, 83 *Cheapside*—Manufacturer.

Pair of two-day marine chronometers, Earnshaw's detached escapements; compound balance adjusted for high temperatures.

12 **LOSEBY, E. T.**, 44 *Gerrard Street, Islington*—Inventor.

Mercurial compensation balance, exhibiting four modifications.

A regulator, illustrating a new principle in clocks, and showing an improved form of mercurial pendulum.

An arc compensation.

13 **HOLL, FREDERICK RICHARD**, 8 *Weymouth Terrace, City Road*—Inventor, Patentee, and Manufacturer.

Gold index pocket-chronometer, with short angle-locking spring to the escapement, set-hands at the pendant.

Gold centre seconds eight-day pocket chronometer, independent seconds, train, and stop work, with left-sided, short, angle-locking spring to the escapement.

Silver thirty-hour pocket chronometer, with right-sided short angle-locking spring, &c.

Gold compensated duplex index watch, gold dial, set-hands at the pendant.

Gold compensated lever index watch.

Gold lever index watch (lady's), gold dial.

Silver lever index watch, set-hands on the dial, with a key, locking spring.

The object of the short angle-locking spring is to make the angle of the escapement so short that the balance, being more detached, the chronometer cannot stop in the pocket from the balance receiving a motion.

The index watches are a new invention, intended to answer the double purpose of supplying a lever to bend the main-spring, and also to indicate the number of hours the watch will go before the power is exhausted.

Gold centre seconds eight-day pocket chronometer, independent seconds train and stop work.

Silver thirty-hour pocket chronometer.

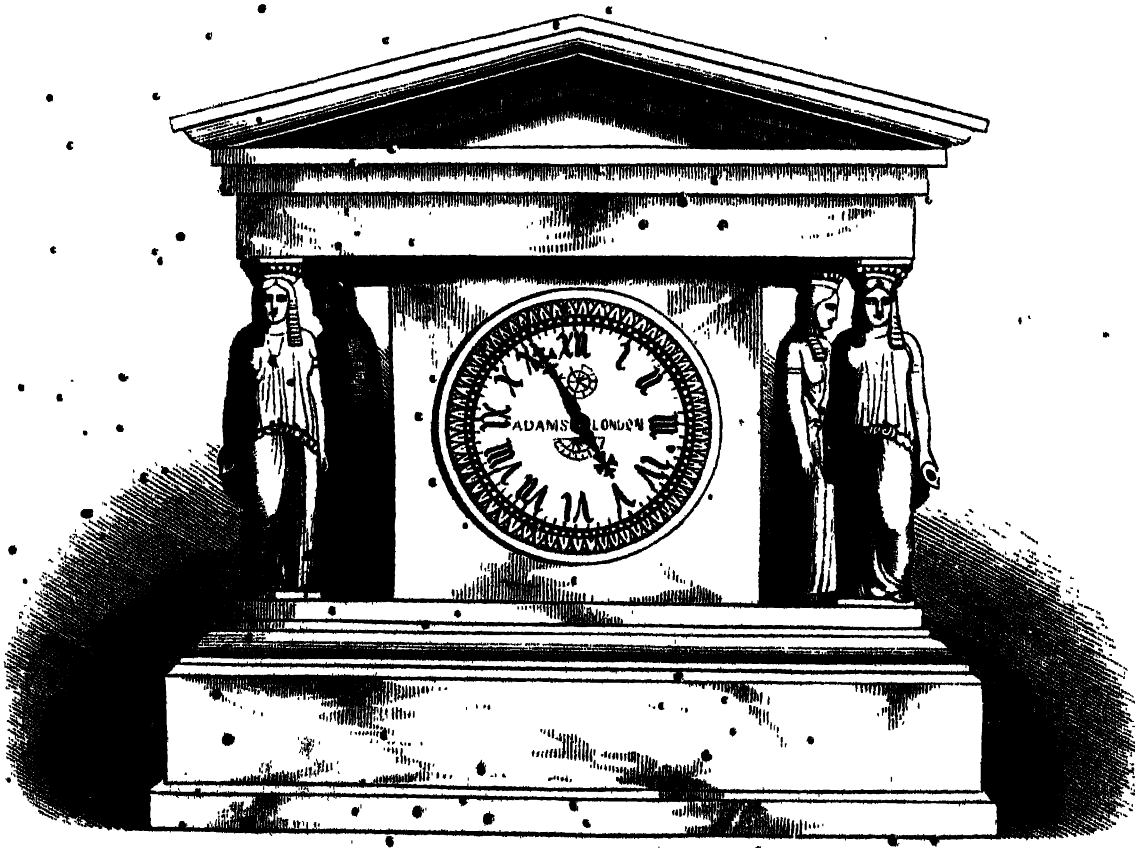
Gold compensated duplex index watches.

Gold and silver lever index watches.

Index watches, upon a new principle, kept going from day to day by simply pushing the index.

14 **ADAMS, THOMAS**, 36 *Lombard Street*—Manufacturer.

Black marble timepiece, of chronometrical movement, blending the Grecian and Egyptian styles.



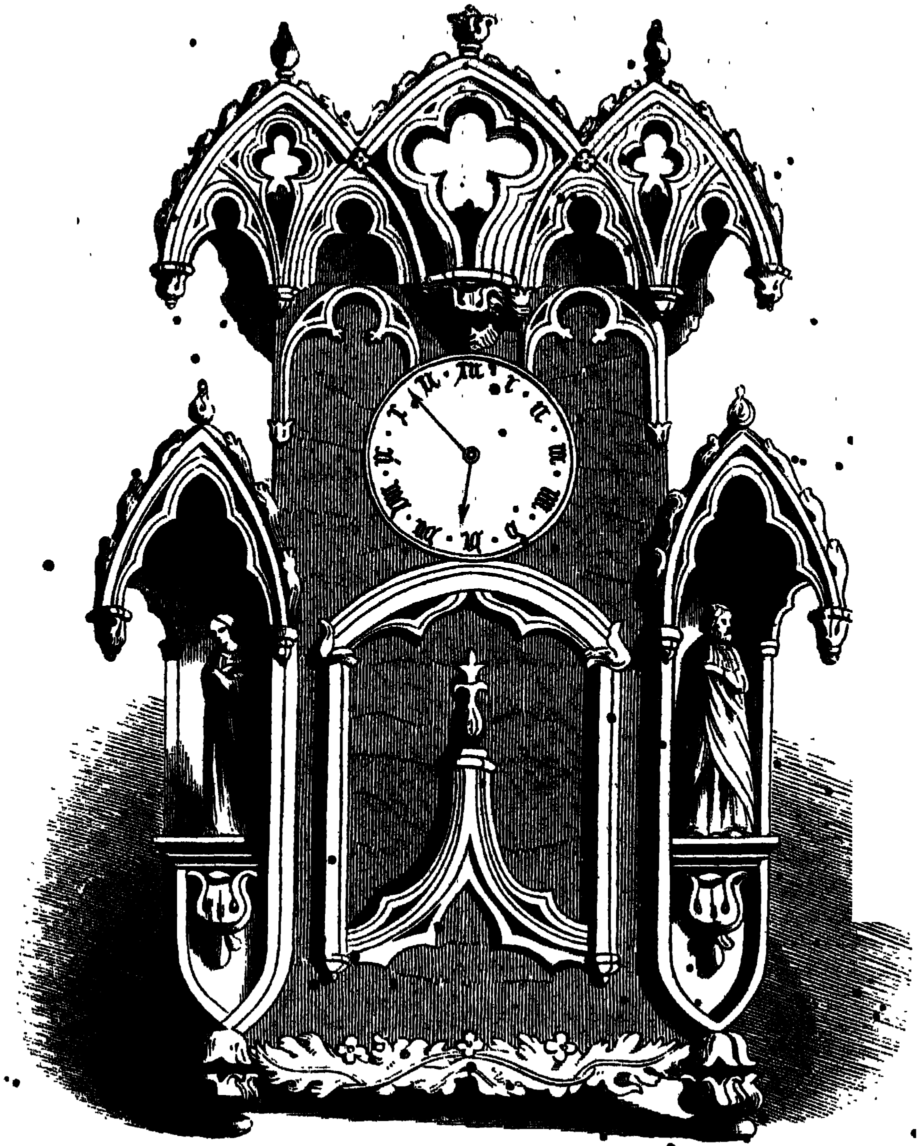
Black Marble Timepiece, by Adams.

Imitation oak timepiece represented in the following engraving.

Timepiece, with self-acting model of the Royal Observatory, with staff and ball, to rise and drop at one o'clock, as at Greenwich. Marine chronometer.

16 **HOWELL, JAMES, & CO.**, 9 *Regent Street*—Manufacturers.

Large or-molu clock, representing Jupiter, the twelve Hours of the Sun, Apollo, and Diana, and Spring and Autumn strewing flowers and fruit on the earth.



Imitation Oak Timepiece, by Adams.

Or-molu clock, representing the four Ages by female figures, and the Seasons by boys, in basso-relievo, and intermingled with foliage, illustrative of the Seasons.

Both designed and modelled by G. G. Adams, Esq.

---

17 **Webster, Richard**, jun., 74 *Cornhill*—Inventor and Manufacturer.

Newly-invented train remontoir clock, the novelty of which is the combination of magnetism with clockwork so as to obviate friction.

Black marble Egyptian clock.

18 **Ventura, Angelo Benedetto**, 17 *Charles Street, Cavendish Square*—Inventor and Manufacturer.

Harp Ventura, played like the guitar, combining the tone of that instrument and the harp. Lyra Ventura. New British Ventura. The Venturina. Ventura; new English Cetra.

---

10 **Delolme, Henry**, 48 *Rathbone Place, Oxford Street*—Designer and Manufacturer.

Seven gold watches, and two marine chronometers, with isochronous pendulum springs. The adjoining cut represents one of the chronometers.

Delolme's Chronometer.

Specimen of the movements of the preceding, as mad in Lancashire to the exhibitor's calibre.

Two specimens of watch movements, to the exhibitor' calibre.

Stethometer, to measure the comparative mobility o the chest in cases of disease of the lungs.

[The effect of most diseases of the lungs is to diminish the extent of the motion of the walls of the chest. It becomes consequently often of considerable importance to ascertain the amount of variation from health in this respect, since this points out, with approximative accuracy, the extent of the disease. The diminished mobility of one side as compared with its opposite thus affords important results. The instrument which reveals the fact is of very simple principles, and was originally invented by Dr. Sibson, F.R.S. It consists essentially of dial plate with a moveable index, which is acted upon by the pressure of the walls of the chest against a projecting stud. The extent of the circle described by the index points out the amount of motion possessed by the walls of the chest in the side to which it is applied. In the present instance a tape is placed upon the chest at one end, and is in connexion with the index of the instrument at the other. Both ends being fixed by gentl pressure, the degree of expansion of the chest is easily read off by the extent of the motion of the index on th dial-plate.—R. E.]

20 **NEWINGTON, S.**, *Hastings*—Inventor.

Patent clock, or regulator. A common clock with spring and balance-wheel; having the hands and dial-plate removed, and a dial substituted, which revolves in the same way as an hour-hand. This clock is placed in a flat round box, and is arranged to show whether a person has been at a particular spot at any required time.

21 **GIBBS, H.**, 2 *Nelson Street, City Road*—Maker.

Watch, showing double time, with improved stop-work.

22 **PHILCOX, GEORGE**, 89, *Great Norfolk Street, Borough*—
Inventor and Patentee.

Patent marine time-keeper. This time-keeper is intended to give correct time in taking observations, where a chronometer is not at hand, or as a companion to a chronometer. It is adapted for use in locomotive railway engines, to show the engineer the rate of his speed, being the only species of escapement not affected by the motion or tremor of a railway carriage. The construction of the calibre for the train is a going barrel. The advantage is getting the motive power close to the centre, and by an extra wheel in the train taking the escapement further from the centre, the defects or irregularities of the main spring have less effect on the time, consequently the action, or the arcs of vibration, are more regular, and the time more correct. This train is well adapted for chronometers and watches. The timepiece should be wound up every day, though constructed to go two days. The escapement beats dead half seconds.

Model of the patent "diamond escapement," as intended for the use of marine chronometers. It is much less expensive than the detent escapement now in use; it is not affected, as that is, by the sudden motion and tremor of the vessel, and is not so liable to stop in cold climates. The locking is intended to be jewelled. This compensating balance differs from others, having the arms resting on the brass plate.

A model of a new compensating pendulum. This pendulum is adapted for astronomical and other purposes requiring correct time, showing how to correct the error caused by the expansion and contraction of the pendulum rod. The two brass arms, fixed at each end of a bar of hammered steel, will, as they become heated, expand, and increase the arc of the circle, thus taking up the elongation of the steel rods. The brass expanding about two-thirds more than the steel, will show the proportions required; and should the expansion of the arms be found more than required for the steel rod, an adjustment of the two screws will correct the error, and, once adjusted, will always correct itself. This compensating pendulum is more simple and correct than mercurial and other pendulums.

Patent "double spring." This new principle possesses many important advantages: it eradicates an error now existing in the chronometer spring in present use. With the patent spring the balance of the chronometer will at all temperatures remain in the same position unaffected by heat, and at the extremes of temperature make one uniform rate (the patentee in this instance uses the compensating balance), thus removing the great effect produced on the old principle.

23 **CHEVALIER, BENJAMIN**, 41 *Brunswick Street, Stamford Street*—Manufacturer.

Chronometer cases.

25 **BROOKES, JOSEPH**, 5 *Berkley Court, Clerkenwell*
—Manufacturer.

A chronometer main-spring for a two-day marine chronometer.

---

26 **FUNNELL, EDW.**, 2 *Clarence Place, Brighton*—
Producer.

Small lever watch, the size of a silver three-halfpenny piece of the present reign.

27 **GOWLAND, JAMES**, 52 *London Wall*—Inventor and
Manufacturer.

Improved free pendulum regulator, for the isochronal division of time.

Patent tourbillon remontoir chronometer, in which the impulse is imparted to the balance through the balance spring, its stud being advanced one degree or tooth of the locking-plate at each oscillation.

Large model of the escapement.

Model of Earnshaw's escapement.

Skeleton clock with improved compensation pendulum.

Model of an improved anemometer and wind-dial and vane; and of an electric clock.

Various specimens of watches, including gold keyless hunting lever watch, winding and setting the hands through the pendant, and also unlocking the cover of the case by the same means. A gold keyless repeater, indicating the hours, quarters, and minutes, &c.

28 **TANNER, WILLIAM**, 83 *Upper Street, Islington*—
Inventor.

The polyhorion (or many-hour clock) exhibits, in addition to the local time, the time at Dublin, Paris, and Edinburgh; it can be made to show the time at any other four places. This clock is simple and not liable to get out of order, as one movement and pendulum regulate the different times. This clock is represented in the following cut.

Lever watch, set to Liverpool and Greenwich time; but it can be set to the times of any two places more convenient.

---

30 **DAVIS, WILLIAM**, 37 *Gracechurch Street*—
Manufacturer.

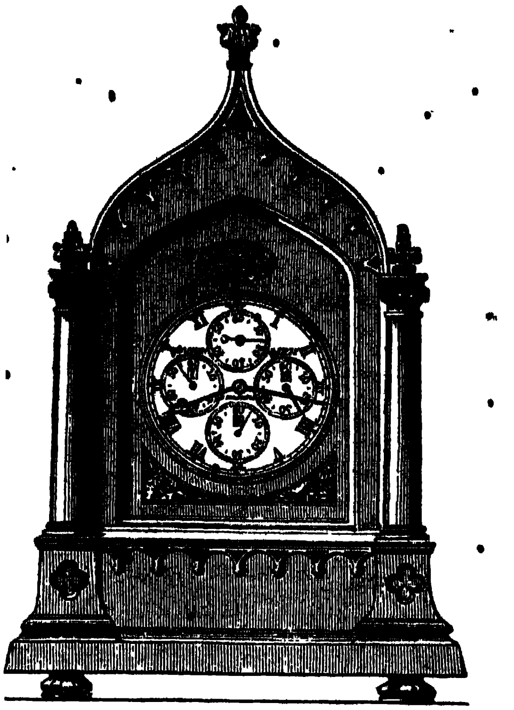
Watch, horizontal escapement, made entirely by hand.

Watch movement, duplex-escapement, made entirely by hand. Made by H. A. Davis, 57 New Street, Birmingham.

---

1 **COLE, THOMAS**, 2 *Upper Vernon St., Lloyd Square, Clerkenwell*—Inventor, Designer, and Maker.

Inkstand, containing requisites for writing; and showing the time, the day of month, and the day of week, with thermometer. In metal, engraved and gilt, inlaid with malachite.



Tanner's Polyhorion.

Design for a portable eight-day timepiece, showing the months and days of the week and the month.

Design for a flat, portable clock, with calendar; metal, engraved and gilt, inlaid with malachite.

Eight-day night and day timepiece, or horological lantern.

Small eight-day clock. Improved calendar, in metal frame.

Flat eight-day striking clock, to repeat the hours and quarters, in engraved and gilt case.

[The substance here called "malachite" is also known as *mountain green*. It is a beautiful mineral of a fine green colour, variegated in a pleasing manner. It consists chemically of carbonate of copper, and is found native in Cornwall and Cumberland.—R. E.]

32 **Jackson, W. H. & S.**, *Red Lion Street, Clerkenwell*—Inventors and Manufacturers.

Registered soliclave lever watch: exhibited for cheapness and various improvements. Specimens in gold of various styles; specimens in cases enamelled, set in gems, and painted with designs; the enamelling the work of this district.

A gold three-quarter plate lever watch, with enamelled dial, jewelled in six holes, of the same construction.

Gold lever watch, with compound balance crystal dome, showing the motion of the escapement.

Duplex time piece with whole or dead seconds from centre; a new calibre.

Lever watch, with whole or dead seconds.

Gold pocket chronometer.

Two-day marine chronometer, and a compensation balance, with adjustment for extremes of temperature.

Parts of watches, showing their construction.

33 **Moore, John, & Sons**, 38 *Clerkenwell Close*—

Chiming skeleton clock to go a month. Chiming clock in rosewood case. Skeleton clock.

34 **Barraud & Lund**, 41 *Cornhill*—Inventors and Manufacturers.

Marine chronometer, with a model of a newly-invented compensation balance, constructed for exact adjustment to all temperatures.

Marine chronometer, of ordinary construction.

Very small gold pocket chronometer, a specimen of minute English manufacture.

35 **Parkinson & Frodsham**, 4 *Change Alley, Cornhill*—Manufacturers.

Astronomical clock, with mercurial pendulum, in mahogany case.

Eight-day chronometer, with ordinary compensation.

Lever watches with compensation.

Gold chronometers for pocket.

Gold watch-cases and carriage clocks.

36 **Fairer, Joseph**, 17 *Bishopsgate Street Without*—Inventor and Manufacturer.

Improved railway guards' timekeeper.

Improved railway station clock, showing the day of the month.

Pocket watch for engineering purposes.

Improved electric clock, to show uniform time, irrespective of distance, from one prime mover.

37 **Robinson, P.**, *Bishop Auckland*—Designer and Manufacturer.

Skeleton spring clock, which strikes the hours and quarters on modulated bells; with a compensator for counteracting temperature. The clock and framework are a representation of the clock-tower and entrance to the palace of the Bishop of Durham, at Bishop-Auckland.

39 **Elisha, Caleb**, 13 *New Bond Street*—Inventor and Manufacturer.

An eight-day time-piece (regulator), to go by a weight, in a mahogany case, with a compensating pendulum. This pendulum has a brass ball, seven inches diameter, and three-quarters of an inch thick, on the face of which is screwed a brass rim, a quarter of an inch thick and one inch broad; on the inside of this is a steel rim, secured to the brass, one-eighth of an inch thick. The outer diameter of this rim, composed of brass and steel, is also seven inches. This rim is divided or separated at the bottom of the ball, leaving two arms of equal length; at the end of each is screwed a brass cup, to admit glasses of a conical shape containing mercury, about 4½ inches high, the lower diameter being about 1⅜ inch, and the upper about the half. The adjustments for variations in temperature are made by the compensation rim with mercury in the glasses. The escapement of the clock is of George Graham's construction, dead-beat, but the pallets are jewelled. The vibration is made as short as possible.

A silver lever watch, with compensation radii, composed of brass and steel united. The proportions are about 1 of steel and 2 of brass. The bar is screwed on to the upper plate at one end, and at the other end a hole is drilled, to admit the pendulum or regulating spring, where it is pinned in.

A silver lever watch, with compensation radii, composed of brass and steel, fixed on the index on the cock, the two shifting together, and acting up and down the spring as the regulator is shifted. In the outer end of this radii compensation, are drilled two holes for the pins, between which the pendulum spring plays.

Model of a mahogany door, with machinery. In the posts of the inside of the door are fixed two staples. An iron chain, case-hardened, rather longer than two widths of the door, is drawn through the staples, and when on the outside, the chain is pulled, so as just to admit the hand to secure a padlock into the links of the double chain. The chain is then drawn, with the padlock, out of sight. The lock catch must also be case-hardened.

40 **Brockbank & Atkins**, 6 *Cowper's Court, Cornhill*—Inventors.

A fifty-six hours' marine chronometer, on spring gimbals, enclosed in improved box with glazed sides and front, for the better admission of light.

The same inverted, showing the interior mechanism.

41 **WALTER, FRANCIS**, 9 *Devonshire Place*—Inventor. Agent—Mr. HAWLEY, 123 *Regent Street.*

Model of a new design for giving a moral and religious application to the dial indications of a clock. The subject has been the study of five years.

---

42 **LAMB, J.**, *Bicester, Oxfordshire*—Manufacturer.

Skeleton clock: to go 400 days.

---

43 **THORNELOE, C.**, *Lichfield*—Designer and Manufacturer.

Clock, which strikes quarters, and goes 32 days. Design, Lichfield cathedral.

Gothic skeleton clock.

46 **GRANT, P.**, 29 *Lower William Street, St. John's Wood*—Designer.

Timepiece-stand, composed of ivory, tulip-wood, and ebony.

46A **COPLAND, C., M.A.**, *South Villa, Kennington Oval*—Proprietor.

A watch once the property of King Henry VIII.

Silver watch, of same character and date, finely engraved.

Gilt watch, 150 years old, chased, Henri Quatre style.

---

47 **HARVEY, W.**, *Stirling, Scotland*—Inventor and Manufacturer.

Improvement in horology, dispensing with striking work. Only one wheel is used, which is placed under the hour-wheel, and receives motion from it. This improvement can be applied to almost any other timepieces, especially to skeleton timepieces. The article exhibited is the original invention.

---

49 **BENNETT, GEORGE WEEDON**, *Blackheath, Kent*—Manufacturer.

A public clock, showing time on four dials, and intended to be fixed in an ornamental case at the intersections of streets, or the approaches to bridges, entrances to parks, village greens, the quadrangles of baronial halls, in colleges or other public places, in order to supply correct time, independently of church clocks (which are, from their lofty and exposed position, almost always wrong), and to serve as useful ornaments in the streets. It has a two-seconds' pendulum, pin-wheel escapement, lantern pinions, gun-metal wheels, and slate dials; and the whole is constructed with every regard to accuracy of performance. Two designs for cases accompany it; but these would necessarily be adapted to the locality and taste of the purchaser.

---

52 **DONEGAN, JOHN**, *Upper Ormond Quay, Dublin*—Manufacturer.

Gold and silver watches, of Dublin manufacture.

Specimens of Irish gold and silver, from Ballycorus works.

52A **AUBERT & KLAFTENBERGER**, 157 *Regent Street*—Manufacturers.

Regulator remontoir, and of continual power. The movement consists of two barrels, centre, third, fourth, and escapement wheels: the axis of the fourth wheel traverses the upper plate, and receives a wheel which is fixed on the axis of the pinion above, the object of which is to wind up the weight of the maintaining power; this movement maintains the oscillation of the half-second pendulum.

The escapement wheel, and the second wheel exposed in the dial, form part of the independent train, which has to maintain the oscillation of the mercurial pendulum.

The principal and medial trains are brought into communication by means of the third wheel, seen in the dial: this wheel is fixed in the centre of a rack mounted on an axle, which is pivoted between the frame; a wheel here forms a depth into the rack, and upon the axle on which this wheel is placed, is fixed a double pulley, on one side of which is suspended a small weight, and on the other the half-second pendulum. The weight and pendulum draw contrary ways, and as the weight is heavier, it gives the power to the independent train.

The third wheel of the principal train, which forms the depth with the medial wheel seen in the dial, will displace it from right to left; by which means, if the two wheels, having the same number of teeth, turn equally quick, the intermedial wheel will be set in motion; but its axle will not change in position, and consequently the rack, and also the wheel in which the rack works, will be immoveable, and the hand fixed to the axle of the pulley will point to zero.

The independent train receiving thus a *force constante*, and maintaining the oscillation of the mercurial pendulum, will not be susceptible of variation. Any difference of quickness in the action of the second wheel upon the medial wheel in the dial, can only be occasioned by the principal train, through the action of the half-second pendulum, which, if not perfectly regulated, will occasion an advance or *retarde*.

If the half-second pendulum should advance, the principal train will raise the weight of the *force constante*, and the half-second pendulum, acting in a contrary sense, will cause it again to fall, and consequently the pendulum will then *retarde*. If, on the contrary, the half-second pendulum loses, the principal train will not raise the weight of the *force constante* sufficiently quick, and the pendulum will then drop; but the regulator acting in a contrary manner will again shorten it, which will then cause it to advance.

Two-day marine chronometer.

Repeating watch, in gold case, striking the hours, quarters, and half-quarters; with lever escapement and compensation balance, showing, on the dial plate, the age of the moon, the day of the month, the hours, minutes, and seconds.

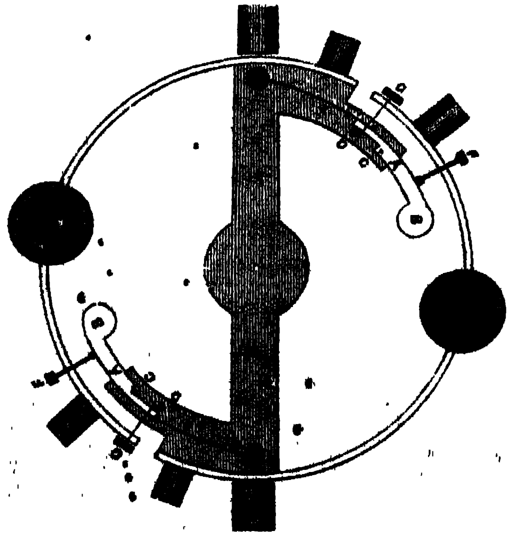
Pocket chronometer, in gold case, with enamel dial.

Duplex and lever watches in gold cases.

53 **PENNINGTON, JOHN**, *High Street, Camberwell*—Inventor and Manufacturer.

Marine chronometer, with improved compensating balance weight, to remedy the defect produced in ordinary chronometers by extremes of temperature.

A A represents levers with weights attached, B B, acting on pivots, C C, held against bankings, D D, in middle temperature when not in action, by springs, E E, moved towards centre of balance in extreme heat by point of screws, F F, and the same by shoulder of screws, G G, in extreme cold.



Pennington's Compensated Balance.

54 **TAFFINDER, —,** *Rotherham*—Manufacturer and Designer.

An eight-day skeleton clock with lever escapement. Design taken from Rotherham cathedral.

---

55 **DENT, EDWARD JOHN,** 61 *Strand*, 33 *Cockspur Street, and* 34 *Royal Exchange*—Inventor and Manufacturer.

1. Gold "tac" watch. The term "tac" implies that the time is ascertained by turning round the large external gold hand until it is stopped. The time is then known by determining the place of the hand with reference to the twelve projecting nibs on the edge of the case by the touch. The interval of time can be thus determined to about a minute. This description of watch supersedes the usual striking repeater, is less liable to derangement, and is less expensive. It is wound up and the hands set without the usual detached key.

2. Similar watch, with hunting-case, and small opening in the centre to know the time without opening the cover.

3. Hunting cased watch, with case-springs outside, and to wind up and set the hands without a detached key. For use in India, and may be considered air-tight, by which arrangement frequent cleaning is avoided.

4. Gold open-faced watch, with compensation-balance, &c. A specimen of the best description of English watch.

5. Gold watch, with compensation-balance, &c., and two seconds' hands in the centre. The under one (as shown stationary at the 45 seconds or minutes) drops instantly on pressing a nib at the end of the pendant of the watch. This auxiliary hand remains still as long as required. Intended for delicate experiments where small intervals of time are required to be noted.

6. Chased watch, with compensation-balance, &c., having a drop seconds' hand. It is wound up, and the hands are set, without the usual detached key; made for the son of the Viceroy of Egypt.

7. Engraved watch, with compensation-balance, &c.; a specimen of watches intended for the Spanish market.

8, 9. Watches, with compensation-balances, as specimens for the Turkish market.

10. Watch, with compensation-balance, &c., as a specimen for the Persian market.

11. Watch, with compensation-balance, English style.

12, 13. Ladies' watches, with compensation-balances, &c.

14, 15. Ladies' gold watches of the usual construction.

16, 17. Gentlemen's gold watches, with compensation-balances, &c.

18, 19, 20. Gentlemen's watches of the usual construction, without compensation-balances.

21. Marine chronometer, with a glass balance-spring, glass balance, and compensated, for temperature, by means of platinum and silver. This glass balance-spring has been tried at the Royal Observatory, and on board H.M. surveying ship, "Fairy" (for official rates, *see* "Nautical Magazine," xxix).

22. Patent marine chronometer, having the steel balance-spring, gilded by the electro-metallurgic process.

23. Patent marine chronometer, having a secondary compensation, by which the compensation weights are made to move so as to counteract the effect produced by the changes of temperature.

24. Marine chronometer of the ordinary construction.

25. A compass which can be inverted; the magnetic needles are placed on a vertical axis, and the divisions are engraved on both sides of the silver ring (or compass-card), so that one reading can be made before, and the other after, inversion. The mean between these two readings gives the error of the zero on the card; therefore the true magnetic bearing of any observed object can be determined.

[The ordinary way of fixing the card and needle of a compass is upon an inverted cup resting on a fine point. The application of the chronometer suspension to compasses, as above, is with the view of avoiding the great friction upon the fine point, caused by great vertical oscillations.—J. G.]

26. An azimuth and altitude compass. The principle is the same as in the former, with the addition of a telescope carrying cross wires, and a divided arc for altitudes; the rays from the observed object pass through the telescope, whilst those from the card, reflected by the prism, pass to the eye of the observer.

27. A steering compass, with the needles gimballed on a vertical axis, by means of which the effect of the violent motions of the ship on the compass-card, and the effect of variation of dip, are neutralized. The superiority of this over the ordinary compass, in which the point of suspension of the card is higher than the centre of gravity, is most evident in steamers where the speed is great, and where the motion occasioned by the sea, as well as that from the vibration of the engine, disturb the usual compass-card, which obeys the laws of a pendulous body; whilst the compass-card placed on a vertical axis is not disturbed from any such causes.

28. An eight-day quarter striking turret clock, with compensated pendulum, 8 feet long, and weighing above 2 cwt.; vibrating half seconds, with pin-wheel, and dead escapement, but with a small recoil. All the wheels in the clock are of cast-iron, except the 'scape-wheel, which is brass, of only 4 inches diameter, containing 40 pins, and turning in 2 minutes.

The 'scape-wheel is driven by a small spiral spring fixed to a pinion, which turns on a stud set in the same line as the 'scape-wheel arbor, and carrying one of the pivot-holes of that arbor. This spring is wound up a quarter of a turn by the clock, at every quarter of a turn of the 'scape-wheel.

The dial-work is all driven by the great wheel, without the intervention of any pinion, and it is consequently very strong, and capable of working four very large dials. The dials in the great avenue of the Exhibition are 7 feet in diameter. The hands are adjustable by means of hand-screws, and a small regulating-dial set on the clock; this dial is reversed, in order to provide for the case of the external dial being on a level with the clock, and the hands driven directly by the prolonged arbor of the regulating-dial. The hands are counterpoised outside the dials; because, when the counterpoises are within, the force of the wind on the hands is not counterpoised at all; and the weight of a large hand, when unbalanced, tends to loosen the hand on its arbor, and so make it point behind the true time from 6 to 12, and before it from 12 to 6.

The maintaining power for keeping the clock going while winding, is of a new construction. Before winding, the maintaining weight must be raised sufficiently high to keep the clock going about seven minutes, and when wound up, it can be thrown out of action immediately.

All the great wheels are set in the great frame, and the small triangular frames can be taken off without moving the great wheels and barrel, or the pendulums, which may also be suspended from the wall. The smaller wheels will also take out separately. The weights are hung by wire ropes, and they require a fall of about 40 feet, with a single pulley. The pulleys are 1 foot in diameter.

The hammers are raised by cams cast on the great wheels, of such a shape as to raise them with the least friction. They are strong enough for an hour-bell of several tons weight, and quarters to correspond, though the great wheels are only 18 inches in diameter. The hammers all stand ready to fall as soon as they are discharged by the going part. The 1st, 2nd, and 3rd quarters begin exactly at those quarters; the 4th begins half a minute before the hour, and the hour-hammer falls exactly at the hour.

The object aimed at in this clock, is to combine the greatest accuracy of time-keeping with great strength, and the cheapest mode of construction which is consistent with good work.

29. A patent dipleidoscope, to be used as a fixed meridian instrument. The optical arrangement consists in two silvered parallel reflecting glasses placed at an angle of about 60° behind the front glass. The image of the sun is reflected from the front glass, and the sun's rays

which pass through, impinge first on one plane, and are reflected to the other, they then pass out through the front glass. By this optical arrangement, two suns are visible to the eye of the observer moving in opposite directions, and when they coincide, it is the instant of apparent noon. The time can be ascertained by this instrument with considerable precision. The dipleidoscope allows of three observations of the sun: 1st, when the limbs touch; 2nd, when the images coincide; and 3rd, when the limbs separate.

[The dipleidoscope was invented, a few years since, by G. M. Bloxem, Esq., and, when accurately fixed, the time of apparent noon can be determined by it within one or two seconds. Two bright and sharp images of the sun are seen, which approach each other, and exactly coincide at apparent noon.—J. G.]

30. A dipleidoscope fitted up equatorially, which admits of observations being taken from 9 A.M. to 3 P.M., and is rendered portable by having a magnetic needle. When the instrument is set by the needle, the magnetic declination of the place requires to be allowed for.

31. A superior astronomical clock, with a remontoire dead-beat escapement, invented by G. B. Airy, Esq., Astronomer Royal (*see* paper in "Royal Astronomical Society's Monthly Notices," Nov. 11, 1842, by Mr. Airy.)

A large church clock. (*Main Avenue.*)

56 **DRURY, JAMES**, 16 *North Avenue, North Street, Pentonville*—Designer and Manufacturer.

Clock dial-case in brass, adapted for clocks in hot climates, at sea, and in bakers' shops, as they are not affected by steam and heat.

57 **FRODSHAM, CHARLES**, 84 *Strand*—Chronometer Maker.

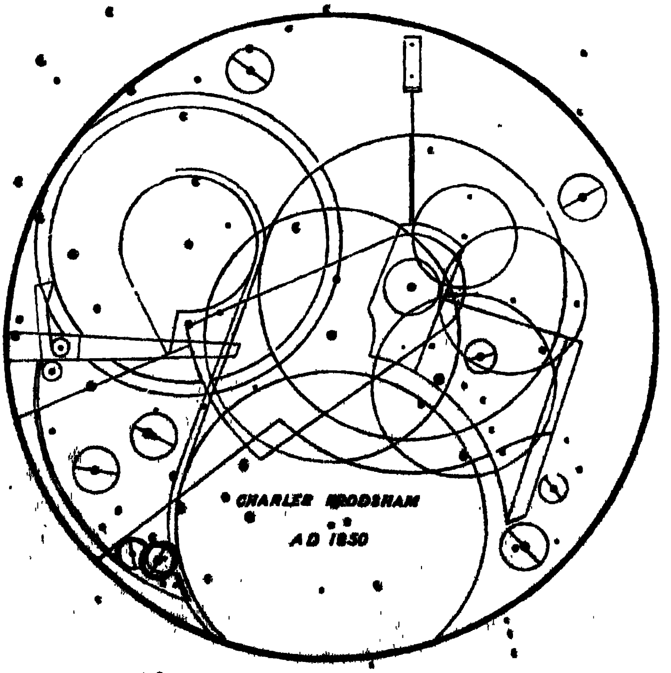
1. Astronomical clock, with mercurial pendulum, and Graham's dead-beat escapement.

[Mercurial pendulums, and Graham's dead-beat escapement, are now used in nearly all astronomical clocks. The number of such clocks now in London exceeds 200; about 80 of these, chiefly the property of eminent chronometer makers, are rated on Greenwich mean time, and it is found that their performance is such as to adapt them for astronomical uses. They certainly reflect great credit on the various artists engaged in the science of horology.

The mercurial pendulum is so called from the circumstance of the bob being of mercury enclosed in a cylinder, screwed to the bottom of a steel rod. Gridiron pendulums were in use before mercurial pendulums were adopted: they consisted of an assemblage of brass and steel rods so arranged that, owing to the difference in the expansion of brass and steel, the brass rods carried the bob up, while the steel ones let it down. The shape of pendulum bobs is important. Until lately they were of the form of a double convex lens, this form offering but little resistance on passing through the air, when its edge was always in the plane of motion; but, as it was liable to be a little twisted, a varying resistance was offered; and which is not the case in the adoption of the form of the cylinder, which probably is the best shape for the bob.

It is usual to call those clocks astronomical which are used in observatories for determining the right ascension of the heavenly bodies, and they are such, including every appendage which contributes to accuracy in the measurement of time under all the changes of atmospheric temperature.—J. G.]

2. Marine chronometers, on a new calibre, with Arnold and Earnshaw's detached escapement; the compensation balance is of the ordinary kind, with Arnold's bar as auxiliary compensation. This new calibre is based upon the plan of the diameter of barrel, fuzee-wheel, and extreme diameter of the balance being the same, namely, one inch and five-tenths. The total weight of the compensation balance is 5 dwts., being as the contents of the barrel. Thus if a barrel, one inch in diameter, by three-tenths of an inch in depth, will carry a balance weighing 20 grains, a barrel of the same diameter, and of double the depth, will carry a balance weighing 40 grains. The balance-spring is 15 inches long; the diameter $\frac{18}{100}$, the thickness of wire $\frac{12}{1000}$ by $\frac{18}{1000}$ broad, and the number of turns 10 to 12. The wheels (escape-wheel included) are each five times the diameter of their respective pinions—that is, the pinion upon which the



Frodsham's new Calibre for Watches.

wheel revolves. The fuzee-wheel has 90 teeth, centre wheel 90, centre pinion 14, third wheel 80, third pinion 12, fourth wheel 80, fourth pinion 10, and 'scape pinion 10, scapewheel 15.

3. Specimens of gold pocket chronometers and lever watches, reduced from the calibre of the chronometer; with improvements in the form of the teeth of wheels and pinions, in the balance-springs, and in the mode of attaching the spring.

4. The double rotatory escapement. This is a specimen of a new calibre movement, by which a powerful watch may be made in a flat case; a method which might have been adopted at the period when flat watches were first introduced, as it has all the advantages of a thick watch, by taking the contents of the barrel in diameter and depth as the basis of power.

5. Day-of-the-month watch, with lever escapement and double rollers. The calibre of this watch may be called more simple than the preceding one, only because it more closely resembles that which is daily made. The number of the teeth of the wheels is peculiar. The centre-wheel is much enlarged, with 100 teeth working in a pinion of 10, whilst the third wheel is diminished, which has 60 teeth working in a pinion of 10; the fourth wheel 63 teeth in a pinion of 7. Although this is a good working calibre for a superior watch, yet if power is admitted to be a principle in watch-making, it is impossible to get the same depth of barrel in this watch, unless the calibre of No. 1 is used.

producing the foregoing calibres, all technical sizes have been rejected, and the common measurement of inches, tenths, hundredths, and thousandths adopted; so that from one calibre, a watch of any size may be made by proportion.

6. Specimen of gold lever watches, with the split-centre seconds-hand movement. This watch, being a complete time-keeper, is capable of determining the precise time of any observation to a quarter of a second, by means of an extra seconds hand, with which it is provided, and which in the ordinary state of the watch lies under the principal seconds hand, and travels with it.

In taking an observation, the observer keeps his eye steadily fixed upon the object, and his finger in readiness to touch a spring, which allows the registering hand to fall simultaneously upon the face of the watch, where it may be allowed to remain upwards of 40 seconds for reading off the time; this being done, the finger is to be immediately removed in order to free the register, which instantly returns to its place ready for the next observation, without having in the least degree interfered with the correct performance of the watch.

7. Specimen of railway watches.

8. Specimen of English pinions for astronomical clocks, showing the true curve of the teeth.

9. Specimen of carriage clocks.

10. Specimen of portable chime clock.

11. Specimen of chronometer and watch movements.

12. Diagrams of calibres of chronometers and watches.

13. Gauges for admeasurement of watch-work to the thousandth of an inch.

14. Specimens of gold watch cases.

15. The new calibre, by means of which the manufacture of watches and chronometers is greatly improved and facilitated, and the expense considerably reduced. The cut in the preceding page represents this new calibre.

16. Five stages of the process of manufacture in the compensation balance.

17. Auxiliary compensation for the adjustments of the extremes of temperature.

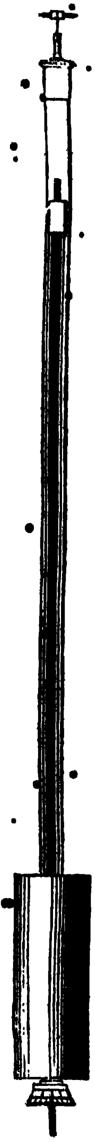
[Power being an indispensable element in time-keeping, it is of the utmost importance that the motive force should be transmitted with a constant velocity-ratio from wheel to pinion throughout the train, without its being absorbed by the increased friction and wear consequent upon improper curves.

The correct forms of curve were described, a century ago, by Camus, and recently in a work on the Principles of Mechanism, by Professor Willis, of Cambridge, 8vo, London, 1841.

In watch-work, the wheel is the driver, and the addendum to the tooth beyond the pitch-line is of the epicycloidal form, which, to the general eye, may be familiarly explained as resembling a Gothic arch, or a bishop's mitre. The pinion is the follower, and has the two flanks of its leaf formed by radial lines direct to the centre; and the addendum upon the pitch-line is a semicircle whose diameter is the breadth of the leaf. The specimen will explain the rest.

The new calibre by the exhibitor is shown as a general improvement in chronometers and watches.]

Fig. 2.



60 **HALL, GEORGE FREDERICK**, *Norfolk St., Fitzroy Square*—Inventor.

An astronomical and meteorological clock, for mean time, and for registering the hourly variations of the barometer and thermometer. The escapement of the clock is a new vertical dead-beat escapement; the pendulum has a new micrometrical compensation adjustment for temperature, intended for the self-registration of natural phenomena.

Fig. 1 is a plan of the escapement, half-size. A is a vertical wheel of seven teeth, which move in a horizontal plane. B is a concentric circle, with two ruby pins moving in a vertical plane: if the pins are circular or chamfered, the action is dead during the coincidence of the two planes; but as the pins vibrate, the top of the teeth strike, and escape, and slide, under the circular or chamfered surface of the ruby pins, and give the necessary impulse to the pendulum.

Fig. 1.

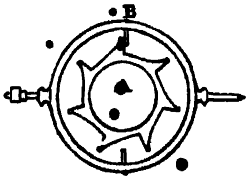


Fig. 2 is the pendulum with the micrometrical adjustment for temperature, which is effected by a compound rod of brass and zinc, in the proportion of 20 brass and 10 zinc, joined just above the bob; a zinc screw is soldered into the top of the brass tube, and a steel screw into the zinc cylinder, both of the same pitch. The length of compensating rod is first obtained by calculation; then, if the pendulum is compensated plus, the rod is turned to the right, which shortens the zinc screw, and increases the steel; the difference between the expansion of zinc and steel is the amount rendered minus in the compensation. If the pendulum is compensated minus, the rod is turned to the left, which increases the zinc, and shortens the steel; the difference of expansion is the quantity rendered plus. The pendulum is made of two glass tubes expanding downwards, and the compound compensating rod expanding upwards; the bob being placed upon studs fastened to the inner glass tube, and passing through the outer. The black line in the drawing is the compensating rod.

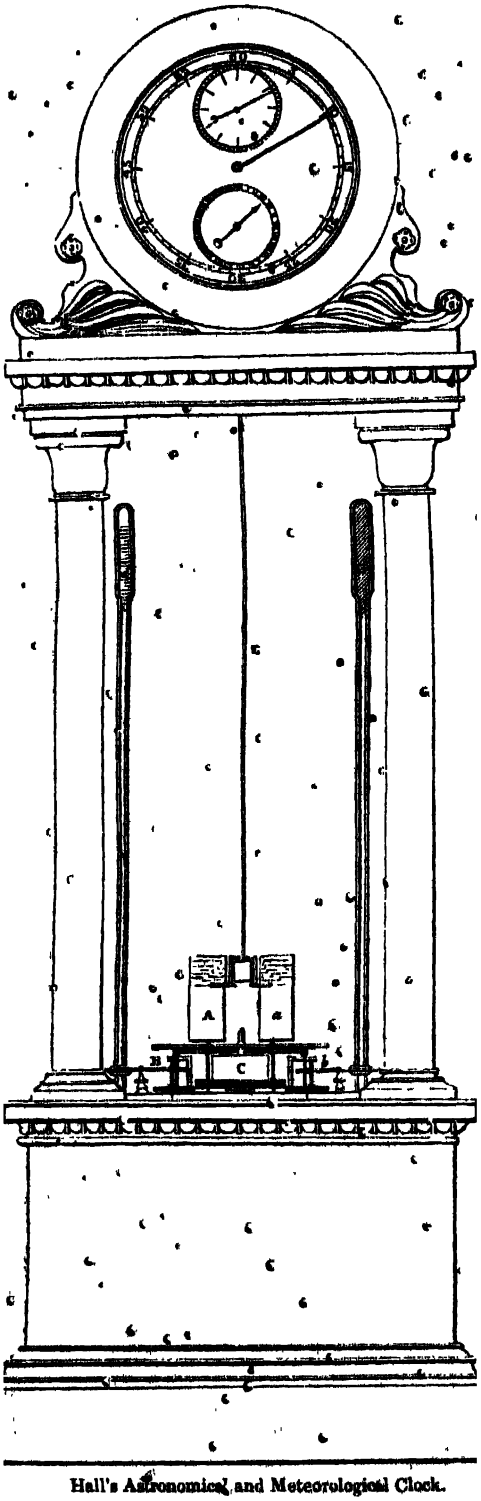
Fig. 3 is the elevation of the clock one-eighth real size, with the dial-plate removed, showing the meteorological registering apparatus. A a are two revolving cylinders

Fig. 8.



Hall's Astronomical and Meteorological Clock.

fastened to the arbors of the first wheels of the train, and which revolve (upon the average) once in three hours. B *b* are the escape wheels of the train, of the same kind as the clock (the vertical dead beat), of 25 teeth. *c* is the going barrel to impel the two independent trains. D *d* is the thermometer and barometer. E is the rod to which is fixed the marking apparatus in connexion with the revolving cylinders A *a*. F is the escape hour-wheel of 24 pins, with a barrel to receive the chain of the rod E. G is a wheel with a logarithmic spiral, the groove of which receives the pin of the bar H. I is the clock-frame. The action of this entirely new invention is as follows:—D *d*, the thermometer and barometer, are made to vibrate continually by the escapement B *b*, as inverted pendulums; the radii of the gyrations of which are continually affected, either by the pressure of the atmosphere, or by the change of temperature: thus *d*, the Torricellian barometer, will, if the mercury fall one inch, increase the number of its vibrations per hour by 1,000, every one of which is registered on the revolving cylinder A, which gives a line in length equal to the number of vibrations given by the barometer *d* per hour; a similar effect is produced by the thermometer D, by any change of temperature, and its variation registered on A. The hourly measure is marked by breaking the lines, which is effected by the escape of the wheel F, and the descent of the rod E, with its attached apparatus.

Patent diplometer for railway purposes; the tickets are stamped with the date and the number of tickets issued, with the amount paid.

---

62 HINTON, CHARLES, 10 *Corporation Lane, Clerkenwell* —Designer and Manufacturer.

English hard white enamel watch dial, with sunk centre and seconds, allowing free motion of the hands, with a flatter glass than usual.

64 JONES, JOHN, 338 *Strand*—Manufacturer.

Gold and silver watches of peculiar construction.

No. 1. The Rose Watch, showing Time and its doings. On one half of the margin around the back is engraved, on blue enamel, "Man cometh forth as a flower, and is cut down." On the surface of the richly engraved gold back is a Maltese cross, in white enamel, and on its four limbs are depicted the four seasons of life—in the bud, blossom, decay, and death of a rose. On the other half of the margin is engraved, "It is sown in dishonour, it is raised in glory." The dial represents, in enamel colours, the rose window of Westminster Abbey. On the twelve compartments indicating the twelve hours, are the names of the twelve Apostles. On the bezil that holds the glass is engraved, in blue enamel, "He that taketh not his cross daily is not worthy of me."

No. 2 shows, when viewed through a magnifying power, a series of cubical crystals, that being the primary crystal of gold.

No. 3 is a new and simpler mode than hitherto employed of producing dead seconds, with sunk centre in the dial, also a novelty.

No. 4 shows comparative merits of English and foreign work at equal prices.

No. 5. Centre-seconds hunter with compensation balance, isochronal spring, and lever escapement.

---

66 KAISER, JOSEPH, 30 *Park Terrace, Regent's Park*— Inventor and Manufacturer.

Improved detector clock, on a novel principle, indicating, at a glance, the days of the week and of the month, also the name of the month. It goes eight days, and requires no attendance after winding.

66 A MOORE, Major W., 3 *Cornish Terrace, Rathmines, Dublin*—Inventor.

A surgical instrument for use previous to operation for lithotrity, &c.

---

67 MACDOUAL, E. J., 12 *Dorset Place, Pall Mall East* —Inventor and Manufacturer.

Patent escapement for chronometers, watches, and clocks, without escape wheel. The same spring by India-rubber.

Drill-stocks: Archimedean; centrifugal Archimedean; vibrating; and duplex, simple, and centrifugal.

A new method of converting rectilinear into rotary motion.

A new decomposition cell. Medals made by the process.

68 **MACDOWALL, C.**, 4 *Hyde Street, Bloomsbury*—Inventor.

Clock-movement, with a dead escapement of a new construction, in which the escape-wheel consists merely of a small disc, with a single pin in it. The parts are arranged for the purpose of exhibiting the action of the escapement. The advantages claimed are—the impulse takes place at the middle of the vibration of the pendulum, as in the common dead escapement; it is given chiefly by direct action instead of oblique, and requires little oil; the construction is easy, and may be made with a ruby for the escape-pin as cheaply as with a common recoil escapement. It is applicable to watches as well as clocks.

(E. J. Dent, Manufacturer and Patentee, by assignment.)

69 **MAPPLE, D. D.**, 17 *Hull's Place, John's Row, St. Luke's*—Producer and Designer.

Registered skeleton timepiece, with improved lever escapement.

Improved clock-winder.

70 **DAVIS, J.**, 119 *High Holborn*—Inventor and Manufacturer.

An instrument, on a new principle, to survey without calculation.

71 **MARCHAND, LUCIEN**, 1 *Red Lion Street, Holborn*—Manufacturer.

Very small gold lever watch.

Musical clock, with four overtures, independent seconds, and amusing figures. Size, three feet high, two square.

73 **PAYNE, WILLIAM, & Co.**, 163 *New Bond Street*—Inventors and Manufacturers.

Quarter clock, on eight bells, in Amboyna wood, and or-molu case, made for the Sultan of Turkey.

Timepieces, in buhl and or-molu case; and in tulip wood and or-molu case.

Clocks, with lever escapement, in engraved gilt case with patent musical chimes; and in black marble case, with half dead beat-escapement.

Small carriage clock, with lever escapement.

Astronomical clock, with chronometer escapement, perpetual day of month, moon's age, noon and night, day of week, repeat hours and quarters, and zodiacal signs, in engraved gilt case.

Timepiece in square buhl case.

Clock, in square rosewood case, with lever escapement.

Lever timepiece, in satin-wood case.

Small clock, in rosewood case, with patent musical chimes.

Half-regulator, in mahogany case, new style.

Small timepiece, with thermometer.

Clock, in ebony case, with silvered ornaments.

Clock with or-molu ornaments, old English style.

Patent pedometer, for measuring walking distances; pedometer attached to a repeating watch, with patent winding, showing seconds and day of month.

Odometer, for measuring carriage distances.

74 **RIX, ISAAC**, 21 *Conduit Street, Westbourne Terrace*—Inventor.

Skeleton chronometer time piece, slow motion, beating only once in three seconds; the escapement so contrived as to allow the pendulum to vibrate two seconds every beat without touching anything; a perfectly dead escape.

78 **TOBIAS & Co.**, *Liverpool*—Manufacturers.

Registered compound-seconds watch movement, a new configuration produced by combining a quarter-seconds train of wheels with an independent full-seconds train, in such a manner as to cause the seconds hand of the independent seconds train to perform one revolution in the same space of time that the quarter-seconds train is performing four revolutions.

Gold watch, dome case, made from similar movement. Three-quarter plate movement, combining soundness and utility.

Gold watch, with same movement. Lady's watch, with ornamental engraving, and engine-turned case.

Gold hunting watch, with ornamented and engine-turned case.

Silver lever watch, as used in Turkey.

Horizontal movement, jewelled in five pair of holes; extra chronometer-balance, adapted to all climates.

Left-handed movement, extra-jewelled, gold balance.

Silver hunting and plain watches.

Railway guards' timepiece, secured in case.

79 **GILLETT, W. S.**, *Upper Harley Street*—Inventor.

Models of a system of thin rings or discs of metal, which being conical or disked, may by pressure be shortened, and thereby extended either inwards or outwards; applicable to pistons, stuffing-boxes, and other similar purposes; also to the construction of hollow cylinders to bear pressure from within.

80 **THOMSON, ADAM**, 25 *New Bond Street*—Inventor and Maker.

Autochronograph: for the instantaneous marking or printing of time, giving the month, day, and hour (night and day), with the minutes and portions of minutes.

The machine requires setting but once a-month. The clock must be wound once a-week. The register may be extended to any required length, and the date, with the exact time, may be stamped or printed in one second of time.

The attendance of guards and of workmen can be correctly noted; and the presence or substitution of particular individuals can be known by their signature upon the register.

The commencement and duration of any event can be correctly registered within a few seconds of time, and all the work of a "time-clerk" correctly done. Provisionally registered.

81 **PETTIT, W., & Co.**, 2 *Crombie's Row, Commercial Road, East*—Inventors.

A watch, keeping time, though suspended in a glass globe, filled with water, and surrounded with gold and silver fish. The object of the invention is to secure the protection of time-keeping and other instruments from water, sea-damp, rust, &c.

85 **HARDY, G.**, 5 *Wellington Road, St. John's Wood*—Inventor.

Electro-magnetic motive engine; exhibiting a new mode of employing electricity as a motive power.

85A **WATKINS, A.**, 7 *Weymouth Terrace, City Road*—Inventor and Manufacturer.

Original eight-day chronometer, striking the hours; being a self-acting repeater, chiming the quarters upon a set of five bells, and showing the day of the month; each set of works detached; the whole comprising 200 pieces of mechanism in a diameter of not more than two inches.

Chronometers of three-quarter plate construction, with hard cylindrical springs, jewelled with rubies in every hole; presumed to be the smallest ever made of the same construction, the diameter being nearly that of a guinea.

86 **COUSENS & WHITESIDE**, 27 *Davies Street, Berkeley Square*—Inventors and Manufacturers.

A sporting watch, the novelty of which consists in its determining the time to one-sixth of a second, by means of an independent hand acting from the centre, and detached from all the other hands, with stopping and starting springs. It has a detached lever escapement, is jewelled in 14 holes, and is particularly adapted for racing and other purposes. It may be considerably reduced in size.

87 **ALLIS, J. H.**, *Bristol*—Inventor and Manufacturer.

Bracket-regulator timepiece, with a new description of compound pendulum, which vibrates seconds, though less than half the length of a usual seconds pendulum. Adapted for compensation against the effects of heat and cold.

90 **BARLING, JOSEPH,** 90 *High Street, Maidstone*—Designer.

Dial of a clock, exhibiting a new pattern figure.

Table and dessert spoons and forks, ornamented in a novel manner, with enamel.

91 **VIEYRES & REPINGON,** 129 *Regent Street*—Manufacturers.

Two-day marine chronometer, in temporary gimbals, for the convenience of exhibition.

Gold and silver watches, of various fashions, for the home trade and for South America.

Steel for chronometer pendulum springs, by A. Ganeral.

92 **BLAYLOCK, JOHN,** *Long Island, Carlisle*—Inventor and Manufacturer.

Motion-work for the hour and minute hands of a turret-clock with four dials.

Apparatus for turning on and off gas for illuminating dials, self-acting and self-regulating for each half-year.

94 **BOLTON, THOMAS,** *Coventry*—Manufacturer.

German silver watches, plated with silver.

Gold plated watch.

95 **MOUILLARD, PIERRE FORTIME VICTOR,** 71 *Albany Street, Regent's Park*—Inventor.

The artificial leech. It is composed of a body of cylindrical form, about three and a quarter inches long, and about one inch in diameter. Towards the bottom end is a small cylinder, slightly flattened at its lower part, containing a small spoon of about two-thirds of an inch of elevation on its upper part, the opening of which is slightly oblique, of an oval form. This tube, including the spoon, is about two inches long by about half an inch in diameter. The other extremity of the body of the pump is furnished with a piston, which, on being drawn back, empties the pump. This piston, being entirely drawn out to its full length, and pressed by the thumb, releases an interior spring in which the lancets are fixed, and these pierce the skin raised by its suction. The operation is not painful, as the lancets do not remain an instant in the wound.

95A **BRISCALL, JAMES,** 48 *Constitution Hill, Birmingham*—Designer and Manufacturer.

Self-correcting clock, with a detached lever escapement; it goes a month; and shows the day of the week and month. At the end of each month, and in leap-year, it corrects itself.

96 **BRUTTON, CHARLES,** *Exeter*—Proprietor.

A clock, in a case, which occupied thirty-four years in its completion. The movements are as follow:—moving panorama of Day and Night; Day represented by Apollo in his car drawn by four coursers, accompanied by the twelve Hours; and Diana in her car, drawn by stags, attended by the twelve Hours, representing Night. Two figures which salute each other, as the panorama revolves, and the bells are ringing. Perpetual almanac, showing the day of the month on a semicircular plate, and the equation of time, regulated only once in 130 years. Circle, the index of which shows the day of the week, with its appropriate planet. Circle showing the leap-year, the index revolving only once in four years. The sun in his course, with the correct time of rising and setting by a horizon receding or advancing as the days shorten or lengthen; and the moon, showing her different quarters, age, &c. Two female figures, one on each side of the dial-plate, representing Fame and Terpsichore, which move in time when the organ plays. Movement regulating the clock as a repeater. Saturn, the god of time, who beats in movement when the organ plays. Circle on the face, showing the tunes played by the organ every four hours. Belfry, with six ringers. Bird organ, which plays when required. This clock is shown in the annexed Plate, 33. It was made by Jacob Loudan.

99 **CHURCHILL, GEORGE,** *Downton, near Salisbury*—Manufacturer.

An eight-day spring-clock, with music attached, playing a tune every three hours: cast and manufactured by a blacksmith.

100 **DELL BROTHERS,** *Bristol*—Inventors and Manufacturers.

Specimens of ordinary clock-work. Transparent timepiece for the bed-room: a small light is placed behind the dial, showing the time distinctly; the time-piece has a lever escapement, going two days.

Specimens of iron and brass wheel-cutting, for clock-work, lathe-work, &c.; and wood-pattern cutting, for cast-iron and other wheels.

Pianoforte music-box, playing six overtures, made by Nicole Freres, of Geneva.

102 **DRIVER, J.,** *Silver Street, Wakefield*—Designer and Manufacturer.

Chime-clock, showing simultaneously upon the dial the time in any part of the world.

A compensating clock, with a lever escapement, and without pendulum.

103 **EDWARDS, JAMES THOMPSON,** *Dudley*—Manufacturer.

Portable spring time-keeper, to go 426 days.

104 **EDWARDS, JAMES,** *Stourbridge.*

Large transparent skeleton spring timepiece, made of a combination of brass and glass: the wheels consist of cut flint-glass centres, hooped with brass teeth rims, engraved glass dial-plate, and crystal cut pendulum ball; it goes eight days.

New skeleton quarter-day spring timepiece, made of cut flint-glass centres, hooped with brass teeth rims, having engraved glass dial-plate, and glass pendulum ball; it goes three months, and is kept in motion by a new clock-movement propeller.

104A **GRAY, JAMES, DR.,** *Perth*—Inventor.

Medical walking-staff, containing an enema—syringe, a catheter, a test tube and test paper, a pair of forceps, a number of wax matches, and a pill-box, divided, containing in each division pills of various medicines.

105

Clock on carved mahogany pillar.

106 **EVANS, WILLIAM F.,** *Soho Street, Handsworth, near Birmingham*—Manufacturer.

Gothic skeleton clock, detached lever escapement.

Elizabethan timepiece, chronometer escapement.

Skeleton lever clock, with representation of Sir Walter Scott's monument, Edinburgh.

Cabin clock, detached lever escapement.

109 **GERARD, ALEX.,** *Gordon's Hospital, Aberdeen*—Inventor.

"Spherical-trigonometer," or an instrument adapted to the mechanical solution of problems in spherical trigonometry and nautical astronomy.

Portable, or field transit instrument, for finding the time on shore, laying down meridian lines, &c.

Water-meter, for registering the quantity without interrupting the pressure.

Clock, with conical pendulum.

Marine clock, with two pendulums.

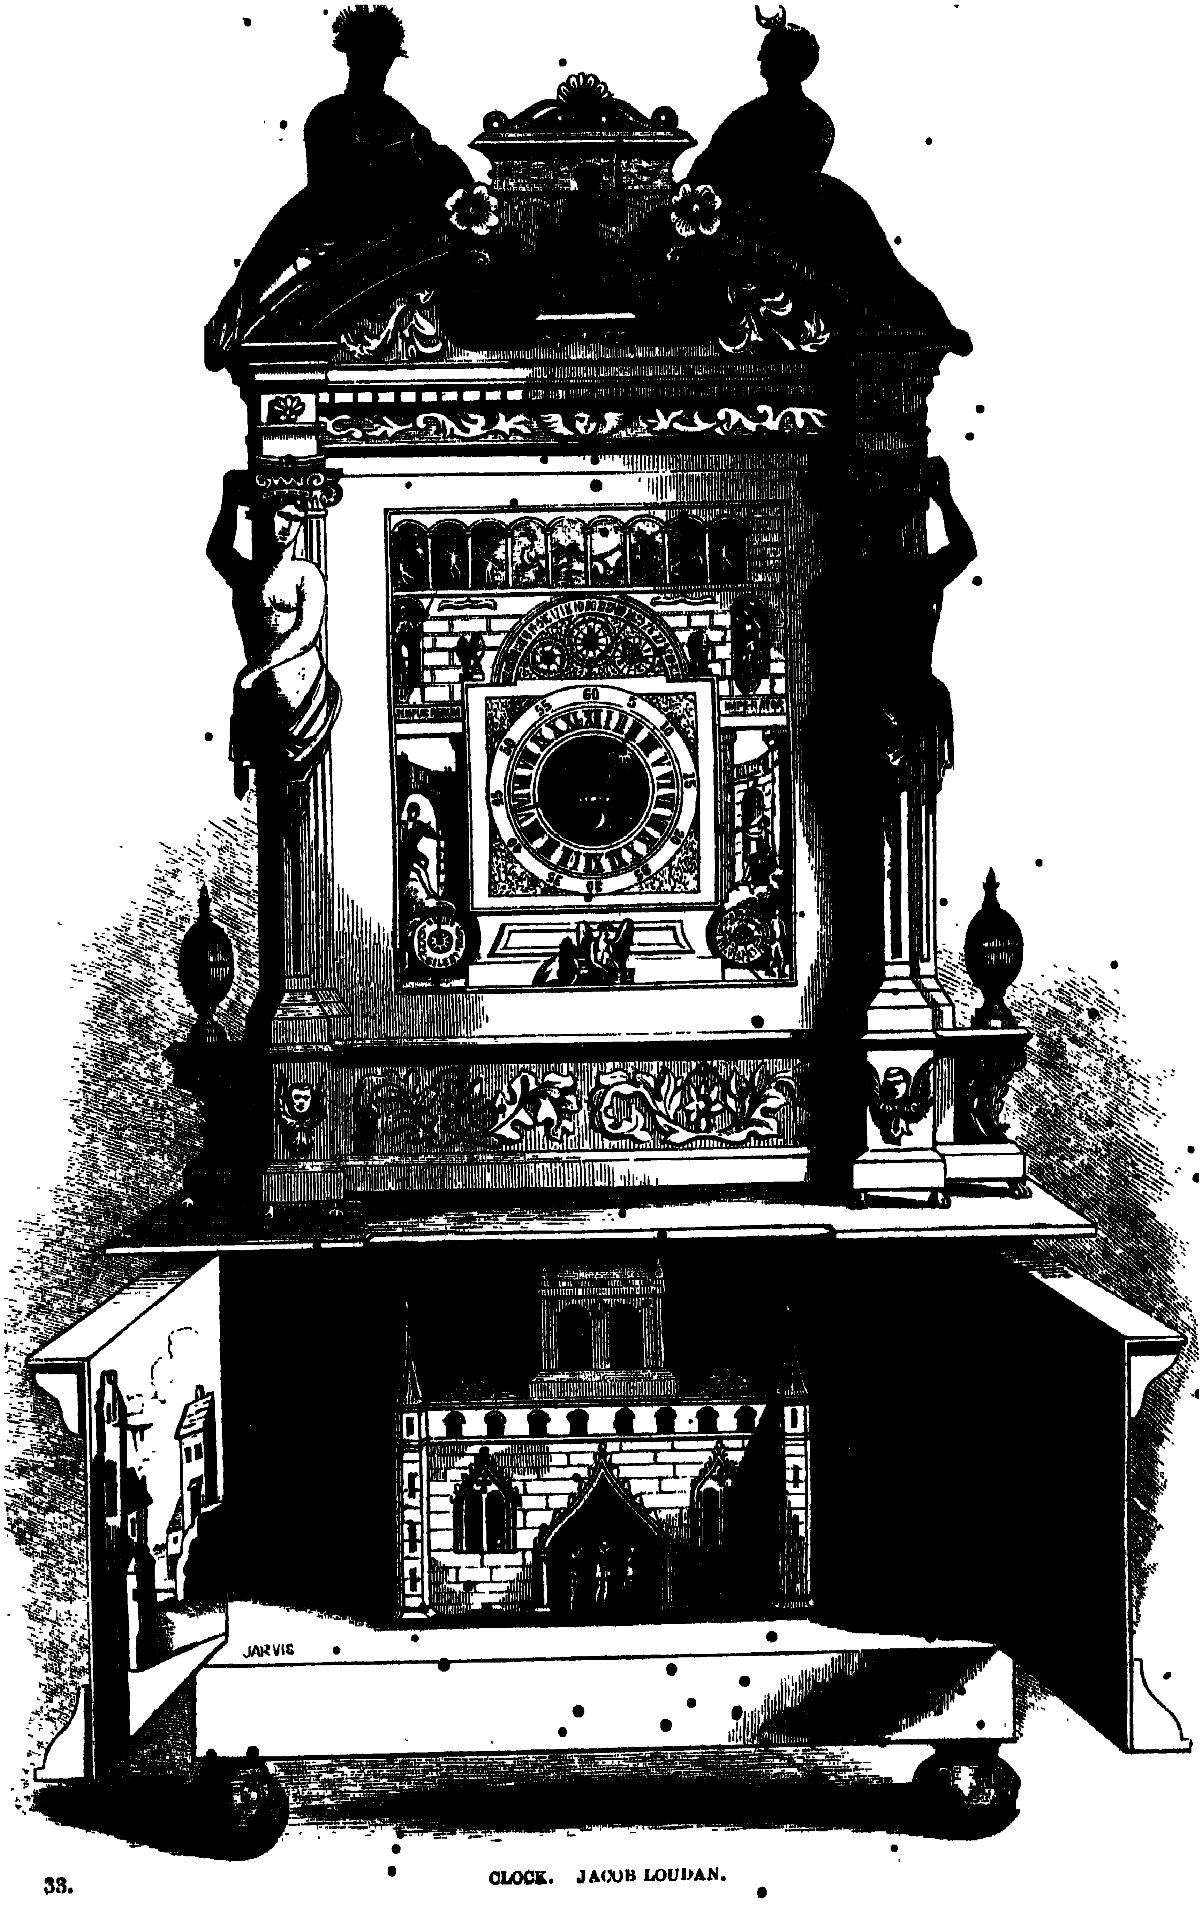
A centrifugal, or conical pendulum clock; capable of performing much heavy work with great accuracy.

113 **HART, WILLIAM, & Co.,** *Christchurch, Hants*—Manufacturers.

Chronometer and watch fusee chains, of different sizes.

115 **LAWRENCE, I.,** *North Curry, near Taunton*—Inventor.

Sun-dial, to suit any latitude in the northern hemisphere. Hand-drill. Turner's centre, with friction rollers. Spring screw-wrench. Dividers.



33. CLOCK. JACOB LOUDAN.

117 **PACE, J.,** *Bury St. Edmunds*—Inventor, Designer, and Manufacturer.

Skeleton clock, which goes three years. This period is obtained by the use of six springs, the united force of which is 250lbs. They are enclosed in six barrels or boxes: three are connected with chains to a fusee on the right hand, and three to one on the left.

Pyramidical skeleton timepiece, which goes three months. The dial is placed at the bottom of the clock to show the motion of all the wheels; with Graham's dead-beat escapement, and the hands moved by a simple mechanism.

Barometer of highly-polished brass, containing three glass tubes supported by scroll-work. The centre tube is the barometer, and those on each side move an index which rises and falls by turning a nut at the base of the stand: by means of wheel-work, they turn the hands on two dials, one for night and the other for day, indicating the state of the barometer.

119 **RADFORD, JONAS,** 339 *High Street, Cheltenham*—Inventor and Designer.

Design and diagrams of a geographical clock or watch; model made by F. Drury, 26 Albert Terrace, Penton Street, Islington.

Two timepieces. Provisionally registered.

121 **WRIGHT, WILLIAM,** *Exchequer Row, Aberdeen*—Designer and Manufacturer.

A clock, showing the minutes, hours, days of the month, and months of the year; the time of the sun's rising and setting; the diurnal revolution of the sun and moon; the moon's age; phases; time of her meridian passage and position relative to the sun; the time of high water at Aberdeen, both superior and inferior tides, and its depth at the bar; and the state of the tide at some of the principal sea-ports of Great Britain, Ireland, France, North and South America, Spain, Portugal, Holland, and Germany; it goes twelve months.

[By adding one or two wheels below the great wheel, and by greatly increasing the usual weight of a clock, it can be made to go for a year. Occasionally such clocks are furnished with two barrels, for the purpose of avoiding the great strain upon the teeth of one large wheel and pinion.—J. G.]

122 **BROADBENT, JOHN,** *Ashton-under-Lyne*—Exhibitor.

Peal of small bells to ring changes; worked by springs. Scale for pitching wheels. Time piece.

123 **ROSKELL, JOHN,** *Church Street, Liverpool*—Designer and Manufacturer.

Watch and clock machinery.

124 **ROTHERHAM & SONS,** *Coventry*—Manufacturers.

Gold and silver watches. Specimens illustrative of the progressive stages of manufacture of a lever watch

[A large number of watches are made at Coventry, not only for home, but also for colonial trade. The best forms of the common English watch, together with patented and others of a superior manufacture, are here prepared and completed. The manufacture has had its local establishment in Coventry about 80 years.—R. E.]

126 **MAPPLE, H.,** *Child's Hill, Hampstead*—Inventor.

Machine for saving life on railways, now used in America. Fire alarum, on the principle of the telegraphic alarum now used on the English lines. Resonant spring for English clocks. Compensation pendulum. Supporting telegraph wires on tripods of iron rods. Improved clock escapement; system of railway signals; and mariners' compass needle. Electric telegraph. Specimen of insulated wire for telegraphic purposes. Compensation for pianoforte strings. Improved system of collecting lamp black; and of making permanent magnets. Improvements in electric timekeepers. Implement for shoemakers. Model to illustrate a theory for crossing any expanse of water by electric currents, for telegraphic purposes.

127 **EINSLE, EDWARD,** 46 *St. Martin's Lane*—Manufacturer.

Syphon douche, invented by Dr. Charles Jones.

Model of an improved syphon, for brewers, distillers, &c., dispensing with the suction-pipe.

Stomach-pump, with several useful adaptations. Complete case of amputating and other instruments. Double-action enema pump, enclosed in bronze. British plate and electro-plated reservoirs, the valves so arranged that they work freely, and are not likely to get out of order.

Double-action enema apparatus, with metallic folding joints, suitable to warm climates; the same with flexible tube. Portable enema apparatus, with metallic joints. Improved enema apparatus, in round reservoir, discharging the contents with one stroke of the piston. Veterinary enema and stomach-pump, with useful tubes and pipes, for hove cattle, &c. Common enema apparatus. Model, to show the action of the double-action enema pumps.

127A **TAYLOR, G.,** *Wolverhampton*—Inventor and Manufacturer.

Registered self-correcting eight-day date clock, showing the day of week, day of month, &c.

128 **SHEPHERD, CHARLES,** 53 *Leadenhall Street*—Inventor and Patentee.

Patent electro-magnetic striking clock. From the pendulum of this clock, a number of dials may be worked. The greatest novelty consists in the method of giving the impulse by means of a remontoir escapement, by which the variations of the battery take no effect on the time measured. The novelty of the Large Clock in the Transept of the Exhibition Building, in connexion with the former, is in the method of locking the escape wheel, to prevent the train from running by the action of the wind on the hands.

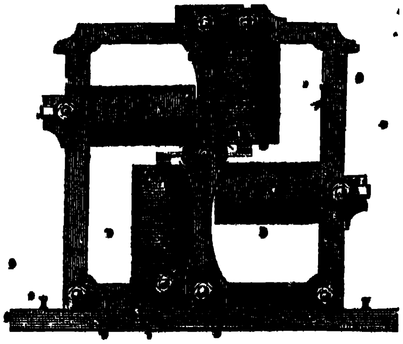
Two dials, five feet in diameter each.

A skeleton electro-magnetic striking clock, showing how the number of blows to be struck is regulated.

Small turret bell, illustrating the method of applying electro-magnetism to move the hammer.

The power employed for keeping in continual action the electric clock, is one of Smee's batteries in connexion with a powerful horse-shoe magnet. In the case of the mechanism of the great clock now under consideration, a series of such magnets is used, the connexion of which, with their armature, is shown in fig. 1.

Fig. 1.



These are surrounded by 25,000 feet, or nearly five miles of No. 18 copper wire, the total weight of which is about 180 lbs. As weights are entirely dispensed with, the frame containing the wheel-work is much lighter than usual; the escape-wheel, *a, a,* fig. 2, is 10 inches in diameter, and is in two parts, the teeth of each being reversed; the click and ratchet escapement, which is moved by the electro-magnets, acts on the teeth of one of the parts, while the teeth of the other part are used for the purpose of locking the train, in order to prevent it running forward from the action of the wind on the extra-sized hands which present a large surface. A central vertical wheel, *b*, of larger diameter (see fig. 2 and fig. 3,), which works into a pinion, *c*, on the arbor of the escape-wheel, gives motion to the wheel-work in connexion with the hands, which are at a height of 40 feet above the pedestal in the South Gallery of the Transept on which the machinery is placed, the communication being effected by a 12-inch bevelled wheel, *d*, which rotates on the end of the spindle of the great wheel, and works into a horizontal bevelled wheel, *e*, with which a vertical shaft, *f*, made of brass tubes of 1½ inch diameter, and screwed together in several lengths, revolves, and which, in connexion with wheel-work at top, gives motion to the hands.

Fig. 2.

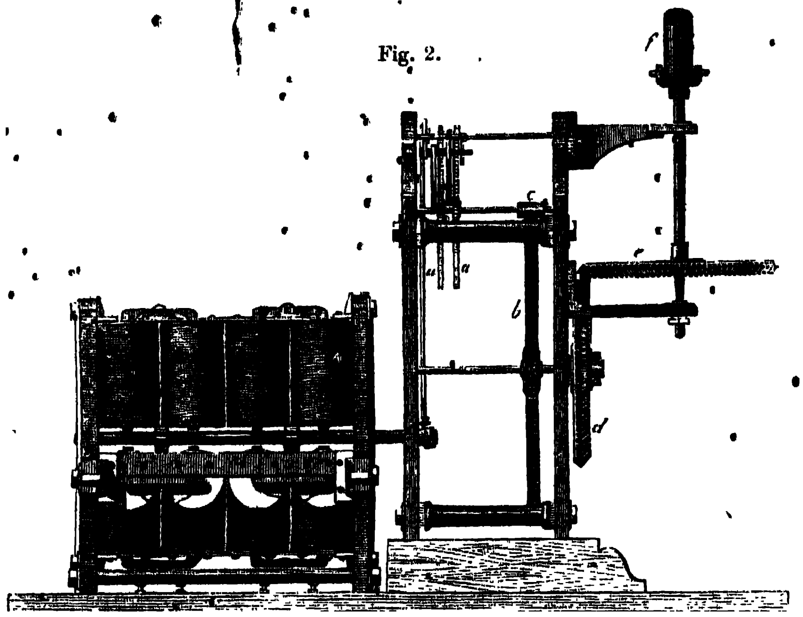


Fig. 3.

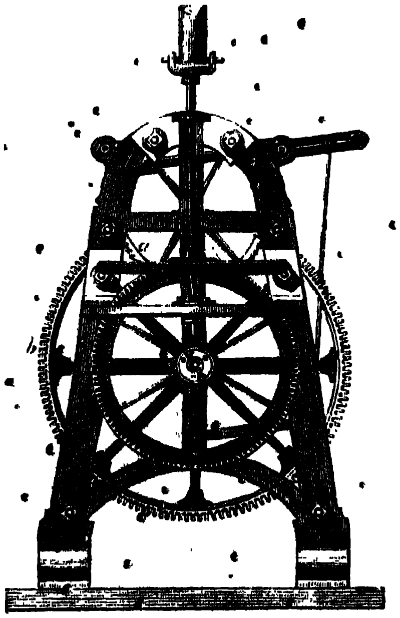
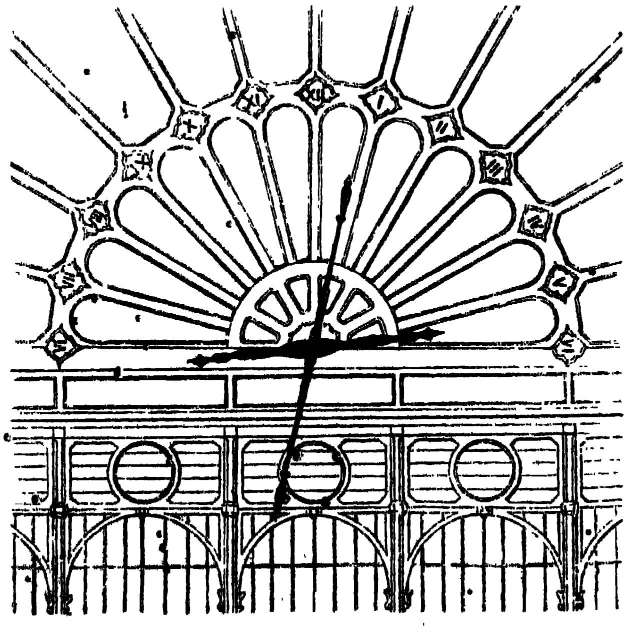


In order that the clock-face might harmonize with the design of the south elevation of the Transept, it was considered that the conventional form of a circle for the dial might be dispensed with; the figures were accordingly arranged in a semicircle, and placed at the intersections of the radial bars with the second semi-ring from the centre of the great fanlight.—(See fig. 4.) As is the case in ordinary dials, so in the present instance, XII. is at the top, I. to VI. following on the right hand side of the semicircle; while on the left side the figure VI. is repeated, and the remaining figures up to XI. inclusive follow in the usual order. In order to render the new form of dial perfectly useful, it was necessary to have two minute hands, and also two hour hands; so that when one of the minute hands, for instance, leaves the figure VI. on the right hand, the other minute hand also points to the corresponding VI. on the left hand. The two minute hands together are 16 feet, and the two hour hands 12 feet in length respectively. Two smaller dials, each of five feet diameter, are fixed up inside the

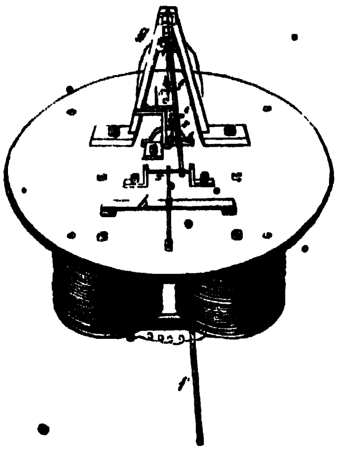
Fig. 4.



Shepherd's Patent Electro-Magnetic Clock.

building; one in front of the cross gallery at the east end of the central aisle, and the other in front of the south gallery of the transept. All the dials are regulated by one pendulum, represented in fig. 5, and which

Fig. 5.



is suspended from a triangular frame, *g*, resting on a bed-plate, to which it is secured by screw-bolts in the ordinary way. The pendulum has a mercurial compensation for heat and cold, and is kept in motion by electro-magnetism by a method entirely different to any previously invented. Instead of applying directly the attractive and repulsive forces of electro-magnetism to the pendulum, according to all the previous methods, the power of an electro-magnet is here employed to bend a spring to a certain fixed extent, the reaction of which gives the necessary impulse to the pendulum, by which means the variations which are continually taking place in the batteries have no effect on the time measured. The arrangement of the spring for giving the impulse is represented at *s* (fig. 5), in which *b* is the impulse spring, consisting of a short steel spring, to which are attached two arms, *e* and *d*, at right angles to each other; *e* is the detent, or catch, for holding this spring when bent by the action of the magnet; *f* is the pendulum-rod carrying the two screws, *h* and *i*, which may be called the impulse and discharging pallets. As the pendulum vibrates to the left, the discharging-pallet pressing against the perpendicular arm of the detent, *e*, forces it into the position indicated by the curved lines; the impulse spring is thus liberated and immediately falls against the impulse pallet *h*. As the pendulum returns to the right, the impulse spring by its elasticity urges the pendulum forward with the exact power required to continue its vibration. The spring is limited in its motion by a screw, *o*, by screwing or unscrewing which the length of the stroke of the spring, and consequently the power may be regulated to the greatest nicety. The pendulum, continuing its motion to the right, comes in contact with a slight spring tipped with platina, which completes the circuit of the galvanic battery through the coils of the electro-magnet, which is placed immediately underneath the bed-plate in an inverted position, the poles of which pass through the bed-plate. An armature, *k*, consisting of a flat bar of iron, is placed immediately above the poles, being attached to a horizontal arm at right angles thereto, which arm moves freely on an axis *x*, properly supported at either end on a bracket. On the opposite side of the axis is another arm also projecting at right angles, but considerably longer than the first. The use of the second arm in connexion with an adjustable weight, is to raise the armature from the poles of the magnet. When, therefore, a current of electricity is made to pass through the coils of wire which surround the magnet, the armature is attracted towards the poles, and consequently the long arm with the adjustable weight is elevated in the opposite direction. It is evident that this arm cannot be raised without lifting the arm, *d*, of the impulse spring, *b*, bending the impulse spring, and locking the upper end of the arm, *c*, on the detent, ready for the next impulse.

[A point of importance in the construction of this clock is the method of making and breaking contact for the electric currents. When the circuit is broken, a spark is seen to pass between the points of contact. The continued action of this spark causes the points between which it passes to become oxidised; and as the metallic oxides are non-conductors of electricity, it follows that the passage of the electricity will be thereby interfered with and prevented.

In the first clock constructed, a piece of steel-wire was used as a break spring, touching against the side of the pendulum-rod; but the points of contact oxidised so rapidly, that the clock would not go for more than a few days without stopping. The steel spring was then removed, and one of gold substituted, and a small plate of gold was soldered to the side of the pendulum-rod. The difficulty appeared to have been entirely overcome; but in six weeks the quantity of electricity passing was considerably reduced, and at the end of two months the clock stopped.

Platina was next tried, in the same manner as the gold, in a new clock, completed in 1848, since which time the points of contact have never required cleaning, the circuits being completed at the present time with as much certainty as when the clock was first put together. These points of contact present some peculiarities when examined with a lens. With metals having a great affinity for oxygen, a black spot forms immediately at the point of contact; while in the case of platina the immediate point of contact remains perfectly clean, a rim of black forming around it. This black rim has been found to be quite capable of conducting electricity. The probable conclusion, therefore, is, that the black rim is platina in a very fine state of division, and not an oxide of the metal.

The battery best adapted for these clocks is that of Mr. Smee, both on account of its simplicity and the ease with which it is recharged. The amalgamated zinc employed in this battery is subject to rapid local action, by the quantity of impurity which it contains, consisting usually of lead, iron, copper, tin, and cadmium; all these metals having less affinity for oxygen than zinc, become negative when immersed in dilute acid, and form a voltaic circle with the surrounding particles of zinc. The use of amalgamation is to stop this action, which, when the amalgamation is fresh, it accomplishes; but in a few days the local action again commences, and increases until the acid is neutralised, or the whole of the zinc dissolved.

This may be obviated by standing the zinc plate loose in the jar, resting on the bottom, and pouring in an ounce or two of mercury. This plan is found to answer remarkably well; the quicksilver soaking up the zinc plate, keeps it thoroughly amalgamated. The zinc may be melted, and after being mixed with mercury, cast in moulds; the quicksilver would then form one of the impurities present: and should local action take place at any one point, the solution of the zinc would not only liberate the other metals present, but liberate at the same time sufficient quicksilver to cover them, and stop the local action.

It is well known that the zinc of a battery is acted upon more severely at the surface of the liquid than elsewhere, by which the lower part is wasted. This appears to depend on the presence of oxygen; for it does not go on, where the battery has been enclosed in a bottle to collect the hydrogen evolved. A double advantage results from making the batteries air-tight; not only is this peculiar action stopped, but the evaporation of the water prevented. In batteries required to act for long periods, one zinc plate should be employed, as when two are used, one of them almost always becomes negative to the other; and although this action is very slight, yet when it continues constantly for several months, its effect is very perceptible.

This clock, although quite equal to that of St. Paul's Cathedral, occupies far less space; the heavy weights, with the room necessary for their descent, being of course dispensed with. One of the most obvious advantages in electro-magnetic clocks is, that precisely similar time will be kept by any number of dials situated in the different parts of a large establishment, and connected with one pendulum. Such a series has been in operation for some time at an extensive commercial warehouse. The whole of the dials are regulated by one pendulum, situated in the counting-house. The wire required to communicate between the pendulum and the dials in the different departments of the warehouse is upwards of a quarter of a mile in length.]

129 Smith & Sons, John, Lancelot, & William, *St. John's Square, Clerkenwell*—Manufacturers.

Regulator and case, with self-adjusting pendulum, suited to any temperature, by its own action; with barometer, thermometer, &c.

[Astronomical clocks are sometimes made, and yet not used in observation, but kept by clockmakers themselves, for the purpose of being used as a standard by which to adjust other clocks, chronometers, and watches not yet brought to time; and such clocks, when so used, are called *regulators*, from the use to which they are put; and when they have good compensating pendulums, and the best escapements, they differ from astronomical clocks only in the name.—J. G.]

Detector clock, or watchman's timepiece, for indicating the precise time of absence or neglect of duty in watchmen, nightwardens, &c.; forming also a bracket time-piece.

Eight-day office dials. Eight-day church or turret clock. Church clock to chime the quarters.

Skeleton timepiece and almanac, which goes twelve months with once winding, and shows seconds, minutes, and hours, with the days of the week, and the month, on one dial. Skeleton quarter clock, which chimes the quarters on eight bells, and strikes on steel wire gong.

Whishaw's uniformity of time clock and telegraph instruments.

---

130 Roberts, Richard, *Globe Works, Manchester*—Proprietor.

Patent alpha (church or turret) clock, the wheels and pinions made of cast-iron, with the teeth retaining the scale; it has only one weight to actuate both the going and striking trains, and the chain or cord, requiring no lateral traverse, can be taken off in any direction. The pendulum (compensation) and the escapement (remontoire) are adapted to keep the clock at an almost uniform rate, whilst the hands being advanced at intervals of thirty (or, if preferred, sixty) seconds, afford opportunity for ascertaining the time to a second.

[The striking of the hour is effected through means by which the blows are given at equal intervals of time, thus avoiding both the irregularity of the fan and the expenditure of power to drive it. The upper part of the case in which the clock stands shows a simple mode of constructing a turret, to consist of four pillars connected together by as many dials, which turret it is proposed should be placed diagonally with reference to the building on which it is to stand, in which position the dial will be better seen in all directions.]

Watch which beats dead (centre) seconds with only one train of wheels, &c.

Patent recorder watch with double hands.

Patent normal drill, for drilling all the pivot, screw, and steady pin-holes in the frame-plates of watches, chronometers, and small clocks. A boy may drill with this machine any number of watch frame-plates, so precisely alike, that the parts that fit one of the frames will fit all or any of the others.

[It will be seen that by varying the distance of the drill from the fulcrum of the graduated beam, any size of watch-plate may be drilled from the same model-plate; and that by changing the model-plate, the arrangement of the holes may be varied at pleasure.]

Patent synchronometer model, to show that by the application of pneumatics, a clock may be made to indicate simultaneously the time of day on dials in various places at a distance from each other.

Patent wheel sector. By this instrument the external and pitch line diameters of wheels and pinions of any pitch and number of teeth are accurately ascertained.

Electro-magnet, 2½ inches square, the iron of which weighs only one pound four ounces and a half; capable of sustaining upwards of 500 lbs.

Electro-magnet, three inches square, the iron of which weighs only two pounds six ounces; capable of sustaining 678 lbs.

Photographic self-registering magnetic and meteorological apparatus.

The object of this apparatus is to obtain a more perfect knowledge of magnetic and meteorological phenomena, by continuous observation of all the changes that occur simultaneously in the various instruments. As the magnetic changes are too minute to actuate continuously any mechanism, however delicate, a record can be obtained by an imponderable agent only, as light.

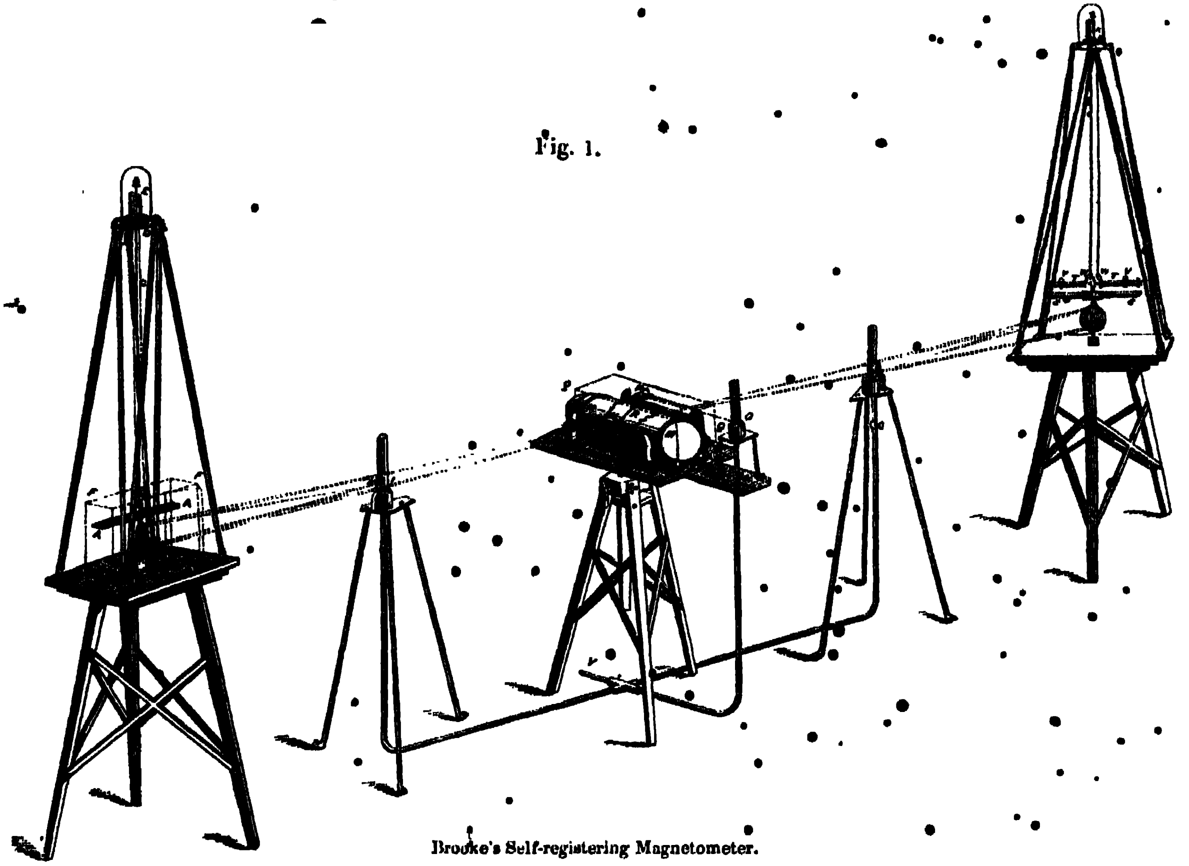
Even with a staff of assistants so large that the eye of one of them should be constantly applied to every telescope, the results would be liable to errors of observation; besides which, the magnetic changes occasionally occur too rapidly to be continuously recorded by an observer. Since the apparatus has been employed at the Royal Observatory, Greenwich, the number of the staff has been reduced, and the fatiguing process of nocturnal observations in the magnetic department has been entirely superseded. The apparatus consists of—

1. A declinometer.
2. A bifilar magnetometer.

In these instruments, the torsion circle from which the suspension skin hangs is supported by eight brass tubes springing from the four corners of a marble slab (which, when in actual operation, would be cemented on the top of a stone pillar firmly fixed in the ground, and insulated from the floor of the observatory): these tubes, about 4 feet long, converge alternately to four points of the torsion plate; they thus compose a framework possessing great stiffness. To the suspension-frame of each magnet, a plane glass mirror and a concave metallic speculum are attached. The plane mirror is for the purpose of making eye-observations with a telescope in the usual manner. A gas-light or lamp is so placed at a distance of about two feet in front of each speculum, that an image of a small slit in the copper chimney surrounding the burner may fall on the sensitive paper attached to—

3. The registering apparatus. This is placed midway between 1 and 2, and consists of a stand supporting horizontally on friction rollers two concentric glass cylinders, round the inner of which is wrapped a sheet of prepared photographic paper: the outer or covering cylinder keeps the paper moist during the 24 hours it remains in action. A bent arm, attached to the axis of these cylinders, is carried round by a fork at the end of the hour-hand of a timepiece specially constructed for the purpose. The horizontal motion of the tracing point of light, combined with the vertical motion of the paper, traces out the magnetic curve, which, when the paper is removed from the cylinder, is developed and fixed by the usual photographic process. A third light is attached to the registering apparatus, for the purpose of drawing a standard or base line on the paper; by the varying distance of any point of the magnetic curve from this line, the magnetic variation is determined. At the distance at which these instruments are placed, an angle of 1° is represented by 2 inches on the paper; but the scale valve may be enlarged at pleasure, by placing them further apart. This instrument is shown in fig. 1.

Fig. 1.



Brooke's Self-registering Magnetometer.

AA, the declination magnet.

B, a concave speculum attached to the magnet.

C, a plane glass mirror also attached to the magnet, for making observations by a telescope, on the old method, when required.

D, the torsion plate, reading to minutes by two verniers.

E, a frame standing upon the torsion plate. A hook capable of being raised or lowered by a screw, is attached to this frame, from which the magnet is suspended by a skein of untwisted silk fibres.

FFF, a glass box, in which the magnet and its appendages are enclosed, to protect them from the air; for the same purpose, the suspension skein is enclosed in a glass tube G, which passes through a stuffing box H, in the lid of the box.

I, a gas-burner enclosed in a brass chimney, from which no light can escape, except a small pencil which passes through a narrow slit K, capable of being adjusted by a screw; on the breadth of this slit, the breadth of the register line depends.

LL, a combination of two plano-convex lenses. The pencil of light passing through K, falls on the mirror B, and is reflected to the cylindrical lenses; by these, the image of the slit is condensed to a point of light on the surface of

MM, the registering apparatus, consisting of two concentric cylinders, between which the photographic paper is placed.

N, the magnetic curve traced by the point of light.

O, a gas-burner, fixed to the stand on which the cylinders rest.

P, a plano-convex prismatic lens, attached to the top of

QQ, an opaque box, which protects the photographic paper from extraneous light. A pencil of light from O passes through P, and is brought to a focus on the surface of the paper.

R, the base line, described by the point of light.

SS, the bifilar, or horizontal force magnetometer.

TT, the apparatus for producing an automatic temperature compensation; this consists of two zinc tubes, which are clamped to a glass rod by two adjustible clamps VV, the suspension skein passes over a pulley X, and the ends are attached to two hooks WW; as the temperature rises, these hooks are approximated to each other by a quantity equal to the difference of the expansion of the glass rod and the zinc tubes, between the clamps VV; and thus the torsion force is diminished; the position of the clamps is so adjusted, that the diminution of the torsion force shall be equivalent to the loss of power in the magnet: and *vice versâ*, when the temperature falls. The magnet, its appendages, and the suspension skein are enclosed similarly to the declination magnet; the glass box, &c., is omitted to avoid confusion. The registration of its movements is likewise similarly effected on the opposite side of the cylinders.

4. A blackened zinc case, which is placed over the cylinders, when in actual operation, to prevent any light from falling on the paper, except the two pencils which describe the magnetic curves, and another which passes through a prism on the top of the case, and draws the base line. N.B.—This prism is placed on the top of the glass case, to show its proper position.

5. A case of the same material, which covers the whole of the apparatus, to protect the sensitive paper from any stray light, as well as to defend the whole from dust, &c.

6. A balanced magnetometer, supported by agate knife-edges, resting on agate planes. The variations of this instrument are similarly recorded on—

7. A registering apparatus, similar to the preceding No. 3, except that the axis of the revolving cylinder is vertical. The top of the inner cylinder rests on a turn-table, which is carried round by the hour-hand of a time-piece. In this and in the preceding apparatus, the lines of light reflected from the specula are each reduced to a point, by passing through two cylindrical plane convex lenses placed near the sides of the cylinders.

8. A self-registering barometer. The short arm of a lever carries a float which rests on the surface of the mercury in the lower end of a syphon barometer tube. The long arm carries a light screen with a small aperture in it, which is interposed between the revolving cylinder of No. 5, and a light. The small pencil of light passing through the screen marks the photographic paper, and thus records the changes in the mercurial column. The same light which registers the barometer serves also to describe the base line for the magnetic curve, by a pencil conducted from the back of the chimney through a tube with a right-angled prism at each end of it. This instrument is shown in fig. 2.

AA, a self-registering barometer, enclosed in a case, resting on a stand.

BB, the upper and lower ends of a syphon barometer, which are of the same diameter, and of large size.

C, a float resting on the surface of the mercury, which hangs in a notch on the short arm of a lever.

D, the pivot on which the lever turns.

E, the long arm of the lever, which carries at its extremity an opaque screen F, with a small aperture, through which a small pencil of light passes.

G, a plate on which the tube rests, which is raised or lowered by a screw.

H, a stand supporting a gas-burner.

I, the register line, described by this pencil of light. The screen F will evidently rise and fall with the column of mercury, and the indications will be amplified in proportion to the length of leverage.

K, a tube with a plano-convex prismatic lens at each end of it, placed at the back of the burner; through this, a pencil of light is conducted in the direction indicated by the dotted line, and describes the base line L. By this arrangement, two pencils are derived from the same source of light, which fall perpendicularly on two remote points of the paper.

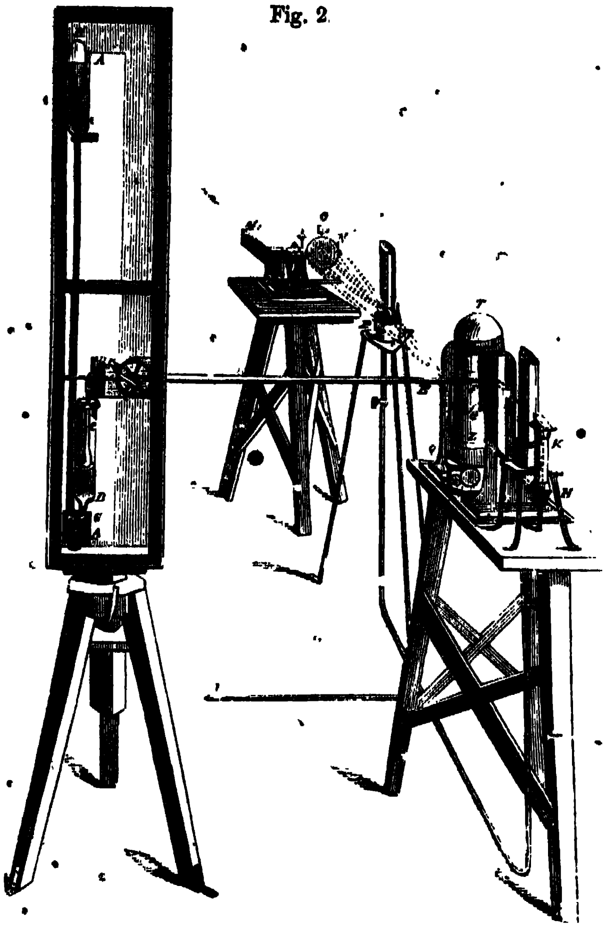
M, the balanced magnetometer.

N, a concave speculum connected with the magnet by a bar, to which are attached agate knife edges; these rest on agate planes attached to the supporting frame.

O, a plane mirror for making observations with a telescope in the usual manner.

P, a gas-burner, from which a pencil of light is reflected from the speculum N, and passing through a combination of two plano-cylindrical lenses in the frame Q, describes the register line R.

Fig. 2.



Brooke's Self registering Barometer.

S, a frame supporting a turn-table.

T, the cylinder resting on the turn-table.

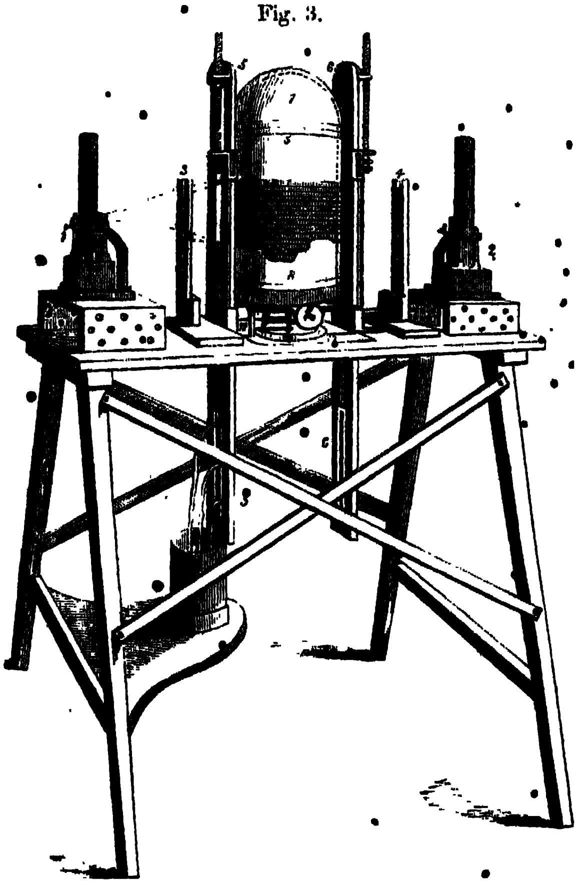
V, the gas-pipe supplying the burners.

9 and 10. Zinc cases analogous to 4 and 5.

11. A wet and dry bulb thermometer, and apparatus for registering the temperature they indicate. The registering apparatus consists of a pair of vertical concentric cylinders, similar to No. 7, supported on a table. The bulbs of the thermometers are underneath the table, through which the stems pass vertically, and are placed between the opposite sides of the cylinders and two lights. A narrow vertical line of light brought to a focus by a cylindrical lens, falls on the stem of the thermometer, and passing through the empty portion of the bore, affects the paper. The boundary between the darkened and undarkened portion indicates the position of the mercury in the stem of the thermometer. Five wires are placed across the slit in the frame, through which the light falls on the stem. They intercept narrow portions of the light, and thus the scale of the thermometer is continuously impressed on the register, as well as the temperature. This instrument is shown in fig. 3.

1, 2, camphine lamps.
3, 4, cylindrical lenses, by which a bright focal line of light is obtained.
5, the psychrometer, or wet-bulb thermometer.
6, the dry-bulb thermometer.
7, two concentric cylinders, between which the photographic paper is placed.
8, the register, as it appears after the impression is developed.
9, one of the rollers of a turn-table, on which the cylinders rest.
10, the frame which contains the timepiece.
11, a bent pin, or carrier, attached to the axis of the cylinders; this is carried round by a fork at the end of the hour-hand of the time-piece.

Fig. 3.



Brooke's Self-registering Thermometer.

As this apparatus is necessarily placed in the open air, when in actual operation, it is provided with—

12. An inner cylindrical zinc case, with sliding doors, to protect the sensitive paper from light, when the cylinder is removed from, and brought back to, the photographic room.

13. An outer wind and water-tight zinc case, with water-tight doors, for removing and replacing the cylinders, and for trimming the lamps, if lamps are used.

14. A timepiece, to show the arrangement of the train. In order to avoid the unsteadiness of the hour-hand, which in ordinary movements results from the play of the motion-wheels under the dial, the central axis which carries the hour-hand is in the train, and the axis which carries the minute-hand is placed out of the centre. As the forked or carrying arm is firmly attached to the axis, another moveable hand or pointer is added, which travels with the former, and points to the hour. The compensating-bars of the balance of this piece are composed of brass and palladium, to prevent the rate being influenced by proximity to the magnets. The numbers of the leaves in the pinions are all prime to the numbers of the teeth in the wheels with which they are in gear, to diminish the chance of irregular motion from wear, as the face of the piece must necessarily be exposed.

15. An elastic scale of vulcanized India-rubber, stretched on a brass frame, for readily marking the subdivisions of time on the registers, which differ slightly in length.

16. Specimens of the registers obtained by similar apparatus.

17. A lithographic fac-simile of one day's work of all the instruments employed at the Royal Observatory, from the volume of "Greenwich Magnetical and Meteorological Observations for 1847," to which the reader is referred for further details, as well as to a series of papers by the inventor, published in recent volumes of the "Philosophical Transactions." The most recent improvement of this apparatus is an automatic temperature compensation, adapted to the horizontal-force magnetometer, 2; and to the vertical-force magnetometer, 6. In the former instrument, this object is attained by approximating the lower ends of the bifilar suspension, by the excess of the expansion of a zinc tube, over that of a glass rod: in the latter, by the weight of a small quantity of mercury enclosed in a thermometer tube attached to the magnets, passing from one side of the centre to the other.

[The skilful application of photography, by Mr. Brooke, to register natural phenomena, with no more labour than that of supplying the cylinder punctually with prepared paper, is one of the most useful and beautiful uses to which photography has yet been applied. The paper is prepared so as to render it extremely sensitive to light, being first washed with a solution of isinglass, bromide of potassium, and iodide of potassium, in the proportion of 1, 3, and 2, respectively; and when required for use, it is washed with an aqueous solution of nitrate of silver, which causes the paper to be sufficiently sensitive to the action of light, so that if a beam of light be allowed to fall upon it, an impression is made upon that part where the light falls, which becomes visible on being washed with a solution of gallic acid, with a small admixture of acetic acid. A light is placed near a small aperture, through which rays pass and fall upon a concave mirror carried by a part of the suspension apparatus of the magnet, and this reflection falls upon a plano-cylindrical lens of glass placed at the distance of its focal length from the paper on the cylinder. As the magnet is ever varying and making small excursions on one or other side of its mean position, the point of light traces a corresponding zigzag line on the paper. The thermometer apparatus has no mirror and no reflector, the mercury in the tubes themselves intercepting the pencils of light; and thus this apparatus, throughout the day and night, is constantly recording the slightest change of position of the magnets, and the smallest changes of temperature.

The object of the self-registering magnetometer above described is to determine the direction and intensity of the earth's magnetism. Its direction is generally found by suspending a piece of steel previously magnetized, or in other words, a magnet, by parallel threads of untwisted silk, and the bar settles in that position in which magnetism causes it to rest, and which is called the magnetic meridian. The angle between the astronomical meridian and the magnetic meridian gives the magnetic declination, which is the subject of research with the declination magnetometer; at present this value in London is about 22½° west of the astronomical meridian.

Having determined the declination, the vertical plane is determined in which the force of magnetism is exerted. The angle which the magnet makes, when freely suspended on this plane from the horizon, is termed the dip. At present, the dip at London is about 68° 40′. The force of magnetism exerted in this inclined direction can be resolved into two forces, the one acting in a horizontal direction, the other in a vertical direction, so that conjointly they shall produce exactly the same force as the single force. The bifilar, or horizontal force magnetometer, is intended for measuring the variations of the horizontal component of the variations of the force of magnetism. It consists of a magnet suspended by two halves of a skein of untwisted silk, kept at a certain distance apart. If an unmagnetized bar were thus suspended, it would remain at rest only in that position in which the two parts of the suspension skein were without twist, and if it were turned out of this position, it would endeavour to resume its former position, with a force proportionate to its weight, and the angle through which it had been turned. This principle is made the means of measuring the force of magnetism. A freely-suspended magnet always endeavours to rest in the magnetic meridian.

The variations in the vertical component of the magnetic dip are the subjects of investigation with the vertical force magnet, which is a magnet placed nearly at right angles to the magnetic meridian. It is kept horizontal, or nearly so, by weights balanced with extreme accuracy, and made to vibrate like a balance; and from its different inclination, the variation of the vertical force of magnetism is determined.—J. G.]

145 **DOLLOND, GEORGE**, *St. Paul's Churchyard*—Inventor.

Atmospheric recorder. This instrument self-registers simultaneously, on paper, the varying pressures of the atmosphere, the changes of the temperature of air and evaporation, and those of the electrical states of the atmosphere, the fall of rain, the amount of water evaporated from a surface of water, and the force and direction of the wind.

[Self-registering instruments, which move equally by clock-work or otherwise, and are made subservient to the registration of natural phenomena, are of the highest importance, and particularly so in meteorological investigations, where the changes of every element of research are perpetual, and those which accrue during the night are of equal importance to those happening during the day.—J. G.]

The atmospheric recorder will correctly register the slightest change which takes place during any period of time, according to the length of the paper.

The apparatus is composed of a frame of about two feet by three feet six inches, firmly supported upon four pillars, the sides of the frame being strongly bolted together at two feet from each other. At one-fourth from each end of the frame, a roller of one foot in circumference is introduced. To one of these rollers an eight-day clock is attached, which moves it round once in twenty-four hours. At half right angles above that roller is another of the same dimensions, so arranged as to press upon it equally throughout its length. The last-mentioned roller is for the purpose of keeping the paper in contact with the driving or clock roller.

The apparatus is represented in the annexed Plate.

The roller at the other end of the frame acts as a rest for carrying the paper to be registered to a platform in the middle of the frame, which has its face in the same plane as the upper sides of the rollers.

Near the end of the frame, which is placed towards the north, is a strong bar, upon which all the fulcrums of the indicators or markers are placed, from which arms of one foot in length, having spring points at their ends for the barometer, thermometer, and hygrometer, are struck into the paper every half hour by a falling lever or frame. For the electrometer, rain, evaporator, force and direction of the wind, ever-pointed pencils are used, which make a continuous mark upon the paper, with a weight pressing upon them so as to render the marks perfectly distinct without interrupting their proper motion.

Beyond the fulcrums there are continuations of the arms of the indicators, to which are applied, by various contrivances, the powers which give motion to the indicators, in those proportions which are required by the scales of the eight instruments which mark the various changes of the atmosphere. Each indicator has its proper scale placed near to the line of the registering points and pencils, so that the last indentures or marks on the paper may be compared with their respective scales, and the time referred to at which the indication took place.

There are also a set of liners which separate each department, and form zeros or boundary lines throughout the whole run of the paper, commencing at the point or place of the indicators, from which any movement or hygrometric change of the paper may be referred to for correction.

On each side of the frame, there is a marker for time; these are governed by a wheel attached to the clock roller, which, by a lever and inclined planes, are made to register the time correctly at every half-hour, and sixth hour more strongly, for the convenience of counting. The advantage of thus marking the time on both the edges of the paper is very considerable; for when the paper is taken off, or at any time examined, a line drawn across, corresponding with the opposite marks, will show the correct period at which any change in the atmosphere took place.

Having described the general formation of the apparatus, it will be requisite to give a detailed account of those parts which are more immediately acted upon by the atmosphere, and the manner in which they are made to register the results.

The barometer is upon the siphon principle of a large bore. Upon the surface of the mercury, in the shortest leg, is placed a float very accurately counterpoised, leaving only sufficient weight to compel it to follow the mercury, and correctly adjusted to that part of the apparatus which moves the indicator, when the pressure of the atmosphere is at thirty inches. The connection of the float with the indicator is so arranged as to give a scale of three to one, which has been found to maintain the register in the most perfect manner, under comparison with an excellent instrument of the best construction.

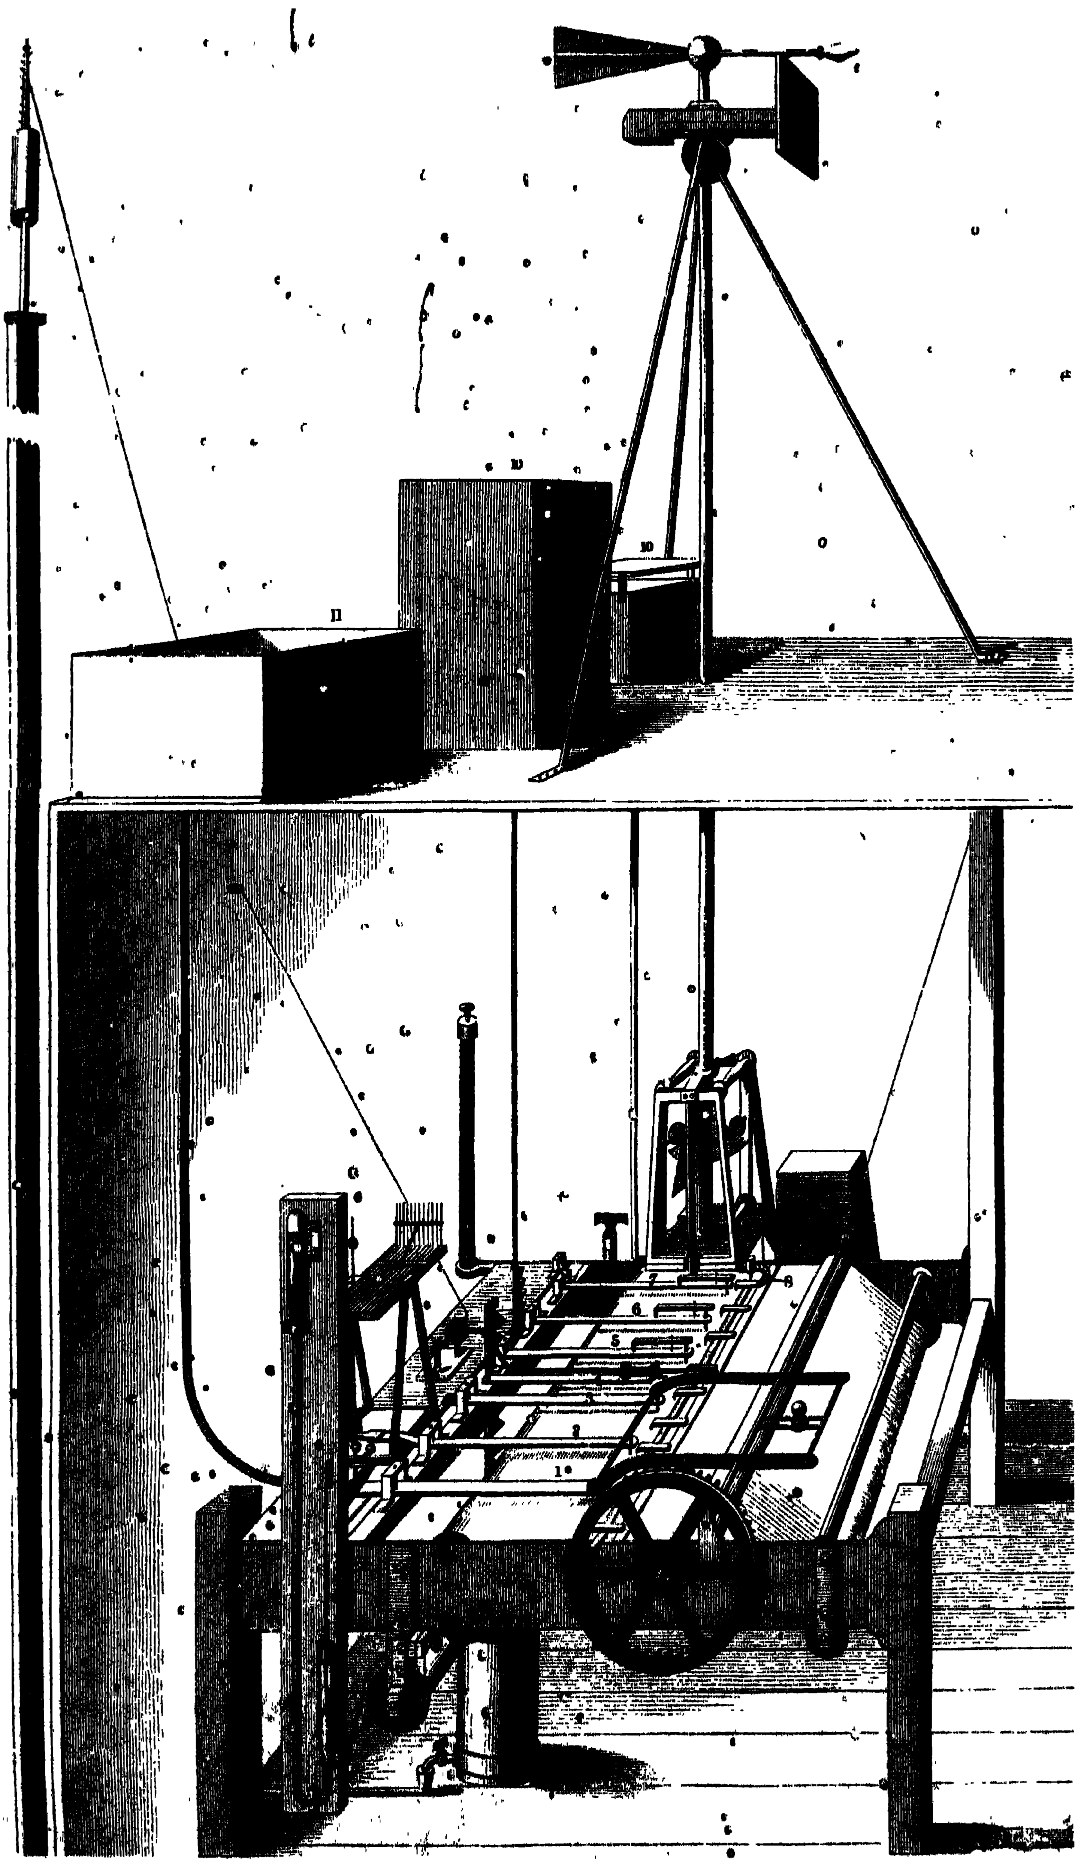
The thermometrical arrangement consists of ten mercurial thermometers of a peculiar form. These are suspended upon an extremely delicate and accurate balance, by which a correct register of all the various changes in this climate have been found to agree with the best thermometers of the usual construction. They are placed at the north end of the frame, and are screened from the effects of the wind and rain by perforated plates of zinc.

The hygrometer consists of a slip of mahogany cut across the grain. This was placed in a cylinder filled with water, and suspended from the upper end, with a weight of two pounds at the other end, until it was found by repeated examination to be completely saturated, and no longer to increase in length. The length was then referred to an accurate scale, and the slip of mahogany placed by the side of the pipe of a stove, under the same suspension and weights until its shortest length was obtained. The difference of the two results being carefully taken, the scale was formed accordingly. It is placed in a tube, open at both ends for a free passage of air, outside the observatory. It is suspended, and weighted as before, with full power to act upon the arm of the indicator, quite free from the action of the sun or rain, and is found to be extremely active and firm in its operation, showing upon an open scale every hundredth of its extremes in dryness and moisture.*

The next part of the arrangement to be described is the electrometer for thunder-storms and electric changes. This is constructed by placing a well-insulated conductor upon the highest convenient place, from which a wire is brought down to an insulation on the top of the observatory, and from thence to a standard through another insulation to a metal disc, between which and a spring there is a moveable disc attached to a glass or insulating arm, for the purpose of connecting it with an accurate support upon which it can move with the greatest facility. In connexion with this arm and disc there is a pencil carried forward to the line of indication. The spring before stated is fixed to a standard at about three inches from the first disc; to this a wire is attached and carried into the earth. By this arrangement, the electricity put in motion by a thunder-cloud is received and registered. The effect of this arrangement during a thunderstorm is extremely interesting. When a cloud charged with the electric fluid comes within the range of the conductor, the moveable disc begins slowly to pass from the first disc to the spring, discharging each time a proportion of the electricity, and increasing in rapidity of motion until the discharge of the cloud by lightning takes place. It then falls back to the

---

* This method of constructing a hygrometer was recommended by Henry Lawson, Esq., F.R.S., from one in his possession made for and used by the late Dr. Benjamin Franklin, which now performs with precision, although made more than half a century ago.



95. THE ATMOSPHERIC RECORDER. DOLLOND.

first disc, and remains perfectly quiet until the next electric cloud approaches. If, in the interim, a cloud charged with rain only should descend or pass over, no movement of the disc takes place.

The pluviometer, or that part of the apparatus which is arranged for registering the quantity of rain that falls, is formed in the following manner:—On the top of the observatory there is a receiver of one foot square, clear from all surrounding matter that might interfere with the direct fall of the rain upon its surface. From this receiver a pipe conducts the rain into another receiver inside the observatory, directly under the registering apparatus; in this there is an air-float, connected with a set of inclined planes, each inclined plane being equal to one inch of rain. These inclined planes, as they pass up, move the indicator across the destined proportion of the paper; showing, as it proceeds, the result of each drop to the hundredth part of an inch in superficies, and continues to advance until it arrives at one inch. It is then instantly discharged, and returns to the zero of the scale, or commencement of another inch. The internal receiver is calculated to contain six inches of rain, a quantity that seldom falls in this island during one month. The register will show when it is nearly full. The water can then be drawn off without the slightest inconvenience, and the float be re-adjusted to the zero of the first inch.

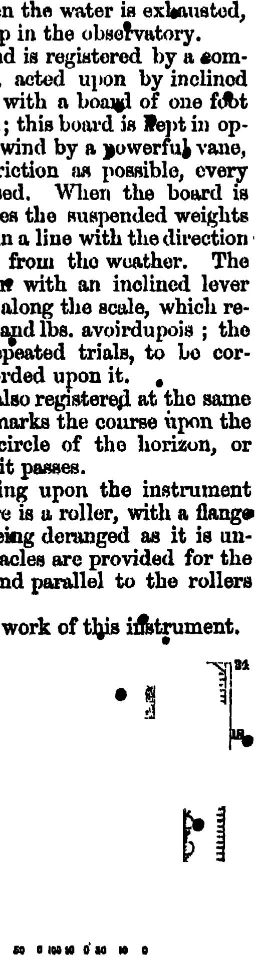
The evaporator, 10, is an open cube of one foot square, which is supplied with water from the larger vessel, and is connected with the cube by a pipe underneath the two vessels, 10-10. From that connexion the indicator of evaporation is carried to the marker or arm, 6, of the registering paper, and is supported by a float from the surface of the water in the larger vessel. The cube or evaporator is covered by a plate of glass at an angle of sufficient elevation to prevent rain from falling into it, but not so close as to resist the air from freely acting upon the surface of the water. When the water is exhausted, it may be refilled from the pump in the observatory.

The power or force of the wind is registered by a combination of suspended weights, acted upon by inclined planes or edges, in connexion with a board of one foot square to receive the impression; this board is kept in opposition to the direction of the wind by a powerful vane, its motion being as free from friction as possible, every part being correctly counterpoised. When the board is acted upon by the wind, it raises the suspended weights by a chain passing over a pulley in a line with the direction of the wind, and well secured from the weather. The suspended weights in connexion with an inclined lever carry the pencil of indication along the scale, which registers the weight lifted in ozs. and lbs. avoirdupois; the scale having been found, by repeated trials, to be correctly equal to the weights recorded upon it.

The direction of the wind is also registered at the same time by another pencil, which marks the course upon the paper, throughout the whole circle of the horizon, or that proportion through which it passes.

For the convenience of placing upon the instrument the paper to be registered, there is a roller, with a flange at each end, to keep it from being deranged as it is unrolled, for which proper receptacles are provided for the pivots underneath the frame, and parallel to the rollers above.

The cut represents one day's work of this instrument.



The end of the paper is carried from this roller over the one above, at the north end of the frame, and conducted under the indicators, and over the platform to the driving and pressing rollers; it is then to be drawn forward until it reaches a similar roller to that on which it was first rolled, also underneath the frame; to this roller it is then to be fastened by springs prepared for that purpose. This roller has attached to one of its pivots a worm, upon which a weight is wound up; which weight is equal to the power requisite to wind up the paper as it comes from the driving roller, leaving a space between them, which gives the observer an opportunity of seeing what has been registered during the last twenty-four hours.

For the purpose of reading off the register when removed from the apparatus, there are a set of scales in combination, corresponding correctly with those upon the instrument.

The whole may be placed in a room six feet square, having an opening to the north for the convenience of placing the thermometer out of the range of the sun's rays, and the better for the action of the hygrometer. For the convenience of the lightning conductor and vane, an upper room would be preferable.

Lawson's meteorological thermometer stand: this apparatus consists of a frame (fig. 1) of white deal boards, and can be formed or constructed by any carpenter. It is represented in the cut. It is made of an oblong trunk, T, 12 inches by 8 inches outside measure; to the opposite sides of which are nailed boards, *b*, *b*, at the distance of three-quarters of an inch, and projecting about six inches from it towards the north. Outside of these are nailed other thin boards, *c*, *c*, full half an inch distant, and projecting about four inches beyond the last-mentioned boards, also towards the north. These sides or shades prevent the sun from heating the interior of the stand where the thermometers are placed. The top, or pent board, P, is made double, and the boards are placed at full three-quarters of an inch distant from each other, and come forward so as to overhang, by a full inch, the night index thermometer, placed immediately beneath, for the purpose of preventing rain or dew from falling perpendicularly upon the bulb of the thermometer. The legs, L, L, of the stand are merely the continuation of the sides of the trunk. The board, F, F, is loaded, or the feet fixed to the ground, to sustain the force of the wind. The interior, T, is blackened to prevent strong reflections of light.

The whole is to be painted white, and no other colour; except the face of the trunk, which may be black, to prevent strong reflections of light.

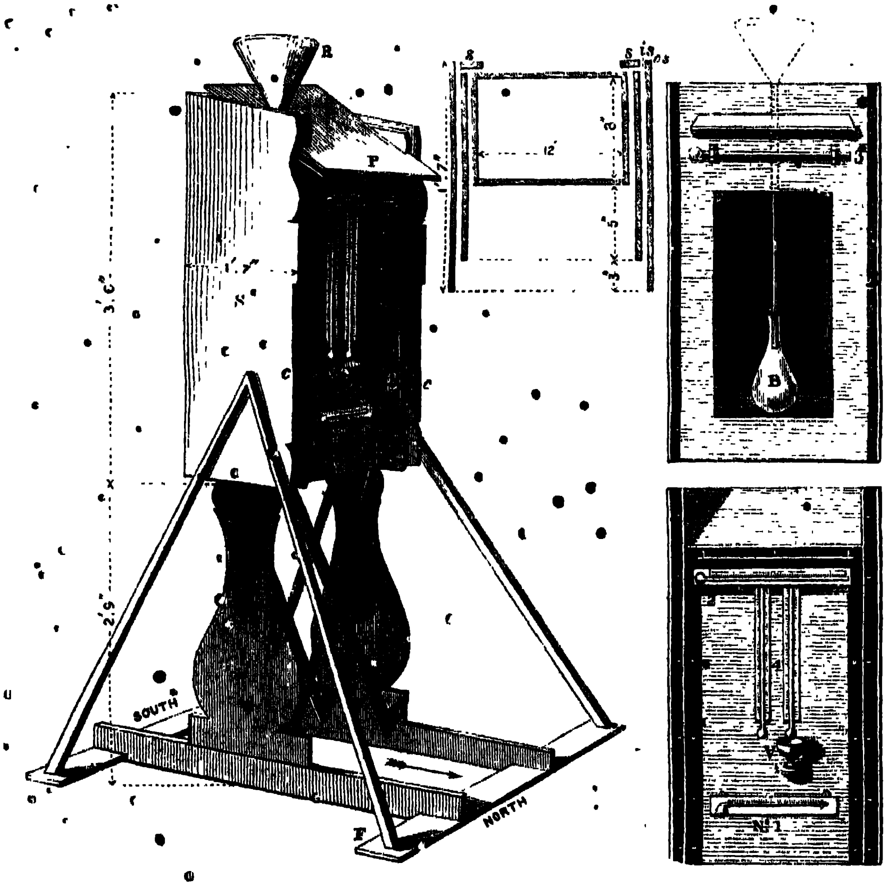
Fig. 4 is a ground plan, or bird's-eye view of the machine, which will assist any intelligent workman in its construction. The sides and wood-work generally are of half-inch white deal. The distance between the sides of the trunk T (fig. 1), and the board, or inner side, *i*, *s*, (fig. 4 is three-quarters of an inch; and the distance from that board to the outer side, *o*, *s* (fig 4), is full half an inch. The narrow boards, *s*, *s*, (fig. 4), are to be nailed, with studs intervening, to the middle board or side *i*, *s*; and are designed to prevent the sun from shining between the trunk and the sides, *o*, *s*, and *i*, *s*, when near the meridian. The sides are fixed, one upon the other, at the required distance (viz., three-quarters of an inch, and half an inch), by numerous wooden studs, shown in figs. 1, 2, and 3, about three quarters of an inch diameter; the nails or screws passed through the sides and studs, fixing the whole firmly together. The whole is to be painted white, except the face of the trunk T, which may be black, to prevent strong reflection of light.

Fig. 2 is the view of the north side of the stand. No. 1 is an index thermometer, to give the greatest heat of the air in the shade each day. No. 2 is an index spirit thermometer, to give the greatest cold of the night. No. 4

are two thermometers, with finely-graduated scales, which are called the wet and dry bulb thermometer, to show the power of air to evaporate water. V is a conical vase of considerable size to hold water for the wet bulb thermometer; it is of glass, for the purpose of seeing when it requires re-filling, and conical, to prevent its being broken by frost.

Fig. 3 is the view of the south side of the stand. No. 3 is an index mercurial thermometer, with a black bulb, to give the greatest solar heat of each day. R is a rain gauge, which conveys the rain into the bottle, B, enclosed within the trunk, T (fig. 1). From the bottle, B, the water is to be poured into the gauge tubes, provided for the purpose of showing the quantity of rain that has fallen.

The meteorological thermometer stand, as above arranged, will be found to possess the following advantages. It can be placed in any eligible spot that may suit the convenience of its owner. Its four sides being placed to face the cardinal points, it commands a true north and south aspect. It can be visited on every side, and be free from all surrounding objects. The instruments or thermometers used can be read off with the greatest facility; and the whole will be at a known distance from the ground. Those instruments placed on the south face will have the meridian sun; and those on the north face will be always in the shade, in consequence of the projecting wings. It can be employed by any meteorologist, wherever residing. It is of a determinate form, height, and size. The instruments may be read off with promptitude, so as to prevent or reduce errors arising from the person of the observer being too long in the vicinity of the thermometers. By the general adoption of this stand, instruments placed upon it will all be used or observed, under similar circumstances; and deductions therefrom be more correctly drawn than at present. It follows, therefore, that observations made either in Europe, Asia, Africa, or America, if drawn from instruments thus similarly placed, can be compared with each other more accurately than heretofore.



Lawson's Thermometer Stand

In using instruments a certain adroitness is necessary; but a little practice will render the use of the thermometer stand in every respect easy. The thermometers used should have their bulbs perfectly free from the scales, whether of metal or wood, and a space of at least half an inch should be interposed between the bulb of each thermometer and its scale, and the place whereon it is fixed; as in some states of the atmosphere great error will be the consequence of their touching any surrounding body. The metallic indices in the tubes of registering thermometers are apt to tarnish and cease to slide with the required ease, which may be prevented by passing them up and down the tube, half a dozen times, at every notation of the thermometer. When the thermometers are put by, and out of use, the indexes should be moved to the end of the tube furthest from the bulb, and left there.

146 GOOD, S. A., *H.M. Dockyard, Pembroke*—Inventor.

New method of transmitting motion, applied to a globe for illustrating the effect of the earth's diurnal motion upon the plane of a pendulum's oscillation at any latitude. Provisionally patented.

148 SCHOLEFIELD, DANIEL, *Freeman's Sq., Huddersfield*—Manufacturer.

Portable metronome, for denoting time in music; it weighs less than half an ounce, and can be carried in the waistcoat pocket.

149 HARRIS, WILLIAM, & SON, 50 *High Holborn*—Manufacturers.

Patent compensating portable barometers for measuring the heights of mountains, and peculiarly applicable for marine purposes. House barometer. Patent pocket travelling barometer.

New and improved self-registering thermometer.

Patent micrometrical and double-image telescope, and "coming-up glass," according to Brewster, for measuring distances either on sea or land. Applicable as a micrometer for the purposes of practical astronomy; as a naval telescope, for measuring distances at sea; and as a "coming-up glass," for ascertaining whether a ship is approaching to or receding from the observer.

151 **MERRYWEATHER, GEORGE, M.D.,** *Whitby, Yorkshire*—Designer and Inventor.

"Tempest prognosticator," or, atmospheric electro-magnetic telegraph, conducted by animal instinct; for the protection of life and property.

152 **HEWITSON, J.,** *Newcastle-upon-Tyne*—Inventor and Manufacturer.

Self-acting and self-registering tide gauge and tidal indicator, recording with accuracy any variation of the tide, and requiring no supervision. Time is kept by an astronomical clock, with pendulum vibrating seconds. Hours, minutes, and seconds shown on their respective circles, with the height of the tide at the moment of observation, exhibited on the opposite dial. In connexion with the instrument, other machinery is applied to exhibit to an observer, on a large scale, and to be seen at a great distance, the depth of water on the bar, or over shoals, or, in short, at any given place.

154 **BRYSON & SONS,** *Edinburgh*—Inventors and Manufacturers.

Five models, exhibiting the various escapements of watches at present in general use.

Self-registering barometer clock.

157 **ROSS, ARCHIBALD HILSON,** 25 *Bridge St., Sunderland*—Inventor and Designer.

A self-compensating barometer, having the scale which denotes the height of the mercurial column attached to float on the surface of the mercury in the cistern, to show the height of the barometrical column, which is the exact distance between the two surfaces. Design, a Corinthian column, supporting a figure of the late Sir Robert Peel.

157A **CASELLO, LOUIS P., & CO.,** 23 *Hatton Garden*—Manufacturers.

Combined comparative barometer; designed, arranged, and manufactured by the exhibitor; exhibiting the Torricellian, the Cartesian, and wheel barometers, and sympiesometer, acting in combination; with varying scales of 1, 11, 4, and 2 inches respectively.

Improved self-registering window thermometer, which, while it protects the scale from the weather, admits of setting and correct reading without opening the window.

Small pocket barometer, adapted for measuring heights.

Brown's registered barometer, made by the exhibitor, and exhibited for accuracy and cheapness.

158 **LOVEJOY, G.,** *Reading*—Proprietor.

A novel timepiece, consisting of a dial of glass, in the centre of which an index-hand turns and points out the time, without any visible mechanism. It keeps correct time; strikes the hours and half hours; and requires only to be wound up once in twenty-one days.

159 **GRIMOLDI, HENRY,** 31 *Brooke Street, Holborn*—Maker.

Improved pediment barometer in carved gilt frame.

160 **SANDERSON, G.,** *Mansfield, Nottingham*—Designer.

Map of the country twenty miles round Mansfield, in the county of Nottingham, upon a scale of one inch to 36 chains, or 2,376 feet.

160A **NEGRETTI & ZAMBRA,** 11 *Hatton Garden*—Inventors and Manufacturers.

Standard open-cistern barometer, with adjusting scale.

Self-registering barometer.

New pocket barometer.

Pocket sympiesometer or air barometer.

Standard thermometer, with comparative scales for atmospheric and chemical purposes.

Rutherford's thermometer.

Sixes' self-registering thermometer.

Set of very sensitive thermometers, for delicate experiments.

Registered thermometer for out-door exposure.

Three of the most approved hygrometers now in use: a Daniel's hygrometer: a dry-bulb and wet-bulb thermometer, and Regnault's condenser hygrometer; the latter instrument is so constructed as to be used like the preceding one, having been altered from Regnault's original form, by substituting black glass for silver caps, to avoid the necessity of cleaning the caps, an operation rendered necessary by the oxidation of metal caps.

Two distinct thermometers in one stem.

Simple and improved pressure gauge, less liable to get out of order than the ordinary mercury gauge.

[The dry and wet bulb thermometers consist of two of these instruments, whose readings, when under the same circumstances, are identical. In use, one of the bulbs is covered with thin muslin, and moistened by means of water passing by capillary action from a vessel containing that fluid, and will take a temperature depending on the amount of moisture in the air. If the air be saturated with moisture, there will be no difference in the readings of the two thermometers; but if the air be not saturated, it will take up additional vapour: this vapour will be combined with heat, and the reduction of temperature will be shown. The different readings of the two thermometers will be according to the quantity of heat which has been required to change the state of water on the bulb to vapour. From the readings of the dry and wet bulb thermometers, nearly all hygrometrical problems can be solved. Ether is more generally used for evaporation with Daniell's hygrometer.—J. G.]

161 **ORCHARD, JOHN,** *Kensington*—Designer and Manufacturer.

Standard barometer, with various improvements.

Series of rack slides for magic lanterns, to show the varied movements of the planets.

Air-pump—having no valve to interfere between it and the receiver, so that the air can be exhausted from the receiver to such an extent as to freeze a vessel of water placed over sulphuric acid for desiccation.

162 **PIZZALA, FRANCIS AUGUSTUS,** 19 *Hatton Garden*—Designer and Manufacturer.

Wheel barometer or weather glass, with rack-work motion, intended to supersede the use of ordinary glass weights. The case is carved in walnut, of novel design, representing the leaves, buds, blossoms, &c., of the lilac, larkspur, collomia, potato-bloom, Solomon's seal, and other plants. The dial-plate is engraved with a globe in the centre, surrounded by the signs of the zodiac.

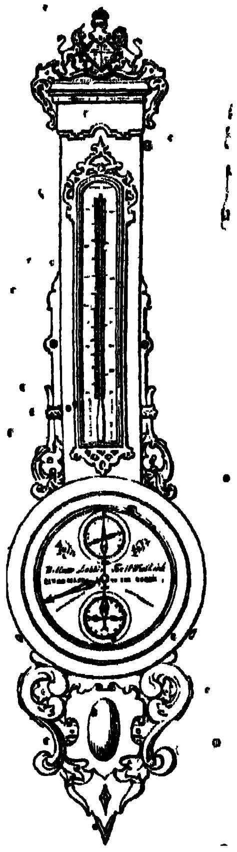
163 **TREMLETT, RICHARD,** 9 *Albemarle Street, St John's Sq., Clerkenwell*—Inventor and Manufacturer.

Marine barometer, in metal frame, with thermometer, &c., and enamelled metal scales and springs, to check oscillation.

166 **DOBBIE, WILLIAM,** *Falkirk, Scotland*—Manufacturer.

Barometer, on an improved construction, which has two indices, the one of the common range, and the other pointing out the thousandth part of an inch in the rise and fall of the mercury.

This instrument is represented in the annexed cut.



Dobbie's Improved Barometer.

168 **COLLARD & COLLARD**, *Cheapside*—Manufacturers.

Grand pianoforte, in British mottled oak, with gold decorations, in the style of Louis Quinze; bichord pianoforte, square semi-pianoforte, vase form, and grand cabinet pianoforte, all with the patent check and repeater action.

Pianoforte for the people.—(*Grand pianoforte in Main Avenue.*)

---

175 **LISTE, G. B.**, *Southampton*—Inventor.

An apparatus for setting fractures, and as a rest for the treatment of other accidents and diseases of the lower extremities. Manufactured by J. R. Stebbing, Southampton. It is stated that a surgeon, by the use of this apparatus, can, without any other assistance, set simple, compound, and comminuted fractures of the lower extremity: that it keeps the fractured ends of the bone in apposition, without the aid of splints for the after-treatment; that tight straps or bandages encircling the limb above the injury, are not employed; that the limb, when the bone is set, can immediately, or at any time during the healing process, be put into any position that may be most comfortable to the patient without inconvenience. This apparatus is also stated to be an excellent rest for the treatment of fractured patella, diseased hip-joints, popliteal aneurism (by compression), varicose veins, ulcers, and other accidents and diseases of the lower extremities.

---

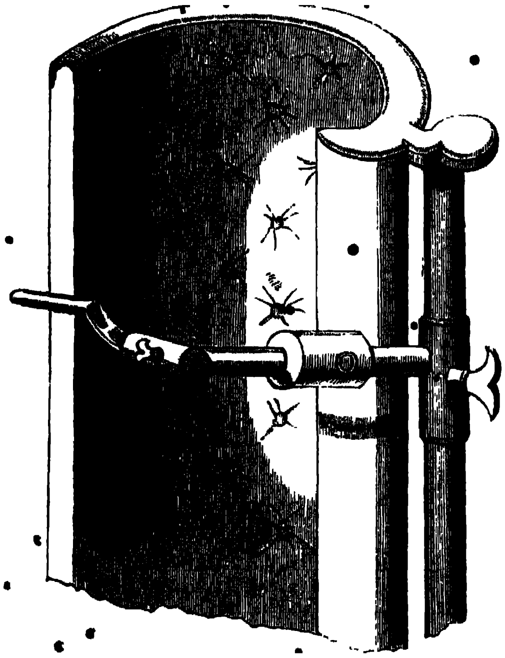
181 **MATTHEWS, WILLIAM**, 10 *Portugal Street, Lincoln's Inn Fields*—Manufacturer.

Stethoscope—the ear-piece, subserving the uses of both a conductor and sounding board, is of large dimensions, so as to transmit the vibrations of the instrument undiminished.

[The science of medicine is indebted to Laennec, a French physician, for the discovery of the stethoscope. This physician first made known the important fact, that diseases of the heart and lungs might be rendered perceptible to a practised ear by the intervention simply of a hollow cylinder of wood. The instrument in all its forms is merely a medium for the conveyance of sound, healthy or morbid, to the ear of the physician. Stethoscopes are made in various materials; those of light deal are to be preferred.—R. E.]

Specula for the ear, &c., made of glass, silvered with silver leaf, and covered with cotton cloth and elastic gum.

Gilbert's patent fulcrum and chair, for extracting teeth. This apparatus is shown in the annexed cut:—



Gilbert's Tooth Extractor.

New swinging apparatus for the treatment of fractures of the leg; to prevent the bed-clothes from interfering with the motion of the leg.

Inhaler, for opium and other medicines requiring the aid of heat for their inhalation.

Inhaler, for administering chloroform in surgical operations, with water-bath to regulate the evaporation.

Inhaler, for hydrocyanic acid, conicine, and other medicines. Table knives.

---

187 **BATEMAN, JOSEPH, LL.D.**, *East India Road*, and *Inland Revenue Office*—Designer and Proprietor.

Centrifugal machine, illustrating planetary motion.

The object of this machine is to exhibit the remarkable tendency of all bodies, having a longer and shorter axis, to revolve upon their shorter axis: a tendency common to all the planetary bodies, as far as we are acquainted with their motions, as well as to all bodies on or near the earth's surface. To illustrate this tendency, a model of the planet Saturn is suspended by its longer axis, and set in revolution by means of a machine which, in the present instance, is regulated by clockwork. As soon as it is in motion, the model, of its own accord, quits its vertical position, and assumes a horizontal one, so as to spin on its shorter axis, and this it continues to do as long as the motion is kept up,—just in the same way as the planet itself is revolving at millions of miles distance. The machine is fitted up in open brass-work, the escapement for which has been arranged by Mr. Jennings, of Birmingham. It is mounted on a kind of triumphal arch, executed by Mr. Flint and Mr. Stokes, of the same place. And the model planet revolves in a circular space, representing the solar system, surrounded by the signs of the zodiac, painted on glass by Mrs. Bateman, and Mr. Mason, of Exeter.

188 **RICHARDS, N.**, 3 *Somerset St., Aldgate*—Proprietor.

Globe, with an endless rotary action, named "the geographical instructor."

---

189 **MORRISON, JAMES DARSIE**, 6 *Rankeillor Street, Edinburgh*—Manufacturer.

Mineral teeth in gold plate, with compound swivels, by means of which the mouth may be opened wide, without displacing the plates from the gums.

Set of teeth, the under gold-screwed, the upper gold-lined.

Set of carved teeth made from the hippopotamus' tusk; with a variety of other teeth of different styles and manufactures.

190 **RYLES, MOSES**, *Cobridge, Staffordshire Potteries*—Inventor.

An apparatus, of a peculiar construction, showing the ebb and flow of the tides.

---

191 **PAXON, WILLIAM**, *Hampstead*—Proprietor.

Lunarian, with improved contrivance for showing the phases of the moon.

---

193 **MATHEWS, MARY**, 16 *Westbourne Street, Hyde Park Gardens*—Inventor.

"Astrorama," with a sketch explaining its use. A concave representation of the heavens, with the apparent diurnal motion of the stars, and the real paths of the planets, folding up in the form of an umbrella.

---

194 **ASHE, W. AUSTIN**, 15 *Brompton Crescent*—Proprietor.

Great circle course indicator, invented by Lieut. E. D. Ashe, of the Royal Navy. Its object is to point out the course which a ship must steer in order to sail on a great circle between any two places on the globe, instead of steering by the true bearings of the port to which she is bound, and thereby materially shortening the voyage, in some instances to the amount of 600 miles.

[It is well known that the shortest line which can be drawn between any two places on the surface of the globe is the arc of the great circle intercepted between them; great circle sailing, however, cannot always be practised, but it may be usefully combined with other sailings. This instrument is adapted as a companion to Mr. Towson's tables for "Great Circle Sailing," lately published by order of the Lords of the Admiralty.]

---

195 **FACY, RICHARD**, *Wapping Wall*—Designer and Manufacturer.

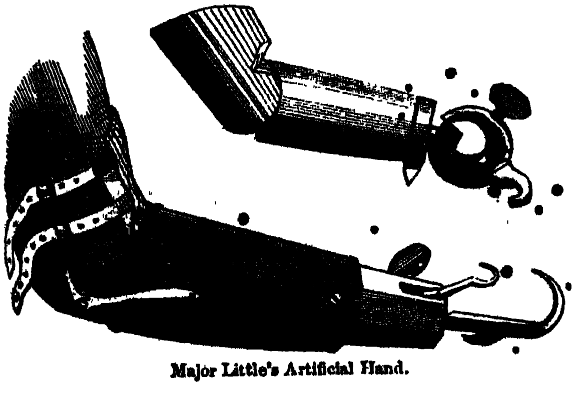
A vertical orrery, exhibiting the diurnal and annual motion of the planets; also, showing the path of a comet whose perihelion distance is less than the mean distance of Mercury, and whose aphelion distance extends beyond the farthest known planet in the solar system.

---

196 **LITTLE, Major R. J.**, *Woolwich Common*—Designer.

Apparatus, and a few small tools in a case, contrived to meet the loss of the right hand: its objects—simplicity, durability, and cheapness. Manufactured by Gaze, 14 Beresford Street, Woolwich.

This apparatus is shown in the annexed cut.



Major Little's Artificial Hand.

197 **ROPER, W.**, *Bath*—Manufacturer.

The "reclinia." Invented by Henry Lawson, Esq., for the purpose of enabling astronomers to use large telescopes with greater speed and comfort.

198 **JOHNSTON, W. & A. K.**, *Edinburgh*—Manufacturers.

A terrestrial globe, 30 inches in diameter, showing the geological structure of the earth, the currents of the air and of the ocean, the trade winds, trade routes, monsoons, and isothermal lines, or lines of equal temperature. The stand is carved in walnut, and was designed and manufactured by W. Davidson. It has, at the four corners of the base, heads emblematical of the four seasons. Surrounding the compass-box are figures which represent the four quarters of the globe, with their appropriate emblems; and the circular supports of the horizon are composed of clusters of fruit, indigenous to the quarters of the world over which they are suspended.

[The temperature of any particular month, or any place, varies very much in different years, and its true value can only be determined from observations made during a long series of years. Professor Dove, of Berlin, has collected the observations made at nearly 900 stations on the globe, and from them he has constructed maps of the isothermal lines, by joining those places, by lines, whose temperature was found to be the same.—J. G.]

200 **FLETCHER, PETER**, 11 *South St. Andrew Street, Edinburgh*—Manufacturer.

Pair of globes, terrestrial and celestial, with cases; showing the various stages in globe making.

201 **ALLAN, THOMAS**, 20 *St. Andrew's Square, Edinburgh*—Inventor.

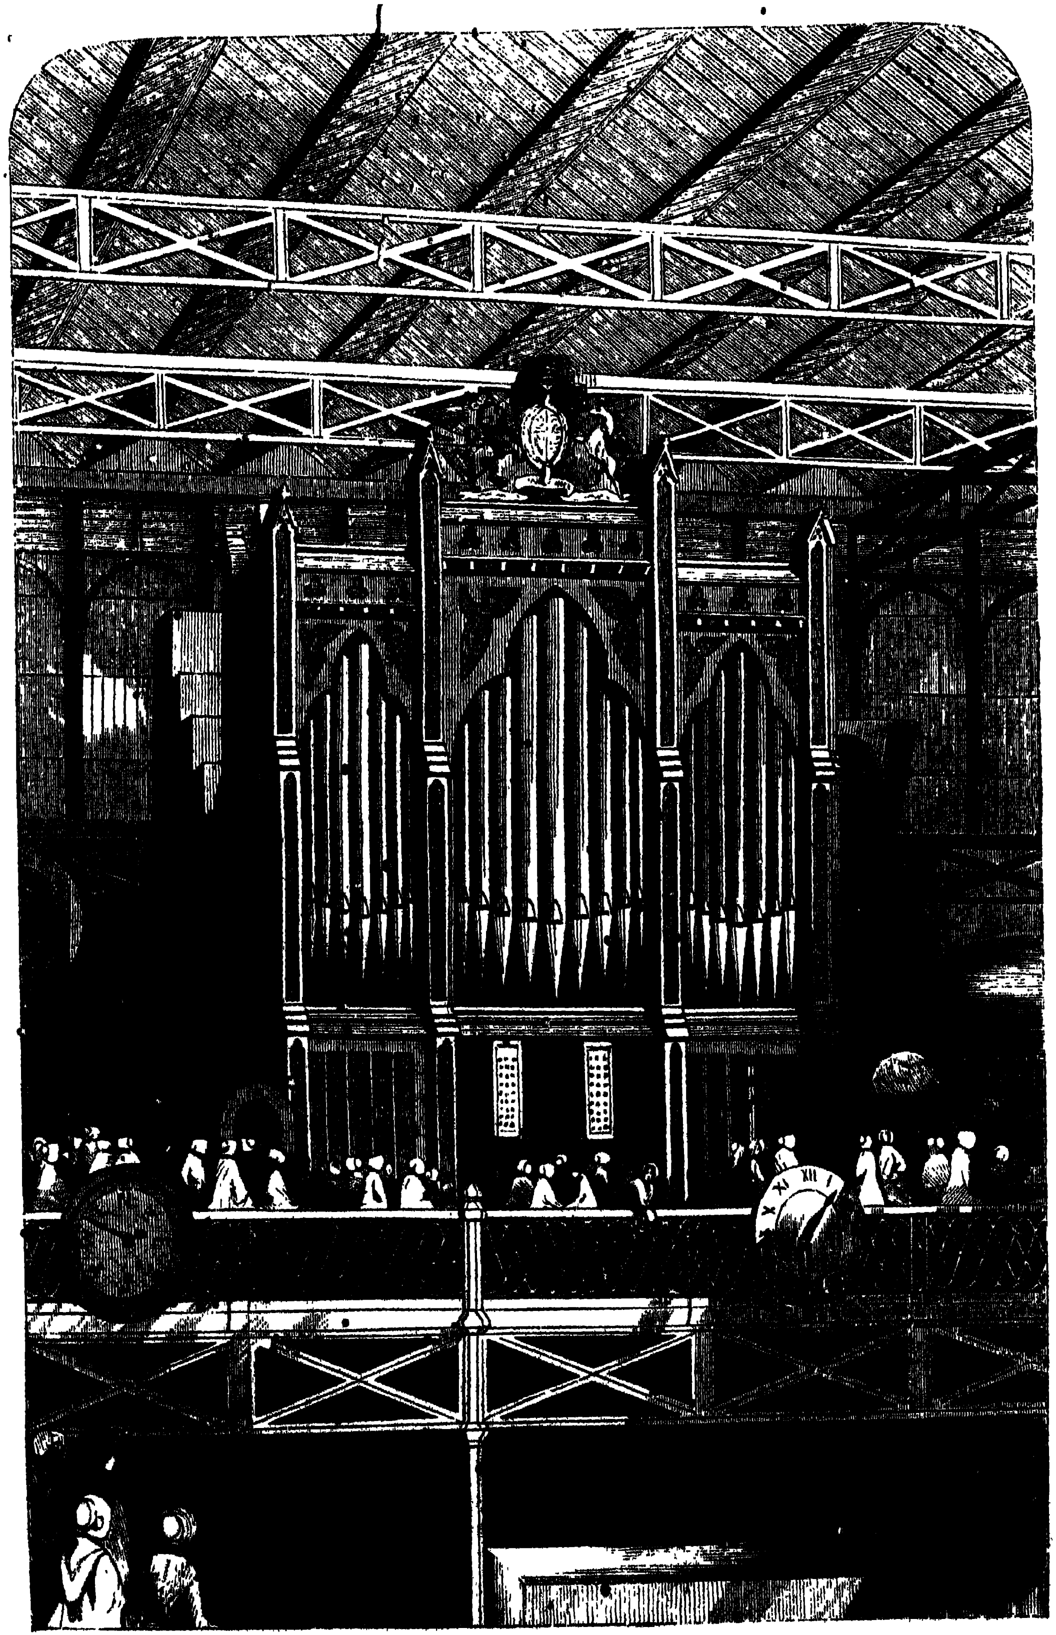
Two pairs of patent electric telegraphs.

[The general principle upon which electric telegraphs depend for their indications, is the remarkable fact discovered by Professor Oersted, that a magnetic needle freely moving on its axis is capable of being turned to one side by the transmission of an electric current through a wire placed parallel and near to it. It was subsequently found, that by placing the needle so as to surround it with a coil composed of many lengths of insulated wire, this effect was immensely multiplied, and a very feeble current became sufficient to deflect the needle so placed. The galvanometer was thus invented, and subsequently—the needle-telegraph. It is obvious that a means of communicating signals was discovered when this fact was first developed, since a needle thus placed might be arranged at any distance, and being connected with the operator by insulated wires, he could cause it to turn to one side at pleasure. Such is the principal feature of the needle-telegraphs. These instruments consist essentially of the following parts—a source of the electric current, or voltaic battery, a medium through which it can be conveyed without loss, or insulated wires, and a magnetic needle arranged so as to be influenced by its passage, which is generally suspended in front of the index-plate of the apparatus, upon which certain marks are arranged. The movements of two such needles, and the combination of signals which these obviously afford, form the alphabet, or signal code of the electric telegraph.—R. E.]

---

202 **MURDOCH, JAMES**, *Rothes, Fochabers, Elgin, Scotland.*

Mechanical indicator of eclipses, without mean motions, intended to unite simplicity and expedition in operations. Invented by the exhibitor.



Willis's Grand Organ.

204 **STOKER, JOHN**, *Doncaster*—Inventor and Manufacturer.

Angular terrestrial globe, adapted for the ready solution of geographical problems, and particularly to show the true motion of the earth in its orbit.

Spherical geographical clock, intended to show the difference of time between two given places. Provisionally registored.

---

205 **SAUNDERS, GEORGE, & SON**, 278 *Strand*.

An original revolving kaleidoscope. The object of this instrument is to afford useful information to designers, pattern-drawers, &c.

Octagon temple, containing metallic tablet, razor strops with four sides.

Mechanical revolving pictorial kaleidoscope.

Metallic tablet razor strops.

---

207 **EDKINS & SON**, 16 *Salisbury Square, Fleet Street*—Manufacturers.

Pair of 18-inch globes.

208 **MALLOCH, P.**, 18 *Market Street, Edinburgh*—Inventor and Producer.

Mechanical indicator for teaching geography, designed and manufactured by the exhibitor.

The means used are studs placed in their proper position, as on the map, which on being pressed down raise others at the index, and thus indicate the correctness of the places wanted.

---

209 **WILLIS, HENRY**, 18 *Manchester Street, Gray's Inn Road*—Designer and Manufacturer.

An organ, with three rows of keys, and two octaves and a fifth of pedals. This instrument is built upon the German plan, viz., 8 feet manuals, and 32 feet pedals; it contains 77 stops, nearly 4,500 pipes, the largest being CCCC 32 feet, the smallest C ⅜ of an inch. The great and swell organs are played by means of the pneumatic lever, applied vertically, and worked without the aid of additional wind pressure. In the choir and pedal organs are introduced two newly-invented patent valves, over which the pressure of the air has little influence; also a patent movement in connexion with a compound application of the pneumatic lever, which brings the instrument entirely under the performer's command. The mechanism includes several new arrangements, and in the various bellows there are five different pressures of air. This organ is represented in the opposite page as it stands in the Exhibition.

[The superiority of the German plan for building organs chiefly consists in its preserving a balance of power amongst its various masses. The attention of our native builders has been profitably directed to this essential point for some time past, and we hope the time will soon come when an instrument will not be considered complete without a commensurate pedal organ.—H. E. D.]

An organ, consisting of a swell, with 22 stops.

A choir organ of 14 stops.

A great organ of 20 stops.

A pedal organ of 14 stops, and several coupling stops, exhibiting various improvements, including an extensive use of the "pneumatic lever."

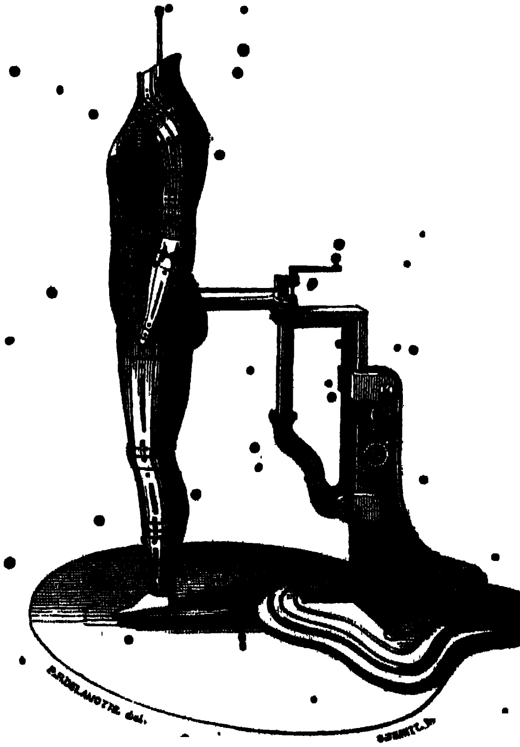
[Organs on the pneumatic principle were first introduced into churches by Pope Vitalianus, anno 666. Coupling-stops are used for combining two or more keyboards, so that playing on one produces the effect of both.—H. E. D.]

---

210 **DUNIN, MR. C. DE**, *London*—Inventor, Manufacturer, and Patentee.

Piece of mechanism intended to illustrate the different proportions of the human figure: it admits of being expanded from the size of the Apollo Belvidere to that of a colossal statue.

The external part of the figure consists of a series of steel and copper plates sliding upon each other, and kept in contact by screws, nuts, and spiral springs; attached to these plates, and within the figure, are metal slides, having projecting pins at their extremities: these pins are inserted in curved grooves cut in circular steel plates; the curvature of these grooves being so arranged that when the steel plates are put in revolution by a train of wheels and screws the slides belonging to each particular part of the figure are expanded or contracted in correct proportion. The elongation of the figure is accomplished either by sliding metal tubes, provided with racks, and acted upon by a combination of wheels, or by screws and slides, as found most applicable for each particular part. Besides the general adjustments described, each part of the figure has an independent and separate adjustment, by which it can be put out of its correct likeness to the Apollo Belvedere, and made to represent the deformities or peculiarities of form of any individual. The varieties of figure and size of the human body are so numerous that it necessarily requires a great number of movements to represent them. Some idea may be formed of the number of mechanical combinations included in the figure, from the following list of the parts of which it is constructed, viz.—875 framing-pieces, 48 grooved steel plates, 163 wheels, 202 slides, 476 metal washers, 482 spiral springs, 704 sliding plates, 32 sliding tubes, 497 nuts, 3500 fixing and adjusting screws, and a considerable number of steadying pinions, &c., making the number of pieces, of which the figure is composed, upwards of 7000. It is stated that this invention could easily be made applicable in the artist's studio; but that its more immediate object is to facilitate the exact fitting of garments, more especially in cases where great numbers are to be provided for, as in the equipment of an army, or providing clothing for a distant colony; that personal attendance is not required, since there is adapted to the figure, a new system of measurement which enables any person to take the exact size and form of an individual; and from the measurement so taken, the figure can be adjusted to represent correctly the person to be fitted, so that the clothing may be tried on, and, if necessary, altered with as much facility as if the original person, whose measure had been taken, were present.



Count Dunin's Mechanical Figure.

An establishment provided with three or four of such figures, would be sufficient to fit perfectly, and without any subsequent alteration, the clothing of an army of several hundred thousand men, at whatever distance they might be from the establishment.

The inventor states it as his intention to present this figure to his Majesty the Emperor of all the Russias.

212 **NEWTON, WM., & SON**, 66 *Chancery Lane, and* 3 *Fleet Street*.—Manufacturers.

Large manuscript celestial globe, 6 feet in diameter, in which the positions of the stars are laid down from Flamstead's Catalogue, brought up to the year 1850.

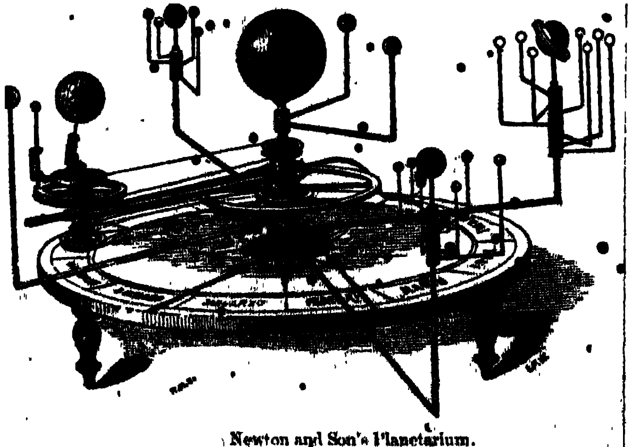
Pair of 25-inch globes, in carved rosewood frames.

Slate globes of various sizes, with the meridians and parallels of latitude marked upon them, so that outline maps may be drawn by the student with pencil.

Variety of globes of various sizes, and in different kinds of mounting.

Newton and Son's Terrestrial Globe.

Complete orrery, or planetarium, in which the motions of the earth and moon, and of the planets and their satellites, are effected by mechanism, actuated by clockwork.



Newton and Son's Planetarium.

Orreries, for educational purposes.

Armillary sphere, mounted in a brass meridian, and attached to a brass stand.

Spherical sun-dial for a lawn.

[A celestial globe is an inverted representation of the heavens, on which the stars are laid down according to their relative positions. The eye is supposed to be in the centre of the globe. A terrestrial globe is a representation of the surface of the earth as far as it is known. The diurnal motion of this globe is from west to east, whilst that of the celestial globe is from east to west, to represent the apparent diurnal motion of the sun and stars.—J. G.]

213 **BENTLEY, JOSEPH**, 13 *Paternoster Row*—Inventor and Publisher.

Plano-globe. The northern and southern hemispheres are printed on circular pieces of pasteboard; each is confined to its revolving movement, by a brass meridian, allowing the same facility in working problems as the ordinary globe.

215 **PLANT, FREDERIC**, *Nottingham*—Inventor.

Mechanical orrery: the sun being represented by a luminous body.

Model of a self-regulating steam-boiler feeding apparatus, being a substitute for the common force-pump and regulating float, &c.

218 **ADORNO, J. N.**, 6 *Golden Square*—Inventor and Patentee.

A machine designed to measure and exhibit the ratio between the periphery and diameter of the circle.

A machine or instrument designed to draw ellipses derived from cylinders and cones, and also the other conic sections, as parabolas and hyperbolas.

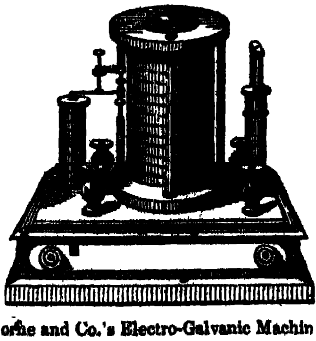
A terrestrial and celestial globe combined, with the constellations arranged for facilitating the solution of astronomical problems, and for geographical and nautical purposes; with an apparatus to show the passage of the earth among the signs of the zodiac in its annual orbit, and the position of the sun in the opposite signs.

A terrestrial globe, capable of separation into pieces, which may be used as convex maps for navigation, and other geographical purposes.

Twelve patent convex maps of the earth, invented by the exhibitor, to form a geographical sphere, or to be used separately for marine purposes, and to constitute useful and ornamental fittings for rooms or cabins.

220 **HORNE, THORNWAITE & WOOD**, 123 *Newgate Street*—Manufacturers.

Electro-galvanic machine and set of instruments, for medical galvanism. The current of galvanism produced by this machine "flows only in one direction," and the quantity and intensity of the current are capable of being easily regulated. Represented in the following cut:—



Horne and Co.'s Electro-Galvanic Machine.

Apparatus for exhibiting dissolving views, chromatropes, &c., by the oxyhydrogen lime light, with illustrative paintings and apparatus, showing the method of producing the light, the arrangement of the lenses, and contrivance for dissolving the pictures.

Oxyhydrogen microscope and apparatus, in case.

Daguerreotype apparatus, consisting of an adjusting back camera, with compound achromatic lens, an improved bromine and iodine box, with contrivance for transferring the prepared plate to the frame of the camera, mercury box, plate-box, chemical-chest, buffs, plate-holders, gilding stand, tripod, &c. The parts of the apparatus are so arranged that the process may be entirely performed in the light, without the necessity of a dark room.

Registered portable folding calotype camera, with achromatic lenses, for portraits and views, &c.

Improved reversing frame, for producing positive pictures from calotype negatives and other photogenic processes.

Registered improved agricultural drainage-level.

Balance galvanometer, for indicating the strength of galvanic currents in grain weights.

"Optometer," an instrument for ascertaining the existence of any defect in the refracting media of the eye, and for determining the range of adjustment for distances which it possesses.

Patent electric indicator, for fire and thieves.

Planning rule, comprising the chief scales required by architects and surveyors, with a peculiar arrangement of the odd and even scales, and reading from the edges.

Chemico-mechanical voltaic battery.

Registering hygrometer.

Bust of Napoleon Bonaparte, from a model by Canova, executed by the electrotype process.

Similar bust of Sir Walter Scott, from a model by Chantrey.

Transparency, exhibiting the appearance of the lunar disc when in direct opposition to the sun, as seen through Herschel's 40-feet reflecting telescope.

233 **GRAHAM, GEORGE,** 8 *Liverpool Street, Walworth*—Inventor.

Invention for directing an aerial machine.

234 **GILBERT, G. MOUBRAY,** *Ealing*—Proprietor.

Patent portable celestial and terrestrial globes, inflated with atmospheric air, manufactured of superior tissue paper. The celestial globe is particularly adapted for the use of lecturers on astronomy: a view of the stars in their true position may be thus obtained.

The terrestrial globe is inflated by means of an air-pump, or simple movement of the hand.

[A view of the stars in their true position, relatively to each other and to the observer, can only be obtained by placing the eye inside of the celestial globe at its centre. A view of the countries of the earth in their true position can only be obtained by placing the eye *outside* of the terrestrial globe, at an infinite distance; but this being impossible, the greater the distance, the more accurate is the view.]

Charvolant, or carriage drawn by kites.

---

237 **LUNTLEY, JOHN,** *New Broad Street Court*—Inventor and Manufacturer.

Model of a self-propelling rotary balloon. Provisionally registered.

Specimens of engraving by the ruling machine, composed of circular, elliptical, spiral, straight, and graduated lines. Designed to prevent fraudulent imitation; with a border in chromo-lithography.

248 **PRITCHARD, ANDREW,** 162 *Fleet Street*—Inventor and Manufacturer.

An achromatic microscope.

249 **HETT, ALEXANDER,** 24 *Bridge St., Southwark*—Preparer.

Variety of injected microscopic objects, showing the application of this mode of preparation, for displaying the structure of parts and organs, and also serving to illustrate the utility and importance of the microscope in its application to the sciences of physiology and pathology.

Microscope to exhibit the objects.

[The injection of coloured substances into the minuter vessels of the animal frame is an art peculiar and difficult. Leuwenhoek succeeded perhaps better than any previous, and the majority of subsequent, observers, in preparing minute injections, many of which are still preserved as precious relics by the Royal Society. The injections employed consist of substances fluid when warm, and partially solidifying when cold. The apparatus employed is a powerful pump, the taper nozzle-piece of which is inserted into an artery.—R. E.]

---

250 **FIELD, ROBERT, & SON,** 113 *New Street, Birmingham*—Manufacturers.

Large and small achromatic microscopes, with moveable stage.

Dissecting microscope, with Wollaston's doublets.

Compound achromatic lenses for photographic purposes.

Calotype pictures; scene: Forest of Arden, Warwickshire; staircase, Haddon Hall, Derbyshire; and Wych Elm, Packington churchyard, Warwickshire.

[The calotype picture is a negative one, in which the lights of nature are represented by shades; but copies from them can readily be made in which the lights are conformable to nature.—J. G.]

252 **POULTON, CORNELIUS,** *Southern Hill, Reading*—Manufacturer.

Objects prepared and mounted for the microscope, with illustrative drawings by Mr. M. S. Legg.

---

253 **SMITH, JAMES, & BECK, RICHARD,** 6 *Coleman Street*—Manufacturers.

Glass case; in the top, are stands for compound achromatic microscopes, constructed so as to avoid tremor, with adjustments and complete apparatus. In the middle, are the requisites for mounting microscopic objects, the cells, slips, thin glass, fluid-covers, &c., and a few preparations as specimens. The bottom is a new form of cabinet for the objects.

Two tables, with revolving tops, for successively turning the microscope to two or three persons who can conveniently sit round.

[A compound achromatic microscope consists of two or more combinations of lenses, by one of which an enlarged image of the object is formed, and by means of the other, or eye-glass, a magnified representation of the enlarged image is seen.]

---

254 **ROSS, A.,** 2 *Featherstone Buildings, Holborn*—Inventor and Manufacturer.

Astronomical telescope, the diameter of the object-glass is 11½ inches, mounted on a stand, with equatorial movements and complete adjustments. The optical part wrought by Ross's improved system and machinery.

This instrument is exhibited in the Western Nave.

[The grinding of an object-glass of 11½ inches in diameter to a good figure, and free from both spherical and chromatic aberration, is very difficult. The advantage of a large object-glass will be seen from the following consideration. The principal reason of the superior distinctness of a telescope over unassisted vision arises from the fact, that the pupil of the eye takes in a certain number of rays of light; but, on looking through a telescope, it takes in as many more rays in proportion as the object-glass is larger than the pupil itself, and the object appears as brilliant as it would were the pupil of the eye to be enlarged to the size of the object-glass.—J. G.]

Chemical pottery wares. Complete apparatus for distillation and condensation. Manufactured in terra cotta chemical-stone ware, to stand great heat, and lined with acid-proof glaze.

Astronomical telescope, 3⅜ inches in diameter, mounted on an equatorial stand.

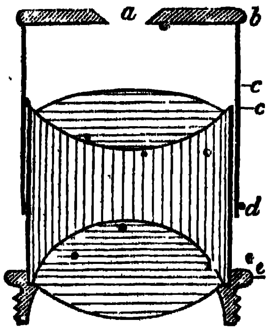
Astronomical telescope, 2½ inches in diameter, mounted on a pillar-and-claw stand.

Improved microscopes, with new method of illumination. Improved photographic camera obscuras.

254A **READE, Rev. J. B., F.R.S.,** *Stone Vicarage, Aylesbury*
—Inventor.

Positive solid eye-pieces. (*Main Avenue West.*)

The solid eye-piece (see the following cut) consists of two double convex lenses, *c* and *e* of crown glass, with an intermediate double concave lens, *d*, of flint, having the contact surfaces cemented together. The cap, *b*, contains a small eye-hole, *a*. Its novelty consists in its construction, which secures a large and flat field of view, together with the removal of spherical and chromatic aberration. In consequence of the purity of its achromatism, the webs of the transit instrument and micrometer are seen as fine black lines, and hence it is found by experiment that observations are made more perfectly than with the common positive eye-piece which is not achromatic. No light is lost, as in the usual construction, by inner reflections, and there is no formation of the false image or "ghost" of planets and the brighter stars. From the following data the curves of the lenses may be determined for a given focal length;—



Reade's Solid Eye-piece.

Index of refraction of flint . .	1·600
Index of refraction of crown . .	1·523
Ratio of dispersive powers . .	0·657
Thickness of flint lens	0·775 × *f*.

where *f* = whole focal length for parallel rays.

---

256 **HUDSON, FREDERICK THOMAS,** *Greenwich*—
Producer and Designer.

Microscopic objects—being minute parts of animal, vegetable, and mineral tissues, and structures, prepared for examination by the microscope.

---

257 **VARLEY & SON,** 1 *Charles Street, Clarendon Square*—Inventors and Makers

Graphic telescopes, by which general views or images of objects, may be accurately traced, of any size.

Reversing camera, by which pictures of objects may be traced the reverse way.

Microscope, in which the moveable stage is kept parallel to one position whilst moved about in any direction.

Reflecting telescopes.

Model of the apparatus for mounting together and changing three small speculums of large Gregorian telescopes, so as not to lose sight of the object; thus the power may be doubled, or quadrupled, or reduced without loss of time.

Air-pump, with crank motion and double-acting single barrel. New double-acting exhausting air-pump.

Portable electrical apparatus: on moving the inner tubes to and fro, the outer tube becomes charged in the same manner as the Leyden phial.

---

258 **JACKSON, E. & W.,** 315 *Oxford Street*—Inventors.

Thin glass, used for microscopic purposes, and for the polarization of light. Cells for mounting microscopic objects. Slides for microscopic purposes; exhibited for economy in production.

---

259 **CHADBURN BROTHERS,** *Sheffield and Liverpool*—
Manufacturers.

Specimens of glass in the rough state, suitable for spectacles.

Glass, cut round and oval, ready for cementing on the blocks.

A block of glasses ready for grinding, being plane or parallel.

A block of glasses ground to the required radius. The focus of the glass depending on the radius of the lap in which they are ground.

A lap, 12 inches radius; glasses when ground on both sides in it, are 12 inches focus.

A block of glasses, ground and polished, ready to be taken off. Tool used for polishing the glasses.

A block of concave glasses finished; being cemented in the lap, they are ground hollow.

Glasses ready for fitting into spectacles. The exhibitors grind 750 dozen per week, on the average.

Provisionally registered portable barometer. The improvement consists in making the cistern of glass (which is covered) with a flexible cover, which can be pressed down, so as to prevent the mercury oscillating when the barometer is carried about or packed for travelling.

Optical lenses, of various kinds. Spectacles—reading and magnifying glasses, &c. Opera glasses and small telescopes. Day or night ship and signal telescopes. Large and portable achromatic telescopes. Simple and compound microscopes. Magic lanterns and views. Camera-obscuras and diagonal mirrors. Agricultural and surveyors' levels, &c. Horse-shoe and other magnets. Steam and vacuum gauges. Barometers, &c. Garden and window syringes. Galvano-electric machines. Ship's berth or side illuminators and ventilators. Working models of steam-engines, &c. Craig's charactograph.

---

260 **BOND, J. W.,** *Emma Street, Ann's Place, Hackney Road*—Inventor and Manufacturer.

Natural objects, prepared in Canada balsam, for the oxyhydrogen microscope.

---

263 **ABRAHAM, ABRAHAM, & CO.,** 20 *Lord Street, Liverpool*—Manufacturers.

Trinoptric prismatic lantern, with apparatus for making oxygen gas, viz.: gas bag, retort, and purifier, invented by the Rev. St. Vincent Beechy. It combines the powers of three lanterns, with one small lamp of intense brightness. A disc of 25 feet for each tube may be obtained, and each disc is capable of being darkened to any required extent, without shadow on any portion of the picture.

Dioptric prismatic lantern, producing two in lieu of three discs.

Compound miscroscope, exhibited for workmanship.

Portable sketching camera obscura. In the optical arrangement, a meniscus and prism are employed in lieu of a lens and mirror, and a vivid flat picture is obtained.

[The trinoptric and dioptric lanterns exhibited, are for the purpose of producing panoramic and other pictures, generally displayed by means of the phantasmagoria lanterns and dissolving-view apparatus. The lamp employed is an oil-lamp, supplied with oxygen gas, on the principle of the Bude light.]

264 **RICHARDSON, T. W.**, *Brede, near Northam, Sussex*—Inventor.

A reflecting telescope, for observing the sun's surface: the reflector, made of crown glass, is part of a paraboloid of revolution.

Improved screw for straining wire fences. Hop-tallies.

Specimens of the prismatic colour on glass, &c.

265 **WILLATS, T. & R.**, 28 *Ironmonger Lane, Cheapside*—Inventors and Manufacturers.

Improved portable photographic camera and stand, for obtaining pictures by any known photographic process, on metal plates, paper, glass, &c.

The advantages of this form of camera are, the facility with which it can be packed into a small compass; the adjustments for placing the paper or plates at the proper focus, without exposing them to the daylight; and the comparatively small weight of the apparatus: thus rendering the practice of photography easy to a traveller.

Improved registering thread calculator, or linen prover, to ascertain the number of threads in a given space, of silk, linen, or cotton fabric, and to register this number on paper.

It is of importance in purchasing any woven fabric, to ascertain the number of threads, warp, and woof, contained within a square inch, as the knowledge of these enables the purchaser to judge of its strength and durability. This instrument is devised to render the operation easy to the merchant.

266 **SALMON, WILLIAM JOHN**, 254 *Whitechapel Road*—Manufacturer.

Day or night telescopes for ships' use.

267 **CRICKITT, R. E.**, *Doctors' Commons*—Designer.

Universal equatorial telescope-stand, to revolve round the polar axis without altering, and at the same time to secure steadiness.

268 **CALLAGHAN, W.**, 45 *Great Russell Street, Bloomsbury*—Manufacturer.

An improved deer-stalking telescope.

A pair of portable steel spectacles.

269 **PILLISCHER, MORRICE**, 398 *Oxford Street*—Designer and Manufacturer.

Large and small achromatic microscopes, with the stage movements simplified.

Students' microscope, capable of forming a portable dissecting, as well as clinical microscope, with all the necessary apparatus.

Double achromatic opera-glass. Opera-glasses, mounted in tortoiseshell and gilt, and mounted in ivory.

Newly invented compasses, for describing ellipses of any size.

Six's thermometer in ivory, for registering maximum and minimum temperatures.

270 **CARPENTER & WESTLEY**, 24 *Regent Street*—Manufacturers and Proprietors.

Phantasmagoria lanterns, with the latest mechanical and optical arrangements. Set of lenses, and a set of sections of the apparatus to show the optical principle.

Paintings of natural history, with some of the same subjects in outline, as printed from copper plates, and supplied to artists.

Series of astronomical diagrams. Paintings adapted to dissolving lanterns.

[The phantasmagoria lanterns exhibited are a scientific form of magic-lantern, differing from it in no essential principle. The images they produce are variously exhibited, either on opaque or transparent screens. The light is an improved kind of solar lamp. The manner in which the beautiful melting pictures called dissolving views are produced, as respects the mechanism employed, deserves to be explained. The arrangement adopted in the instruments exhibited is the following:—Two lanterns of the same size and power, and in all respects exactly agreeing, are arranged together upon a little tray or platform. They are held fast to this stand by screws, which admit of a certain degree of half-revolving motion from side to side, in order to adjust the foci. This being done in such a manner that the circle of light of each lantern falls precisely upon the same spot upon the screen, the screws are tightened to the utmost extent, so as to remove all probability of further movement. The dissolving apparatus consists of a circular tin plate, japanned in black, along three parts of the circumference of which a crescentic aperture runs, the interval between the horns of the crescent being occupied by a circular opening, covered by a screwed plate, removeable at pleasure. This plate is fixed to a horizontal wooden axis, at the other end of which is a handle, by which the plate can be caused to rotate. The axis of wood is supported by two pillars, connected with a flat piece which is secured to the tray. This apparatus is placed between the lanterns in such a manner that the circular plate is in front of the tubes of both, while the handle projects behind the lanterns at the back. The plate can, therefore, be turned round by means of the handle, without difficulty, from behind. A peg of wood is fixed into the axis, so as to prevent its effecting more than half a revolution. The widest part of the crescentic opening in the plate, is sufficiently so to admit all the rays of the lantern before which it happens to be placed. On the plate being slowly turned half round, by means of the handle behind, the opening narrows until it is altogether lost in one of the horns of the crescent. The light of that lantern is gradually cut off as the aperture diminishes, until it is at length wholly shaded under the moveable cover occupying the interval between the horns of this crescentic opening. In proportion as the light is cut off from one, it is let on from the other tube, in consequence of the gradually increasing size of the crescent revolving before it, until at length the widest part of this opening in the plate is presented before the tube of the second lantern, the first being, as we have seen, shaded. This movement being reversed, the light is cut off from the second lantern, and again let on from the first, and so on alternately. Thus while the screen always presents the same circle of light, yet it is derived first from one lantern, then from the next.

When in use, a slider is introduced into each lantern. The lantern before the mouth of which the widest part of the opening in the plate is placed, exhibits the painting on the screen, the light of the other lantern being then hid behind the cover. On turning the handle, this picture gradually becomes shaded, while the light from the second lantern streams through the widening opening. The effect on the screen is the melting away of the first picture, and the brilliant development of the second, the screen being at no instant left unoccupied by a picture.

The principle involved in this apparently complex, but in reality simple mechanism, is, merely the obscuration of one picture and the throwing of a second in the same place on the screen. And it may be accomplished in a great variety of ways. Thus, by simply placing a flat piece of wood, somewhat like the letter Z, on a point in the centre, so that alternately one or the other of the pieces at the end should be raised or depressed before the lanterns, a dissolving scene is produced. Or, by fixing a moveable upright shade, which can be pushed alternately before one or the other of the lanterns, the same effect is produced.

Individuals exist in this metropolis whose sole occupation consists in painting the minute scenes or slides used for the phantasmagoria lanterns. The perfection to which these paintings are brought is surprising. There are two methods by which the sliders now employed are produced. In one of these, the outline and detail are entirely the work of the artist's pencil. For pictures representing landscapes, or wherever a spirited painting is required, this is the exclusive method employed. The colours are rendered transparent by being ground in Canada balsam and mixed with varnish. The other method is a transfer process. The outlines of the subjects are engraved on copper plates, and the impression is received from these on thin sheets of glue, and is then transferred to a plate of glass, the impression being burnt in the same manner as is effected in earthenware. Sliders produced in this way receive the distinctive name of copper-plate sliders. The subject is merely represented in outline, it being left to the artist to fill up with the necessary tints, &c. The advantages of this method for the production of paintings of a limited kind are obvious. Latterly photography on glass has been employed to obtain pictures for the magic lantern.—R. E.]

271 DIXEY, C. W., 3 *New Bond Street*—Manufacturer.

Carved oak barometer. Barometer showing the action of the mercury. Improved nautical sextant. Assortment of spectacles. Eye-glasses. Binocular opera-glasses. Thermometers. Registered thermometers. Telescopes. Mathematical drawing instruments. Ivory rolling parallel rule (fully divided).

---

273 BAYLEY, ROBERT, 18 *Half Moon Crescent, White Conduit House*—Manufacturer.

Gold and steel spectacles.

274 GODDARD, JAMES THOMAS, 35 *Goswell Street*—Manufacturer.

Achromatic object-glass for a telescope of 9 inches aperture, and about 16 feet focus.

[The larger glass placed in telescopes, or that which is placed the farthest from the eye, is termed the object-glass. If this glass consists of a single lens, the image of a circular object will not be a perfect circle, as it ought to be, for such a lens will not refract all the rays falling upon it to a single point, and will cause an image in its focus to be both distorted and coloured; the former defect arises from the fact that no spherical lens will produce a perfect image; and the latter, from the unequal refrangibility of the coloured rays which, united, form a perfectly colourless image, and thus the image will be surrounded with several colours. The most important improvement in object-glasses was made in the year 1757, by Dollond. This was effected by making the object-glass double, one portion being made of flint glass and the other of crown glass, of different refractive powers, which mutually correct each other, and thus give a pencil of light entirely colourless. Such object-glasses are called achromatic.—J. G.]

274A EVANS, W., *Brecknock, South Wales*—Inventor and Manufacturer.

Artificial leg, to enable persons who have lost the knee either to walk or ride. By a concentric action a stiffness is given to the knee joint, which causes a pressure in the stirrup equal to nature, and requires only a touch of the finger outside the trousers or breeches, under the knee-joint, before mounting; by a similar touch on the front of the thigh, before dismouting, the pressure is removed, when the person may walk with ease.

276 CLARK, F., 13 *Park Side, Knightsbridge*—Inventor and Manufacturer.

Newly-invented adjusting spectacles and opera glasses.

---

278 HYAMS, HYAM, 59 *Cornhill*—Inventor and Manufacturer.

New object-glass, acting as a telescope or opera-glass, and consisting of only a single piece of glass or lens, in the shape of a truncated cone, having a convex surface at the base or large end, and a concave surface at the other.

Improved Stanhope lens of a conical shape.

---

279 WEABER, HENRY, 129 *Oxford Street*—Manufacturer.

Invisible steel spectacles; gold spectacles, and a variety of other spectacles, and hand-glasses.

---

280 WHITEHOUSE, NATHANIEL, 2 *Cranbourn Street*—Proprietor and Manufacturer.

Artificial eye. Artificial silver nose.

Solid silver opera-glass. Gold spectacles to fold in a walking-stick.

Tortoiseshell spectacles. Improved sketching spectacles, without rim to obstruct vision.

Invisible spectacles; the frame being let in, the glass is concealed.

---

281 WOODMAN, JAMES T., 6 *Commercial Place, Commercial Road, Peckham*—Inventor and Manufacturer.

Portable self-adjusting leg and foot rest. Its advantages consist in the facility of being raised to the required height, and its immediate self-adaptation to the position in the leg or foot may be placed. If necessary the whole action may be made rigid without removal of the limb. As to size, it can be packed in a common carpet bag.

---

283 BRAITHWAITE, S., 169 *Kirkgate, Wakefield*—Inventor and Manufacturer.

Registered ventilating eye-shades.

284 STARK, ROBERT M., 1 *Hope Street, Edinburgh*—Inventor and Manufacturer.

Microscopic objects of vegetable origin, prepared in gutta percha cells; intended as a substitute for glass cells, being equally durable, and produced at less cost. They are adapted for most vegetable and animal tissues, requiring to be kept in a liquid medium.

Slides for exhibiting opaque objects under the microscope. The groove in the centre, to receive the cover, is made with a circular bit designed for that purpose.

[It is an evidence of the progress of microscopic knowledge, that the preparation of objects of the kind described constitutes at present a distinct art.—R. E.]

285 JORDAN, CHARLES, 37 *Chapman Street, Manchester*—Inventor and Manufacturer.

Case of optical instruments for surgical and other purposes:—

No. 1 is an instrument for the inspection of the internal parts of the ear. The instrument as seen in the case, with silver truncated tube, is for the ear only. The silver tubes Nos. 2 and 3, the two long brass tubes, the sliding tube No. 4 (with magnifier), and the large brass tube, are used for other internal parts of the body.

No. 5 is an instrument for the Eustachian tube: an elastic tube is made to slide inside a silver one, and inside the elastic tube, is a steel spring wire for the purpose of giving curvature to the elastic tube, when introduced into the Eustachian tube.

Before introducing the instrument the elastic tube must be partially withdrawn from the silver tube, and when the orifice of the Eustachian tube is felt, the elastic tube must be gently slid therein, when the spring wire will adapt itself to the required curve.

The wire is intended to convey a feeble galvanic current through the membrane tympani, through a little aperture at the end of the elastic tube; when the wire is withdrawn, fluid or vapour may be injected.

No. 6 is a lamp for illuminating the deep cavities of moulds in iron-founding, &c. Much inconvenience has often been felt by moulders in large foundries for want of a right method of directing light down the deep parts of moulds.

Ivory concentric shells, turned from the solid ball. The ball is five inches diameter; there are 14 shells, the inner ones being 1-20th inch thick and the space 1-16th inch between each shell. The tusk from which the ball was turned weighed 160lbs.

Specimens of all the useful metals and alloys, showing the surface and fracture.

286 **Solomon, Joseph**, 22 *Red Lion Square*—Manufacturer.

Registered papier maché opera glasses. Eye protectors, &c.

287 **King, Thomas D.**, *Bristol*—Designer and Manufacturer.

Compound achromatic microscope mounted on a pyramidal tripod, with mechanical stage, traversing in rectangular planes by micrometer screws, achromatic condenser, polariscope, double refracting goniometer, cobweb micrometer and other eye-pieces, insect forceps, and various accessories. In this microscope the weight is equally distributed over the base, and when inclined at its working angle, the chief portion is brought below the point of suspension; the traversing stage has divided scales and verniers, whereby admeasurements can be accurately determined.

Student's compound achromatic and single microscope.

Improved spherical prismatic illuminator, for transparent and opaque microscopic objects, enabling the rays of light to be thrown either obliquely or vertically.

288 **Earl, Francis J.**, *Pitt's Head, Grange Road, Bermondsey*.

A perpetual calendar. Registered.

289 **Braham, John**, 17 *St. Augustine's Parade, Bristol*—Manufacturer and Inventor.

Spectacles, from their earliest invention: various modes adopted by Sir Isaac Newton, Drs. Kitchiner, Wollaston, and Herschel. Perfect and imperfect lenses. Lenses, from 60 inches to 1½ inch focus. Meniscus and double-convex lenses.

Specimens of Brazilian crystal.

Mode of producing convex and concave lenses for spectacle-eyes.

Improvements on Wollaston's principle of curved lenses.

Model of the eye.

Spectacles without rims; and hand-frames.

Patent pantoscopic spectacles, in gold, silver, steel, and shell mountings.

Double pantoscopic lens, for near and far sight; the same worked in one disc of glass (two pairs). Registered trigonometer, for measuring and protracting angles from a centre.

Herapath's registered gas blow-pipe.

290 **Rowley, J.**, *Wolverhampton*—Manufacturer.

Front of a pair of spectacles worked out of a solid piece of cast-steel.

Improved spectacles, the sides being so formed that they may be used without being placed upon the head; they also include Braham's patent.

Pair of spectacles, with several improvements.

Spectacles, exhibited for their extreme lightness, worked out of best cast-steel; weight, 2 pennyweights.

Globular glass travelling spectacles. Wire-gauze eye-preserving spectacles. Horse-shoe eye-preserving travelling spectacles. Another pair (finer). Small oval eye spectacle, preserver glasses. A similar pair, oblong. Small octagon eye spectacles. Folding hand-spectacle, or double eye-glass. Inclosed spring hand-spectacle, or double eye-glass. Folding hand-spectacle, or double eye-glass. Oval single eye-glass for reading. Octagon single eye-glass for reading. Hexagon single eye-glass for reading. Eye-glass handle, a preservative for the glass.

291 **Mayall, J. E.**, 433 *West Strand*—Producer.

Daguerreotypes of various kinds.

Daguerreotype panoramas.—Niagara Falls. Fairmount Water Works, Philadelphia. Birthplace of Shakspeare. River Avon, with a view of Stratford Church. Ann Hathaway's House.

[By a little expenditure of ingenuity, it is perfectly possible to take daguerreotype views of nature in the open fields, by the river side, or on the sea-shore. All that is necessary is to obtain a means of transferring the prepared plate, and also of mercurializing it when impressed, in the dark; and by a small amount of manual dexterity, with the assistance of a piece of black velvet, this may be accomplished.—R. E.]

Daguerreotype pictures to illustrate poetry and sentiment, the backgrounds in some cases being sketched, and the sitter posed so as to make the whole harmonise together. The Soldier's Dream (Campbell), an illustrated poem (from life), in four tableaux. The Venerable Bede blessing an Anglo-Saxon child (after nature). The Lord's Prayer, in a series of ten designs (from life). The Fisher Boys, a study from nature; and a variety of others.

[The application of the daguerreotype to the production of the pictures referred to is effected in the following manner:—The sitter, or the persons comprising the group, dressed in appropriate costume, are artistically posed so as to form a *tableau vivant*, and in this position are taken by the ordinary process. The background is procured either by placing the sitters in front of a scene painted upon canvas, in which case the plate receives the impression as usual, and the scene appears as a natural background to the figures; or, in other cases, the plate is painted with a fine brush, and the landscape, &c., are thus artificially sketched upon its surface. The practised eye will immediately decide which of these methods have been adopted.—R. E.]

Frame of interesting specimens, including a portrait of Daguerre, the inventor of the art.

[The discovery by M. Daguerre of the sensitiveness to luminous impressions of an iodized silver plate, and of the development of the picture by mercurial vapour, was first announced to the French Academy of Sciences, by M. Arago, in January, 1839. The original process is not now pursued, bromine and iodine, in combination or succession, being employed to render the plate sensitive to light.—R. E.]

Daguerreotypes of sculpture, and novel applications of the art to a variety of subjects.

"Crayon daguerreotypes."

[This peculiar process is understood to be a French invention. In No. 1197 of the *Athenæum*, Mr. Mayall has described, in the following terms, the method of producing crayon daguerreotypes:—

"First. Take a daguerreotype image on a prepared plate as usual, taking care to mark the end of the plate on which the head is produced. When taken, and before mercurializing, remove the plate and place on it a plate of glass, prepared as follows: Second. Cut a piece of thin plate glass of the same size as the daguerreotype plate; gum upon one side of it a thin oval piece of blackened zinc, the centre of the oval to coincide with the centre of the image upon the plate. Having carefully placed the glass thus prepared, with the centre of the zinc disc, upon the centre of the image, expose the whole to daylight for twenty seconds. The action of the light will obliterate every trace of the image from every part of the plate, except that which is covered with the blackened zinc, and also from the thickness of the glass the action will be refracted under the edges of the zinc disc, and will soften into the dark parts. Third. Mercurialize the plate as usual; the image will be found with a halo of light around it, gradually softening into the background. By grinding the glass on which the disc is fixed, and by altering the size and shape of the disc, a variety of effects may be produced."

The appearance of these pictures is extremely singular. The fact that the exposure of plates already impressed with an image in the camera-obscura to daylight entirely removed the original impression, is one of the practical discoveries made by every daguerreotypist who has accidentally lifted the shutter of the plate-holder after removing it from the camera. But such an application of this fact could scarcely have been anticipated.—R. E.]

Specimens of photography, on glass.

[The art of photography on glass is more recent than either the daguerreotype or talbotype processes. But the principles upon which it is successfully practised are essentially similar to those involved in the latter art. In consequence of the inequality of the texture of photographic paper, it became desirable to obtain some more homogeneous medium for the reception of the negative talbotype picture. Glass and porcelain have been employed with great success for this purpose. In order to render the surface sufficiently retentive of the sensitive coating of silver, the plates of glass are covered in the first instance with a thin layer of the albumen of an egg, containing a few drops of a solution of iodide of potassium. The sensitive washes are then applied, and the plate is exposed to the lenticular image in the camera. The picture is developed in the usual manner. The "prints" from glass plates are of the most exquisitely beautiful character.—R. E.]

---

291 A **LADD, W.**, 29 *Penton Place, Walworth*—
Manufacturer.

Box of apparatus for showing experiments in pneumatics, consisting of an air-pump and 14 other instruments.

[The air-pump was invented by Otto Guericke, a citizen of Magdeburg, in Prussian Saxony, about the year 1654. He illustrated the pressure of the atmosphere by the beautiful experiment of exhausting a hollow sphere, composed of two pieces accurately fitting at their edges, which before the experiment were slightly rubbed with fat. On pumping out the air, the external atmosphere pressed the hemispheres together with such force that, to the great astonishment of the spectators, a number of horses were unable to pull them asunder. In the hands of Boyle and Mariotte it served shortly afterwards for the discovery of the principal mechanical properties of the atmosphere.—W. D. L. R.]

Compound microscope, with chain and spindle, in lieu of rack and pinion now in use. Registered.

---

292 **BEARD, RICHARD**, 85 *King William Street, City*—
Producer and Patentee.

Photographic pictures by a new patent process, whereby daguerreotypes are "enamelled."

[The enamelling referred to would appear to consist in removing the glare of the polished plate by a transparent covering, resembling a varnish. The present method of fixing a daguerreotype picture is by gilding, with a solution of the hypo-sulphite or chloride of gold.—R. E.]

294 **KILBURN, WILLIAM EDWARD**, 234 *Regent Street*—
Producer.

Photographic miniatures.

---

295 **PAINE, WILLIAM**, 5 *Trinity Row, Islington*—
Producer.

Photographic pictures, to exhibit the progress of the art.

---

296 **CLAUDET, ANTOINE FRANÇOIS JEAN**, 18 *King William Street, Charing Cross*—Inventor.

Multiplying camera-obscura, to represent on the same surface a number of different pictures, or the same in various aspects, the portraits of several persons, &c. The novelty consists in moving the prepared plate by means of racks and pinions in a vertical and in a horizontal direction, thus making several parts of the surface pass alternately before an opening placed at the focus of the lens.' A sculptor being supplied with seven different aspects of the features of the same person, is enabled, without seeing that person, to make a perfect bust or model.

Photographometer, to measure the intensity of the direct photogenic rays, and to compare the sensitiveness of various photogenic preparations.

[It is of the utmost importance in practice to know, at all times, the amount of chemical agency (*actinism*) which may be associated with the light of the sun, as they bear no direct relation to each other; the light may be intense and the chemical power very deficient, or the contrary: hence the value to the daguerreotypist of an instrument of this kind.—R. H.]

Dynactinometer, to measure the intensity of the reflected photogenic radiation, and to compare the power of lenses or object glasses.

[Lenses vary very considerably in their powers of transmitting radiations; the difference arising from the molecular condition of the glass itself, which varies, and also from very slight deviations from the true curve, which in the delicate operation of grinding it is exceedingly difficult to avoid.—R. H.]

Focimeter. It is impossible to obtain well-defined, photographic pictures, without previously ascertaining the exact position of the photogenic focus, which is easily done by taking the image of the focimeter on a photographic surface, and comparing the segments of the apparatus with the image, then on the ground glass and on the photographic surface.

[Mr. Towson first observed that the focus of the chemical rays was not identical with the luminous focus; that the best photographic picture was always produced at a short distance nearer the lens, than the point at which the most perfect visible image is produced: M. Claudet has shown that this applies equally to achromatic as to non-achromatic lenses; and this instrument is for the purpose of determining the chemical focus with facility.—R. H.]

Screens, to modify the action of light on the various parts of the figure in taking portraits, and thus obtain artistic effects.

Patent photographic camera-obscura. The novelty consists in its being possible to adapt to it with the greatest facility any system of object-glasses, to change them at will according to the power wanted, and also to use plates of any size; each having a separate moveable frame, in which the ground glass and plate fit the same groove. Without the least alteration it will serve for silver plates or paper, and answer either for views or portraits.

[The photographic camera is a modified form of the camera obscura, invented by Baptista Porta, the principle in both cases being the same, the arrangements only being modified to allow of the easy introduction of the daguerreotype plate or photographic paper. The principle is often popularly studied by simply making a hole in the window shutter of a dark room and examining the images of external objects on a sheet of paper at a certain distance from it.—R. H.]

Dark boxes, for containing the prepared plates, and carrying them to and from the camera-obscura.

Brass frames, to hold two plates, face to face, without contact.

Mercury box. The novelty is that a number of plates of various sizes may be mercurialized at once, in a vertical position, and that the heat is applied by the uniform temperature of boiling water.

Apparatus for cleaning and finishing a daguerreotype plate, without burning the oil which has been used for the polishing, and without employing cotton wool, spirit of wine, or any powder.

Bromide of iodine. Iodine and bromine combined in proportions found to afford means of giving the plate the highest state of sensitiveness.

[In preparing a daguerreotype plate, it is essential that the agent employed to act chemically on the polished silver surface should be in such a condition, that the affinity may be easily upset by solar agency. This is peculiarly the case with compounds of bromine, iodine, and chlorine. The balance of action is very easily disturbed, and hence the extreme sensibility of plates prepared with these compounds.—R. H.]

Daguerreotype pictures, plain and coloured. Representation of objects of art, scientific experiments on the effect of the various rays, illustrations of the non-coincidence of the visual and photogenic foci, portraits from nature, taken by means of a prism placed before the object glass, in order to obtain a non-inverted picture.

[The effects shown in these experiments illustrate the influences exerted by various media, natural and artificial, upon the solar rays. In some examples, the luminous rays are shown to act as protecting the plates from change, and in others the energetic power of the chemical rays (*actinism*) is separated to a great extent from the luminous rays (*light*). The general result is to prove that the radiations which give rise to photographic phenomena, although associated with light and heat in the sunbeams, are not identical with it in their action on material bodies.—R. H.]

Photographic table; showing that photographic productions may be employed in various ways, as the ornamental part of drawing-room furniture.

Daguerreotype plates, perfectly plane and free from specks, forming true mirrors.

[Daguerreotype plates are of copper, plated with silver; by placing two pieces of these metals in contact with very clean surfaces, and thus passing them through steel rollers, they are pressed so closely together that the full action of cohesive force is exerted between their particles, and they adhere with great firmness. The silver is subsequently polished, and by nice manipulation prepared for the use of the daguerreotype artist.—R. H.]

Photogenic paradox, showing that what is light for the eyes is darkness for the photogenic action; a frame containing, on one half, the portrait of the Queen, covered with yellow glass, and on the other half the portrait of Prince Albert, covered with deep blue glass, being represented on a daguerreotype plate. The result is that the yellow glass, although showing clearly to the eyes the picture of Her Majesty, has prevented the photogenic action, and that the deep blue glass, although completely hiding the portrait of Prince Albert, the photogenic rays reflected by his picture through the blue glass have had the same action on the daguerreotype as if the engraving had been covered with transparent glass, or with no glass at all. This experiment proves why when light appears yellow on account of vapours existing in the atmosphere, the photogenic action is always so feeble and altogether impeded.

Frame containing six specimens:—

(1) Light of a candle represented on a daguerreotype plate.

(2) Image of a statue produced by the continued action of light on a daguerreotype plate, without any mercury; the white forming the image is due to a fine precipitate of the silver combined with iodine, taking place under the action of light during the decomposition of the compound.

(3) Negative portrait produced on a plate first exposed to light, and in that state having received the image of the camera obscura through yellow glass; this proves the destructive action of the yellow rays in the photographic operation, and that the yellow rays are not only antagonistic to the photogenic rays, but that they destroy the effect produced by the last.

(4) Image of the sun produced during a clear atmosphere.

(5) Image of the sun produced when it appears red through a fog.

(6) Image of the moon produced during a clear night.

Frame containing four specimens—

(1) Image of the solar spectrum on iodide of silver.

(2) Image of the solar spectrum on bromo iodine of silver.

(3) Experiment of the focimeter, showing the difference between the visual focus and the photogenic focus and their variation.

(4) Experiment of the dynactinometer, showing the intensity of the photogenic light at any given moment, for various spaces of time in a geometrical progression. It is curious to observe the small difference produced by a double intensity.

Image of clouds, taken instantaneously during boisterous weather. Interesting study for artists.

Frame containing the various colours of water colour, and another the daguerreotype representation of the first. This experiment shows that all the tints of blue, indigo, and violet produce white in photography, and that all the tints of green, yellow, orange, and red, produce black, or rather that they have no photogenic action.

---

297 **Henneman & Malone**, 122 *Regent St., Westminster*—Designers.

1. Talbotype apparatus of improved design, made by J. Newman, of 122 Regent Street.
2. Talbotype pictures produced on paper, silk, and other fabrics; and on porcelain, coated glass, stone, steel, wood, and ivory.
3. Talbotypes treated with caustic potash and a lead salt, in order to produce an agreeable tint of colour, and to render more secure the fixation.
4. Specimens of Sir J. Herschel's cyanotype and chrysotype, and of Mr. Robert Hunt's chromatype pictures.

[Talbotype is the name applied, in the first instance, by Sir David Brewster, to the calotype pictures, his object being to distinguish by the name of the discoverer a photographic process, which is little, if anything, inferior to the daguerreotype of the French. Paper being covered with a pure iodide of silver, is rendered sensitive to luminous radiations by being washed over with a mixture of gallic acid and nitrate of silver; and after the paper is taken from the camera, a dormant picture being produced upon it, it is developed by a second application of gallic acid.

Sir John Herschel's cyanotype and chrysotype processes admit of many modifications, the former consisting of the change of a persalt of iron into a protosalt by the solar rays; the paper being then washed with a compound of cyanogen (hence its name), the picture is represented in Prussian blue.

The latter is in most respects similar, only that a solution of gold is applied to the altered iron salt, and oxide of gold is formed in the place of Prussian blue.

The chromatype is formed by washing paper with a mixture of the bichromate of potash and sulphate of copper; and after the picture has been faintly developed by the chemical principle of the solar beam, it is washed with nitrate of silver, by which a *positive* picture, or one with correct lights and shadows, is produced by one operation.—R. H.]

---

298 **HAYWARD BROTHERS**, 196 *Blackfriars Road*—Inventors and Proprietors.

Gauge for measuring the thickness of metal and other plates, rods, or bars:—The principle of this gauge is the progressive movement of an accurately cut screw, to which is affixed a dial or circular index, which may be divided so that each space shall indicate that the screw has advanced the 1000th part of an inch, or otherwise marked as may be required, such as to show the aliquot parts of an inch, the weights per foot super., &c., of any particular metals, alloys, or other material, whose specific gravity is known, or with any arbitrary line of numbers, such as the ordinary wire gauge.

The gauge which is exhibited has the outer circle set out, so that each minor division is equal to 1 oz. per foot super. of sheet-iron sp. gr. 7·68, the quarters and lbs. being shown up to 20 lbs. to the foot. The relative weights per foot super. of any other metals, &c., may be found from the sliding or circular scale of equivalents which accompanies the gauge. The next circle has a line of numbers, which are suggested by the inventor of the gauge, as an improved scale for universal adoption; the advantages being that each whole number will tell its own particular value in 100ths of an inch, with fractions added, expressing 1000ths; and if written thus, "1^2, 1^4, &c., could not be mistaken for the whole numbers, 12, 14, &c., as might be the case in ordinary commercial transactions. If placed with the decimal point only, for substances less than 100ths of an inch, the numbers might be written 01, 02 to 09, each representing 1, 2 to 9 thousandths of an inch respectively. The inner circle gives the numbers of the present Birmingham wire gauge, or (as commonly known) "the wire gauge," by which are measured iron, brass, and black steel-wires, iron and steel-sheets, and many other articles.

If the weight per foot superficial of sheet-iron be required, the screw is turned to the left until there is more than sufficient room to admit the plate to be measured; then the instrument being supported with the fingers of the left hand in such a manner as to press the three points against the under side of the plate, and the thumb being placed on the plate to hold the gauge firmly, leaving the screw perfectly free, from the relative position which this bears to the three points, it will rise and descend at right angles with the face of the plate. Now the screw being turned slowly to the right, until its further progress is obstructed, in the outer circle on the dial, against the perpendicular line inside the case, will be shown the weight of the plate in ounces and lbs. to the foot superficial of sheet-iron, sp. gr. 7·68.

For measuring wire, the screw should be turned to the right, until the wire cannot pass between it and the point immediately under it; then the wire being gently pressed between the two, and the screw turned slowly to the left until the wire passes, the number of the wire will be found in the inner circles on the dial.

Sliding and circular scales of equivalents for weights:—If the weight per foot superficial of any other material than iron be required, it is placed in the gauge, and then on the outer circle is found the weight which it would be if sheet-iron; this weight being found on the slide, and placed against the "iron-sheet," opposite to the name of the material on the fixed part of the rule, on the slide, will be shown the weight per foot superficial of that which is under examination; and against all the rest, their respective equivalents. The scale is also applicable to all other calculations of relative weights: thus, the weight of a casting in iron is found from the weight of the model, by finding its weight on the slider and placing it opposite to the article of which it is made; then on the slider opposite to cast-iron, will be found its weight in this material, the customary allowance being made for the shifting of the model, and the contraction of the iron as it cools. If the whole numbers, instead of being called lbs., are taken as cwts., then the ounces will each represent 7 lbs. If the lbs. are called ounces, then the ounces will represent drachms.

Circular scale:—In this scale the same results are obtained by moving the various articles which are set off on the centre, opposite to the weights on the stationary margin.

---

299 **TYREE BROTHERS**, 44 *Regent's Circus, Piccadilly*—Inventor.

Daguerreotypes, including several, in which is introduced a new and ornamental process. The colouring by Mr. Alfred Tyree.

[In these daguerreotypes an effect somewhat resembling that of an engraved border has been produced. Such a result is capable of being attained by means of a perforated plate of metal laid over the picture and momentarily exposed to the light. The action of the light through the perforated parts will then produce, on exposure to the mercury, the engraved appearance.—R. E.]

---

301 **SADD, WILLIAM**, *East Hill, Wandsworth*—Designer, Manufacturer, & Proprietor.

Model of an aerial machine, which consists of two revolving wheels for propelling, and a rudder at each end to steer the machine; and two floats to raise or lower it without the aid of ballast. The whole is sustained by two cylindrical balloons, placed horizontally. This constitutes the apparatus, which is said by the exhibitor to be as much under control as a ship on the seas; and that, notwithstanding contrary currents of air, it can be steered in any course that may be indicated, with equal facility.

---

302 **BINGHAM, ROBERT JAMES**—Producer.

Photographs, from paper negatives.

---

303 **COLLS, R. & L.**, 168 *New Bond Street*—Producers.

Sun pictures, on paper.

[The art of producing pictures by the aid of sunlight, commonly called photography, is due, so far as the processes on paper are concerned, to Mr. Fox Talbot. Other methods of obtaining photographic pictures on paper, equally expeditiously, are known; but the principles embodied in Mr. Talbot's patent are those which in actual practice produce the finest and best pictures.—R. E.]

---

304 **RIPPINGHAM, M. J.**, 17 *Great Prescot Street*.

A case of photographic portraits, on paper, from negatives, taken with collodion on plate glass.

06 **LEONARD, SAMUEL WILLIAM**, 11 *Upper Stamford Street*—Designer.

Microscopical drawings, illustrating the use of the microscope for detecting adulterations in articles of food, and for discoveries in minute anatomy.

---

08 **SHARP, SAMUEL**, *New George Street, Sheffield*—Manufacturer.

Set of ten lenses for a single microscope, from 1-10th to 1-100th of an inch focal length.

---

09 **WRAY, WILLIAM**, 43 *Havering Street, Commercial Road East*—Inventor and Manufacturer.

A seven-feet achromatic telescope, four and a half inches aperture, upon a new principle, in which the difficulty of obtaining large discs of flint glass is overcome by the employment of a solid substitute.

This substitute is a combination of a resinous substance, with a very highly refractive and dispersive essential oil, and its application is extremely simple and effective, as well as comparatively inexpensive. From its homogeneous nature, it would appear that a finer telescope might be constructed with lenses of this substance, than with lenses of flint-glass; for it has been found a matter of extreme difficulty to produce the dense flint-glass perfectly homogeneous, and free from striæ. The substitute for flint-glass is highly transparent, of a pale straw colour, and is unalterable by light air, moisture, and moderate heat; it fuses at about 200 degrees, and is applied in a fluid state between crown-glass lenses. It becomes solid on cooling, and remains so at all atmospheric temperatures. Its refractive index and dispersive power allow a shallower system of curves than flint-glass usually does, and consequently a better correction of the spherical aberration. On account of the composition being in perfect contact with the two crown-glass lenses between which it is put, little light is lost by reflection at the four interior surfaces, which is not the case with the ordinary achromatic object-glass.

[An achromatic glass is a compound lens formed of two kinds of glass, which act differently upon the rays of light transmitted by them. The effect of their united action is to bring all the rays of light to a common focus, which ordinary single lenses will not effect. Objects seen through achromatic lenses are not surrounded with those fringes of colour which encircle them when examined by a single lens. Hence the term achromatic. In the case in question, the disc of flint-glass is substituted by a solid resinous substance.—R. E.]

---

317 DENTON, J. B., *Gray's Inn Square*—Inventor.

Specimens of model or relief mapping, finished and in skeleton, accompanied by a beam-level, for ascertaining heights and distances, with plans and tools elucidating the method of construction.

Model mapping is designed for the representation of districts where works of drainage and other hydraulic operations are contemplated, as the best means of developing the natural capabilities of an undulatory surface, and of displaying the geological formation of the substrata.

Workman's draining-level—particularly designed for labourers incapable of using the spirit-level, but who are familiar with the properties of the plumb-bob.

Improved workman's level, similar in principle, but capable of greater facility of adjustment, with or without the spirit-level.

---

318 PENROSE, FRANCIS CRANMER, 4 *Trafalgar Square* —Inventor and Proprietor.

Registered screw and sliding helicographs for drawing volutes, scrollwork, and spirals of various kinds. The curves may be drawn on paper by means of an impression obtained from the disc by transfer paper; they may be drawn in ink or with pencil by the sliding helicograph.

Fig. 1. Sliding helicograph. A heavy frame BB′ slides upon a smooth straight bar AA′, which passes through the guide sockets GG′, forming part of the frame. Attached to the bar AA′ is a point C, on which the instrument turns as a centre. Within the frame is a circular ring, carrying the axle of a small wheel or disc, D, fixed to one of its diameters. This ring, and the disc connected with it, may be placed at any angle with respect to the frame. The middle part of the frame is hollow, so that the wheel rests on the paper. By means of a gauge screw at E, and the carriage on castors FF′, the instrument is adjusted to the proper level. A bar HK, which turns horizontally round K, a point in the frame, is provided with a pen-and-pencil socket, so that the describing point may be placed at any point within its range. The centre of gravity of the frame is so arranged that its whole weight falls directly upon the wheel, and the edge of the latter is milled so as to ensure its taking a firm hold of the paper, while the frame slides on the smooth bar. The spiral motion results from the obliquity of the axis of the wheel with respect to the smooth bar AA′ when the instrument is made to revolve about the point C; the rate or pitch of the spiral depending upon the angle which the axis of the wheel makes with the frame. The graduations on the instrument are given on one side in degrees, and on the other in such angles as to make the longer and shorter radii in one revolution, to each other as the numbers 2: 1, 3: 1 . . . 10: 1, &c. The point C is placed at the same distance from AA′ as the point where the circumference of the wheel touches the paper. The path of the wheel is the logarithmic spiral, when the instrument is made to revolve about the point C, and the pen P placed as near as possible to the wheel. To describe a volute (fig. 3), the instrument is made to revolve about its centre, when the wheel turns round, and causes the frame to slide uniformly along the bar, until it carries the describing point as near to the centre as required. The frame being simply brought back along the bar, all the adjustments remaining unaltered, and the pen placed upon other points, a riband will be formed, preserving an uniformly decreasing thickness all the way. If a parallel line be desired, the pen must be shifted along the line of the axis of the wheel, and the latter made to traverse the same path as it did when the first line was drawn.

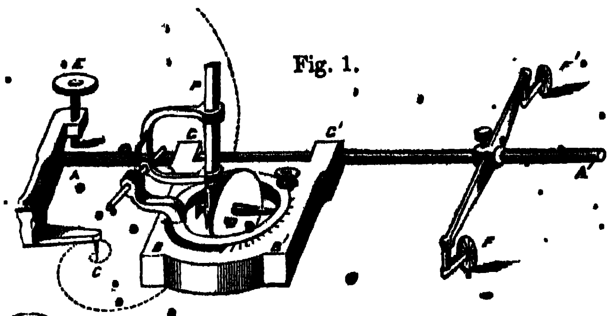


Fig. 1.

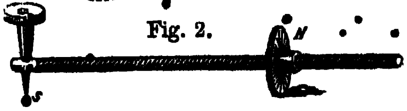

Fig. 2.

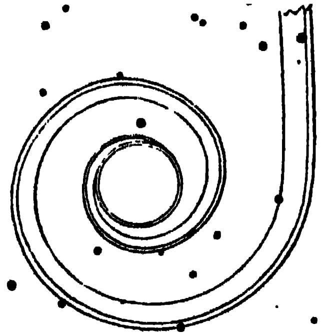

Fig. 3.

Penrose's Registered Helicographs.

In drawing a volute, or other figure composed of several lines, it will generally be necessary that all the lines should be drawn either towards the eye, or away from it; as owing to a change in the action of the guide-sockets upon the smooth bar, when the motion is reversed, the angle is slightly affected. This does not impair the equiangular truth of each individual line.

Fig. 2 is the screw helicograph; S, the fixed centre; and N the wheel which works upon the screw.

320 ELLIOTT & SONS, 56 *Strand*—Manufacturers.

azine case of drawing instruments. The same, containing every requisite for drawing circles from the

1-100th of an inch to 6 feet in diameter; elliptical instruments, complete set of scales, standard measure and triangles, also complete set of water-colours.

Improved dumpy-level, being simple in its adjustments; and strengthened by having the bar which supports the telescope placed vertically instead of horizontally. The same with compass. 5-inch and 6-inch transit theodolites. 30-inch transit instrument.

New instrument for measuring the distance of accessible and inaccessible objects.

Opisometers, or map-meters, for measuring curved lines.

Wheel and pediment barometers, carved to illustrate the four seasons. Gothic barometer. Ebony and gold barometers.

Astronomical telescope. Naval and military telescopes. Opera-glasses, with variously-coloured bodies.

Scale, with slide, for comparing the following measures:—Swedish, Turkish, Bavarian, Spanish, Portuguese, Moscow, Rusoian, Amsterdam, Rhynland, French, and English.

Standard English yard.

Improved slide-rule, adapted for the use of the practical engineer, having all the necessary tables for calculating metal, earth, and wood works, with useful foroign measures.

Thermometers. 15-inch azimuth and altitude instrument.

322 Lloyd, Lieut.-Col. J. A., F.R.S.—Inventor.

Typhodeictor, (from *τυφῶς* or *tufose*, and *δεικτὴς*, or *deictes*) or storm-pointer, an instrument for obtaining, by inspection, the bearing and relative position of a revolving storm or hurricane. Manufactured by Elliott & Sons.

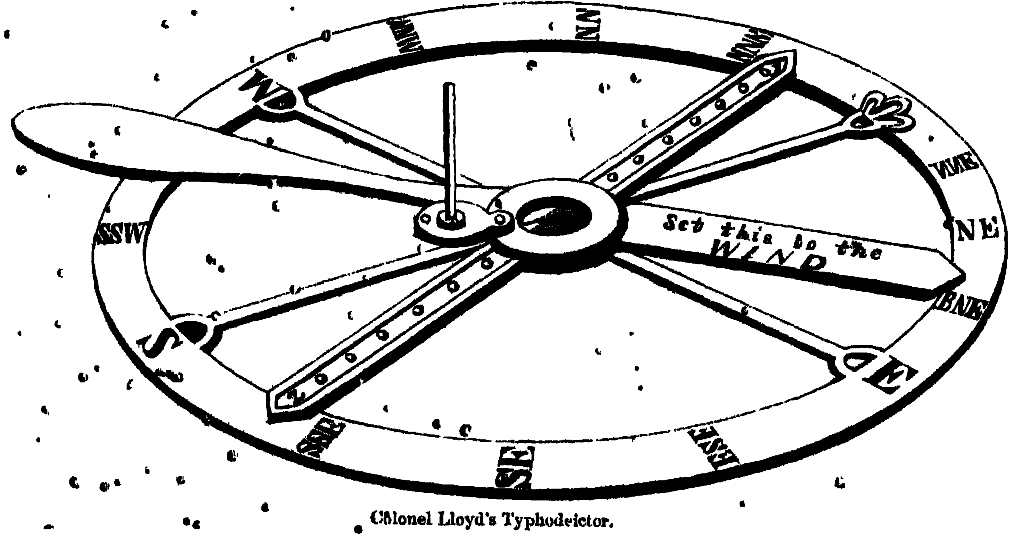
It is now a well-ascertained fact that great storms have a rotary motion like whirlwinds. The theory, commonly called the "law of storms," as made known in several publications by Colonel Reid, has been established from thousands of well-authenticated observations in different parts of the world, and extending over several years. It proves that during a gale of wind, particularly near to the tropics, the winds blow with the greatest fury round a common centre. At this centre, there is little or no wind, even a perfect calm, but there is, generally, a terrific and confused sea.

The most violent and dangerous part of these revolving gales is somewhere near this central calm, the wind there blowing the most fiercely, acquiring, it is stated, a velocity of even 100 miles per hour. These storms sweep both land and sea, in certain parts of the globe; their track and direction are pretty well known; and they travel bodily from their place of origin to their destination at variable speeds; sometimes at not more than the rate of 4 to 6 miles an hour; sometimes, but seldom, at that of 20 to 30 miles an hour, although the wind within their range is blowing round with the fury above mentioned.

If a ship, unhappily, becomes entangled within the range of these terrible gales, she is in great peril; many have foundered, and others have pursued their fearful course round and round, until they have been reduced to helpless wrecks, dismasted and water-logged.

In the northern hemisphere, these winds blow round the compass from east-by-north to west, or the contrary way to the hands of a watch; whereas, in a southern hemisphere, it is just the reverse, blowing round as the hands of a watch would go. This principle must be always borne in mind, as the very foundation of all the information to be sought hereafter.

On these most valuable data, instructions have been drawn up by Colonel Reid and others, how to ascertain the relative position of a gale, so as to know whether it is approaching to, or going from a ship, travelling by its side, or passing across its path. The following cut represents the Typhodeictor.



Colonel Lloyd's Typhodeictor.

The object of the instrument is, by graphic illustration, to show that, when the wind blows from a particular point of the compass, you can only be in one relative position in regard to the centre of the whirlstorm, so that, either the storm is approaching the ship, or the ship approaching the storm, and first of course encountering the outer edge.

As a consequence of the law of rotation, the wind, supposing the whirl to be circular, *must* blow at a tangent, or at right angles to the point of the compass, where the ship or observer may be, but under diametrically opposite conditions, as far as regards the two hemispheres.

Thus, in a northern hemisphere, if the wind blows east, the centre of the storm *must* be due south of the observer; blowing north, the vortex east; coming from the west, the centre of the gale is due north; and, lastly, with the wind south, the gale is due west. Of course, in the intermediate points of the compass, the bearings are likewise different.

In a southern latitude, the whirlstorm blows round just the contrary way. With an east wind, the storm centre bears north; with a north wind, west; with a west wind, south; with a south wind, east.

Bearing in mind these facts, and with sea room, it is easy not only to avoid a hurricane, but to make it subservient in many cases to the ship's ultimate course.

Instructions.

When the barometer is falling and the wind increasing, set the large pointer of the instrument marked in red (*set this to the wind*), to the true point of the compass from whence the wind blows, corrected for variation.

The glass plate is to represent the wind: spin it, to the left when in a northern hemisphere, to the right in the southern, it will give a good idea of the course of the winds around the centre.

Now lay the instrument down on the chart or map, with the N. point engraven on the metal corresponding with the north of the chart. Move the whole instrument backwards or forwards, always preserving the identity of the two N. points until the ship's place on the chart is beneath the hand marked "*ship's place*"—No. 1 for the northern hemisphere, No. 2 for the other hemisphere.

Unship the revolving glass, representing the circular, or nearly circular gale, push back the moveable centre and pivot, and beneath, is the centre of the storm nearly. A good sailor then knows his duty, and will give it a wide berth accordingly.

NOTE.—The use of the several holes along the arms in the transparent horn marked "*Ship's place,*" is to adapt the instrument to any scale on a chart—bearing in mind that the usual diameter of one of these hurricanes or tornadoes is about 300 to 500 miles in extent.

Example.—Suppose, in a southern hemisphere, in lat. 19°, and long. 60° 30′ E., the barometer is falling, a swell is encountered, and the wind is S.S.E. Place the RED arm of the instrument at S.S.E. on the ring; lay the instrument on the chart, with the north point on to the meridian of the arm No. 2, at the ship's place. The vortex of the gale is E.N.E. of the ship; and, as its path is approximately known, the most violent part of the hurricane would sweep over the ship if it remained in that place. A sailor will immediately get out of its way as he would from a dangerous reef.

Again—if a ship coming from India towards Mauritius, and in the same spot, had encountered a N.W. wind and a troubled sea, the intelligent commander would immediately know that he was coming up to a hurricane, the centre of which was south-west of him; and if he pursued his course, and did not wait a few hours, he would run the risk of foundering. In a northern latitude the circumstances are just opposite. The following extracts from the *Nautical Magazine* for September, 1849, from a letter by the inventor, will show how the rise and progress of these terrific gales may be made subservient to human intelligence:—

"The history of our first few days' adventures at sea, will go far to illustrate the perfect truth and beauty of the theory of circular storms. We sailed in our excellent ship, the *Sir Robert Seppings*, on Wednesday afternoon, the 4th of April. The gentle breeze just served to waft us clear of the shores, when it so far failed us, that even at noon of the next day we yet discerned Round Island.

"Excepting our lack of wind (which we had not long to complain of), the weather was most lovely and serene, but very sultry; and our next day (Friday) was ushered in with a most magnificent sunrise, very calm, but a heavy swell from the south-east. The day was passed in listless apathy, when at dark, a clear moon and a fine and fair breeze gave us some energy, and gratified our best wishes. The ship increased her speed. The increase from a gentle whisper to a rapid gurgle of the water, and from that rather suddenly, to a continuous roar beneath the stern windows, with the increased motion and the clank of the tiller-chains, spoiled our slumbers. A look out on the lovely and apparently mild night, showed enough in the haze of the moon, and the "burr" of the planets, with a fleetly-passing scud, to convince us that our dreams of mortal discomfort were about to be realized. However, Saturday's light appeared with a spanking breeze, and our worthy commander in good spirits, with the ship close-hauled, and nothing to spare. Whatever might be our inward thoughts, we all appeared extremely lively in having so unexpectedly found the trades.

"It would not do: the increasing gale, the heavy clouds, and the murky gloom to the south-east, the onward and hurried, and even furious, career of the scud, told us that we must prepare. There were no signs of the trades; and the tremendous and irregular sea, the inexplicable heaping up of the troubled waves, the roar and whistling through the rigging, and the labouring of the ship, spoke to all our perilous position. It was becoming so, at least; for although we were to windward of the Island of Cargados Garajs, and the intricate banks, we had run on sufficiently to make the heart of them a lee-shore; not so close as to make it an immediate cause of anxiety, but sufficiently near to leave us little choice for shaping our course in an approaching hurricane, of which, by the direction of the wind, we knew we were then steering for the centre.

"The beautiful precision of Col. Reid's theory, so well worked up, and supported by Messrs. Thom's and Piddington's labours, was now about to undergo a severe and practical test, through the very means they have so anxiously desired and invited, namely, the judgment and intelligence of a daring English sailor. We consulted the Horn card on the chart, and, with a radius of 400 miles for the hurricane, asked his advice. He gave it to us nobly. Our commander, Captain Stuart, saw his position and the approaching peril, and that he would be "hobbled." He knew his ship, too, and, after consulting the elements, computing the time he required to get a clear sea way, and asking his barometer leave, away he stood boldly on. All precautions were in the mean time taken—hatches down, dead-lights, &c. in, masts and yards housed, and all made snug, and the lower rigging of the heavy masts secured by preventers and frapped (swifted). So passed Sunday; we could keep our course no longer; the furious gusts and the mountains of seas overwhelmed us; it would have been madness to stand on any longer; one object was attained—we had secured ample sea room. A pull at the weather braces, and a rather easing the lee ones, made a fair wind of our dreaded enemy, and, with all necessary and seamanlike precaution, away we went by a N.N.E. course, for the outer edge or limit of the fearful sway of the gathering storm. An extract from Captain Stuart's log, a copy of which I send you, will show how we made a fair wind and a true course towards our destination with such means; it will show, in fact, how we employed a wind from south-east, or S.E. by E., to very nearly south, going round by the west, and with a precision and a confidence quite wonderful even in these times. I observed sufficient to find that it was a gale extending to a great radius, permitting us as it did to stand on so long."

Extract from the Sir R. Seppings' Log.

Saturday, 7th April, 1849—In moderate breezes from the eastward and fine weather. Ship under all sail. At 4 A. M. ditto, ditto. At 8 A. M. ditto ditto. Meridian, fresh breezes and cloudy, with a strong S.E. swell, lat. 17° 50′, long. chron. 59° 10, bar. 29° 90′; at 4 P.M. fresh breezes, unsettled looking weather; at 8 P. M. ditto. Single reefed the topsails; at midnight strong breezes from the S.E.; squally; bar. 29° 90′.

Sunday, 8th—Commences with strong breezes, and puffy, and a very threatening appearance to the south; bar. 29° 85′; in, topgallant sails and double reefed topsails. At 8 A. M. fresh gales, with a heavy confused sea; stowed the mainsail, jib, and mizen; ship labouring and straining heavily. Meridian, strong gales with heavy squalls of wind and rain; close-reefed topsails, sent down royal yards; every appearance of a hurricane raging to the southward. Shaped course N.N.E., lat. 16° 58′, long. chron. 60° 15′; bar. 29° 80′. P.M. Strong gales with heavy squalls and rain, a confused cross sea running, causing the ship to strain and labour heavily; at 8 P. M. ditto weather. Midnight—still blowing hard in squalls, and the appearance of the sky very threatening.

Monday, 9th—Strong gales continued, and very threatening weather; at 8 A.M. bar. 29° 90′. At noon, a more settled appearance; wind at S.W.; shaped course E.N.E.; sounded on the Cargados Bank with Erickson's patent machine; 18 fathoms water; lat. obs. 14° 30′, long. chron. 60° 48′, E. bar. 29° 90′. P. M. 9th. The weather at 4 P. M. again assuming a threatening appearance, and barometer falling to 29° 75′; every indication of a severe hurricane blowing to the S.W.; heavy wild-looking clouds rising in that quarter, and a tremendous south and south-westerly swell, causing the ship to roll and labour fearfully. At 8 P. M. no appearance of a change; *again run the ship to the northward;* soundings 55 fathoms. At 10 P. M. still very unsettled; ship under close-reefed topsails; bar. 29° 80′. At midnight more moderate; wind at W.S.W. and barometer rising; shaped course N.E., and made all necessary sail.

Tuesday, 10th—At 4 A. M. bar. 29° 9′ and the weather having a more settled appearance, wind at west; all necessary sail set, the lower rigging set up fore and aft. At noon fair settled weather, lat. ob. 12° 23′ S; long. chron. 62° 30′; bar. 30°.

There are many works of reference on the subject of rotary storms, and of the greatest value, as *The Laws of Storms*, by Colonel Reid; *The Nature and Course of Storms*; the same, by Thom; *The Hand-book of Storms*, by Piddington.

323 Dobson, J., 268 *High Holborn*—Manufacturer.

Complete magazine set of drawing instruments in electrum or British metal.

A variety of smaller sets in brass and electrum.

324 Tree, James, & Co., 22 *Charlotte Street, Blackfriars Road*—Manufacturers.

Ewart's improved cattle gauge and key to the weighing machine, on the principle of the slide rule, for computing by inspection, the carcase-weight of oxen, sheep, and swine, from their weight alive; the same arranged in a circle on tape.

Ewart's farmer's slide rule and cattle gauge, for computing, by inspection, matters relating to practical husbandry, and for ascertaining the carcase-weight of cattle, in any weight in use in the United Kingdom.

Ewart's circular cattle gauge, with logarithmic circle of natural and square numbers on the reverse side.

Ivory, boxwood, and electrum scales, for architectural surveying, and mathematical purposes; of improved arrangement. Ivory and electrum protractors. Marquois scales, for military drawing, fortification, &c., in ivory and electrum. Rolling parallels, in ivory, ebony, brass, and electrum. Engineers' rules, arranged by Bolton and Hawthorn, made in ivory. Architects' rules, in ivory mounted in electrum, new arrangement of dividing.

325 Purvis, J., *Newcastle-upon-Tyne*—Inventor.

Mechanical square, containing plumb-rule, spirit-level, square-level, foot-rule, and slide-rule.

326 De Fontaine Moreau, Peter A., 4 *South Street, Finsbury*—Producer.

Aneroid barometer; aneroid gauge, Lucien Vidie's invention.—Patented in England.

[From the extreme portability and sensibility of this recently invented barometer, it has justly come into very general use. Its action depends on the varying effects produced upon a metallic box, exhausted or nearly exhausted of air, and these small vertical motions are converted into large horizontal motions, by a system of lever and spiral springs. The instrument is not adapted for meteorological investigations, but is well suited for most other purposes to which a barometer is applicable.—J. G.]

327 Towns, William, 19 *Stangate Street, Lambeth*—Inventor.

Spirit meter, on a new and simple principle.

328 Haggard, William Debonaire, *Bank of England*—Inventor.

A double protractor, three inches square.

329 Sinclair & Hockley, 42 *Gerrard Street, Soho*—Designers and Manufacturers.

Mechanical arrangement for supplying artificial teeth, and making up the deficiency of the right half of the upper jawbone. Sets of mineral teeth, mounted on gold embossed and bone gums.

Various specimens of mechanical dentistry.

330 Best, Thomas, *Oldham*—Manufacturer.

Micrometer measuring and dividing machine.

Twelve-inch and six-inch rules, marked and divided by the above machine, and intended as standard rules for opticians, mathematical instrument makers, &c.

331 Griffith, John, *Darley Parsonage, near Derby*—Designer.

Standard barometer, manufactured by John Davis, Derby, designed to give observations accurately to one-thousandth of an inch.

332 Yeates, George, 2 *Grafton Street, Dublin*—Proprietor and in part Designer and Manufacturer.

Standard barometer. A barometer, with registering apparatus attached, the mercury in the cistern of which can be cleansed without disturbing that in the column.

Small theodolite. Simple theodolite, for road work, drainage, &c. Simple and effective air-pump.

Improved prismatic compass, capable of taking altitudes. The same, on tripod, having spirit level attached.

Optic square, for measuring inaccessible distances. Various specimens of spectacles.

333 De Grave, Short, & Fanner, 59 *St. Martin's-le-Grand*—Manufacturers.

Assay balances and weights. Hydrostatic balances and weights. Balances and weights for weighing diamonds to 500 and 100 carats.

Letter-balances and weights; portable, and with three beams, as used in the Post Office.

Beams and scales mounted, with brass pillar, and weighing-machine, on mahogany pedestal, for shop counters. Bankers' scales.

Bronzed beam for weighing 1,000 ounces of gold or silver. Gilt beam, used by inspectors of weights.

Complete set of imperial standard measures from bushel to half-gill. Imperial standard yard, bed, and rod.

Complete set of standard avoirdupois weights, from 56 lbs. to $\frac{1}{2}$ drachm, of spherical shape. The same, from 56 lbs. to 1 lb. bell shape; and from 8 ounces to $\frac{1}{2}$ drachm, flat shape.

The fine assay balance will turn with the thousandth part of a grain.

334 Oertling, Ludwig, 13 *Store Street, Bedford Square*—Manufacturer.

Balance, to carry $\frac{1}{2}$ cwt. in each pan, and turn when loaded with $\frac{3}{10}$ of a grain. Chemical balance, to carry 1 lb. in each pan, and turn when loaded with $\frac{1}{200}$ of a grain. Balance to carry 1,000 grains in each pan, and turn when loaded with $\frac{1}{1000}$ of a grain.

In the two latter, the knife-edges are made of agate, and the suspending pieces for the pans are provided with agate planes.

[The sensibility of these balances may be expressed by saying, that the first turns with about the 1,300,000th part of the weight which it can weigh; the second with the 1,400,000th part; and the third with the 1,000,000th part. The value of such balances is perceived in delicate chemical analyses, in which a fractional error has often led to important mistakes.—R. E.]

335 Brown, S., 6 *Marlborough Place, Kennington Cross*—Inventor.

Patent power-engine, being a water-meter and a power-engine. Patent water-meter, capable of adjustment under varying pressure. Patent meter, for measuring or weighing the liquid by an overshot wheel, and working in compressed air without cock or valve.

Patent water and spirit meter, self-acting, capable of adjustment under varying pressure. Patent spirit-meter, showing at the same time the quantity measured and its money value, in order to obviate mistake or fraud.

The novelty of the power-engine consists in its being a water-meter and a water-pressure engine, and also in its being applicable to steam power without alteration of its parts. It is represented in fig. 1.

The machine consists of an outer case or cistern, containing two collapsible measuring-vessels, connected by pipes or tubes to a four-way tap or slide-valve at the lower part, and at the upper part they are connected by a beam working on a centre, one end of which centre passes through the outer case, and gives motion to the indicating chain of wheels, and also to a beam and quadrant connected with driving gear. The liquid is admitted through the upper part of the case, and withdrawn at the lower part, after having passed through the collapsible measuring vessel. Attached to the four-way tap or valve is an arrangement of rods or chains connecting it with a tube containing a weight, or a weight otherwise arranged, so that, as the measuring vessels rise and fall, the tap or valve is acted upon and the motion is reversed, the liquid is allowed to rise in the case until the measuring vessels are immersed, and as the pipe by which the liquid is conveyed to the case is not connected with the four-way tap or valve, the liquid flows freely in at all times, according to the pressure, thus the measuring vessels, having the same pressure without as within, are not exposed to undue strain.

On turning the tap to withdraw the liquid and start the machine, the measuring vessels to which the four-way tap or valve is open, will descend and empty the other measuring vessels, at the same time rising and filling until a certain point is attained, when, by the action of the weights and rods, the action of the tap or valve is reversed, and consequently that of the vessels also, and thus motion will continue as long as there is liquid to pass through, or until the tap is turned to stop it. The motion is converted into a circular one by the rack and pinion represented in fig. 2.

The patent meter (fig 3), in construction, resembles the one before described, but has no external apparatus except the indicator. There is no loss of power in the liquid passing through the meter to a high level. It is perfect in adjustment under varying pressures, and consists of two cylinders, containing a float in each; to these floats are attached a rod having a projecting pin at the upper part, with a pointer attached. A moveable beam is fixed over and between the cylinder, having rods and chains attached, to work the indicating chain of wheels, and to turn the four-way tap at the lower part of, and between the cylinders. On the top of the cylinders are placed moveable ketches and chambers, to allow of the escape of air as the cylinders are being filled, and to admit air as they are being emptied. Also on the top of each cylinder there is an indicator, graduated to small quantities, having a slot in it through which passes the pin of the float-rod with the pointer, indicating the quantity drawn off as the float descends. Both cylinders having been filled with liquid, the one float is held down by the pin at the end of the rod, being under the ketch on the top of the cylinder; the other float is up and has forced the beam to an inclined position, by its rising as the cylinder filled. On turning the tap to withdraw the liquid, the float descends, showing in its descent, by the pointer on the scale, the exact quantity drawn off, until, in its descent, the pin at the top of the rod comes upon the ketch, forcing it back and passing by it; but in forcing it back, as the ketch is attached to the other ketch on the opposite cylinder by a rod, the float held down is now released, and rising through the liquid, reverses the beam, thereby turning the four-way tap, and indicating one measure of liquid passed. The empty cylinder is now filled, the float being held down as before, and so the motion and indicating go on as long as there is liquid to flow, or until the tap is turned to stop it.

Fig. 1.

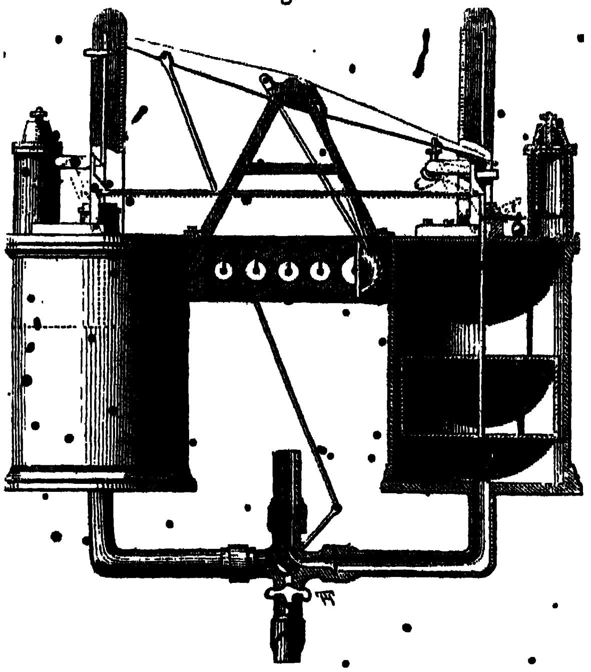


Fig. 2.

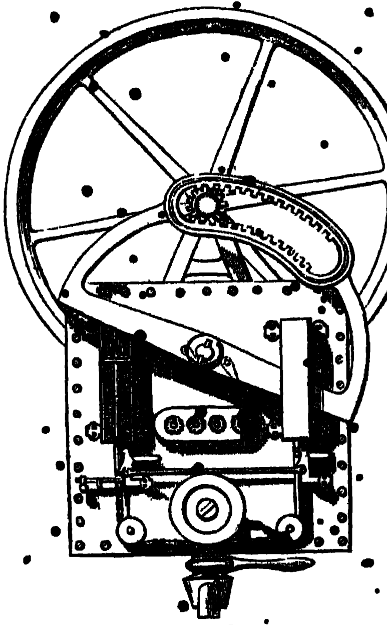
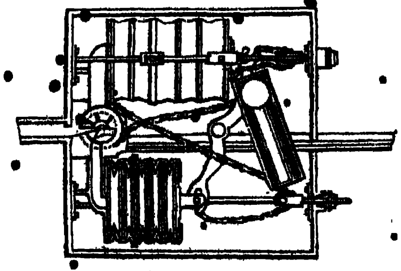


Brown's Patent Power-engine.

The power obtained will, of course, depend upon the amount of pressure applied by either steam or water that may be the prime mover.

Fig. 3.



Brown's Patent Meter.

336 **Langlands, J.**, 71 *High Street, Camden Town*—Inventor.

Patent compound tap, with meter.

337 **Park, S. H.**, *Kingswood, Wotton-under-Edge, Gloucestershire*—Designer and Manufacturer.

Set of improved spanners, registered, comprising nine different sizes.

The use of the instrument is to find the most accurate centre in round or square iron, for the lathe.

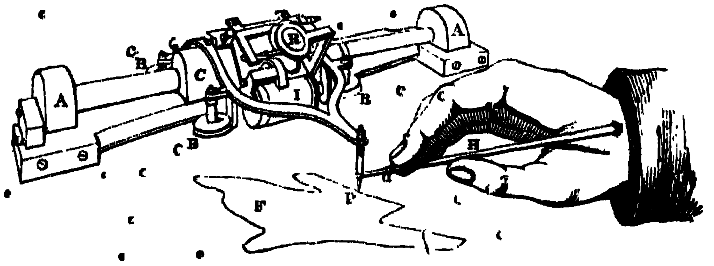
338 **Sang, John**, *Kirkaldy, Scotland*—Inventor and Manufacturer.

A planometer or self-acting calculator of surface.

This instrument is used for measuring the area of figures drawn on paper, which it does in an accurate and rapid manner, the operator merely requiring to guide the point of a pen round the outline of the figure, however irregular it may be. It measures any figure, but its great advantage consists in determining the area of those of irregular forms, the measuring and calculating of which by scales in the common manner is a laborious process, and one requiring to be repeatedly performed and revised, in order to ensure minute accuracy, and to do away with the chance of arithmetical errors. Adapted for the use of surveyors of land and engineers, and also calculated to assist students of physical geography, of geology, and of statistics; to the latter it affords the means of indicating from the best maps, with little trouble, the extents of states and other subdivisions, and of correcting the approximations given in published tables.

In order to use the planometer it is to be laid on the figure in such a manner that the tracer can be carried round its outline. The handle is to be held like a pen in writing, and the tracer is to be brought on the outline and pressed very slightly into the paper, so as to make a small mark. The index is to be read. The tracer is then to be carried along the outline until the mark be again reached. The index is to be read again, and the difference between the two readings is the area of the figure in square inches, tenths and hundredth parts, or the area may be got without subtraction, by setting the index at zero at the commencement, but the former is the preferable mode. When the boundary consists of straight lines the process is aided by using a straight-edged ruler to guide the tracer, as in drawing.

The numbers engraved on the silver index indicate square inches, which are divided by lines into tenths, and further by a vernier in the common manner into hundredth parts. This index reads up to 20 inches; the brass index carries on the divisions as far as 100 square inches. The instrument will measure any figure not exceeding 4½ inches in breadth and 22 in length. If the figure is of greater size it is to be divided by pencil lines into parts, which are to be treated separately. The only adjustment required is, when the instrument is lifted out of its case, to make the two indices read zero at the same time, which is readily done by lifting up the brass one and turning it a little forward or backward. If the tracer be carried round the figure in the direction that the hands of a watch move, the first reading is less than the last. If it be carried in the opposite direction, the first reading is greater. This machine is represented in the annexed cut.



Sang's Planometer.

The mode of action is very simple. The rollers (A, A) are attached to the same axis, on which there is also a cone, which revolves with them; they are exactly of equal size, so that as they move up and down the paper; the axis of the cone is always parallel to the same line. The four friction rollers, of which three (B, B, B) are shown in the drawing, carry a frame and the tracing point to the right or left, parallel to that line which it is possible to trace on the surface of the cone parallel to the paper. Attached to this frame is the index wheel (I), the edge of which touches the cone in that line, and is made to revolve by it; consequently, the revolving motion of the index-wheel is in proportion to the motion of the tracer up or down the paper, multiplied by the right and left distance of the wheel from the apex of the cone; and therefore, when the tracer is made to describe any complete perimeter, the whole rotatory motion of the index-wheel represents the algebraic sum of the products of ordinates to every point in that perimeter, multiplied by the increment of their co-ordinates; or it is a measure of the included space.

It is obvious that while this arrangement of motions should in theory indicate the product of the ordinating lines by the increment of their co-ordinates, the result of mechanical imperfections in the motion is also a product, so that very great care and nicety must be used in the construction of the instrument. The specimen exhibited is the first model made by the inventor's own hands; it performs its work nevertheless very correctly. It is true that the area of a three or four-sided figure will be found a little more accurately by a scale and calculation than by the instrument. This may be tested by measuring the same figure a few times each way, and observing the difference of the results; but on the other hand, an irregular or curved figure will be measured more accurately by the instrument than by the scale, and with infinitely less labour, which may be tested in the same way. This is not because the instrument measures the irregular figure more accurately than it does the simple ones, but because the scale measures them less so. The accuracy meant is the absence of minute errors. In respect to great errors, caused by mistaken figures in calculation, the instrument is exceedingly preferable, even for simple boundaries, as it is not liable to faulty arithmetic.

339 **Bridges, George**, *Hampton Wick, Kingston*—Inventor.

Instrument for "ascertaining the distances of objects, either by day or night, by inspection and without reference to tables."

340 **Rooker, John & Alfred**, 26 *East Street, Foundling*—Manufacturers.

Sliding rule of involution, presenting at one view the series of powers arising from the successive multiplication of whole or fractional numbers. Questions relating to the increase of population, to the calculation of probabilities, to compound interest, &c., are resolvable by this instrument.

Specimen of hand dividing.

341 **MARRIOTT, M.**, *Montpelier Square*—Inventor.

Balance for chemical analysis; the beam, made of pine, weighs less than one-third of an ounce; when loaded with 1,000 grains in each scale it will turn with the $\frac{1}{250}$th of a grain, and with the $\frac{1}{100}$th of a grain when light.

342 **ROSS, WILLIAM**, *Strathsteven, Golspie, Sutherland*—Inventor.

Graduator. An instrument for the approximate determination of the heights and distances of objects, in miles, chains, yards, or feet, as found by reference to tables adapted for its use; it also shows the time of day by the sun in any part of the globe.

343 **WILLIAM, BARTON HUGH**, *Waterfoot, Ireland.*

An instrument designed to take angles and bearings in the field, and transfer them mechanically to paper, without reading off.

This instrument consists of two rulers, with sights attached to each. These rulers turn on a pivot, and a compass is fixed in the lower valve. It is designed to take angles and bearings in the field, and transfer them mechanically to paper without reading off. It is particularly intended to take the place of Sir Howard Douglas's reflecting instrument, and Schmalcalder's compass and protractor, the offices of all three of which instruments it undertakes to perform.

344 **DOVER, JOHN**, 14 *Little New Street*—Producer.

Delicate balance contained in mahogany lantern case, with weights packed in a drawer for chemical analysis and assaying.

346 **DOBBS, GEORGE**, 37 *St. Alban's Street, Lambeth*—Inventor.

Universal spirit level, adapted for levelling all kinds of machinery.

347 **COX, GEORGE**, 5 *Barbican*—Manufacturer.

A portable instrument for ascertaining correct time by equal altitudes of the sun, and intended for rating time-pieces, watches, and chronometers.

The "periphan," an instrument for facilitating the study of astronomy and astronomical geography; intended to explain many phenomena which cannot be illustrated by a common globe.

Beam draining-level, with adjusting parallel plates on tripod stand, giving by inspection the rise and fall of land intended to be drained; useful in laying tiles, levelling, and building operations.

The A-level for the above purposes, without parallel plates or tripod stand.

348 **HARDY, JAMES**, 5 *Wellington Road, St. John's Wood*—Inventor.

Metrograph, an instrument to enable a person to draw any object from nature, by actual measurement.

349 **BARRETT, ROBERT M.**, 4 *Jamaica Terrace, Limehouse*—Manufacturer.

Improved lunar sextants. Their object is increased facility in reading off by night. Plain sextant. Improved brass quadrant, divided to half minutes.

350 **TAYLOR, JANET**, 104 *Minories*—Manufacturer.

Sextant for measuring angular distances between the heavenly bodies.

351 **HEATH, GEORGE**, *Erith, Kent*—Manufacturer.

Solid bell-metal ivory arched sextant, divided to 10 seconds, combining the clearness of ivory with the durability of metal. Owing to the extreme minuteness of the divisions on instruments divided to 10 seconds, the difficulty of reading them off is great. This is obviated by the use of ivory, as a black mark on a white ground presents a much greater contrast than a self-coloured mark on metal.

Improved action magnifier. In other instruments, the magnifier placed to facilitate the reading off the divisions moving in a smaller circle than the arch, distorts the divisions upon approaching the extremity of the vernier, by their being thrown out of the centre of the lens. This is avoided by the present plan.

Improved spring hollow leg, thus to avoid the possibility of altering the adjustments of the instrument in placing it down.

Improved ivory arch metal quadrant, possessing, in respect to the ivory, the qualifications of the before-mentioned sextant: the ivory being dovetailed into the metal, cannot come out or shrink.

352 **WILLIAMS, WILLIAM**, 57 *Johnson Street, Somers Town*—Inventor and Manufacturer.

A radiator, or instrument for artists, designers, or draughtsmen, to enable them to draw lines radiating from a centre.

353 **ADCOCK, JOHN**, 4 *Marlborough Road, Dalston*—Inventor.

Model of a new machine for measuring and mapping roads, &c., on the scale of 1½ inch to a foot. In its use the slightest tendency to error from accidental displacement, an unevenness of the road, &c., can easily be detected by placing a compass upon one of the right lines of the map, which will enable the least deviation from the original or starting position to be at once perceived.

354 **BRAKE, R.**, *Glastonbury, Somersetshire*—Inventor.

Model of an instrument for explaining solar and lunar phenomena. Its novelty consists in the means adopted for showing the daily increase or decrease of the sun's declination, for explaining the nature of eclipses and the causes of the harvest moon, and of the difference between true and apparent time. There are two small appendages, one for measuring the sun's altitude, and the other for describing his apparent diurnal motion in the ecliptic, and for showing the angle which, at any particular time, the latter makes with the horizon. The model (six inches in diameter) is complete, but only about one-third the proposed size of the instrument.

355 **GRAHAM, JOHN**, *High Row, Darlington, Durham*—Inventor.

A rule for showing the circumference of a circle when the diameter is given, and *vice versâ*; and for showing also the side of the square equal in area to a circle whose diameter or circumference is given.

356 **CAMERON, PAUL**, 87 *London Street, Glasgow*—Inventor.

Azimuth compass, adapted to solve various problems in nautical astronomy, practical navigation, and civil

———'s improved indicating level.

Mathematical and nautical slide rule, for the use of engineers and naval officers.

Improved thermometer, steam and vacuum gauge.

357 **MACDONALD, DR.**, 4 *Coburg Place, Upper Kennington Lane*—Inventor.

Instrument to facilitate the finding of the longitude at sea.

358 **Siebe, Augustus**, 5 *Denmark Street, Soho*—Inventor and Manufacturer.

New-constructed dial weighing machine, with measuring apparatus. The annexed cut shows the form of this machine.

Siebe's Dial Weighing and Measuring Machine.

Self-acting water supply or steam-boiler feeder, with a patent joint to connect lead pipe without soldering.

359 **Smith, W.**, 6 *Wyatt Street, Maidstone*—Inventor.

Early-calling machine. The object for which this is intended is, by the aid of a clock, to awake persons at any hour required without noise.

361 **Miller, James**, jun., 30 *Thomas Street, Woolwich*—Inventor.

A radiator, an instrument for drawing lines to a point or centre, with a graduated arc, fitting the instrument for being used as a protractor.

[The manner of using this instrument is by placing the centre of the glass over a given point, and keeping one arm fixed, whilst drawing all the lines required by the inner edge of the other.—J. G.]

362 **Liddell, John Josiah**, *Edinburgh*—Designer and Manufacturer.

Spirit levels of various kinds, used in draining, road-levelling, &c.

363 **Thompson, John**, 4 *Wellington Place, West India Dock Road, Limehouse*—Inventor.

Trigonometrical machine, for drafting every description of coat, jacket, waistcoat, trousers, and riding-habit.

364 **Adcock, J.**, *Teignmouth*—Inventor and Designer.

Registered approximative comparative scale of the diameter and quadrant of the circle, designed to facilitate the measurement of standing timber.

Drawing of a paddle-wheel, illustrative of an arrangement by which the paddles may be made to enter and leave the water at the most effective angle.

Drawings of an invention for determining and registering the duration of the courses of the wind at stationary places within any given time; of a new water-wheel, applicable to falls of any height, and capable of working under water without much diminution of effect; and of a new tug-boat, intended for canal tunnels of great length, which have not a towing-path, and where steam power cannot be applied.

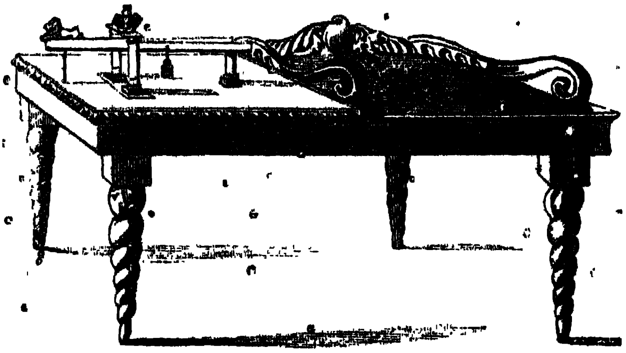
365 **Gardner & Co.**, 21 *Buchanan Street, Glasgow*—Manufacturers.

Optical instruments.

366 **Young & Son**, 5 *Bear Street, and* 46 *Cranbourn Street*—Inventors and Manufacturers.

A seat scale weighing machine of multiplying power.

A table weighing machine. This is represented in the annexed cut.



Young's Table Weighing Machine.

367 **Blyth, Robt.**, 2 *Cheltenham Place, Westminster Road, Lambeth*—Inventor.

Patent indicating level, for carpenters, masons, builders, &c. (adapted with telescope and stand).

368 **Ackland, William**, 19 *Dorset Street, Portman-square*—Inventor.

Machine for the graduation of hydrometers, thermometers, &c. Scale for an hydrometer, showing specific gravities. Another, showing per centages, according to Tralles. Hydrometer in a finished state, showing Twaddell's scale.

In hydrometers showing specific gravities and per centages, the divisions are of unequal magnitude. By this machine, the subdivisions are placed so that each shall be in its true mathematical position; it is applicable to the subdivisions on the scales of thermometers, barometers, verniers, the lines of sines, secants, tangents, semi-tangents, chords, logarithmic numbers, and, indeed, to all straight scales requiring equal or unequal divisions.

A brass hydrometer for showing specific gravities.

[An hydrometer is an instrument originally designed for the purpose of measuring the gravity, density, &c., of water; but the knowledge of the specific gravities of bodies, both fluid and solid, is so essential, that there have been many contrivances for their determination.—J. G.]

369 **Besant, —**, *Wiltshire*—Manufacturer.

Music stands.

371 **Nunn, Richard Maddock**, *Wexford, Ireland*—Inventor.

Hydrometer, for ascertaining the specific gravity of liquids from 0·600 to 2·000. The weights are introduced into the instrument below the centre of gravity.

Pump for medical and other purposes, stomach enemata, &c.

Door-spring, to act without noise.

372 **Blunt, H.**, *Shrewsbury*—Producer.

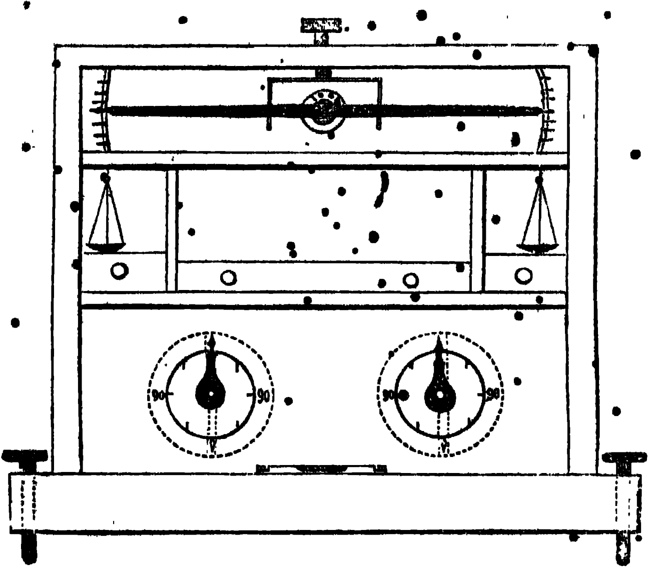
Model of a lunar crater (Eratosthenes), diameter of the crater about 28 miles.

376 **Hay, William**, 113 *Union Street, Aberdeen*—Designer and Proprietor.

Foot gauge, by which all the measurements of the foot are taken at once. Useful to shoemakers, &c.

377 **FOX, R. W.**, *Falmouth*—Inventor.

Magnetic balance. The beam is supported by fine cylindrical axles, of polished steel, moving in holes of very small depth, made in agates, or hard metal: it is furnished with an apparatus for diminishing the friction of the axles in the holes, so that the ten-thousandth part of a grain sensibly affects the balance; the *beam* is magnetized, and it may, when required, be adjusted at O, by means of the index at the back, which is connected with a magnet within the box—the point of the pin being rubbed during the operation. The following cut is a front view of this balance.



Fox's Magnetic Balance.

[In this balance the body is weighed against the force of magnetism, instead of that of gravitation, as in the ordinary balance. The beam is itself a magnet, and its position is governed and adjusted by the repulsive action of another magnet.

To adjust the instrument for use, it must be carefully levelled by the screws. The beam is then brought to the zero points by turning the deflectors. The weight and materials to be weighed are then introduced, and the sliding door closed; the beam being released takes its position with great accuracy, showing the difference of the materials and weights by the small space passed over by the points of the needle; or weights may be added till the beam becomes perfectly horizontal.—R. H.]

---

378 **YATES, EMMA JANE**, 9 *Portland Place, Wandsworth Road*—Inventor.

Instrument for the approximate determination of the problem of squaring the circle.

---

379 **DYER, HENRY**, *Great Western Railway, Hungerford*—Inventor.

Registered office-index and tablet-memento. The revolving circular plate, being properly adjusted at the end of each month, shows the month, the day of the month, and the day of the week, throughout that month.

---

382 **TOLLPUTT, W. B.**, *Folkestone*—Inventor.

Instrument for teaching the blind to write.

---

383 **DARNELL, J.**, 3 *King Edward Terrace, Liverpool Road, Islington*—Inventor.

Portable house alarum, for the detection of fire and robbery.

Universal sun-dial, which may be adjusted to any latitude in the northern or southern hemisphere.

---

385 **DAVIDSON, A.** *Nairne*—Inventor.

Instrument for taking the girt of trees.

---

386 **WEARE, R.**, *Prince's Road, Plumstead Common*—Inventor.

Fire annihilator.

387 **WERTHEIMER, D. J.**, 5 *Charing Cross*—Patentee and Manufacturer.

Calculating machine, performing the operations of the four arithmetical rules, viz., addition, subtraction, multiplication, and division, simply by mechanical action; and applicable for addition and subtraction of English money, from one farthing up to one million pounds sterling.

Calculating machines for Indian, American, Russian, Prussian, Brazilian, Portuguese, Neapolitan, Roman, French, Turkish, and Chinese money.

Counting machine, for showing the number of strokes made by a steam-engine, or any other piece of machinery; and which can also be used for telling off scores, &c.

[Automaton calculation of this kind is effected by a number of toothed wheels, each turning freely about its own centre, and the "value" of the operations depend upon the number of teeth in those wheels: thus, if a wheel has 12 teeth, it may be used for pence; another with 20 teeth may be used for shillings, and so on. But, notwithstanding the skill and ingenuity bestowed upon such instruments, their power is very limited.—J. G.]

---

389 **DARVELL, WM. JOHN**, *Chesham, Bucks*—Inventor.

An improved cooler, or refrigerator, for cooling malt liquors.

---

392 **BOYLE, —**

Reflecting telescope.

395 **MATTHIAS, JOHN HENRY**, 47 *Hatton Garden, and* 1 *Dorset St., Ball's Pond*—Inventor and Maker.

New invention for dividing lines, upon a geometrical principle; made of German silver and of box.

---

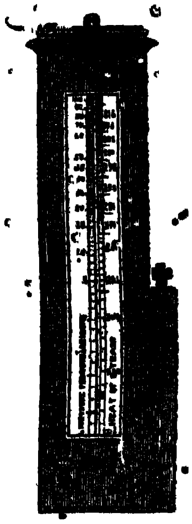
396 **BAKER, HENRY**, 90 *Hatton Garden*—Inventor and Manufacturer.

Steam gauge, upon the compressed air principle, showing the pressure per square inch, and also the temperature of the steam at various pressures. (See fig. 1.)

Vacuum gauge, with sliding scale; the glass tube is protected by a bronze covering. The same in a brass case, showing a scale of 22 inches and upwards, intended for sugar boiling, or situations where space is an object. (See fig. 2.)

Fig. 2.

Fig. 1.



Baker's Steam and Vacuum Gauges.

New steam gauge. Rain gauge, upon a simple plan.

Thermometric alarum, for giving an alarm at any required temperature; useful in case of fire, overheating, &c. It consists of a bent glass tube, with a bulb at each end, one of which is open to the external air, a certain quantity of mercury is poured into it. The ether vapour in one bulb acts as a thermometer, and by its expansion displaces the mercury, which flows into the other; the tube rests upon a pivot, and is by this movement overbalanced. The brass tube over the glass one contains a ball, which then rolls down and falls upon a lever in the upright pillar, which sets the clockwork in motion, giving an alarm which will continue for some time. It will also act as a thief-alarum, by means of wires being fixed from it to the doors and windows.

Horticultural and other thermometers. Barometers, for the working classes. Glass hydrometer for testing the strength of spirits, in a box, with a thermometer. Glass saccharometers, for testing beer. Glass lactometer, for showing the quality of milk; also the per centage of cream by measure. Urinometers, fitted up in various ways, with bottles, lamps, and test tubes.

---

399 **CHAMBERLAIN, WILLIAM**, jun., *St. Leonards-on-Sea*—Inventor.

Large model of a patent machine, to be used in recording votes by ballot

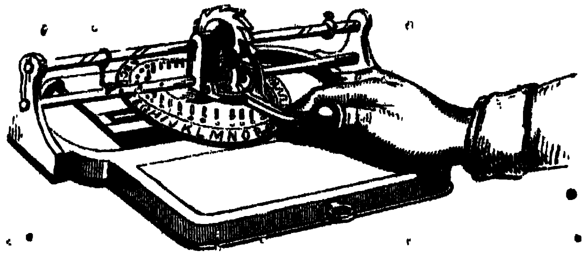
Model of a similar patent machine aking votes on divisions.

---

401 **HUGHES, WILLIAM**, *Governor of the Blind Asylum, Manchester*—Inventor.

Registered portable typograph. A new mechanical contrivance for the use of the blind. See the annexed cut.

By the aid of this instrument persons who can read the common embossed Roman letters (even of double the ordinary size) may communicate, by letter, after a few minutes' instruction. This typograph is calculated to give, at pleasure, any letter or figure in the eighth part of an inch; and, if required, a blind person may with ease put sixty-four distinct letters within the space of a square inch. The typograph is applicable to many other purposes, such as printing uniform labels for museums, &c.



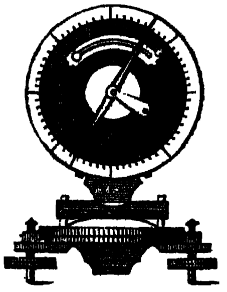
Hughes's Registered Typograph.

The typograph, a similar instrument, constructed for embossing, or printing in relief.

---

402 **WILTON, WILLIAM**, *St. Day, Truro*—Manufacturer.

Fox's magnetic dip and intensity instruments, various sizes, for showing the exact dip of the magnetic needle, and for measuring relative magnetic intensities. See the annexed cut.



Fox's Magnetic Dip and Intensity Instrument.

This instrument consists of the following parts:—

1st. Of a horizontal plate, traversing within a graduated limb mounted upon a tripod of brass, and adjusted by screws to the true level, by a ground-glass spirit bubble.

2nd. Of a strong ring fixed at right angles to the former, within which are two graduated limbs, the outer one divided to 15°, and the inner one to 30°, and so fixed to the instrument as to direct the eye in reading off from the points of the needle, thereby avoiding error from parallax.

3rd. Of a solid back with a graduated limb outside, and an armature carrying a telescope, with verniers made to revolve thereon.

4th. Of a concentric ring, revolving in the centre of this, and carrying a plate with bracket and appendages for the needles.

5th. Of a magnetic needle attached to a strong steel axle, terminating at the extremities in very fine, but perfect cylinders of hardened and polished steel; these fit into jewelled holes, which may be moved around with the concentric ring, and which suspend the needle in a vertical plane, making it very steady, yet allowing it perfect freedom to settle in the magnetic dip.

6th. Of a small brass stud projecting behind, and so fixed as to form a continuation from the axle of the needle; against this, is employed a small ivory disc as a rubber, which counteracts the friction of the needle on its axle.

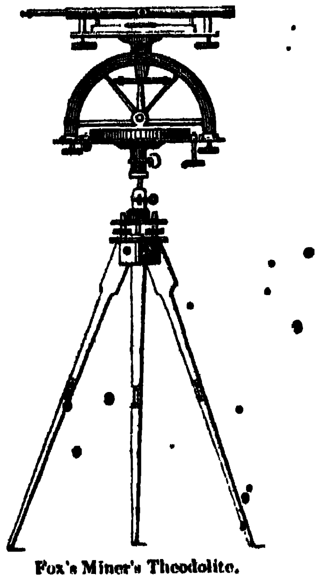
7th. Of a fine concentric brass pulley on the axle of the needle, over which passes a fibre of unspun silk, carrying a small hook at each end, for the purpose of testing magnetic intensities by the employment of small weights, a series of which are furnished with the instrument.

8th. Of a pair of small cylindrical magnets fitted into brass tubes, and made to screw into the armature behind; when the verniers of the armature are placed to read off the same degree as the points of the needle, then the points of these magnets are exactly opposite thereto, and are employed in deflecting the needle from its true position, and thereby determining magnetic forces, and also of correcting the dip.

9th. Of a thermometer, for registering temperature, when observations are made with the instrument.

Lastly. Of an extra needle, to be employed for correcting errors, arising from accident or otherwise, in the needle generally used. This is effected by taking the mean of several readings of the dip of this needle, with the face of the instrument towards the east, moving the horizontal limb through 180°, and taking the mean of several readings west, then of reversing the poles of the needle, and again taking the mean of several readings east and west, and lastly of taking the mean of these two results; if these correspond with the dip shown by the needle regularly employed, then the dip is correct. A mean of several readings will generally give the dip within a minute or two. The instrument may also be employed for measuring angles in azimuth and altitude, or be used as a theodolite. In using it as a magnetic variation, or declination instrument, the true meridian can be ascertained in the usual manner, by means of the telescope and the vertical and horizontal movements. The magnetic meridian can be exactly determined by reading off the azimuths when the needle is vertical, or rather when one of its poles, or points, is at 90° facing north as well as south, and the mean of the azimuths gives the magnetic meridian. These observations may be multiplied by turning the face of the needle towards the back of the instrument, and also by employing the other needle to repeat the observations. The method of different azimuths may also be employed *ad libitum*, reading off when the point of the needle is ½°, 1°, 2°, &c., on each side of 90° in succession. In all cases the rubbing of the point of the stud, or pin at the back, should be continued till the needle has settled in its place of rest. It should be gently done, especially at the last.

[Fox's dipping-needle deflector has now been employed by Ross, Stanley, Belcher, and others, for determining the variations of the dip, and intensity of magnetic force, for many years, with the most marked advantage; as it enables the observer to determine, with great accuracy even at sea, various points of interest in connexion with the phenomena of terrestrial magnetism. The needle being brought to its true bearing at any spot on the earth's surface, a small balance is hung on the disc around the centre of suspension, and the weight required to bring the needle back to zero is the measure of the intensity of the magnetic force in action. For a detailed account, the Second Annual Report of the Royal Cornwall Polytechnic Society should be consulted.—R. H.]



Fox's Miner's Theodolite.

Practical miner's theodolite, or improved dial and quadrant, used for underground and surface surveying, and constructed so as to answer all the purposes of the scientific and practical miner, while it may also be used as a surveyor's theodolite. This instrument is shown in the preceding cut.

403 ANDERSON, JAMES, *Queensferry South, Edinburgh*—Inventor.

Perspective drawing machine.

404 GRIFFITHS & LE BEAU, 15 *Coborn Road, Mile End*—Producer.

Daguerreotype portraits and pictures, with electrotype copies taken from them.

[The daguerreotype picture being produced by a film of mercury upon a silvered plate, there is necessarily an irregularity over its surface. If a plate thus prepared is connected with a galvanic battery, and placed in a solution of sulphate of copper, the copper precipitated on the surface receives a most delicate impression of the daguerreotype image. In addition to the differences produced by the varying thickness of the mercurial film, there is not unfrequently a slight difference in the colour of the copper deposited over those parts thickly coated with mercury, and those over which the silver is exposed.—R. H.]

404A HEYWOOD, WILLIAM, 95 *Duke Street, Manchester*—Inventor.

Experimental air-pump, with self-acting exhaust-tap placed in immediate contact with the bottom of the cylinder.

406 BEAUFORD, R., *Hastings*—Inventor.

Registered daguerreotype accelerator. This consists of a properly-constructed lens, applied in a particular manner to the ordinary daguerreotype instrument. Its advantages are assumed to be as follow:—

The actinic rays (which have their primitive source in the solar beam, and which produce the photographic effect) diverge from the object of which an image is to be produced on the photographic plate. These rays are made, by the action of the ordinary daguerreotype instrument, to converge to a point at a certain distance within the camera. By applying the accelerator, these rays are made to converge more rapidly; and, by putting the prepared plate more forward, a smaller image is procured by means of the accelerator than could be obtained without it. Hence, by means of the accelerator, the actinic rays are condensed into a smaller area, and the intensity of the effect is heightened.

This latter fact is considered to include three others, namely—photographic effects [illegible] be obtained by the application of the accelerator, when, without its aid, the desired effect could not be obtained; as, for instance, on a dark and cloudy day. Again, all other things being the same, the image of the object is much more intense and well-defined with the accelerator than without it—the flatness and deadness generally observable in photographic portraits being exchanged for a roundness of surface, and a natural projection or "bringing out" of the parts, which constitute an effect highly pleasing. A third benefit secured by the accelerator is observable in the diminished time required for producing a photographic effect, owing to the actinic rays being intensified by the introduction of the accelerator. The time required for producing a photographic picture with the aid of the accelerator, is only one-half or two-thirds of that required with the ordinary apparatus alone.

A further advantage obtained is the economy of space. When the daguerreotype instrument is used without the accelerator, the artist, if he wish to obtain actinic rays of less divergence (which is often the case), must remove from the object. In removing further, he must use (in most cases) a large instrument. Such inconvenience is avoided by means of the accelerator; for, when this is stated to be applied, the rays can be at once refracted into the right course, whereby the increase of distance and the change of instrument are avoided; the accelerator therefore favours not only the economy of space, but also the economy of means, the use of the larger instrument being in this case obviated. This will appear to be still further the case, when we consider that by applying accelerators of different foci, we can produce portraits or views of proportional magnitudes; so that from one daguerreotype instrument both large and small plates can be produced.

Another advantage of the accelerator is, that it prevents that distortion of the image often observable in photographic portraits. Without the application of the accelerator, the image produced is of such a size that any exaggeration of relative magnitude, due to the superior forwardness of any part of the object, is magnified to an inconvenient extent. The image produced by the accelerator is reduced in size, and this exaggeration is reduced in an equal degree, so that it appears free from all distortion; by this means, the ingenious but troublesome contrivances hitherto adopted to avoid this source of annoyance are superseded.

407 **Gogerty, Robert**, 72 *Fleet Street*—Inventor.

Model of a pair of direct-acting steam-engines, with paddle-wheels.

Plate electrical machine to exhibit negative and positive electricity.

Double-barrel air-pump with iron plate.

Delicate galvanometer, &c.

408 **Bryan, Rev. Joshua**, 8 *Haymarket, Norwich*—Inventor.

Improved air-pump without valves, having a rotary motion and double action, exhausting both by the rise and fall of the piston; it will also condense as well as exhaust.

409 **Marratt, J. S.**, 63 *King William Street, London Bridge*—Manufacturer.

Five-feet achromatic telescope, the vertical and horizontal motion produced by endless screws.

Seven-inch transit theodolite, reading to 15″ in altitude and azimuth, furnished with inverting and diagonal eye pieces, needle box, tripod staff, and locking plate, axis level, &c. It can be used with or without tripod, as may be required; and is adapted for surveying, tunnelling, magnetic, or astronomical purposes.

411 **Phillips, John**, F.R.S., *St. Mary's Lodge, York*—Inventor.

An electrophorus, (fig. 1.), which differs from that of ordinary construction, by having metallic conductors through the resin to the base on which it is placed. By this contrivance it is unnecessary to touch with the hand the metallic cover, which as often as it is lifted and replaced will give powerful sparks.

Rain-gauge (fig. 2.), with one horizontal and four vertical receiving funnels, each furnished with a stopcock. By a simple calculation from the measures of water collected in the funnels after a shower, not only the depth of rain which has fallen, but also the direction in which it came, and the angle of inclination of its descent, become known. These instruments are shown in the preceding cut.

Maximum thermometer, with a separated column of mercury for the index, instead of the wire, which is liable to get entangled in the mercury, and demands a large-sized instrument. By the construction exhibited, these defects are avoided, and the use of the instrument is extended.

Anemometer, for collieries, hospitals, &c. The pressure is received on a semicircular disc, suspended by the diameter, and measured on a graduated arc. By tables calculated for the equation vel. $\left(= M\sqrt{\frac{\sin\theta}{\cos^2\theta}}\right)$ the velocity is obtained in terms of the angle.

Air barometer, of very cheap construction, suited to collieries, in which a large scale is desirable for rendering the changes of atmospheric pressure obvious.

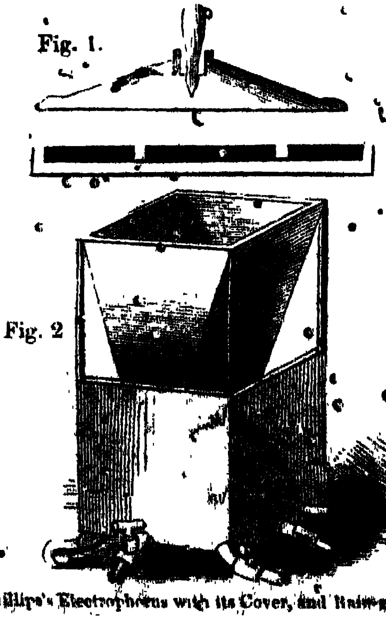


Fig. 1.

Fig. 2

Phillips's Electrophorus with its Cover, and Rain-gauge.

413 **Allen, Edward Ellis**, *Steel Yard Wharf, Upper Thames Street*—Inventor.

Electro-magnetic railway-train alarum, for communicating with the engine-driver from any part of the train. The alarum consists of the ordinary steam whistle worked by an electro-magnet, the current passing through the side-chains; thus any additional connexion between the carriages after they are attached in the usual way is avoided.

413 A **Parks, W. J.**, 25, *Newington Crescent*—Manufacturer.

Gold plate with mineral teeth mounted on it. Complete upper set, with natural teeth on the one side, socketed in hippopotamus ivory, and imitated on the other.

414 **Nichols, W.**, *Cambridge*—Inventor.

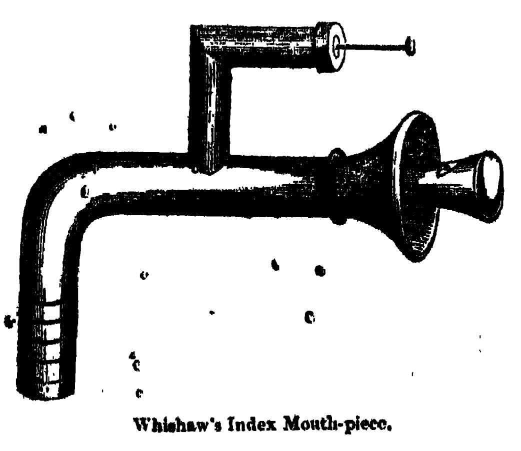
Electro-magnetic alarum, for protection against robbery or fire; with a model showing the arrangements.

417 **Cresswell, John**, *Winchmore Hill, Edmonton*—Inventor.

Electro-magnetic engine, for the production of motion. The principal novelty in this engine consists in the mode of applying the attractive power.

419 **Whishaw, Francis**, 9 *John Street, Adelphi*—Designer and Inventor.

Telekouphonon, or speaking telegraph. Consisting of gutta percha, glass, metal, or other proper tubing, with mouthpieces of ivory, hard wood, or metal; furnished with whistles, organ-pipes, and other means of calling at-



Whishaw's Index Mouth-piece.

tention. The index mouthpiece attached to one end of the tube has an indicator to show from which room the call has been made. See the preceding cut.

Gutta percha telephone.

Railway trains communicator, for communicating between guard and driver, or passengers and driver, a telekouphonon, in different lengths, with screw joints to suit the lengths of the carriages and the spaces between them.

Gutta percha tube and lathe-band, as first made by the exhibitor in 1845.

Subaqueous insulated electric telegraph conductors.

Battery protector.

Telegraphic private code box. Model to illustrate the hydraulic telegraph.

Index electro one-wire telegraph, with perforated conversation codes.

Centimetral chronometer, made by Johnston, Clerkenwell. By means of tabulated velocities on a moveable ring, the speeds of railway trains, &c., are accurately ascertained to the hundredth part of a minute, by observation merely, and without calculation.

Comparative plan of that part of the City of London which was destroyed by the Great Fire in 1666; showing its state at that period, and the alterations and improvements effected up to 1829, with historical and other notices.

Patent glass pipes to insulate and protect the wires of electric telegraphs when placed under ground. Patent multitubular pipes, of glazed earthenware. Manufactured by William Northen, Vauxhall.

Chess-Board, enamelled slate, executed by Mr. Magnus, Pimlico.

Whishaw's uniformity-of-time clock and telegraph mechanical domestic telegraph; and index electric telegraph.

[The mechanical domestic telegraph consists of an arrangement of tubes formed of gutta percha, and supplied with metallic and other mouthpieces, to which a whistle is attached. By blowing into the tube the whistle is sounded in a remote apartment, and the message can then be delivered with scarcely any elevation of the voice through the tube, which transmits sound in a remarkable manner.—R. E.]

Wrought-iron chain pipes, with swivel joints, for protecting the wires of electric telegraphs under water.

420 **Harrison, C. W., & J. J.**, *Richmond*—Inventors.

Electro-magnetic engine, for producing a motive power on a new principle.

---

421 **McNair, A. & Co.**, 33 *Oswald Street, Glasgow*—
Inventors and Manufacturers.

Conductor for electric telegraphs, consisting of a copper wire insulated with gutta percha, and inclosed in a leaden tube.

---

422 **Brett, Alfred**, 138 *Holborn Bars*—Proprietor.

Brett and Little's patent electric telegraph, alarum bell, bell handle, and battery.

The electric telegraph. The various letters or numerals represented on the dial are made by the motions of either or both of the indicators; the number of the motions for each letter or numeral is defined by the figures on the centre of the dial, commencing at all times with the indicator on the side next the letter or numeral, and when both indicators are used, finishing with the opposite one. The helices are double, and of a circular form; and the magnet is in the form of a ring or horseshoe, suspended in the centre of the helices, and is deflected either to the right or to the left, according to the direction of the current. The poles of the magnet being equidistant from the earth, the magnet is rendered astatic, and not affected by the terrestrial magnetism.

These magnets move parallel with the coils of wire and planes of electricity. The indicators, not being magnets, are perfectly free from vibration, and the indication is therefore distinct and certain.

The alarum bell, for calling the attention of the attendant, being liberated by a motion similar to that of the telegraph, gives three distinct blows; and should it, by any chance, be liberated by a current of atmospheric electricity, the apparatus would not be deranged.

The deflector on the left of the instrument enables the current to be transferred from the telegraph to the bell, and *vice versâ*; and it can also be used in case of an instrument getting injured, to pass the current along the line, without stopping the communications at other stations; with this, one wire only is required to enable every station on a line of railway to communicate with the whole by means of one instrument only at each station.

The battery is of the ordinary form, except that the cells are of porcelain and separate, and the plates are connected with binding screws.

By the use of an underground arrangement of conductors (as exhibited in combination) the cost in the first instance, with wire encased in lead, is very little more than posts with wires suspended in the air; and with wire, encased in gutta percha only, much less; while the cost of maintenance is greatly reduced, and the liability of interference from atmospheric influence avoided.

---

423 **Winter, J.**, 44 *Littlewood House, Leeds*—
Manufacturer.

Galvanic walking-stick, made of a kind of oak, from Australia. It contains an electro-galvanic machine and battery complete. On holding the knob in the hand, a shock is slightly felt; and by taking a piece of silver or copper in each hand, and touching the knob on each side, the shock is greatly increased.

424 **Smith, George Richard**, 16 *De Beauvoir Terrace, Culford Road*—Inventor.

Comic electric telegraph and key board, which consists of a mahogany case, having in front a comic face, and three signs concealed by shutters, the features of the face and the shutters being capable of simultaneous motion by an electric current, which also rings a bell placed inside. With three signs, it not only conveys every letter in the alphabet, but exhibits distinctly the ends of letters, words, and sentences. By the bell arrangement, it intimates when a message is about to be sent, and is made to facilitate the deciphering of the signs. Magnetic polarity, as an indicator, being dispensed with, no electric disturbance in the atmosphere can render it ineffective; the internal arrangement being very simple, it will not soon be disordered by use.

---

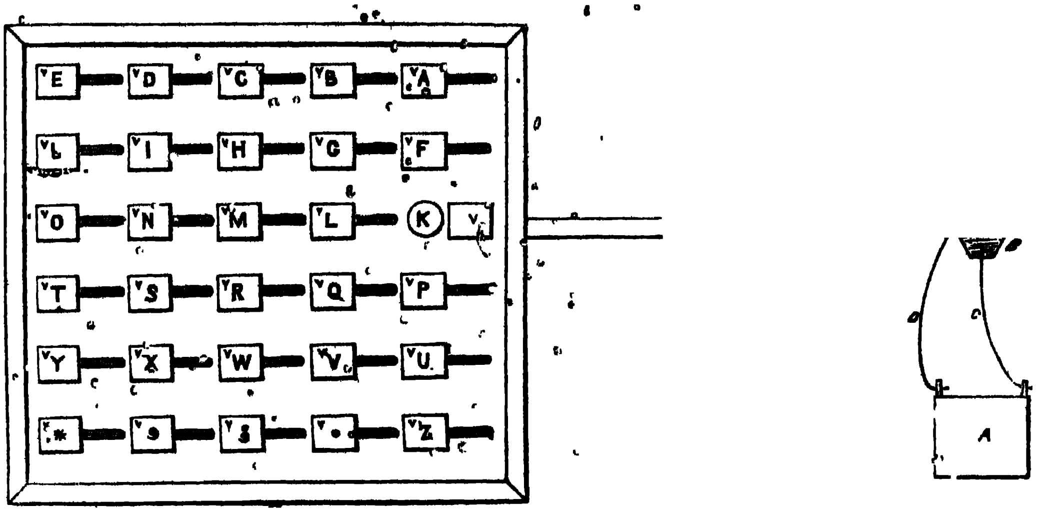
425 **Burdett, Joseph**, 28 *Hanover Square, Clapham Road*—Inventor.

Domestic telegraph, requiring only one bell for any number of rooms. All the rooms being numbered, wires are brought to corresponding numbers on this machine, so that when the wire of any room is agitated, the bell will ring and the indicator will point out the number of the room on the dial where attention is required.

---

426 **Alexander, William, F.R.S.E.**, 52 *West Register Street, Edinburgh*—Inventor.

Model of an electro-magnetic telegraph, worked by means of voltaic currents through metallic conductors, deflecting magnetic needles, and thus unveiling the letters of the alphabet in the order required for any communication. The model was exhibited at the meeting of the Royal Scottish Society of Arts, on 15th November, 1837, after previous experiments throughout the year, to test the practicability and efficiency of the plan, made through a metallic circuit of four miles in the chemistry class-room of the University of Edinburgh. It is believed by the inventor to be the first definite plan for an electro-magnetic telegraph ever shown in operation before the public or a scientific society. In 1837, the applicability of electro-magnetism to telegraphic purposes was matter of doubt and uncertainty, and the object of the inventor was to solve the problem by apparatus of the most simple construction, and which might lead to future improvements. The perfection to which electric telegraphs have since arrived, their superiority over all other methods for conveying intelligence between distant places, and their inconceivable importance and utility, are now well known and established, and are justly considered one of the wonders of the age. The following cut represents this early telegraph:—



Alexander's Electric Telegraph.

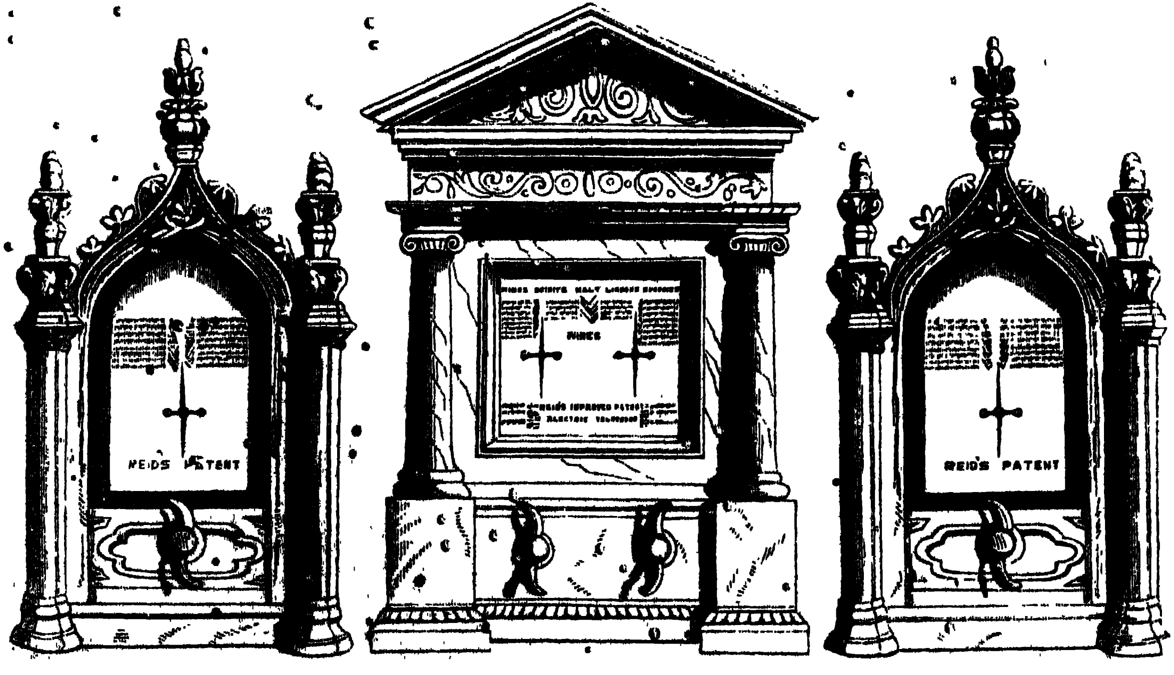
A is a voltaic battery; B, a trough filled with mercury; C, a wire connecting the zinc plate in the battery with the trough of mercury; D, the return wire connected with the copper plate of the battery; E, a key to be pressed down by the finger of the operator, like the key of a pianoforte; F, is a pendant wire which dips into the mercury when the key is depressed, and completes the circuit formed by the wires C and D, extending from one terminus of the telegraph to the other.

G is the distant dial upon which the whole letters of the alphabet and stops are marked. These are not seen when the magnetic needles—poised horizontally in free space behind the dial—are in their natural position of North and South, with screens or veils marked V, attached to each of their North poles, and concealing the letters, but when the circuit is completed by the depression of the key E, the corresponding magnetic needle is deflected to the West, and exposes, as at K, the letter previously concealed. Thirty copper wires and a return wire extend from the keys to the magnetic needles.

A metallic rod may be advantageously substituted for the trough of mercury below the keys.

427. **REID, WM.**, 25 *University Street, Bedford Square*—
Inventor, Patentee, and Manufacturer.

Pair of electric-telegraph instruments, adapted for hotels, &c.; the same adapted for public companies, &c.; domestic telegraph, adapted for dressing-rooms, &c. See the following cuts:—



Reid's Electric Telegraphs.

An electrical apparatus for ringing bells, in large mansions, brought into instantaneous action by pulling a cord or lever; and capable of performing at the distance of 50 miles, with as much ease and rapidity as at 50 yards.

Electric-telegraph instrument, for the purpose of conveying general intelligence over the country.

Specimens of insulated wire, for submarine electric telegraphs; specimens taken from the English Channel, used in the electric telegraph between Dover and Cape Grinez, near Calais.

---

428 **HENLEY, WILLIAM THOMAS**, 46 *St. John's Street Road, Clerkenwell*—Inventor and Manufacturer.

Large permanent horse-shoe magnet, weighing 6¼ cwt.

Patent electric telegraphs, worked by the magneto-electric current.

Fig. 1.

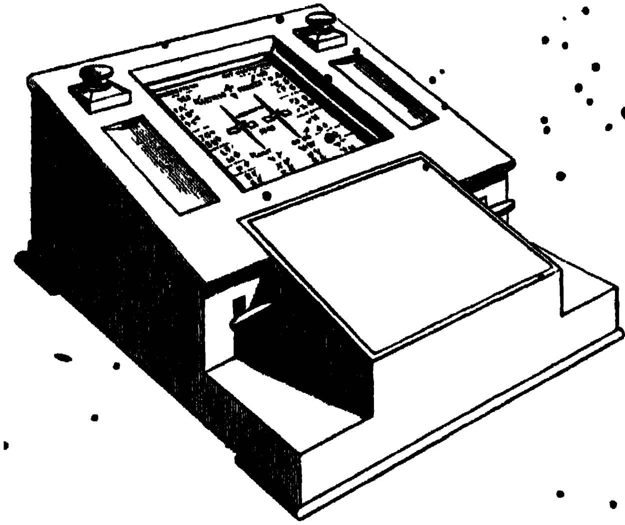


Fig. 2.

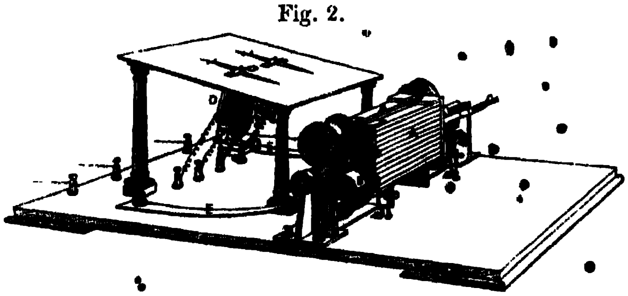
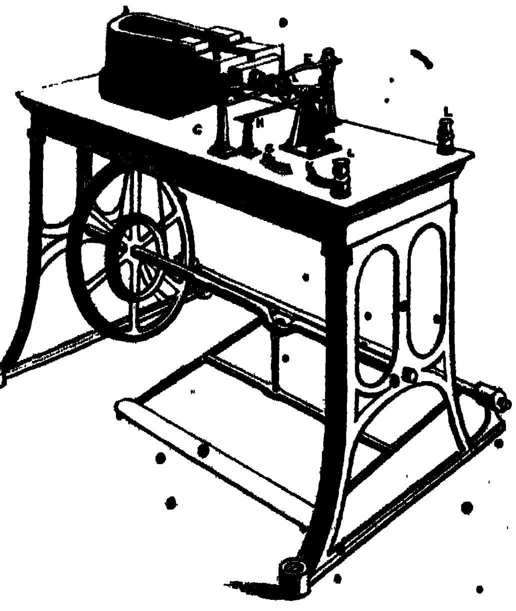


Henley's Patent Electric Telegraph.

Fig. 3.



Henley's Magneto-Electric Machine.

Magneto-electric machine, illustrating the application of the electric current derived from magnets, to the purposes of electro-chemical decomposition, electro-metallurgy, &c.

The telegraphs have been tested in the worst insulated line in the country, during the most unfavourable weather, and found to work any distance that it was possible to try them, without any diminution of their power. Working without the aid of a voltaic battery, they are always ready for use, without any preparation or expense. Fig. 1 represents the telegraph with its cover, as in use; fig. 2, the same with its cover removed, each consists of two parts, one for producing electricity, the other for receiving it, and indicating the signals; the parts of each telegraph are alike. The first part consists of two compound bar magnets A A, the ends of each being capped with soft iron, to bring the influence of all the plates to any particular point. B B, two armatures, wound with fine-covered copper wire, each placed on a separate axis, and moved by the levers C C, seen projecting through the case in fig. 1; the ends of the wire are carried from the armature through the pieces of ivory in the axle to the wood base, and from thence to the distant instrument, every motion of the lever and armature producing a current of electricity, the downward motion giving a current in one direction, and the upward motion a current in the opposite. The second part of the apparatus consists of a dial, containing the alphabet and certain marks corresponding to the motions of the needles on the face of the dials; for instance, opposite the letter A is seen a single mark inclining to the left, signifying one motion of the left-hand needle; the letter B, two marks; letter C, three marks, signifying three motions of the same needle; the letter D, one mark to the right; E, two; and F, three; G, one right and one left; L, one left; and once both needles together, and so on. Under the dial are placed two electro-magnets D D, each having four poles, formed by two semicircular pieces of iron with a magnetic needle, suspended freely within, placed on the same axis as the corresponding needle, or pointer, seen on the dial. The downward motion of the lever deflects the corresponding needles of all the instruments that may be included in the circuit, as well as its own; the needles remain so, until the lever is allowed to return by the force of the spring E, when the needles all return to their position, and this taking place with certainty, although the instruments may be at any distance.

The current obtained from the apparatus represented in fig. 3 is very powerful, and capable of producing electro-chemical decomposition, and all the effects obtained from a powerful voltaic battery. The horse-shoe magnet A, with the revolving armature B, formed of hoop-iron, is placed on the mahogany case C, and the whole fixed on the iron framework, on which is suspended the large wheel and treadle, for giving motion to the armature by the pulley D; the magnet has soft caps, and is arranged the same as the telegraph, so that the poles of the magnet are always connected with some part of the iron of the armature, and by that means it always retains its power. The two springs E E rub on the breakpiece F, which is so arranged that the current flows in one direction; the knob G moves a slide to divert the current to the mercury cup H for showing the spark; the cam I moves the point on the spring in and out; the other knob is to make a shock with the two terminals L L.

Electro-magnet capable of sustaining, when excited, 4 tons; the sphere of attraction extends much further by being made of iron hooping.

Large steel permanent magnet, weighing 6¼ cwts., capable of sustaining about 1 ton.

[The received theory of magnetism is, that the attracting power of the bar of steel, which we call a magnet, is due to the circulation of electric currents around the bar. It was discovered by Faraday, that when a metallic mass is moved in proximity to the poles, a current is induced in it: upon this principle magneto-electric machines are constructed. The soft iron armature, or keeper of the permanent magnet, is fixed on an axle, which is made to revolve by some mechanical contrivance, so that a continued and rapid reversal of its poles takes place. By this alone a magneto-electric disturbance is effected; but for the purpose of accumulating the force, coils of copper-wire are fixed on the armature, and every time they approach or leave the poles of the magnet in the course of rotation, an induced current passes through the wire, and the reversal being extremely rapid, though the current is only instantaneous, the result is what may be regarded as an uninterrupted stream of electricity.

The magneto-electric machine was first employed for telegraphic purposes, by Professor Wheatstone. The battery is however usually preferred in this country.—R. H.]

---

429 **BRETT, JACOB, & JOHN**, 2 *Hanover Square*—Patentees and Proprietors.

1. An electric printing telegraph, which, by the aid of a single wire only, prints in Roman (or other) letters, with the certainty of action, and under the control of the distant correspondent; it is worked either by galvanic o magnetic electricity, and controlled by hydraulic or atmospheric regulators, combining also a signal bell. Size, 12 inches by 7 inches, height 12 inches.

2. Similar telegraph with additions for registering in duplicate, indicating by dials or signal bells; by the same simple means and certainty of action. Size, 12 inches by 8 inches, height 12 inches.

3. The communicator, or corresponding apparatus, by means of which any one may at first sight print communications at a distant station; the opening and shutting at the commencement and close of a correspondence by its action, taking, or giving the electric current, from or to the main line. Size, 4 inches by 4 inches, 2 inches deep.

4. A similar one, with pianoforte arrangement; the touching of the keys with the finger acting on the main wire, and printing the required or corresponding letter at the distant station.

5. Communicator, adapted as a pocket apparatus for guards of railway trains, for communicating with distant stations on the instant of an accident. Size, 3 inches by 3 inches, 2 inches deep.

6. A circuit regulator for the absolute control of any number of stations from one given point, by the aid of an independent wire. Size, 3 inches by 3½ inches.

7. A portion of the experimental wire passed along the bottom of the channel in August last, when messages were printed by this telegraph from England to France, preparatory to the great undertaking now in progress, which, by the aid of eight permanently-protected wires, will, it is expected, in June next, place Great Britain in constant and instantaneous communication with all the great capitals of Europe.

8. Specimens of an iron protecting cable for enclosing the covered submarine wires, where great strength is required. (Invented by Thos. W. B. Brett.)

9. Electric bells for division signals in the new Houses of Parliament, by which any number may be brought under instantaneous control.

10. Specimens of the printing executed at 200 miles distance.

11. The grants of Louis Philippe and Louis Napoleon to the Messrs. Brett, for the exclusive privilege of establishing electric communication between France and England.

This printing telegraph effects all the purposes of telegraphic communication by a single wire only; printing in Roman, or other letters, recording in duplicate with the rapidity of a compositor, indicating by dials, or signalising by bells. The telegraphs in general use formerly required 3 or 5 wires for vibrating the single or double needles only, and an independent wire in all cases for a single bell.

It requires but a single wire, and no attendants for watching, copying, or transcribing.

If adapted, at a General Office in London, for the reception of correspondence from all parts of Europe, during the night when the offices are closed, and no attendant present, the whole of the communications of the night from the different capitals of Europe, will, on the arrival of the attendants in the morning, be found accurately printed; and during the day, a signal-bell will announce when, and from where, a communication had been made, requiring attention only to reply to it.

For sending a communication, it is required only to move the hand or strike the key of either of the communicators, Nos. 3, 4, 5, by which a current of electricity is sent through the wire to the distant station, bringing into action the given or required letter on the periphery of a wheel, which instantly impresses itself on part of an endless scroll of paper, folling printed from an aperture in the instrument, as the shocks or currents of electricity are conveyed by the action on the corresponding letters of the distant communicator.

The telegraph is comparatively self-supplying as the colouring or printing material requires renewal only once a month, according to regulation.

[The insulation of the wires for submarine electric communication is effected by covering them with gutta percha. They are covered in the following manner: a mass of gutta percha in a soft state is contained within a cylinder, and being acted upon by a piston, is driven out through a small die, in the centre of which is the wire. The latter being slowly drawn forward, becomes surrounded with an uniform covering of gutta percha, the thickness of which varies with the diameter of the die-hole through which it is compressed. The coated wire is then drawn through a trough of cold water and wound on a drum. Its insulation is afterwards tested by passing an electric current through it while under water, and observing the deflection, or rather the absence of the deflection, of a magnetic needle.—R. E.]

---

430 **WALKER, C. V.**, *Tonbridge*—Inventor.

Insulation of telegraph wires, exhibited as *in situ* on a pole-head, and detached on the table. The earthenware cone by which the telegraph wire is suspended is so shaped that the point of contact with the wire is small, is sheltered, and is far from the pole. The shackle frame used for insulating the wire at winding-posts is glazed iron; and its earthen cylinders are so constructed as to give a great length of insulating material.

Insulation of telegraph wires in tunnels, exhibited as in actual use. The wire is covered with gutta percha by Mr. T. Foster's patent process, and is placed in grooved boards, prepared with varnish, and fixed against the tunnel walls.

[Mr. Forster's process of covering telegraphic wires is as follows:—The gum, after being cleared, is macerated by steam machinery in a heated iron vessel. It is thence transferred, lump by lump, to a pair of heated grooved rollers, between which it is passed and pressed into solid cylinders three or four feet in length. It is now ready for the covering machine to which it is carried, and where it is used while warm and soft. This machine consists of two pair of hollow polished iron flapping rollers, heated, as occasion requires, by steam, and of a pair of small grooved cutting rollers. The cutting rollers vary both in the number and the size of the grooves, according to the character of covering required. The wire employed in the tunnels on the South-Eastern Railway, and which are under the superintendence of Mr. Walker, is No. 16 copper, and is covered by six grooved rollers, six wires being covered at one operation.

The diameter of the wire, with its covering, being one-fourth of an inch. The two pairs of flatting rollers are placed one over the other, with a small interval between them. The six wires traverse the interval between the two pairs of flatting rollers, and pass between the six grooved cutting rollers with one of the sheets of gutta percha above them and another below, and appear on the other side as a perfect band of six covered wires. They are pulled apart when single wires are required, or left undisturbed when required in a band.—J. G.]

Moveable studs, fitted to Cooke and Wheatstone's electric telegraph, to counteract deflections of the needle arising from meteorological phenomena. When the needles are deflected by extraneous causes, so as to touch the ivory studs, or stops, the latter are to be moved in the direction of the deflection, until they are again made equidistant.

Compound needle, consisting of several small needles secured on an ivory disc.

Bell transferrer, an ebony cylinder so inlaid with brass and combined with springs as to transfer the telegraph bell to the up or the down side of an intermediate station, according as that station is talking down or up the line.

Let A B C be a telegraph wire of any length, having instruments at A, B and C; B being the intermediate station, and having the bell and the needle on the said wire. If the bell is so connected as to be on the A side

of the needle at station B, when B and C are in communication, it is required to transfer it to the C side, when A and B are in communication; so that while B talks to A, with the rest of the line cut off, he can hear if C rings; or while he talks to C, he can hear if A rings.

This effect is produced, by selecting some convenient place inside the instrument for dividing the wires, and placing springs at those spots. These springs, six in number, press, three above and three below, on brass laid in the ebony cylinder, visible on the left side of the instrument.

When the word UP, on the stud in front of the instrument is vertical, the springs are connected in pairs, as 1, 2; 3, 4; 5, 6. When the word UP is horizontal, the springs are connected in pairs, as 1, 4; 5, 3; 2, 6, thus transferring the bell to the other side of the needle.

The same operation that transfers the bell to the C side of B, cuts off the C half of the line, by the other springs not concerned in this description.

Branch double turn-plate, being a box-wood cylinder, so inlaid with brass and combined with springs as to enable a junction station to put a branch line of telegraph in communication with either direction of the main line; and completing a perfect circuit for the other portion of the main line.

Lightning conductors, for telegraph wires, shown *in situ* as fitted in telegraph offices, and shown on the table in parts.

Graphite battery; a common sand battery, charged with diluted acid, but having the negative plate constructed of slices of corrosion from gas retorts, instead of copper. Such batteries last longer than the others, there being no salt of copper present to produce action on the zinc.

Up and down ringing key, a contrivance for sending the electric force from an intermediate station to ring bells in the required direction only; the apparatus when at rest constituting part of a complete circuit.

432 THE BRITISH ELECTRIC TELEGRAPH COMPANY.
SAWARD, GEORGE, Secretary.

Highton's patent electric telegraphs and apparatus. Printing telegraph, adapted to one or two wires; another by which any one of 26 symbolical characters is printed by a single touch of a key.

Morse's arrangement of telegraph, worked by secondary power.

Telegraph for showing the letters of the alphabet instantly, by the touch of a single key; with a revolving pointer and a revolving disc.

Series of indicating and pointing telegraphs, worked by various descriptions of coils, and steel magnets; and by coils acting on soft iron.

Series of telegraphic alarums, worked by electro-magnetism, excited in the metal nickel; also by coils and magnets, and by coils and soft iron.

Lightning extractors, for extracting from the wires of a telegraph, charges of atmospheric electricity.

Arrangements for telegraph posts, by means of which a great saving may be effected in the construction of electric telegraphs.

Specimens of wires for a submarine telegraph, protected by means of a covering of wire cable.

[Electric telegraphs admit of a great variety of mechanical arrangements, by which the modes of signalling are modified. In all, the electric current does the work; in some, by deflecting the magnetic needle directly, and in others, by inducing magnetism in soft iron, the force of which acts upon some clock-like arrangement, and thus, by a mechanical contrivance, gives the required signal. Most printing telegraphs are of the latter character. In some, when connexion is made and broken with the battery, electro-chemical decomposition is effected at the opposite end of a line; in others, letters actually inked by mechanical means are made by the induced magnet to print, by being pressed on paper. In this series these several varieties are shown.

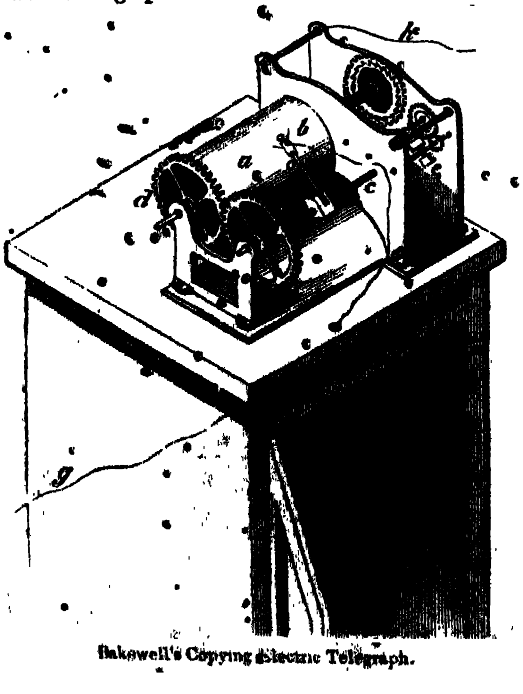
The specimens of wire for a submarine telegraph are designed to overcome the action of breakers, which proved fatal to the telegraph across the Channel, than which nothing otherwise could be more successful; if the wires can be buried deep enough in the sands to place them below the breaker action, there would be no difficulty in communicating readily with the Continent. —R. H.]

433 BAKEWELL, FRED. COLLIER, 6 *Haverstock Terrace, Hampstead*—Inventor and Patentee.

Patent copying electric telegraph, for transmitting fac-similes of the handwriting of correspondents, so that their signatures may be identified. Its objects are, authentication of communications, increased means of secresy, rapidity of action, and economy, as it requires only a single wire.

The transmitting and the receiving instruments are counterparts of each other. Trains of wheels impelled by weights are employed to impart equal movements to cylinders on each instrument. Screws placed parallel to the cylinders, and rotating with them, serve to carry metal styles, which press lightly on the cylinders, from end to end. The metal styles are insulated by being attached to ivory arms connected with brass nuts that traverse on the screws. One of the poles of the voltaic battery is connected with the cylinder of each instrument; the other pole of the battery is connected with the metal styles, so that the electric current may pass from the styles to the cylinders. The message to be transmitted is written on tin-foil with a pen dipped in sealing-wax varnish, and it is placed on the transmitting cylinder. When the instrument is set in motion, the metal style presses on the writing as the cylinder revolves; by which means the electric circuit is broken every time that the varnish interposes. Upon the cylinder of the receiving instrument, paper, moistened with an acidulated solution of prussiate of potass, is placed, and the metal style employed being a piece of steel wire, the electro-chemical decomposition that occurs whenever the electric current passes, produces a line of Prussian blue on the paper. If there were no varnish-writing to interrupt the electric current, the revolution of the cylinder, and the gradual advance of the marking point by the screw, would draw a number of continuous blue lines spirally on the paper, but so close together as to appear parallel. The interruptions, however, caused by the interposition of the varnish-writing on the transmitting cylinder, break the electric circuit in those points, and cause a cessation of marking whilst the style is passing over each letter. As the style traverses several times over each line of writing, the successions of interruptions, by corresponding with the forms of the letters, produce an exact copy of whatever is written or drawn on the tin-foil message, the writing appearing of a pale colour on a ground of closely-drawn blue lines.

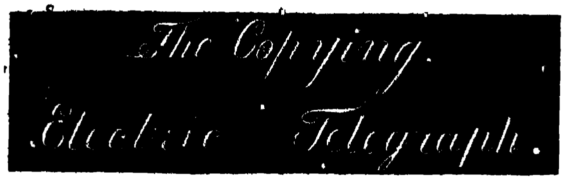
The regulation of the separate instruments, so that they may rotate exactly together, is effected by an electro-magnet or electro-magnets brought into action by local voltaic batteries. When a single wire only is used, contact with the local voltaic batteries of the electro-magnets is made and broken by pendulums, each instrument having a pendulum in connexion with it; by which means the electro-magnets act at regular and quickly-succeeding intervals. Levers, attached to the armatures of the magnets press against eccentric wheels fixed upon one of the arbors of each instrument, and retard the motion of the mechanism so long as they bear against them. The instruments are thus regulated at every beat of the pendulums by having their speed retarded. The degree of retardation depends on the amount of weight applied to impel the cylinders; care being taken that the ungoverned speed should be always somewhat greater than it is required to be, to allow for the regulating action. When there are two wires employed, the regulation of the instruments may be effected without pendulums by bringing the regulating magnet of one instrument into action by a make-and-break contact-wheel fixed on to a corresponding arbor of the other instrument. To assist in adjusting two distant instruments, a "guide line" is employed, which consists merely of a strip of paper placed perpendicularly to the lines of writing on the transmitting instrument. When the corresponding instruments are set in motion, the interruptions of the electric current by the guide line indicate exactly, on the paper of the receiving instrument, how much faster or slower the transmitting instrument is moving; and by adding or taking off weights at the receiving instrument, its average speed may be adjusted to that of the transmitting one, so that the marks or gaps in each successive line drawn on the paper may fall under each other. When the instruments are regulated by pendulums, the guide-line serves to show whether they are beating together; and thus affords the means of adjusting them with great accuracy. The following cut shows the telegraph:—



Bakewell's Copying Electric Telegraph.

a, the cylinder of one of the instruments; *b*, the metal style, connected by the wire *g*, with one pole of the voltaic battery; *o*, the ivory arm to which the metal style is attached, and which insulates the style from the screw; *c*, the screw on which the style traverses as the cylinder revolves; *d*, cog wheels to turn the screw; *e*, a fan to regulate the speed of the instrument; *f*, the impelling weight; *h*, the wire connected with the distant instrument.

The copying electric telegraph is not yet in operation; but its practicability has been successfully tested by the transmission of messages to and from different stations of the Electric Telegraph Company, with the experimental instruments exhibited.



The Copying
Electric Telegraph.

This figure represents the character of the printing effected by this telegraph.

---

434 **Bain, Alexander**, *Beevor Lodge, Hammersmith*—Inventor.

Patent electric clocks, suitable for halls of mansions, offices, steeples, &c., kept in action by a small galvanic battery, or the electricity of the earth.

Time-ball, to be discharged by electricity sent by an ordinary regulator clock.

Pair of electro-chemical telegraphs, stated to be capable of transmitting and recording communications at the rate of 1000 letters, or even 1000 words, per minute.

Patent electro-chemical copying telegraph, said to be capable of copying any figure, such as profiles, autographs, stenography, &c.

Patent electric telegraph, for printing all the letters of the alphabet in the Roman character.

[The copying telegraph referred to, depends for its principle upon the decomposition of certain chemical substances placed on paper, by means of the electric current transmitted through the wires.—R. E.]

435 **French, William Henry**, *Cardiff, Wales*—Inventor.

Hydraulic printing telegraph, enabling one person simultaneously to print telegraphic communications at different distant stations or towns.

"Hydro-fluid" distributor, or water, telegraph, gas, and fire-engine controller, for forming a communication with any particular station or town; or any number of stations or towns connected with the hydraulic telegraph, and for the control of gas, water, and vapour service pipes.

Electric printing telegraph, similar to the former, but altered and improved.

Electric telegraph turn-plates, for changing the wires and circuits from main to branch lines and *vice versâ*.

Portfolios, for filing newspapers, periodicals, music, manuscripts, letters, bills, receipts, &c.

436 **Dering, G. E.**, *Lockley's Welwyn, Herts*—Inventor and Patentee.

Electric telegraph apparatus, illustrative of a variety of improvements.

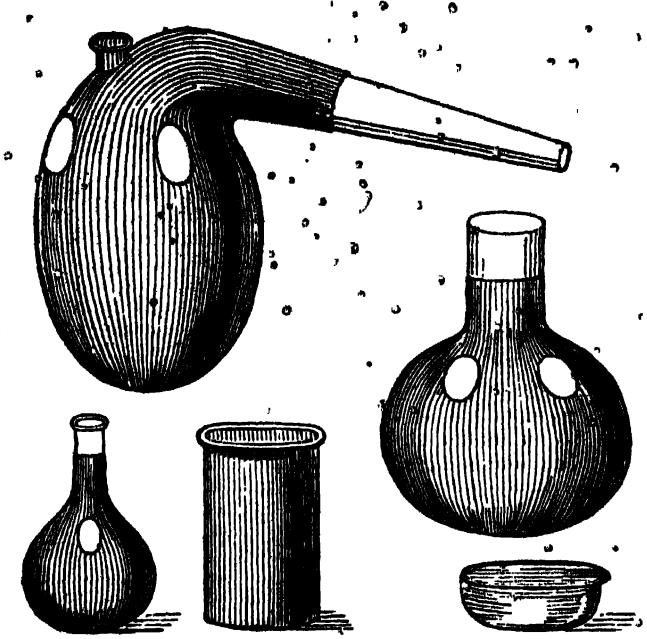
437 **Meinig, Charles Ludovic Augustus**, 103 *Leadenhall Street*—Agent.

Portable galvanic battery of 120 elements, occupying the space of 12 cubic inches. Clockwork, for making and breaking contact. Patent portable galvanic chain battery, of 24 elements.

Portable interruptor for this chain. Invented by Mr. T. L. Pulvermacher.

438 **EDWARDS, JOHN BAKER**, *Liverpool*—Producer and Manufacturer.

Series of glass retorts, beakers, evaporating basins, and other glass and porcelain vessels for chemical purposes, electro-coppered. Vessels thus coated accelerate solution and distillation, and require a minimum of heat to conduct these processes, while the copper conducting the heat equably over the surface of the glass, preserves it from fracture and unequal expansion, and at the same time protects it from external casualties. The cut represents several of these vessels.



Edwards' Copper-covered Glass Apparatus.

[The covering of glass and porcelain vessels with copper was first exhibited at the French Exposition in 1844. These vessels excited great curiosity, and occasioned much perplexing speculation as to the mode of their production. The coating of metal was applied in so smooth, perfect, and uniform a manner, as to render it evident that none of the ordinary methods of metallurgy had been adopted in their manufacture. These vessels were coated by electrotype process, and similar apparatus is now made for chemical purposes in England. The surface of the glass or porcelain is first varnished, then brushed over with bronze-powder, in order to form a conducting surface on which to deposit the copper, and the vessel is then placed in the decomposition-cell, in connexion with a battery. In a few days the whole external surface is covered with bright metallic copper.—R. E.]

438A **RUNDELL, W. W.**, *Falmouth*—Inventor and Manufacturer.

Carbonized cast-iron magnet. The cast iron is carbonized with prussiate of potash and oil, and is hardened and tempered, by which the magnet is improved at a small expense.

Impressions and specimens of seals, executed by machinery.

---

439 **HEARDER, J. N.**, 34 *George Street, Plymouth*—Inventor and Manufacturer.

Cast-iron compound horse-shoe permanent magnet, applicable to purposes requiring high magnetic power. The application of cast iron is new. This magnet consists of 24 plates, 2 inches wide, $\frac{3}{16}$ of an inch thick, cast in the form of a horse-shoe, which is 16¾ inches long from the poles to the outside of the bend; the poles are 1¼ inches as under, and the inside of the bend 3¼ inches wide. The 24 plates weigh about 72lbs., and are fastened together with three bolts and nuts. The poles are capped with cast iron, which concentrates the magnetic power in an extraordinary manner. The construction is very simple: the bars are cast from No. 1 pig iron as hard as green sand can make them, and they require no preparation to adopt them for magnetization. The soft-iron caps render the grinding of the poles unnecessary. The attractive power of the magnet is scarcely inferior to that of a steel magnet of the same dimensions, whilst the economy in construction is nearly as 4 to 1; the cast-iron magnet weighing 72 lbs., lifts 140 lbs.

Powerful horse-shoe steel magnet, of 100 plates, adapted for purposes requiring high magnetic power. It weighs about 39 lbs., and will support nearly 250 lbs. with a round-faced keeper.

[The Rev. Dr. Scoresby appears to have been the first to employ thin sheet steel for the construction of powerful permanent magnets. His idea being that, as magnetism appeared to reside principally on the surface of the metal, by multiplying the number of surfaces, the power of the compound bar would be increased. Mr. Hearder, many years since, constructed powerful magnets from cast iron, and was certainly the first to use that material for the purpose; and the power which can be induced is certainly very great with the soft-iron caps.—R. H.]

Medico-galvanic apparatus, with graduated regulator, employed to administer galvanic electricity. Its improved construction consists in the proper adjustment of the length and thickness of the generating or primary coil to the electro-motive force of the battery, by which the battery-surface is much reduced, and a higher amount of magnetism produced in the iron core.

440 **JOULE, JAMES PRESCOTT**, F.R.S., *Acton Square, Salford*—Inventor.

Electro-magnet, constructed of a plate of well-annealed wrought iron, tapered to the poles. The iron is rendered magnetic by transmitting the voltaic electricity through the bundle of copper wires (fifty yards long, and weighing one hundredweight) with which it is enveloped. Armature to the same.

Pair of tapered armatures, to concentrate the magnetic force when the electro-magnet is excited by a feeble voltaic current, and to direct the magnetic action to any required object.

Surface electro-magnet, consisting of a thick piece of wrought iron, enveloped by a bundle of copper wires. Armature to the same. A battery of moderate power produces such a powerful attraction between the electro-magnet and its armature, that a weight of more than one ton has to be applied in order to draw them asunder.

[The peculiarity of the former electro-magnet, which is adapted for diamagnetic experiments, the magnetization of steel bars, &c., consists in the great comparative breadth of the iron core, by means of which the full effect of the coils of wire is secured, even in the case of their being removed to the distance of one or two inches from the surface of the iron. The form of iron adopted admits of a much greater quantity of electro-magnetic coils, and consequently of a much greater magnetic effect, than can be obtained from the usual cylindrical shape.

The peculiarity of the latter, or surface electro-magnet (which is the first of the kind ever constructed), consists in the comparatively great surface of contact which it presents to its armature. The principle of its construction, and of that of others of its class subsequently constructed by the exhibitor and other parties, is derived from the law of electro-magnetic action discovered by the exhibitor, viz., that the maximum attractive power of an electro-magnet for its armature is about 300 lbs. for each square inch of tranverse section of the magnetic circuit.]

441 WAITE, GEORGE, 2 *Old Burlington Street*—Inventor.

Electro-galvanic apparatus for the teeth, furnished with a platinum point, safety key, elevators, forceps, and other instruments used in dental surgery.

Set of teeth with gold jewelled blocks or masticators. Sets of electro-gilded teeth, fitted with novel blocks for mastication.

Six other pieces, with pearl blocks and plates.

444 WESTMORELAND, JOHN, *Derby*—Designer.

Patent gutta-percha electrical machine.

446 GREEN, SAMUEL, 7 *Helmet Row, Old Street*—
Manufacturer.

Various compasses and sun-dials. Damp detectors. Angle-meters. Ivory circular thermometers with compass or magnetic sun-dial. Miners' compass, with sights, &c.

448 BENTLEY, THOMAS, *Margate.*

A pair of carpenter's compasses, with improved spring joint.

450 WRIGHT, SAMUEL, 14 *Burton Street, Cheltenham*—
Inventor and Manufacturer.

Model of a machine for expelling fire-damp out of coal-pits, and foul air out of wells, brewery vats, or other places where they collect. Provisionally registered.

451 PALMER, W. V., *Somers Town*—Producer.

Electrotypes, and engravings from electrotypes.

452 CRICHTON, JOHN, 112 *Leadenhall Street*—
Manufacturer.

Solid arch sextant, with improved reflector to vernier; double-limb sextant; 4-inch sextant; box sextant; coast-surveying sextant, as made for the Trinity yachts; ebony sextant.

Quadrants, plain, and with tangent screw to index, and with tangent screws to index and horizon. Quadrants with spring vertical adjustment, and with two and three back shades to horizon. Quadrant, with handle, telescopes, and mahogany case, divided to 30 seconds.

Azimuth compass, prismatic, large and small sizes.

Sympiesometer; marine barometer; artificial horizon, with iron bottle and improved iron trough.

Gravatt's levels, bronzed and bright; 5-inch theodolite. Naval telescopes, 3 feet and 2 feet, with signals. Achromatic night-glass; day or night telescope; gunner's quadrant with level; gunner's callipers, large and small; and shell callipers, for side and bottom, as made for the Honourable East India Company.

453 KNIGHT, GEORGE, & SONS, *Foster Lane*—
Manufacturers.

Commercial chemical cabinet.

Urino-chemical chest, containing all the instruments and re-agents necessary for a chemico-pathological examination; designed by Dr. Venables.

Portable universal chemical furnace, on the principle of Dr. Black. It is constructed of stout sheet-iron, lined with fire-bricks; it is suited for the reduction and assay of metallic ores, cupellation of the precious metals, distillations of every kind, decompositions of substances by passing them through heated media, and for nearly every operation for which a furnace is required. With sand-baths, stoppers, crucibles, muffles, tongs, &c.; also an improved hood by the aid of which noxious fumes arising from evaporations pass readily into the flue of the furnace.

Portable assay furnace and apparatus, adapted for the use of mining companies.

Various blowpipes, and blowpipe apparatus, for the examination of minerals on a small scale.

Patent improved air-pump by which a good vacuum can be obtained in a short time. Invented by Mr. C. W. Siemens. The air-pump consists of two cylinders differing in magnitude, of which the smaller is on the top of the larger, while the valved pistons belonging to each respectively, are attached to the same piston-rod. The air withdrawn from the receiver or other vessel intended to be exhausted is condensed in the upper cylinder into one-fourth part of its original volume, and, consequently, always possesses sufficient elasticity to pass through the discharging valve and escape into the atmosphere, the opposing pressure of which on that valve is thus counteracted in a novel manner.

Plate electric machine, on Woodward's arrangement.

Galvanic battery; Professor Daniell's arrangement, consisting of a series of six cells; each cell comprises a copper cylindrical vessel, to be filled with a solution of sulphate of copper; in the centre is a porous tube containing an amalgamated zinc rod, and filled with dilute sulphuric acid.

Galvanic battery; Professor Groves' arrangement, consisting of a series of six cells, each cell being a glass vessel containing an amalgamated zinc plate, to be filled with dilute sulphuric acid, having in the centre a flat porous cell containing a platinum plate, and filled with nitric acid.

Galvanic battery; Alfred Smee's arrangement, consisting of a series of six cells, each cell being a glass vessel to contain dilute sulphuric acid; to each cell is fitted a platinised silver plate, having on each side of it an amalgamated zinc plate; the whole of these plates being connected in series to one rod or bar, they can be readily raised from or lowered into the exciting liquid.

Galvanic battery; Maynooth arrangement, consisting of a series of ten cells, each cell being a cast-iron trough to be filled with dilute nitric acid, in the centre of which is a porous cell containing an amalgamated zinc plate, and charged with dilute sulphuric acid.

Galvanic battery, for telegraph purposes; the cells formed of gutta percha, filled with sand saturated with dilute sulphuric acid; each cell containing a copper and amalgamated zinc plate.

Working model of an electro-magnetic motive engine, being a modification of Dr. Ritchie's arrangement.

Working model of an electro-magnetic motive engine, being a modification of Bain's arrangement.

Improved electro-magnetic coil machine, with conductors, &c., for medical purposes.

Larger and more powerful instrument, in which the primary or secondary current can be applied, with two batteries, water-regulator, conductors, &c.

Arrangement of the coil machine, consisting of a primary and secondary coil in a vertical position. Contact is broken and renewed by the rotation of a soft iron-bar mounted between two brass pillars, situated immediately over the axis of the coil in which is placed a bundle of iron wires. The electric current from the battery passes through one of the brass pillars, and the axis carrying the iron-bar; contact is broken and renewed by a small platinum point fixed to the spindle, dipping, as it revolves, in and out of some mercury placed in a cup mounted on a brass pillar, through which the circuit is completed. The instrument is provided with two pair of binding screws, one pair for communication with the battery, the other for giving shocks and other electrolytical effects.

Photographic apparatus, an horizontal lathe, or machine of a novel construction, for cleansing and polishing daguerreotype plates. Invented by the exhibitor.

Daguerreotype sliding camera, fitted with various plate-frames on different plans.

Improved double box with sliding covers and frames, for applying the sensitive coatings.

Portable mercury box.

Plate-holders on different plans.

A series of buffs, with the different preparations necessary for cleaning plates.

Focimeter, an instrument for ascertaining the difference in the lengths of the optical and chemical focus of photographic lenses.

Camera-stand. designed by W. Matthews, Esq.

Camera-stand, and head-rest, with a series of ball and socket joints, designed by the exhibitor.

Portable folding camera and stand, for paper processes, with frames on different plans.

Pressure frames on different plans.

Glass and porcelain dishes for preparing sensitive paper and glass plates.

454 **Coffey, J., & Smith, J.**, 4 *Providence Row, Finsbury*—Proprietors and Manufacturers.

Improved chemical apparatus, containing a still head, with suite of moveable pans for decoctions, extracts, &c.; a drying closet, a condenser for steam, and worm for other stills, the chamber containing them, acting as a stand and condensing tub. The temperature can be regulated by means of steam-cocks and valves. There is also attached an improved feed for boiler, steam-gauge and thermometer, safety-valve and alarum.

456 **Statham, W. E.**, 4 *Rotherfield St. South, Lower Road, Islington*—Inventor and Manufacturer.

Portable chemical cabinets and laboratories for amusement, analysis, and chemical research.

Hydro-pneumatic apparatus, containing a large pneumatic trough, a gasometer, and an hydraulic blow-pipe, lamp, and tongs complete. Larger apparatus of the same kind for the lecture-table and laboratory.

457 **Griffin, John J., & Co.**, 53 *Baker Street*—Manufacturers.

Graduated glass instruments for chemical testing in the arts; applicable to the examination of soda, potash, ammonia, the mineral acids, vinegar, bleaching powder, limestones, solutions of iron, silver, and other metals, salt-springs, white lead, and other chemical products; graduated measures for liquids, showing the usual divisions of the imperial gallon; and for gases.

Set of decimal weights and measures, founded on the imperial gallon and the avoirdupois pound, with explanatory tables.

Set of hydrometers, with Twaddell's scale of improved oval form.

Stokes' hydrometer for determining the strength of spirits of wine at any temperature, according to the degrees of Sikes', by means of one glass spindle, having two scales without weights, but with a thermometer.

Ammoniameter, or hydrometer for liquid ammonia. A glass spindle with a scale of 100°; every degree shows one test-atom or 212·5 grains of dry ammonia in a gallon of solution.

Small chemical apparatus, in a portable cabinet, adapted for analytical researches by naval and military officers, colonial engineers, &c.

Cabinet apparatus for use in colonial sugar-works, in determining the density of cane-juice, and the exact amount of lime required for properly clarifying the juice. Invented by Dr. Shier.

Apparatus for the chemical analysis of urine. Portable collection of chemical apparatus for elementary experiments.

Set of apparatus for testing the hardness of waters invented by Professor Clark.

[Clark's test for the hardness of water consists in adding a standard solution of soap to water until it produces a lather, the quantity used indicating the degree of hardness. Most waters contain lime in the state of carbonate, with some sulphate of lime, and chloride of sodium. The waters supplied to London give these substances in the following proportions, according to the analyses of Mr. Richard Phillips:—

	Brentford.	Barnes.	Chelsea.
Carb. of lime	16·000	16·900	16·500
Sulph. of lime, chl. of sodium	3·400	1·700	2·900

Dr. Clark has shown that a certain measure of his test, solution of soap, is required to combine with each grain of carbonate of lime, and that the whole of it which is present in the water must combine with the soap before a lather will form. The apparatus exhibited is for measuring the soap solution with great accuracy, and for adding it drop by drop to the water under examination. The Board of Health requires that every new source of water supply should be thus examined, and the number of degrees of hardness stated according to Dr. Clark's scale. Some chemists have lately pointed out sources of error in this process, but Dr. Clark states these may be avoided by care.—R. H.]

Chemical thermometers for corrosive liquors. Set of blowpipe apparatus for the examination of minerals. Collection of small specimens of minerals, in a portable cabinet, adapted for travellers in the colonies. Models of crystals executed in pottery. Apparatus for teaching agricultural chemistry in parish schools. Test-bottles, with indelible inscriptions, for chemical use. Glass vessels for holding chemical liquors, made in Bohemia. Books of test-papers. Circular filter-papers. Frame with pegs for test-tubes. Stoneware lamp-furnace for chemical operations. Beale's furnace for executing combustions in organic analysis by gas. Beale's gas furnace for heating crucibles. Improved achromatic microscope and polariscope, for naturalists and physicians. Ackland's improved combination of Smee's galvanic battery, in which the kind and amount of power can be readily modified. Ackland's improved form of medico-galvanic machine, with single current, producing great power in a small compass.

458 **Allman, Fennell**, 12 *Stanhope Place, Hyde Park*—Inventor.

An electric table-lamp, suitable for a room, with another, illustrating the way in which the dynamic effect of the current is made to govern the lamp. The most important features of the invention are the employment of electricity as a substitute for coal gas, oil, candles, &c.

The novelty consists in the employment of the dynamic effects of the electric current to produce the conditions necessary for the maintenance of a constant light. The great simplicity of the lamp, consisting of only three parts, render it very durable and economic. Patented.

459 **Ibbetson, Capt. L. L. Boscawen**, *Clifton House, Old Brompton*—Inventor.

Electrotypes from the animal and vegetable kingdom. Ornamental castings in various metals; also castings, &c., in iron, and covered with metallic surfaces, by a new method.

Trigonometrical model of the Undercliff, Isle of Wight. The new feature in this model is, that an extent of country has been modelled from a trigonometrical survey, the vertical heights being on the same scale as the base, three feet to a mile. The model was carried to the spot and modelled, and the hypothenuse lines made to correspond with the base. Upwards of 20,000 heights were measured. It is painted so as to combine both geography and geology, the phenomena being carefully delineated.

A blowpipe giving an uninterrupted and regular flame for chemical analysis and other purposes.

An oxyhydrogen microscope, with new safety tubes and an adaptation of the blowpipe for chemical and other purposes, also an arrangement for collecting the gases separately.

Manufactured by C. W. Collins, Royal Polytechnic Institution, Regent Street.

---

460 **NEWBERRY, F.**, *Stoke Newington Green*—Producer.

Electrotypes.

---

464 **HARRISON, JOHN**, 2 *Chorlton Terrace, Upper Brook St., Manchester*—Inventor and Manufacturer.

Electrical battery, intended as a substitute for the Leyden jar.

Galvanic battery, combining the inventions of Professors Smee and Faraday, with a new mode of connexion for producing either quantity or intensity of the electric current.

464A **HARRISON, J.**, 45 *Upper John Street, Fitzroy Square*—Manufacturer and Inventor.

Model of action generally used by pianoforte manufacturers.

Model of registered boudoir pianoforte; action to show in what the improvement consists.

Pianoforte with the registered action.

---

465 **WELLWAY, JOHN SWEET**, 7 *Denmark Street, Bristol*—Inventor and Manufacturer.

Syphon trough, for galvanic battery, made of gutta percha and vulcanized India-rubber; tubes passing from the bottom of each cell to a main tube, form a siphon, by which the trough may be emptied when out of use; a gutta-percha valve, of new construction, closes the main tube when the battery is in use.

Registered gas-carriers' apparatus, rendering gas portable. A drum revolving horizontally, by means of a spring between the ceiling and floor of the room above, round which several feet of glazed vulcanised India-rubber tubing are coiled, which communicate with the main gas-pipe of the house. When in use, one end of the flexible tube is attached to a portable lamp-stand, which, when carried to a distant part of the room, is allowed to recede by the unwinding of the flexible tube; when the light is brought back, the revolving drum winds up the tubing. When out of use, the tubing is detached from the lamp-stand; it is then immediately coiled up by the drum.

---

466 **TAYLOR, THOMAS**, 7 *Fleet Street, Dublin*—Inventor.

Pneumatic battery, for igniting gunpowder in the blasting used in mining operations. Each cell is filled with sulphuric acid. The operator, blowing through the gutta-percha tube, forces the sulphuric acid out of each cell through the short siphon tubes; it then comes in contact with a compound of the chlorate of potass, loaf sugar, and gunpowder, when an explosion takes place. The gutta-percha tube may be of any length, thus placing the operator in perfect safety.

---

467 **KIRKMAN, JOSEPH, & SON**, 3 *Soho Square*, and 9 *Dean Street*—Manufacturers.

Miniature model of a grand pianoforte, six and three-quarter octaves, metal braces, and drilled bridges.

Seven octave, full grand pianoforte, with repetition action, in rosewood case.

The fonda semi-grand pianoforte, in walnut case.

Oblique piccolo pianoforte.

---

468 **GREINER, GEO. FREDERICK**, 51 *Upper Marylebone Street, Portland Place*—Inventor and Maker.

Semi-grand pianoforte, constructed on the principle of the speaking-trumpet, with unison tuning-screws, and repeat tongue check action. Ivory is replaced by a newly-invented material for the keys.

---

469 **SOUTHALL, WILLIAM**, 16 *Baker Street, Portman Square*—Manufacturer.

Grand pianoforte.

---

470 **STODART, WILLIAM, & SON**, 1 *Golden Square*—Manufacturers.

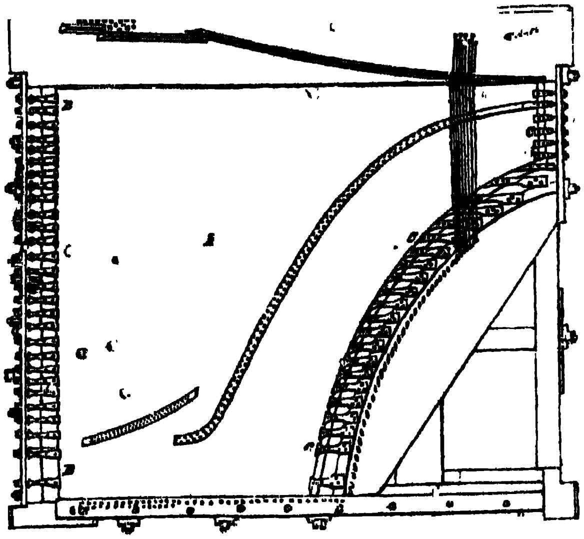
Patent rosewood horizontal grand pianoforte.

Compact rosewood square pianoforte.

---

471 **CADBY, C.**, *Gray's Inn Pianoforte Manufactory*—Manufacturer.

Grand pianoforte, in rosewood, on the exhibitor's new patent suspension principle. The sounding-board, instead of being glued or permanently attached to the wooden framing, is suspended from it by metallic attachments, which, being adjustable, admit of its being tightly strained, to increase the tone. The letters *A*, *B*, *C* in the annexed cut represent the adjustable metallic attachments.



Cadby's Grand Pianoforte.

Grand pianoforte, in zebra wood, on the same principle modified.

Upright cottage pianoforte, showing the application of the same principle to the cheaper kind of pianofortes.

---

472 **ROLFE, WILLIAM, & SONS**, 61 *Cheapside*—Manufacturers.

Specimen of a two-unison common cottage pianoforte, combining the advantages of the ordinary repetition, and check or double actions.

Pianoforte, in which stability, economy, and excellence are the objects aimed at.

---

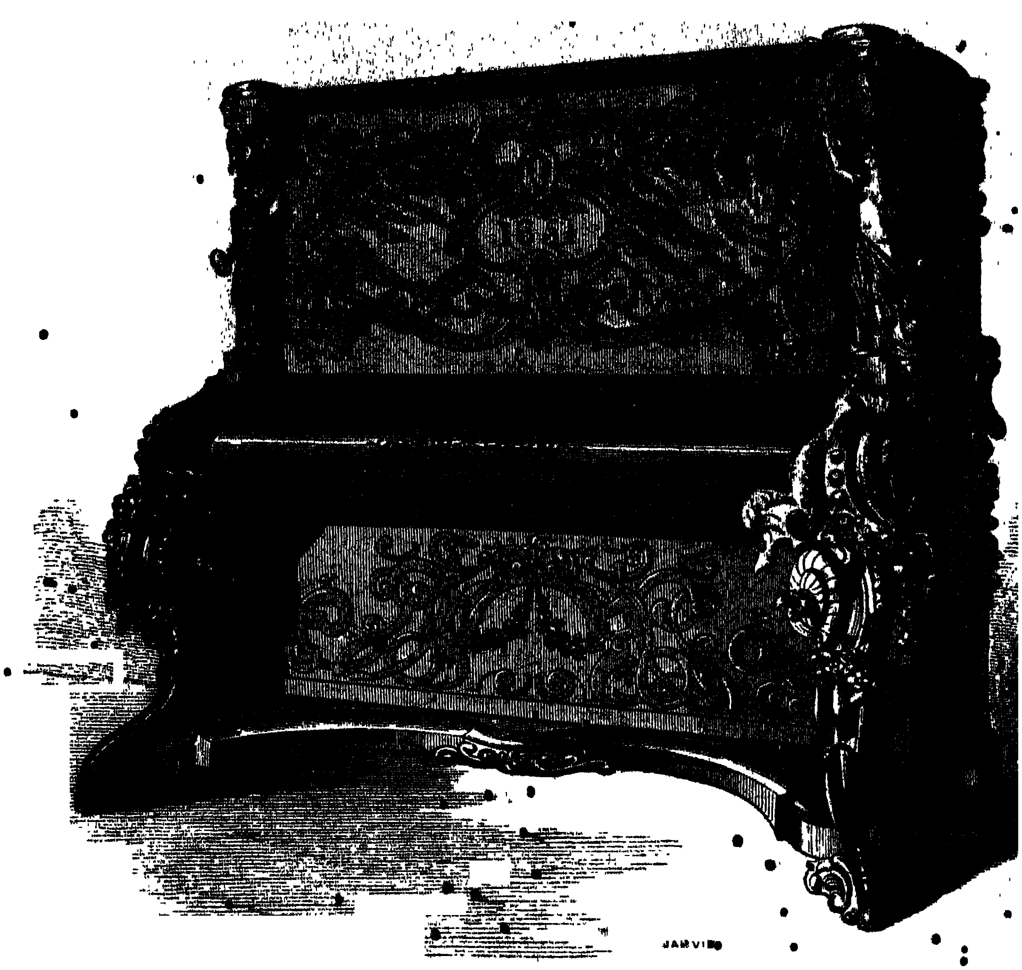
473 **DEACOCK, T.**—Manufacturer.

A pianoforte.

---

474 **BRINSMEAD, JOHN**, 15 *Charlotte Street, Fitzroy Square*—Manufacturer.

Registered pianoforte—the long brass joint generally seen upon the fall of pianofortes, obviated when opening by a simple contrivance. The case permits the instrument to be placed in any part of a room. Embroidered device in the central panel, and music stool. This instrument is shown in next page.



Brinsmead's Registered Pianoforte.

475 Metzler, George, 37 *Great Marlborough Street*—Manufacturer.

Small size cottage pianoforte, made in pollard oak, "O. G." or arched fall, with ornamental shell front.

476 Moore, John & Henry, & Co., 104 *Bishopsgate Street Within*—Designers and Manufacturers.

Grand cottage pianoforte, of new design.

477 Luff, George, & Son, 103 *Great Russell Street, Bloomsbury*—Manufacturers.

Albert cottage pianoforte, of new construction.

Harmonium, an instrument played like the pianoforte or organ, claiming powerful tone and simplicity of construction.

[The peculiar tone of the harmonium class of instruments is produced by metal springs set in motion by a stream of air.—H. E. D.]

477a Hunt, Rich., 22 *Blake Street*—Inventor.

The registered tavola pianoforte. A dining or drawing-room table, stands upon a centre-block or pedestal, and contains a pianoforte (opening with spring-bolts) on the grand principle, with a closet containing music composed by the inventor. This pianoforte has the ordinary power of tone, although occupying half the usual space, and can be made the piccolo or grand size.

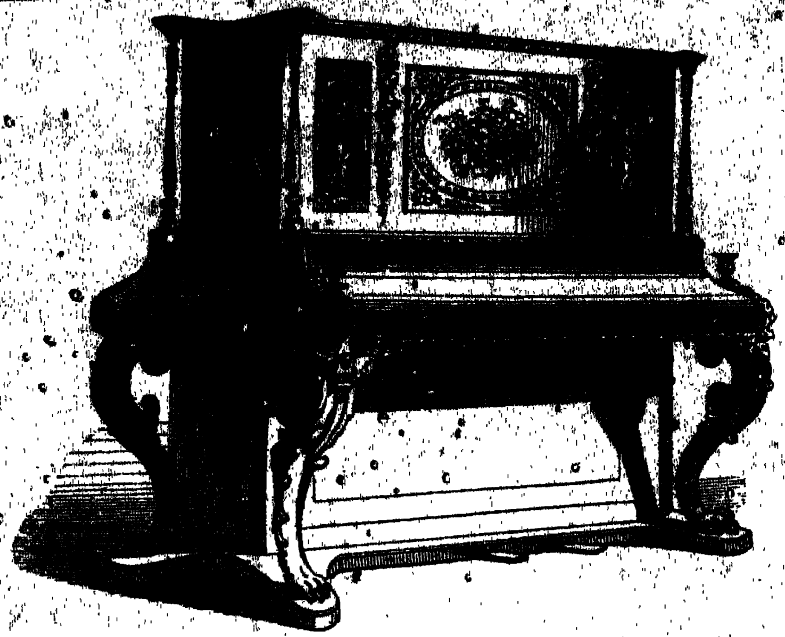
479 Ennever & Steedman, 31 *George Street, Euston Square*—Manufacturers.

Elegant walnut marquetrie, semi-cottage pianofor new design, with double action. The pearl and tortoi shell keys made by T. and H. Brooks, 31 Cumberla Market.

Plain walnut square-fall piccolo, or microchordian piai forte, with single action.

480 Allison, Robert, 69 *Regent Street*—Manufacturer.

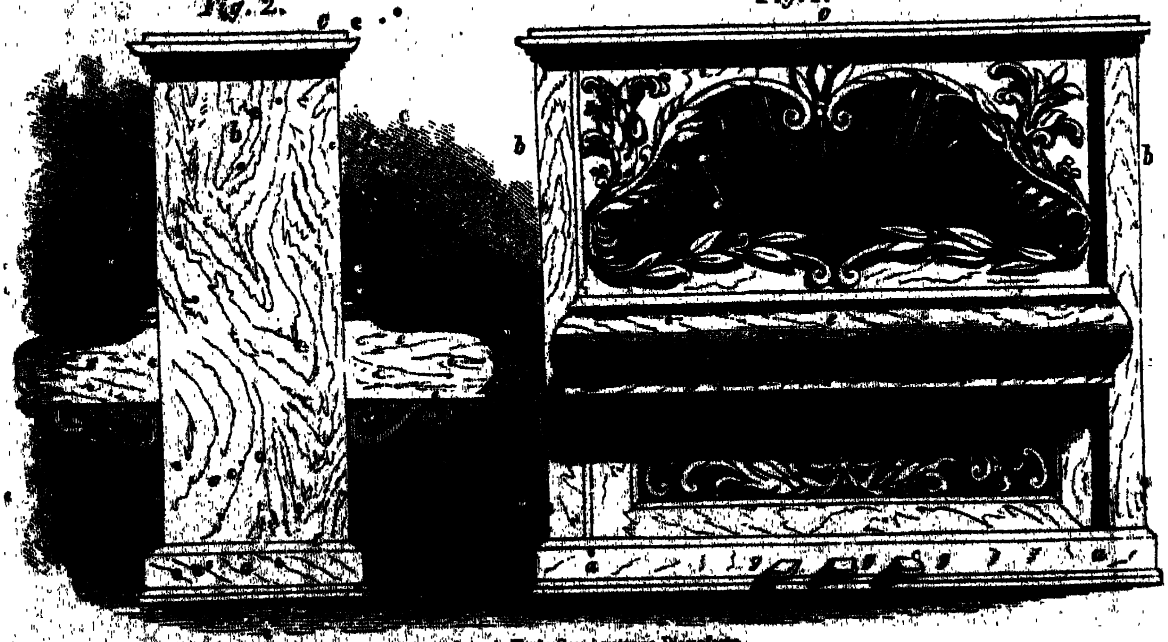
Walnut-wood registered cottage pianoforte—the keys of the finger-board being alternated in colour, to show all the scales, major and minor, according to a single rule for each mood, founded on the place of the semi-tonic interval, which renders the seven notes to be touched for an octave of each of the other eleven scales, as evident as the scale of C. This pianoforte is shown on next page.



Allison's Registered Cottage Pianoforte.

481 JONES, JOHN CHAMPION, 21B *Soho Square*—Inventor and Manufacturer.

A double or twin semi-cottage pianoforte, having two fronts and sets of keys, one on either side, suitable for any number of performers, from one to six; case of walnut-tree. The letters of reference in figs. 1 and 2, indicate the position of corresponding parts in the front and side views of this twin pianoforte; *a*, *b*, *c*, representing the case; *e*, the keyboard; and *g*, *g*, *g*, the pedals.



Jones's Twin Semi-cottage Pianoforte.

482 HOLDERNESSE, CHARLES, 444 *New Oxford Street*

Cottage grand pianoforte, [illegible], in a carved walnut-tree wood case (the design registered), with repeating check action.

---

483 ALLISON, [illegible]
Brook [illegible]

A walnut-tree [illegible]
and inlaid with flowers in

---

484 [illegible], W., & SON, 19

gentlemen's yachts, the saloons of steam-vessels, ladies' cabins, &c.; only 18½ inches from front to back when collapsed.

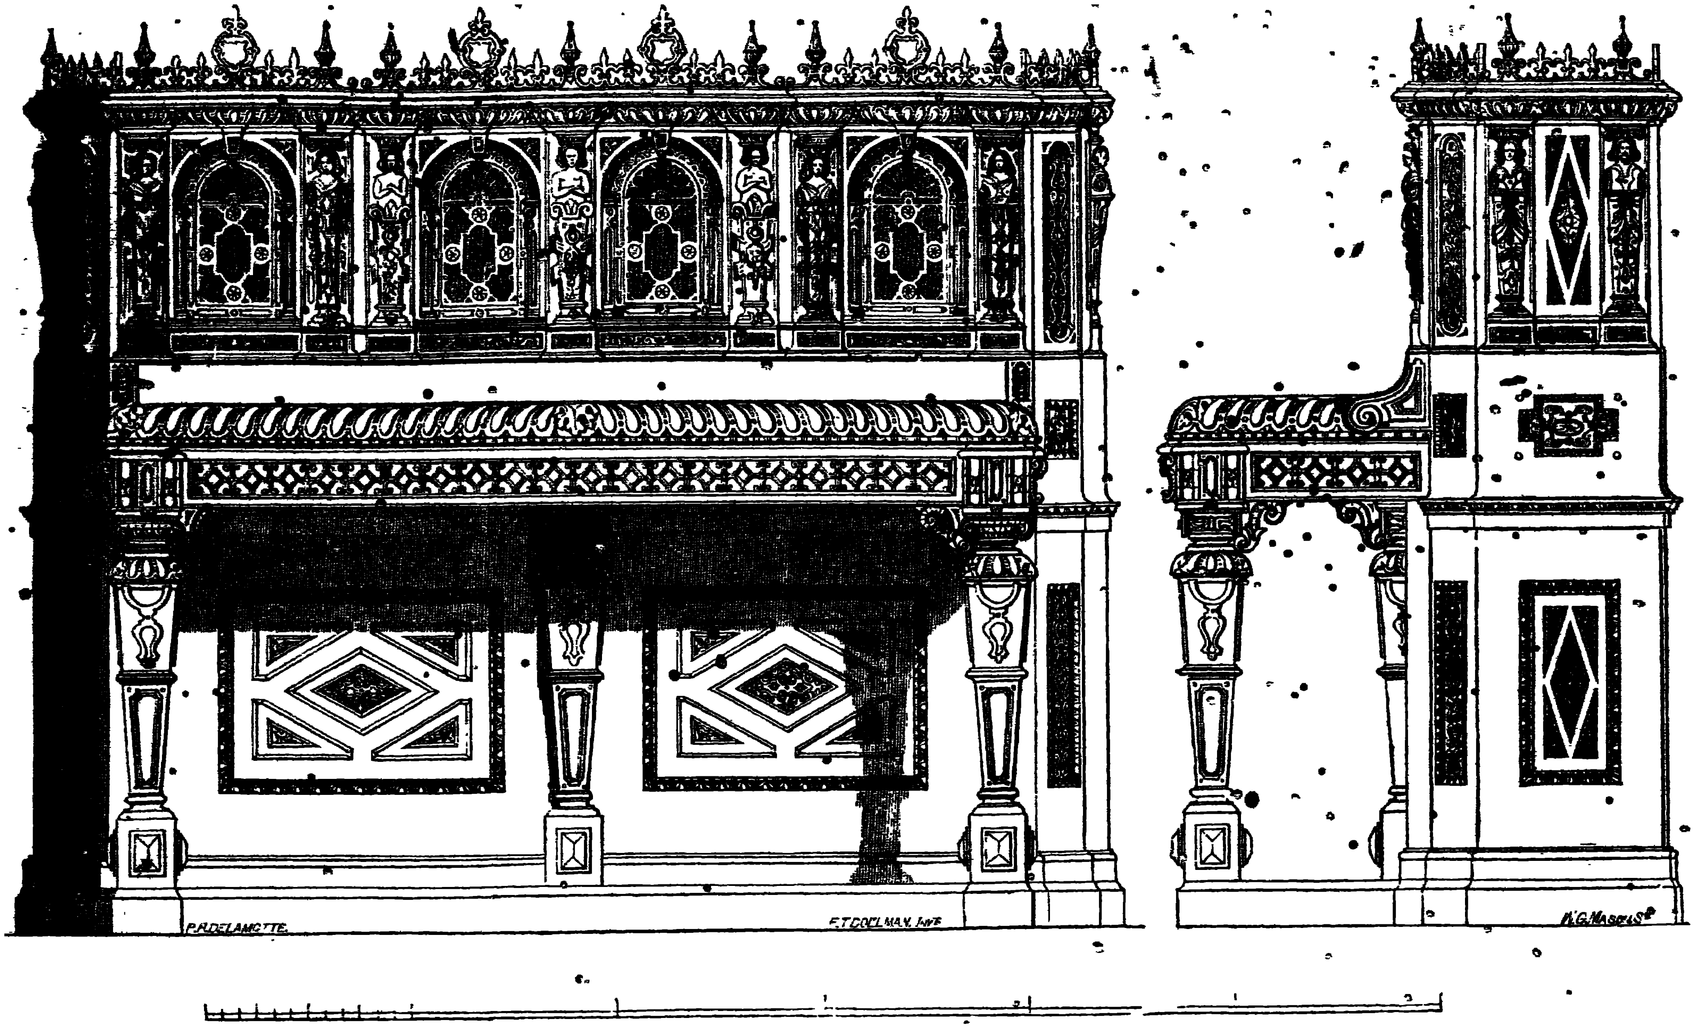
Cabinet pianoforte in figured walnut-tree, carved and ornamented in the Elizabethan style.

---

486 HUND, FREDERICK, & SON, 31 *Ebury Street, Pimlico*—Inventors and Manufacturers.

New kind of cottage pianoforte, called the "Lyra."—provisionally registered.

The "Lyra" stands on a peculiar constructed platform, a sound conductor, into which the bass strings extend; and although the instrument is only 3 feet 5 inches in height, it produces a tone equal to a semi-grand.

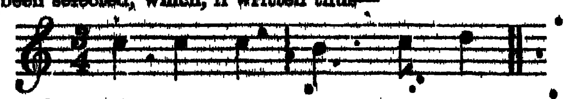


ERARD'S ELIZABETHAN NEW PATENT GRAND OBLIQUE PIANO-FORTE.

The instrument has a grand check action, with levers of great power and elasticity.

487 **Addison, Robert**, 210 *Regent Street*—Patentee and Proprietor.

A transposing pianoforte. This piano will transpose music five semitones higher or lower than the written key, if necessary. Its novelty consists in the key-board, hammers, and strings being immoveable. The internal action cannot be shifted or deranged. To make this intelligible, the first two bars of the National Anthem have been selected, which, if written thus—



can by striking *the same ivory keys as the above notes represent*, be immediately transposed into three higher and three lower keys.

488 **Aggio, George H.**, *Colchester*—Designer and Manufacturer.

Pianoforte, fitted up in plate-glass case, and gold carvings, with embroidered curtain front.

489 **Dimoline, Abraham**, *Denmark Street, Bristol*—Designer and Manufacturer.

Registered compensation pianoforte, seven octave. The mechanism, by its lightness, &c., produces an agreeable touch; improved plan for uncovering the keys; the panels are paintings of mother-of-pearl on glass. Registered semi-cottage, seven octave: with same mechanism, and papier-maché case with inlaid mother-of-pearl, in the Italian style.

490 **Akerman, William H. H.**, *Bridgwater, Somerset*—Inventor and Manufacturer.

Pianoforte, with new improvement; a bevel action for the dampers, applicable to all kinds; intended to give precision of touch by the certain rising of the key. It preserves also the dampers by gentle instead of jerking movement. Octave action at pleasure, to use the octave of the key struck.

491 **Smyth & Roberts**, *Birmingham*—Inventors and Manufacturers.

A 7-8va cottage pianoforte, with grand action and repeat, having a sounding-board and back on the principle of a violoncello, &c., obtained by the application of an iron frame well secured between the sounding-board and the strings, which causes the sounding-board to tighten, in a different manner from other pianofortes. They are suited for hot climates.

493 **Woolley, T.**, *Nottingham*—Patentee and Manufacturer.

Equilibrium patent pianofortes, for all climates.

Grand pianoforte, and "utiliton" pianoforte, 7 octaves each.

493A **Harwar, Joseph**, 28 *Bloomsbury Street*—Manufacturer.

Pianoforte with transposing mechanism, metallic equilibrium string frame, adjusting tension rods, and improved sound-board, fitted up in newly designed case with sliding front.

[The first *transposing pianoforte* was invented by a German named Rolle. The keys in this instrument were *shifted*; the modern system is incomparably superior.—H. E. D.]

494 **Towns & Packer**, 20 *Oxford Street*—Manufacturers.

Grand transposing pianoforte: the pitch can with facility be raised or lowered two notes from the original key, without affecting its touch or durability.

Microphonic cottage pianoforte up to A in alt, of economical construction.

496 **Erard, Pierre Orpheus**, 18 *Gt. Marlborough Street*—Inventor, Designer, and Manufacturer.

New patent pianofortes:—ornamented extra-grand; extra-grand with pedal keys; small grand, improved new scale; grand oblique, ornamented in the Elizabethan style, adapted to extreme climates; grand cottage; reduced cottage; extra-grand and grand oblique.

The plate 22 represents a front and side elevation of the Elizabethan pianoforte.

New patent metal frames for pianofortes, intended to carry the principal part of the weight or pull of the wires, independent of the wood frame, with a new screw apparatus for tuning attached to the same; particularly adapted to extreme climates.

Harps:—full and second size, newly improved; third size; highly ornamented; fourth size, adapted for young beginners. "Prince of Wales' harp," decorated.

[The difficulty of keeping harps in order in extreme climates is greatly lessened by always placing them, when not used, in a common mahogany case.—H. E. D.]

498 **Mott, Isaac Henry Robert**, 76 *Strand*—Inventor and Manufacturer.

Patent metallic cottage grand pianofortes, not liable to be affected by change of climate or weather.

Horizontal grand pianofortes, with metallic frames, above and beneath the strings, capable of resisting change of climate, or great tension, without interfering with the freedom or vibration of the sounding-board. The compass is nearly eight octaves, also an additional key-board of five more octaves, they have the notes in unison with and an octave below the pianoforte, with an improved and peculiar action, which, by means of small rollers, &c., produces a quick repetition of the touch.

499 **Wornum, Robert**, *Store Street*—Inventor and Manufacturer.

Improved piccolo pianoforte.

Semi-bichord grand pianoforte, upon the patent over struck principle.

[In the ordinary pianoforte action, the springs are struck from below, in this instrument the hammers strike down, hence the term overstruck.—H. E. D.]

500 **Hopkinson, John & James**, 18 *Soho Square*—Manufacturers.

Horizontal grand pianoforte with patent action, on an entirely new principle, giving increased power and certainty to the touch, and adding the tremolo similar in effect to that produced by the voice. Mata, inventor.

Rosewood boudoir pianoforte, 6½-octaves.

500A **Turnbull, William**, 6 *Frederick Street, Regent's Park*—Manufacturer.

Set of pianoforte keys.

502 **Peachey, G.**, 73 *Bishopsgate Street Within*—Manufacturer.

Improved Pollard oak "Victoria" piccolo pianoforte.

Improved rosewood "Albert" piccolo pianoforte.

503 **Greaves, E.**, 56 *South Street, Sheffield*—Manufacturer.

Æolian pitch pipes, German silver, electro plated, and gilt, in sets of 4 for violin, 6 for guitar, 8 for harp key E flat, 8 for the diatonic, and 13 for the chromatic.

Æolian violin mute, a combination of pitch pipe and mute.

Chromatic æolian pitch pipe, one vibrator sounding 13 semitones.

[The natural key of the old single-action harp is E flat, and of the double action C flat. The mute is a small instrument which is fixed on the strings of a violin, over the bridge, to soften and thin the tone. The uncertainty which at present exists with regard to the pitch is a source of great annoyance. The modern pitch varies half to a whole tone sharper from that used in the time of Handel.—H. E. D.]

Blued steel sostenuto tuning-forks, philharmonic and Wilhelm's standard pitch; Lilliput size, in case, philharmonic pitch; and French-shape, with foot and case; case of 13 tuning-forks.

Pair of chromatic tuning-forks, sounding the 13 semitones, in an octave, both equal temperament, philharmonic; and Wilhelm's standard pitch; case of amateur pianoforte tuning instruments. The chromatic tuning-forks are useful for tuning the pianoforte, &c.

Tuning-keys for horizontal and cabinet pianofortes.

Registered portable metronomes, in brass, German silver, silver, pearl, tortoiseshell, electro-plate and gilt, silver, silver and pearl, silver and shell. These form a convenient substitute for the large metronome. In principle this is a variable pendulum, the tape winding up within the case, which forms the weight or bob.

504 **KOENIG & PASK**, 441 *Strand*—Manufacturers.

A complete set of brass horns with valves (soprano to contra bass). French horn, trombones, and trumpets. Trombones with slides. Ophicleide with keys. Euphonion with four valves. Cornet à pistons in various designs. Clarionets, from a new design, and in metal. Flutes, on a new system.

Drums—bass, tenor, and side, for military purposes.

505 **DODD, EDWARD**, 112 *Vauxhall Walk, Lambeth*—Manufacturer.

Violin, violoncello, double bass, and harp strings.

506 **DRURY, JAMES FRANCIS**, *Cheshunt, Herts*—Manufacturer.

Box of musical bells.

507 **GISBORNE, JAMES**, 37 *Suffolk Street, Birmingham*—Inventor and Manufacturer.

Cornopeans. Trombo-cornuta, or drawing-room cornopean. Sax horns in B flat alto, and E flat soprano. Keyed bugle. Long valve trumpet. Double sax horn in A flat alto, and E flat tenor: the performer while playing upon this peculiar instrument, can, by using the extra valve with the left hand, without taking the instrument from his lips, glide from the alto to the tenor cleff, and *vice versâ*, with facility.

508 **HENRYS & CO.**, 2 *Budge Row*—Proprietors.

Newly-invented musical instrument, called "Flutina," adapted for concerts, and as an accompaniment to other instruments.

509 **FORSTER, SIMON A.**, 13 *Macclesfield Street, Soho Square*—Manufacturer.

A violin, viola, violoncello, &c., made (according to modern improved gauges) after the models of the exhibitor's grandfather, popularly known as "Old Forster."

510 **HEAPS, JOHN KNOWLES**, *Leeds*—Manufacturer.

Violoncello constructed upon principles producing increased vibration, and superior quality and quantity of tone.

511 **ANELLI, JOSEPH**, 76 *Queen Street, Edinburgh*—Inventor.

Centripetal regulating pegs and pins, which cannot draw back or give way, by which instruments can be tuned and regulated gradually in all their divisions, in less than half the time formerly required.

Also, a spring "capo-tasto," attached to the handle of the guitar, changing at once the diapason of the strings, so as to play in all keys without altering the printed notes or the position of the hand and fingers.

512 **MCNEILL, JOHN**, 140 *Capel Street, Dublin*—Inventor and Proprietor.

Cambridge cavalry field-trumpet bugle, for executing trumpet and bugle field calls without having recourse to a second instrument.

Bulb cornopean; the bulbs are substituted for angles, and curved passages are thus obtained for the wind without enlarging the valves, or increasing the friction, which gives improved quality of tone and facilitates the execution.

514 **CHURCH, G.**, 12 *Berkeley Place, Bristol*—Inventor.

Wrist-supporter, for securing a good position in playing the pianoforte.

Improved guitar: by means of two bars introduced within the instrument, and fixed in the blocks, greater strength is secured.

Improved finger-board for the violoncello, and other bowed instruments: groove runs the whole length of the finger-board under each string.

516 **EDWARDS, ROBERT JAMES**, *Church Street, Burslem*—Inventor.

An instrument invented to assist instrumental performers. It resembles the pianoforte in appearance, but, when acted upon, is perfectly silent. The keys are of porcelain. The degree of action is regulated by turning the screw at the back of the instrument.

517 **PACE & SONS**, 49 *King Street, Westminster*—Inventors and Manufacturers.

Cornopeans, trumpet, and valve horn. The improvements consist in the small diameter of the valves, the removal of angular turnings, and the hardness and quality of the metal employed.

[The *modern* brazen trumpet was invented at Nuremberg; but a similar instrument has been known from time immemorial.—H. E. D.]

518 **BROADWOOD, JOHN, & SONS**, 33 *Great Pulteney Street*—Manufacturers.

Four grand pianofortes, of different constructions:—

No. 1. In ebony case; 7 octaves, G to G; inlaid, carved, and gilt. Designed by E. M. Barry, Esq.; inlaid by G. Watson; carved by J. Thomas; and gilt by G. J. Morant. Straight bracing.

No. 2. In amboyna case; 7 octaves, G to G. Designed, carved, and gilt by Mr. G. J. Morant. Diagonal bracing.

No. 3. In amboyna case; 7 octaves, G to G. Diagonal bracing.

No. 4. In walnut case, inlaid; 7 octaves, G to G. Inlaid by G. Watson. Straight bracing.

(*Main Avenue West.*)

519 **BETTS, ARTHUR**, 27 *Royal Exchange*—Manufacturer.

Two violins.

520 **OATES, J. P.**, *Lichfield*—Inventor.

Improved brass musical instruments:—

The "gem cornet," model, with the ordinary valves. The improvement consisting in the more direct course of the current through the main tube, a greater proportion of which is placed below the valves.

Cornet, with the "central valve" (invented 1845), in which the right angles in the open notes are obviated, and the tone improved.

Cornet. Improvement of the last by the introduction of a bow, obviating the angles in the valve note. Invented 1845.

Cornet, with the bulb valves. In the perfect central valve: the piston casing is widened at the turn of the current by a hollow "bulb," or "bulge," half the diameter of the tube, the other half being formed in the piston.

Cornet, with the "equi-triodlateral valves." The "equitone cornet." The "pista-cor," a new drawing-room instrument. Improved "Sax-horn," upon the equitone principle. Transposing "military trumpet, combining the C bugle with the E flat trumpet. Both complete instruments.

The "Staffordshire horn."

The seven preceding articles are provisionally registered.

522 **Prince, Miss Adelinde**, 29 *Norfolk Crescent, Hyde Park*—Inventor.

Gioco di Euterpe; a new musical game, intended to assist beginners in the knowledge of the relative value of musical characters, and to render them good timeists.

523 **Jordan, James**, 94 *Manchester Street, Liverpool*—Inventor and Manufacturer.

1. Newly-invented euphonic serpentcleide. The pitch is an octave lower than the ordinary serpent, and the bore being much larger, it has a more powerful and mellifluous tone. The keys (eleven) and stays are tubular, thus rendering the instrument extremely light in proportion to its size. The springs, which are spiral, can be regulated or renewed by the performer, a desideratum in the military or naval service.

2. Newly-invented euphonic horn, contra-bass in B flat, compass from double A flat; though more powerful in tone than the ordinary bombardon, is yet more portable, and is consequently peculiarly suited for military, naval, or concert bands.

3. Newly-invented tenor valve ophicleide, silver mounted.

4. Newly-invented German-silver cornopean, with improved transposing slide and water-conductor. On this instrument the keys B flat and A flat (which are the keys most in use by the military) can be produced immediately, thus saving the unnecessary carriage of crooks whilst marching.

5. Newly-invented cornopean. This improvement consists in substituting fixed bows outside the valves for angular turns inside the pistons, without enlarging the tubing, relieving the action from extra weight and friction, and the instrument from leakage.

524 **Dobrowolski, B. W.**, 20 *Norton Street, Portland Place*—Inventor.

Semibreve guitar. This newly-invented instrument is improved from the Spanish guitar: its advantages are, that it contains one octave and a half more in the treble, and that it is more easy to play; the sounding-board is larger, and produces very powerful and melodious notes, and the instrument can be held with great ease and grace. Registered.

525 **Panormo, Louis**, 31 *High Street, Bloomsbury*—Manufacturer.

Enharmonic guitar (inventor and proprietor, T. Perronet Thompson, Eliot Vale, Blackheath), capable of being arranged in the perfect ratios for upwards of 20 keys; the strings can be lengthened separately at the bridge, to correct the defects of the depression to the neck, or of false or worn strings.

526 **Wheatstone, William, & Co.**, 20 *Conduit Street, Regent Street*—Patentees and Manufacturers.

Treble concertina, with 48 keys, for the performance of violin, flute, hautboy, or concertina music singly, or in concert; the same, displaying the whole internal mechanism.

Baritone concertina, with 48 keys, for the performance of harmonized music, especially psalmody, in the same register as sung by four voices.

A concert tenor concertina, with 43 keys, for vocal tenor, tenor violin, or wooden wind instrument music, singly or in concert.

A concert bass concertina, with 56 keys, for violoncello or bassoon music, singly or in concert; the same, of a smaller size, for the use of ladies.

Double concertina, with 50 keys, so disposed that a melody may be played by one hand, and an accompaniment by the other.

A symphonion, with a single vibrator, acted on by rollers moved by stops, so as to produce any note required.

A tonimeter, which produces any note in the chromatic scale merely by finger pressure.

An enharmonic tonimeter, which produces any sound in the enharmonic scale.

Portable harmoniums, for producing expression, which can be played alone, or be placed in front of the key-board of a pianoforte, and played by the same performer; adapted for wooden or stringed instrument solo, or part music.

527 **Ward, Cornelius**, 36 *Great Titchfield Street*—Inventor, Patentee, and Manufacturer.

Kettle-drum, which can be adjusted to any required note, within the range of one octave, with rapidity and accuracy, and also may be set to any note without sounding it.

Bass drum, both the heads of which can be tuned at once by one operation. Bass drum, wherein the tension of the heads is quickly adjusted by means of iron rods, whereby permanent order is obtained. This drum contains cymbals, and both drum and cymbals can be used at pleasure together or separately. Thus precision is insured; one man required in lieu of two, and the cymbals are safe from accident.

Side or signal drum, with iron bracings and two sets of snares adjustible at once. Drum, both the heads of which are adjusted by one screw.

Flute, with the natural proportion of tube required for each note of its scale.

Bassoon of new construction.

All patented or provisionally registered.

[The bassoon or fagotto is the bass hautboy. The word bassoon is derived from *bass sound*, and fagotto from *fagot*, it being composed of several pipes *bound together*.—H. E. D.]

528 **Snell, Robert**, *Ball's Pond*—Inventor and Manufacturer.

Seraphine, with bichromatic or double scale of notes, producing perfect harmony in every key, without the aid of temperament; the improvement effected by an octave of pedals, one being put down, corrects the scale for the key required.

[That the musical scale cannot be perfectly tuned on instruments with fixed sounds, is a fact that can only be *stated*, within the limit of a note; temperament signifies the equal adjustment of the imperfection of the scale on an organ, or similar instrument.—H. E. D.]

529 **Storer, Joseph**, 26 *Piccadilly*—Inventor, Patentee, and Manufacturer.

Percussion Æolophon, with two sets of vibrators, one an octave higher than the other, with appropriate stops, intended as an economical substitute for an organ.

Portable Æolophon, for taking flute or violoncello parts, or for chamber use.

530 **Faulkner, Edwin**, 11 *York Street, St. James's Square*—Designer.

Accordion stand. An apparatus to assist in playing the accordion with greater facility and effect; it will incline to any position suitable for the convenience of the performer, and by the action of a spring stop, it can be instantly fixed in that position. Provisionally registered.

531 **Bray, John**, 26 *Westmoreland Street, Dublin*—Manufacturer.

Double-action harp, with additional notes, Gothic pillar embellished in ultra-marine and gold, and music-stool, desk, and stand.

[The *double-actioned* harp possesses greater powers of modulation than that with the single action, and can also produce *enharmonic* passages; in which respect it is a perfectly unique instrument, excepting those of the violin class. Every major and almost every minor key can be distinctly produced on it. The exceptions are A ♯, D ♯, and G ♯, minors.—H. E. D.]

532 **SIMPSON, THOMAS**, *Sea-Lion Hotel, Hanley-in-the-Potteries*—Inventor.

Norma virium, or musical accentuator, intended to supersede the metronome. It marks the first note in every bar, loud and distinct, in all measures of time; and gives in weaker beats the sectional divisions.

[The word "metronome" is derived from μέτρον, measure; and νόμος, division. The instrument was invented by John Maelzel, in Austria, 1814. The more modern kinds of this instrument exhibit an improvement analagous to the principal feature of the Norma Virium, viz., a distinct separation of the first, from the following beats in a bar, which is effected by the striking of a small bell at the first beat.—H. E. D.]

533 **JONES, BASSETT**, *Cardiff, Wales*—Designer and Maker.

Grand triple-strung Welsh harp, worked in Welsh plane wood, carved in bold relief, the designs being emblematic of the country, in oak, mistletoe, &c., with two dragons in front, cut in round relief. On the comb is an equilibrium bearing-plate, to cause equal tension on the three rows of springs.

[The triple-strung Welsh harp was an ingenious but laborious contrivance to enable the performer to take semitones, and to modulate into different keys. It is now superseded by the pedal harp, particularly that with the double action, invented by Erard. The two outer rows of strings are diatonic and unisonic: the centre row comprises all those sounds necessary to complete the thirteen semitones belonging to each octave. This instrument is described by Mersennas in his "Harmonie Universelle," 1636.—H. E. D.]

535 **SICCAMA, ABEL**, 135 *Fleet Street*—Inventor, Patentee, and Manufacturer.

Diatonic flutes, retaining the old system of fingering while affording numerous additional fingerings, on a system strictly based upon acoustic principles. Their tone is said to be powerful and brilliant. They are easier of execution, and therefore require less exertion to play than the ordinary flute. There are three middle C's on this flute, all of the same quality, and perfectly in tune.

[There are two scales commonly understood—the DIATONIC, from διὰ, *by*, and τονος, *the tone*; and the CHROMATIC, from χρῶμα, *colour*: the first proceeding by tones and semitones, and the second by semitones alone. But there is a third scale, the ENHARMONIC, that is not so well known. It can be thus explained: Notes have their pitch determined by a certain number of vibrations. By this we find that C♯ and D♭, though one sound on a keyed instrument, have distinct sounds in reality. The Enharmonic scale then is a succession of every possible note according to its vibratory intensity, *e. g.* G D♭, C♯, D, E♭, D♯, E, and so on.—H. E. D.]

536 **RUDALL, ROSE, & CO.**, 38 *Southampton St., Strand*—Proprietors and Manufacturers.

Richard Carte's patent flutes, with new and old fingering, made of silver or other metal, or of wood; possessing all the latest improvements arising from equidistant and equal-sized holes and open keys. The arrangement of the holes, and contrivances of the mechanism are available either with Boehm's parabola and cylinder bore, or Rose's improved conical bore.

Patent flute, constructed on the principles first introduced by Boehm, viz., equidistant and equal-sized holes, and open keys. The patent was granted for a parabola-shaped head-joint, and cylindrical body-joints.

Improved ordinary flute—its merits are said to consist in the improvement of the tone, arising from the novel proportions of its conical bore. The fingering and arrangement of holes and keys remain as usual.

537 **PURDY & FENDT**, 74 *Dean Street, Soho*—Manufacturers.

Violins, violoncellos, double bass. To exhibit oil varnish equal to that used on the Cremona instruments; the art of making which is supposed to have been lost.

538 **OTTER, HENRY**, 2 *Bridge Street, Westminster*—Manufacturer.

Clinton's flute, on acoustic principles, being the only one with the old fingering *throughout*, with equality of tone and perfection of tune.

540 **KOHLER, JOHN**, 35 *Henrietta Street, Covent Garden*—Patentee and Manufacturer.

Patent three-valve instruments—lever cornetto, in E♭; cornopean, in B♭; trumpet, in E♭; trombone, in B♭; trombone, in G; patent clavicor and bombardone, each with four valves in E♭; and French horn, with two valves in E♭; patent lever trumpet, in E♭ with two valves; small pocket cornopean in A with two valves; cylinder cornopean in B♭ with three valves; cylinder tenor horn in D with three valves; and Harper's improved chromatic slide trumpet in E♭.

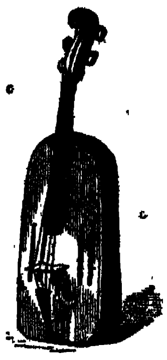
541 **GUINNESS, RICHARD**, 58 *East Street, Manchester Sq.*—Inventor.

Violin and violoncello.

Self-acting pegs for the tuning of violins, violoncellos, and tenors.

542 **SPURGIN, THOMAS**, *Saffron Walden*—Maker.

Violin made from a description of one invented by Mons. Savart of Paris. The figure represents this violin.



Spurgin's Violin.

543 **DODD, JAMES**, *Image Cottage, Holloway*—Manufacturer.

Bows for the violin, tenor, and violoncello, mounted with gold and tortoiseshell. Silver strings for the violin violoncello, and harp.

544 **CHIDLEY, ROCK**, 135 *High Holborn*—Designer, Manufacturer, and Proprietor.

Concertinas, in ivory, with gold stops, working on levers only supported by springs; another in ebony, with glass stops, mounted with gold.

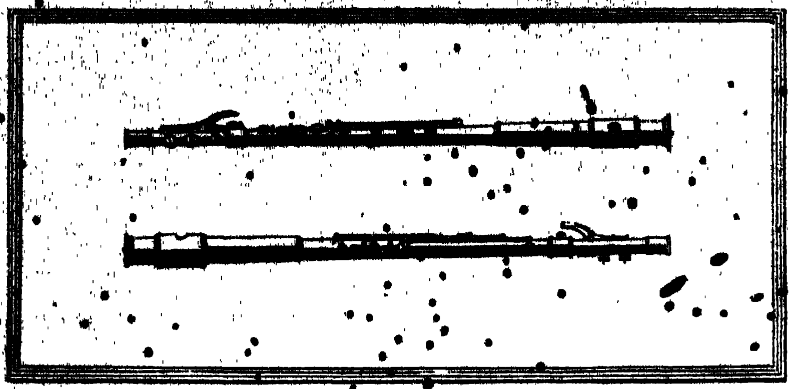
[Though an exceedingly sweet instrument, the concertina is considered to be deficient in forgando effect.—H. E. D.]

545 **CASE, GEORGE**, 32 *New Bond Street*—Manufacturer.

Concertina, on which may be played any description of music, within the compass of three octaves and a half, in single notes or chords.

546 **CARD, WILLIAM**, 29 *St. James' Street*—Designer and Manufacturer.

Silver flute, with rods, rings, and levers, equal to twelve keys.—Stirling's British gold flute. Electro-silvered flute. Cognes wood flute, with silver mountings and keys. The following cut represents the silver flute.



Card's Silver Flute.

547 **Callcott, John**, 31 *Admiral Terrace, Vauxhall Bridge Road*—Inventor and Manufacturer.

Newly invented French horn; the novel feature being its portability, the loose crooks commonly used being dispensed with: to change the key, a continuous tube is graduated into thirteen parts, each part being a semitone, at each of which again an opening is made, into which is inserted a short tube, leading from the belt of the horn to the centre of the hoop, and there turning in any direction, which receiving the wind as it passes through the horn bears it away to the belt.

Cornet à piston, on the same principle.

---

548 **Roome, Thos. Fred.**, 67 *John Street, Fitzroy Square*—Manufacturer.

Organ metal pipes, in plain and spotted metal—trumpet, hautboy, cremona, flute, open diapason, viol de gamba, and keraolophon.

[The best metal for organ pipes is pure tin; this, however, being expensive, it is frequently mixed largely with pewter. Cremona is a corruption of *krumhorn*, an obsolete German wind instrument.—H. E. D.]

549 **Groome, John**, *Watton, Norfolk*—Inventor and Manufacturer.

Transparent music, in which the notes can be distinctly seen at a distance, either by day or candle light, adapted for instructing large classes.

550 **Mathews, W.**, 3 *St. James Street, Nottingham*—Inventor and Manufacturer.

Model, exhibiting the string frame of an upright pianoforte with lever tuning apparatus; the object being to sustain the pressure of the strings, and prevent the instrument getting out of tune.

An upright pianoforte, in which an apparatus is introduced to keep the instrument in its upright position. It is also simple in action, and contains an apparatus whereby various degrees in quality of tone may be produced.

---

551 **Andrews, Richard**, 4 *Palatine Buildings, Manchester*, and 84 *Oxford Street*—Inventor.

Apparatus for giving a good position to the hands, arms, and fingers of pupils commencing the pianoforte; also for strengthening the fingers in exercises for that instrument.

---

553 **Bishop, J. C.**, 1 *Lisson Grove South*—Designer and Manufacturer.

Cabinet organ, containing composition pedals, by which the performer can command any combination of stops, without the aid of the hands or confinement of the feet; the wind being also perfectly steady and free from tremor.

[Composition stops are used for changing the arrangement of organ stops, without the aid of the hands, and vary in different instruments.—H. E. D.]

---

554 **Dawson, Charles**, 395 *Strand*—Inventor.

Autophon. An improvement of the organ, the tunes, which are unlimited, being produced by means of perforated sheets of mill board; it enables any person, unskilled in the art, to perform pieces of music with ease.

---

555 **Gray & Davison**, 9 *New Road, Fitzroy Square*—Designers and Manufacturers.

A grand church organ of the first class, consisting of three full rows of keys or manuals, from CC 8 feet, to F in alt., and an independent pedal organ of two octaves, and a third, from CCC 16 feet, to E; two bellows, horizontal, with double feeders of wind of different weights, and six composition pedals for changing the stops, which are 39 in number,—13 in the great organ, 9 in the swell, 8 in the choir, 4 in the pedal organ, and 5 for coupling the manuals, and the manuals and pedals together. All the latest improvements are adopted in the construction of this instrument. The case is of novel character, made of solid oak, carved with double impost mouldings, supporting four towers of speaking-pipes, which are decorated: the whole from designs by Mr. Albert Howell, architect.

A small church organ, with one manual, from CC 8 feet, to F in alt., and pedals of two octaves and two notes, in extent from CCC 16 feet, to D, with Bourdon stop. The whole of the manuals are enclosed in a Venetian swell, and there are two pedals for changing the stops. The case is of Gothic design, made of deal stained and varnished.

Patent improved church barrel-organ, playing any number of tunes, without the necessity of shifting the barrels in and out of the instrument. The change from one tune to another, on whatever barrel, is made in the simplest manner possible, and an index always shows the name of the tune about to be played.

---

556 **Hill, W., & Co.**, *Tottenham Court Road*—Designers and Manufacturers.

Finger organ with two sets of channels; compass from CC to F, with separate sound-boards on extra pressure of wind, containing a reed stop of great power, separate pedal sound-board of two octaves and a half from CCC; the whole of the channels placed in a swell box; the composition and drawing of the stops being on a new principle.

This organ contains two manuals, a great organ of ten stops, and an echo organ of five stops. Both are enclosed in swell-boxes, the echo organ being in a box which opens into the larger one. The mechanism is upon an entirely new construction, and is much simplified. The stops are drawn by means of keys, to which is attached the pneumatic apparatus, so that a trifling pressure of the finger only is required to change them. The composition pedals also, by acting upon the above keys, are remarkably light, and effect the changes in the stops with much greater ease than those on the old plan. A new system of valves has been introduced to the great organ, which secures lightness and equality of touch. The organ also contains a new stop, of immense power and volume of tone, called the "tuba mirabilis," the invention of the exhibitors.

[The sound-board of an organ is the upper part of the wind chest in which the mouths of the pipes are inserted, and, by the removal of a small valve, *sounded*. The manuals are the stops played by the hand: the term also is synonymous with *key-board*. Pedals were invented by a German, called Bernhard, about 1400. The swell was invented by an Englishman, in the last century, the idea having been suggested, it is said, by the modified intensity of sound from a pianoforte, produced by the opening and closing of the door of a room in which it was played. The channels convey the wind to the pipes.—H. E. D.]

557 **HOLDICH, GEORGE MAYDWELL H.**, 4 *Judd Place East, King's Cross*—Manufacturer.

Small choir-organ; having a stop, called the "dis-octon," which makes every single stop as good as two distinct ones; having, therefore, double the power and variety of an ordinary organ.

[The choir organ, properly so called, is that part of a large organ which is used for accompanying the choir of singers in a church or cathedral, and is softer voiced than the rest of the instrument.—H. E. D.]

558 **NOLAN, W. H.**—Inventor.

Artificial teeth.

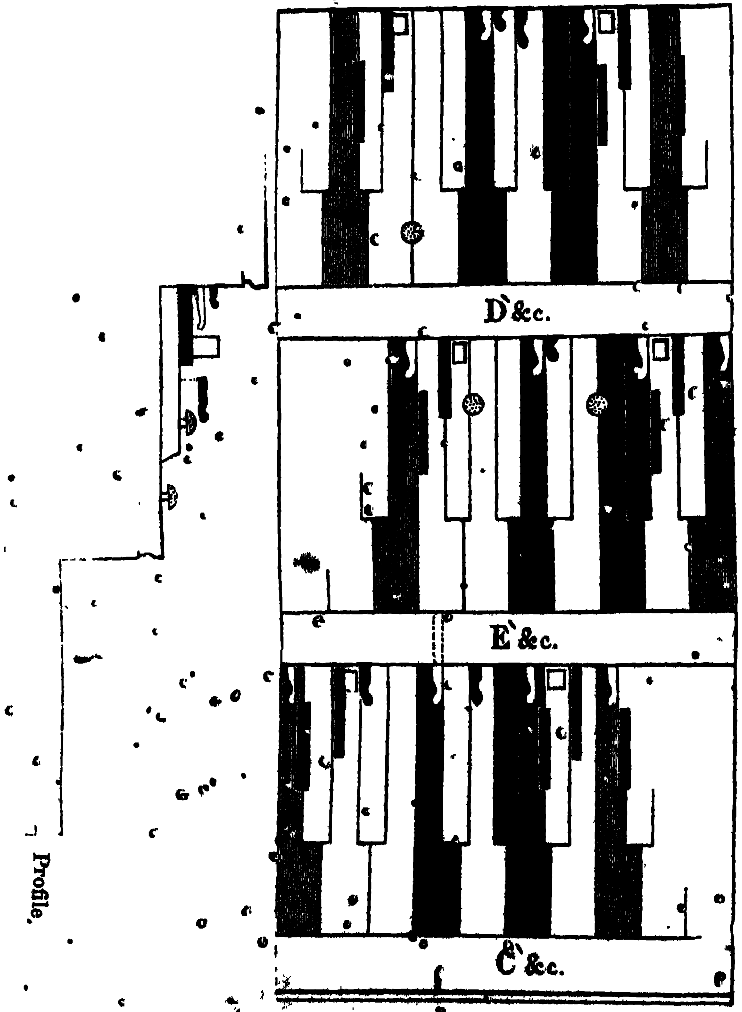
559 **ROBSON, T. J. F.**, 101 *St. Martin's Lane*—Manufacturer.

Enharmonic organ; presenting the power of executing with the simple ratios in twenty keys, with a correction for changes of temperature. By Lt.-Colonel T. Perronet Thompson.

The object of this instrument is, first, to determine the proportions which make music, in a single key, and then to transfer the same proportions to a variety of keys, beginning from some of the previously established sounds as a new key-note.

The same process was attempted by the ancients, constituting what they called the Enharmonic; but it broke down and was finally abandoned, in consequence of making an unfortunate division for a single key.

Front View and Profile of the FINGER-BOARDS, *on a Scale of One Fourth.*



Lowest board contains Keys of C`, E`, G', B♭` Major, B♭' Major, E♭ Major, A♭ Major, D' Minor; and by having Exchangeable pipes for G♭` and G♭', C♭` and C♭', the Keys of D♭` Major, G♭` Major, B♭` Minor, B♭' Minor, E♭' Minor. Middle board, Keys of E`, B', G' Major, D' Major, C` Major, and (with help from the D` board) A`, C♯', G♯'. Uppermost board, the Keys of D`, A`, F` Major, B♭` Major, G`, and (with help from the E` board) B`, E`, and F♯`.

The leading principle involved in this instrument, is, that the Dissonances are *double*, or have each two *forms*, one of which makes harmonious combinations with the Fifth of the Key and the Thirds, and the other with the Fourth and the Sixths. Hence, if the one set is coloured white and the other black, the similarity of colour will help to point out the connexion. The best way of illustrating this will be to refer to the lowest or C board, in the representation of the finger-boards annexed, taking no notice for the present of the smaller manuals resembling the keys of a flute. The key-note C is coloured red; which in the Plate is represented by longitudinal lines, as done in Heraldry.

The same process is applied on the middle board for the key of E, and on the uppermost board for the key of D`. When this was done, it was plain that by the addition of a comparatively small number of manuals, several more keys might be produced; which was accordingly done, by the addition of the manuals which, from the likeness formerly described, may be called the *flutals*.

A further addition was made of the manuals on the middle and uppermost boards, which from their form may be denominated *buttons*; giving the power of making E♯, B♯, and F×. There is also a provision of spare pipes for G♭ and C♭, by means of which preparation may be made for playing in five and in six flats.

On the whole, the number of keys amounts to twenty, extending from eight sharps (or as generally called, six sharps and a double sharp) to six flats. In many cases, there are keys for the two *forms* of the same note, which may be called for according to circumstances. The different sounds resulting, are displayed in the Table which follows (next page). Though adapted to 53 divisions, they are not the sounds of the division into 53 equal intervals, but the accurate sounds, as may be proved by examination of their *Measures*. A line drawn over any number of figures implies that they form a recurring decimal. Though the appearance of such a number of sounds is formidable, it has been proved by experience, that three weeks are sufficient for acquiring the same facility as on an ordinary instrument; and directions are appended to the instrument, by which any performer who will consent to follow them may, at a first sitting, perform with inconsiderable risk of error in a limited number of keys.

The tuning is effected by means of what is called a *Phonometer*, being a monochord with a wire of four feet, stretched by a weight capable of very accurate adjustment. The compass is what is called the German scale, or from C C to *f* in alto. The pipes are of wood, of what is called Stopped Diapason, and each is tuned with a screw, the whole number being 155, besides those which may be denominated Exchangeable. The swell is divided in two at middle *c*ˋ, and each part has a quick movement and a slow. The dimensions of the instrument are, in extreme height 8 feet 5¼ inches English measure (7 feet 11 inches French); length 7 feet 5 inches; depth 3 feet 7 inches.

‵ Flutal. ‖ Hook. † Button. ‡ Exchangeable Pipe.

560 **HEWITT, D. C.,** *Twickenham*—Inventor.

The musical ratiometer. (*South Wall.*)

561 **WALKER, J. W.,** 27 *Francis Street, Bedford Square*—Manufacturer.

An organ (in the Tudor style, designed by Banks and Barry), adapted for a hall or music room. This organ is represented in the cut on the following page.

562 **FORSTER & ANDREWS,** *Hull*—Manufacturers.

Original model of the transposing organ, which enables the performer to change the pitch of his instrument five semitones higher or lower from a given pitch, by an easy turn of a small key. The manuals remain stationary.

[The method generally employed by musicians when transposing (*i. e.* changing the key of) a piece of music, is to suppose it written in another cleff, *e. g.* original key C.  key required D, suppose the music written in the alto cleff  and the note indicated becomes D. —H. E. D.]

565 **GROSSMITH, W. R.,** 175 *Fleet Street*—Inventor and Manufacturer.

Artificial legs, for amputation above and below the knee; or at the ankle, allowing the free use of the natural knee-joint. The same for contracted knee (foot amputated), with locking joints. Common socket and pin leg, with knee-joint. Artificial eyes. Spring braces for the prevention of round shoulders and stooping; with other instruments.

567 **EAGLAND, THOMAS,** *Leeds*—Manufacturer.

Teale's trusses for inguinal and femoral hernia.
Bandage for prolapsus of the rectum.
Knee-joint extensor.

568 **MILES, JAMES,** *Street, near Glastonbury*—Inventor.

Improved double truss for hernia, invented by a labouring man.

569 **MASTERS, MOSES,** 12 *St. David Street, Newington*—Manufacturer.

Artificial leg, for amputation above the knee.

570 **CAPLIN, JEAN FRANÇOIS ISIDORE,** *Strawberry Hill, Pendleton, Manchester*—Inventor and Manufacturer.

Gymnastic apparatus, and orthorachidic instruments, for deformity of the spine, &c.

570A **CAPLIN, Madame,** 58 *Berners Street, Oxford Street, and* 55 *Princess Street, Manchester*—Inventor and Patentee.

The Hygeianic corsets. The registered corporiform corsets, plain and mechanical. The new contracting belt. Abdominal supporters. Medical belt and chest expander. Spinal corsets. The child's boddice; also the reversotractor, to prevent children standing on one leg, with a variety of other Hygeianic adaptations made in accordance with the science of anatomy and physiology.

571 **SWITHENBANK, J.,** 100 *Bridge Street, Bradford, Yorkshire*—Manufacturer.

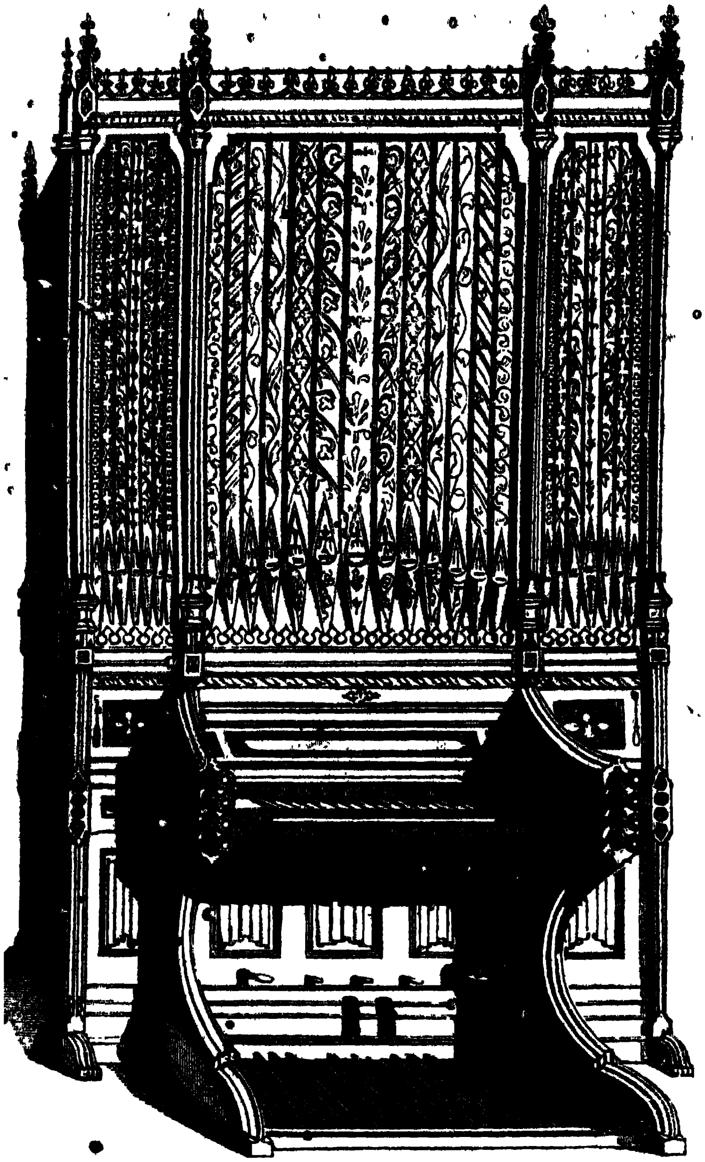
Artificial legs.

572 **LONGDON & TUBBERER,** *Derby*—Inventors and Manufacturers.

Elastic surgical stockings, knee-caps, belts, &c., which require no lacing, and may be washed in hot water.

573 **SMITH, S.,** 1 *High Holborn*—Manufacturer.

Various trusses of different constructions, bandages, belts, &c.



Walker's Organ.

Leg instrument, for right leg.

Elastic knee-cap, to lace, used to support the knee-joint.

Ankle-sock, to lace, used to support the ankle-joint.

Lace stocking, for producing pressure on swollen veins in the legs.

Syringes, silver catheters, bougies, pessaries, &c.

---

574 **GHRIMES, SAMUEL**, 71 *Baker Street, Portman Square*, —Designer and Producer.

Casts of mouths. Sets of artificial teeth. Various cases of artificial teeth.

---

575 **HORNE, JAMES**, *West Regent Street, Glasgow*— Designer and Manufacturer.

Three models of mouths, with artificial cases of teeth, showing a plan of fitting teeth in the mouth so as to obviate the necessity of applying wires or bands of metal to the sound teeth.

Models of irregular sets of teeth, showing a plan of correcting them by means of palladium plates. These plates are tasteless and economical, and may be made so as to gradually press the teeth into the true position. There are three specimens of each regularity, showing improvements in progress.

The models No. 1 represent deformed teeth in their original state.

The models No. 2 represent deformed teeth at first, and afterwards as pressed out with the plate, and drawn in with silk.

The models No. 3 represent deformed teeth made straight by fastening silk round the teeth, and pins at each side.

---

576 **LAURIE, S.**, 36 *Argyle Street, New Road*—Designer.

Artificial teeth, carved in hippopotamus ivory.

577 **JAMES, JOHN HADDY**, F.R.C.S., *Exeter*—Inventor.

Surgical instruments and apparatus.

A collar, resting below, on the collar bones; above, supporting the base of the jaw and cranium, with hinges and screw, by which the face and head may be raised in cases of contraction; disease of the cervical vertebræ; and in wry neck; with two casts illustrating its effects.

A pair of forceps, which may be designated a bone-holder. Its use is to grasp the projecting end of any bone which it may be necessary to saw off: with this instrument a firm and steady hold can be obtained, and the bone as readily sawn through as if it were entire. It is applicable to cases of compound fracture; conical stumps or bones left too long in; common amputations; and nonunited fracture.

An improved saw, which may be advantageously substituted for the various forms of metacarpal saws, or small saws commonly in use for surgical purposes. This saw was invented by the exhibitor for the purpose of sawing through the lower jaw, parallel with and close to the base, in a case of tumour.

Model of an apparatus employed in the treatment of fractures of the thigh, with accompanying sketch, showing its use.

578 **Ash, Claudius, & Sons**, 8 *and* 9 *Broad Street, Golden Square*—Manufacturers.

Improved mineral teeth, with gold tubes.

Two sets of teeth, mounted, and some smaller pieces; also single teeth of various forms and colours.

[Artificial teeth, for a considerable period, were exclusively made of the tusk of the hippopotamus, a material closely resembling in colour human teeth, and susceptible of a fine polish. A large number, inclusive of those described, are now made of a peculiar description of porcelain, so intensely hard as to resist steel files: they are consequently united with corundum. They closely resemble natural teeth, and are made of different shades of colour.—R. E.]

579 **Parks**, 25 *Newington Crescent, Kennington*—Inventor.

Artificial teeth.

581 **Perkins, William**, 175 *Prospect Place, Maida Hill, Paddington*—Designer and Manufacturer.

Artificial teeth, carved from the hippopotamus tooth. Mineral teeth on gold, with side springs complete. Natural teeth, set in hippopotamus tooth sockets. Specimens of partial cases.

582 **Robinson, James**, 7 *Gower Street, Bedford Square*—Inventor.

Artificial teeth, with gold masticators, on suction principles. Elastic gold lever, used for turning irregular teeth in the upper jaw. Spiral spring for correcting deformities in teeth.

583 **Reid, R.**, 19 *Heriot Row, Edinburgh*—Inventor.

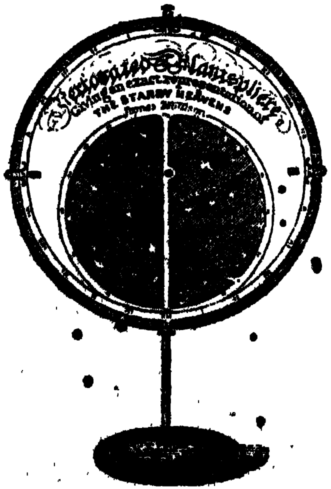
Compress for alveolar hæmorrhage, with expanding plate and turnscrew; adapted to a model head and chin, to show the mode of attachment and working of the apparatus on both jaws.

584 **Ransom, Robert**, 3 *Verulam Place, Hastings*—Manufacturer.

Case of artificial teeth.

585 **Mollison, James**, 3 *Grove Terrace, St. John's Wood*—Inventor.

Pedestal planisphere, giving a natural representation of the heavens at any given time. It is intended to solve the chief problems of the globe, and preserve the forms of the constellations. See preceding cut.



Mollison's Pedestal Planisphere.

587 **White, John**, 228 *Piccadilly*—Manufacturer.

Various single and double trusses, known as the "Patent Moc-main Lever Truss."

589 **Tod, D.**, 5 *Upper Fitzroy Street, Fitzroy Square*—Inventor.

Improved single and double trusses.

590 **Thomson, Hugh, M.D.**, *Greenock, Scotland*—Inventor.

Apparatus intended for fractures of the thigh with the knee bent, or in a straight position, for fractures of the leg. The proposed advantages of this apparatus are: 1st. The power of making suitable extension and counter-extension whilst the knee is bent. 2nd. By means of the pelvic portion, a more advantageous angle is obtained for making counter-extension. 3rd. The bandages containing steel springs, which encircle and grasp the limb, being fixed to the splint, serve for making extension and counter-extension. 4th. Numerous points for making extension and counter-extension are obtained, so that no part may suffer from an undue pressure. The proper angle of flexion of the knee is maintained by the screw for that purpose at the knee-joint, and by pillows placed below the limb.

591 **Sparks, J., & Co.**, 28 *Conduit Street, Regent St.*, and 115 *New Bond St.*—Manufacturers.

Spinal machine, with elastic spring crutches, for weakness of the spine. Registered.

Dr. Foucart's spinal rectifier, and chest-expander.

Dr. Foucart's improved splints for fracture of tibia and fibula. Extending knee instrument for contracted knees.

Spring crutch, for convenience in travelling, &c.

New elastic single and double spring trusses, with vulcanized Indian-rubber pads. Umbilical truss, with air pads. Bathing truss, covered in India rubber.

Elastic spiral silk stockings, ankle-socks, and knee-caps, elastic silk belt for giving support, &c.

Elastic steel backboard, with vulcanized India-rubber arm-straps, for stooping of the shoulders, &c.

Young lady's boot, for weak ankles.

Moulded leather hip, knee, and ankle splints, for confining the motion of the limb during disease.

Hydrostatic, or water-bed, invented by Dr. Arnott. India-rubber water-pillow, for holding hot or cold water.

Waterproof silk coat.

Portable cloak boat, for crossing rivers and lakes; can be worn as an ordinary cloak, and can be instantly inflated. Hand paddles for cloak boat.

592 **Fuller, John**, 239 *Whitechapel Road*—Inventor.

Artificial leg, eyes, and nose. Improved scarificator, with shifting pinions, for cupping. Improved truss. Antique metal-gilt oval watch, made in the reign of Charles I., by "Francois Nawe, at London."

593 **Foucart, Dr.**, 59 *Arlington Street, Mornington Crescent.*

New registered spinal rectifier and chest expander. A safe and amusing calisthenic instrument, well adapted for ladies.

594 **Salmon, Ody, & Co.**, 292 *Strand*—Inventors and Manufacturers.

Patent single and double self-adjusting trusses, for inguinal hernia. Truss for umbilical and right femoral hernia.

New resisting, anti-pressure, self-adjusting truss, with regulating spring, suggested by Dr. Arnott.

596* **Baunton, J.**, *Huddersfield*—Manufacturer.

Artificial leg.

597 **L'ESTRANGE, FRANCIS**, 39 *Dawson Street, Dublin*—Inventor.

Various patent trusses.

Stricture instrument.

Apparatus for the reduction of dislocations; having a windlass and pulleys; and a disengaging apparatus, with extension and counter-extension hooks.

Apparatus for the cure of fractures of the lower jaw, composed of two parts, the divaricator, and the horse-shoe splint with the cramps.

Lithotrite instruments, composed of the sound and sounding-board, the screw lithotrite, and drill.

598 **HUXLEY, EDWARD**, 5 *Vere St.*—Manufacturer.

Stockings, knee caps, calf-pieces, and anclets, for varicose veins, weakness, sprains, fractures, and all cases in which bandages can be applied.

601 **MILES, EDWARD**, 15 *Liverpool Street, Bishopsgate*—Proprietor.

A set of mineral and curved teeth. Several whole and partial highly-finished sets of teeth. Gold palates.

601C **CHAPMAN, T., & ALDERMAN, J.**, 8 *Denmark St., Soho*—Inventors and Manufacturers.

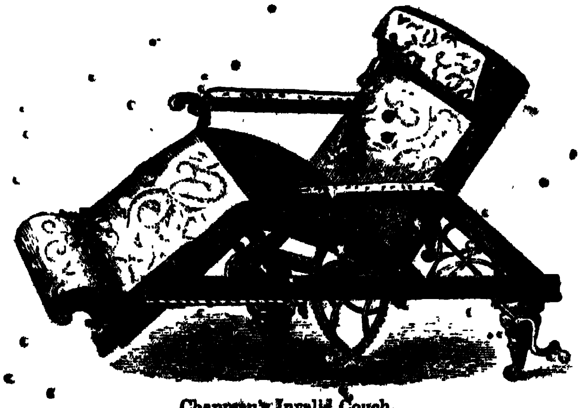
General invalid couch, which is capable, by mechanism, of being changed into any required position, without disturbing the patient; the change of position being so gradual that it is almost imperceptible.

It will form an easy chair, with arms, which adjust themselves without trouble, or can be taken off if required, without unscrewing.

It is also suitable for surgical cases, as every variety of position can be obtained. When converted into a level couch, the moveable scroll end at the head may be turned into a writing table and reading desk, so that a patient, while reclining, may read and write with comfort.

The mattress is elastic, resting upon an elastic-adjusting foundation, by which all pressure can be taken off from any part of the patient, in cases of long illness.

The following cut represents the couch.



Chapman's Invalid Couch.

601D **MACMAHON, CHARLES**, *Upper Camden Street, Dublin*—Inventor.

1. The jaw-lever, a newly-invented instrument for keeping open the mouth of the horse, ox, dog, or any other animal whilst administering medicine or performing an operation. The advantages are simplicity, without injury to the animal's mouth, and protection to the operator.

2. A temporary horse-shoe, to fasten on without nails; useful where a foot is unsound, or where it may be necessary to remove the shoe frequently.

602 **FINZI, S. L.**, 6 *Dalby Terrace, City Road, Islington*—Inventor and Manufacturer.

Universal drill, designed and made for the purpose of removing decay from teeth to prepare them for stopping. Can be used at all angles of the mouth without inconvenience.

Upper, and under set of teeth, carved entirely from a tooth of the hippopotamus.

604 **HALFORD, H.**, 8 *St. John Square*—Manufacturer.

Artificial human eyes. Eyes for figures life-size. Eyes for miniature figures—animals, dolls, and birds—of various sizes and colours.

605 **ATKINSON, BENJAMIN FREDERICK**, 26 *Strand*—Inventor and Proprietor.

Registered anal truss. The instrument consists of an elastic pad, which dispenses with the necessity for steel springs round the body.

Rectum-supporter of ordinary construction. Artificial leg for below the knee. Artificial hand and arm.

Instruments for correcting distortion of the bones of the leg, and for weak knees, when they incline inwards. Variety of trusses. Improved bandage for prolapsus.

606 **BUNNEY, CHARLES**, 27 *Lower Eaton Street, Pimlico*—Manufacturer.

Surgical belts, &c.

607 **WHIBLEY, EBENEZER**, 12 *Lloyd's Place, Brompton.*

Surgical operating table; a contrivance for placing the body and legs of the patient at various elevations and inclinations.

609 **PUCKRIDGE, F. L.**, 4 *York Place, Walworth*—Inventor and Manufacturer.

Transparent waterproof membrane plaisters.

Tinted goldbeaters' skin and court plaister.

610 **BINYON, ALFRED**, 3 *Great Marlborough St., Regent St.*—Inventor and Manufacturer.

Elastic chest-expanders.

612 **SPRATT, WILLIAM HENRY**, 2 *Brook Street, Hanover Square*—Manufacturer.

Single and double trusses; the new truss devised by Dr. Arnott. Pads, belts, and bandages, of various constructions. Elastic laced stocking.

New spinal chair, which may be used as a bed, chair, sofa, or in a carriage, designed by R. Druitt, Esq.

613 **LINDSEY, MARK**, 264 *High Street, Borough*—Inventor and Manufacturer.

Various trusses for hernia in adults and children.

614 **LEE, JOHN**, *Bideford*—Inventor and Manufacturer.

Bedstead, which is so constructed that the patient may be raised by machinery, the bed made up under him, and he may recline in any position most easy to himself; all with the assistance only of one attendant.

615 **HEEPS, JOHN HENRY**, 46A *Liverpool Street, City*—Inventor and Manufacturer.

Pulpit, containing a gutta-percha hearing apparatus, for the deaf in churches, chapels, lecture-rooms, &c.; a gutta-percha funnel is placed out of sight, to which the tubing is attached, and carried under the wood-work or floor, to the pew in which the deaf person sits. The end of the tube is applied to the ear.

Self-adjusting prolapsus spring-bandage and abdominal supporter, with gutta-percha pad; also self-adjusting abdominal spring-belt.

617 **ROBINSON, RICHARD**, 27 *Cumberland Street, Portsea*—Inventor.

An artificial leg; with the foot constructed so as to dispense with steel springs; the invention being adapted to an amputation either above or below the knee-joint.

619 **ARNOTT, J., M.D.**, 34 *Baker Street, Portman Square*—Inventor.

Current apparatus for regulating the temperature of morbid parts with precision, and combining an appropriate temperature with equal pressure.

Apparatus for applying a very low or anæsthetic temperature in various inflammatory and painful diseases.

[The object of the apparatus here described is to supply a constant source of pressure, combined with a constant abstraction or supply of caloric. This is useful in the treatment of inflammatory and irritative diseases, and has been found of service in the relief of the pain of ulcers and diseased joints. A waterproof cushion is applied to the part, and its contents are changed by a current of water from a small reservoir elevated above the patient. A uniform temperature, whether below or above the standard of the body, is thus supplied. It is a singular fact that pain may be actually extinguished by benumbing cold, and the apparatus for supplying this degree of temperature has been successfully used in the relief of inflammatory and neuralgic diseases. The term anæsthetic is applied to agencies which remove the power of perceiving pain. The perpetual siphon exhibited is used in the application of this temperature to internal diseases, and for other purposes in surgery. An anæsthetic temperature may also be substituted for chloroform in many surgical operations.—R. E.]

Apparatus for removing contractions or obstructions in the excretory canals by the dilatation of fluid pressure.

[Dilatation by fluid pressure was suggested as a remedy in the cases described by Dr. Neil Arnott. It excels some modes of treatment in the quickness and safety of its action, and in the permanence of its effects. The *principle* of this dilator is illustrated by the suspended distensible tube; its *construction* by the instruments in the glass case. A fluid pressure dilator, used in the extraction of stone, and another used in dystocia, are also exhibited.—R. E.]

---

620 Leared, Arthur, *Oulart, Wexford, Ireland*—Inventor.

Double stethoscope, made of gutta-percha.

---

624 Simpson, G., F.R.C.S., 6 *Bedford Street, Bedford Square*—Manufacturer and Inventor.

Anatomical model of the human figure, in papier maché and gutta percha. On the right of the figure, are represented the external layer of muscles, the superficial arteries, veins, and nerves; on the left, are shown the second and third layers of muscles, with the deep-seated vessels and nerves. The chest and abdomen are moveable, in order to exhibit the internal organs; and the skull-cap, to show a vertical section of the brain. The arteries are coloured red, the veins blue, and the nerves white.

Anatomical model in gutta percha, being a vertical section of the human head and neck, exhibiting the brain, spinal marrow, membranes, and sinuses; together with the nose, mouth, larynx, fauces, the large blood vessels, and parts concerned in the cavity of the mouth.

625 Towne, Joseph, *Guy's Hospital*—Producer.

Deep section of the head, showing the distribution of the fifth nerve, the internal ear, the muscles and nerves of the orbit, and the muscles, large vessels, and nerves of the cervical region. Model shewing the muscles, blood vessels, and nerves of the neck, upper extremity, and chest. From dissections by John Hilton, Esq., F.R.S., of Guy's Hospital.

Twelve models from the egg of the goose, exhibiting the progress of development during incubation. Twenty models from the egg of the common fowl, exhibiting the same.

---

627 Brown, John, & Son, *Grey Street, Newcastle-upon-Tyne*—Manufacturers.

The railway tourniquet, exhibited for efficiency and simplicity of application.

The aneurismal compress, for the application of the treatment of pressure to aneurism.

Dilators for stricture. The ostracide, or oyster opener.

---

628 Salt, M., & Son, 21 *Bull Street, Birmingham*—Manufacturers.

1—7. Cases of surgical instruments: for amputation; post-mortem examination; minor operations, by Cooper; dissection; catheters, for strictures; for the pocket; and Kidston's mechanical leeches.

[The principle of the mechanical leech is identical with that of the ordinary cupping apparatus. The scarificator is composed of three lancet points, which inflict a wound of the same form as that given by the leech. The puncture is instantaneous, and is produced by the operation of a spiral spring, which, released, projects the points into the flesh; a vacuum pump is attached, the piston of which is withdrawn, also by the operation of a spiral spring, into the barrel of which the blood flows; when filled, it is removed, and another small pump is applied, the piston being at the lower part of the cylinder, and the operation of the spiral spring withdrawing the piston and forming the vacuum alluded to.]

8—13. Salt's registered spontaneous, and enema apparatus.

[The spontaneous action syringe or enema is produced by the compression of the air, which operates upon the surface of the fluid by its elasticity, and forces it out by its reaction or desire to regain its equilibrium. The operation is, of course, less powerful towards the conclusion of the discharge, but it is still sufficiently so to effect the intention.]

14. Improved medical galvanic apparatus.
15. Five patterns of stethoscopes.
16. Five patterns of midwifery forceps.
17. Four patterns of uterine specula.
18. Skey's new tourniquet, for amputations.
19. Scarificator for cupping.
20. Tooth-extracting instruments, including Salt's compound.
21. Two chloroform inhalers.
22. Fifty varieties of surgeon's pocket instruments.
23. Salts, improved pessary, for prolapsus uteri and bandage.
24. Six trusses for hernia.
25. Models of elastic stockings, fracture apparatus, and instrument for club feet.
26. Sundry instruments and appliances.

---

629 Rein, Charles, 108 *Strand*—Inventor.

New instrument for aiding the hearing, which requires no spring, and is not observable; the length of the tube is 18 inches.

Various instruments of the same kind, which may be worn without being seen.

Acoustic chair, vases, bells, walking-sticks, telescopes, &c., adapted for various useful purposes.

Conical flexible whispering-tubes; domestic telegraph; ear-caps or reflectors; acoustic pulpit, and group of acoustic instruments.

Continual stream enema reservoir; several kinds of aperitive vases and enemas.

Ear springs of different constructions. Registered, self-acting lactatory. A variety of tubular ear specula and other instruments.

---

630 Greenhow, T. M., *Newcastle-upon Tyne*—Inventor.

Fracture bed, for the treatment of patients having fractures of the thigh and le

631 Ferguson & Sons, 21 *Giltspur Street*—Manufacturer.

Complete set of surgical instruments, for capital and minor operations.

Specimens of forceps, scissors, knives, and tourniquets, including Mr. Skey's, and Dr. Malan's. Case of gilt catheters. Mr. Wakley's stricture instruments.

Speculums. Instruments for lithotrity.

Dental, polypi, and midwifery instruments.

Splints and inclined planes for the different fractures.

Dr. Burgess's apparatus for fumigations in diseases of the hair.

Apparatus used in orthopedic surgery, showing the latest improvements for the treatment of contractions of the neck, hip, knee, foot, arm and hands, including apparatus for lateral and posterior spinal curvatures.

631A WEISS & SON, 62 *Strand*—Inventors, Manufacturers, and Patentees.

Complete cabinet of surgical instruments, containing all that are necessary for general operations in surgery, and combining the latest improvements. In this cabinet the instruments are so arranged that each set is complete, and the drawers and trays are so planned that the instruments may be seen at once. The handles of the instruments are made of pressed buffalo horn, this substance being light and durable, and calculated to prevent their splitting or breaking.

The screw lithotrite, invented by the exhibitor.

The lithotrite, as used by Professor Fergusson, substituting the rack and pinion for the screw.

Invalid bed couch or bearer. When carefully placed on the bed by an attendant, it will enable the patient, with little assistance, to place himself in an easy position, as in a self-acting arm-chair. By means of a broad band placed underneath, he can be lifted out of bed and taken up or down stairs; and by a board sliding between the arms, it is rendered convenient for reading, writing, or refreshment.

Improved enema syringe, without valves or stop-cock.

Osteotome or rotary saw, for the excision of diseased or fractured bone.

Splint, with extending screw, for fractured leg or thigh.

Apparatus for contracted knee.

Support for the head in paralysis.

Jointed forceps for extracting foreign bodies from the throat.

Patent fleam, for bleeding horses or cattle, in which the depth of the lancet can be nicely regulated, and danger avoided.

The preceding articles are the inventions of the exhibitors.

Avery's lamp and reflector for examining the ear, throat, and different canals of the body. The peculiar features of this apparatus are, the employment of a lamp and mirror with an opening in the centre which enables the operator to look immediately upon the object: and the use of gazeine, in the lamp, which gives a more brilliant light than can be obtained either from oil or from a candle: to this is added the necessary tubes, specula, &c.

Avery's new instrument for facilitating the operation of lithotomy: by this instrument an operation is performed with certainty.

Bulley's splint for fracture of the thigh. The advantages of this splint are, that while extension is kept up by means of a screw at the foot, the long continued and injurious strain upon the knee is taken off by the use of a soft band passing above, and all excurvation of the thigh is prevented, by a short regulating splint passing within the long one.

Bulley's double tourniquet, for compressing the artery in aneurism. The advantages of this instrument are, the firmness with which it sets upon the limb, and the peculiarity of its form, adapting itself more completely to the form of the limb when compressed by the pads.

Dr. Jarvis's surgical adjuster, for reducing dislocations, adjusting fractures, and maintaining coaptation. By means of this instrument an extending and counter-extending force, equal to that of twelve men, may be employed; all or any part of which can be applied to the limb at pleasure, and yet the limb remains perfectly moveable and free for manipulation.

Rynd's instrument for applying fluid to the nerves in tic doloureux.

Wakley's stricture instruments. The great advantage of these instruments is, that where the required passage is once secured, it need not be surrendered until the proper end is gained.

Whitehouse's safety apparatus for transfusion. By means of this apparatus the operator is enabled to detect the presence of any globules of air in the fluid to be injected, and to prevent their entering the veins.

Yearsley's acoemeter, or instrument for ascertaining the different degrees of deafness, by a series of modulated sounds.

Yearsley's tympanotoire, and instruments for artificial tympanum. Instruments for the excision of the tonsils, nasal probe, bottle, and tube.

Dr. Tyler Smith's periodoscope.

An assortment of razors and table cutlery; among the latter are some table-knives made from the materials of old London bridge.

631B ELLIS, JOSEPH, 41 *Spring Street, Sheffield*—Manufacturer.

Amputating and post-mortem instruments.

Pocket instruments, and scalpels.

Lancets of various qualities.

Trusses of various kinds, for hernia.

---

633 HARNETT, WILLIAM, 4 *Francis Street, Brewer Street, Golden Square*—Manufacturer.

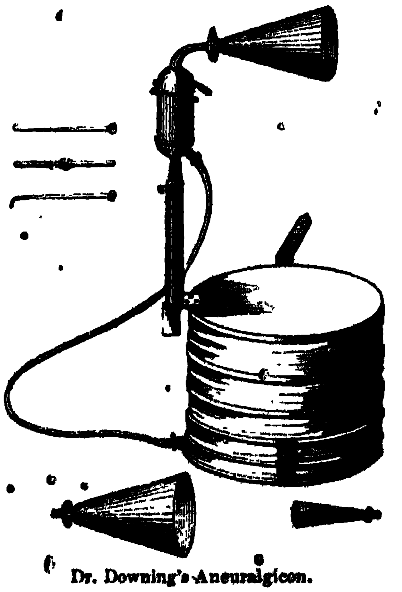
Dental instruments, mineral teeth, and materials used by dentists.

---

634 DOWNING, CHARLES TOOGOOD, M.D., 42 *Great Russell Street*—Inventor.

The aneuralgicon, an apparatus used for the application of warm medicated vapour, in the treatment of tic douloureux, and other neuralgic affections.

The aneuralgicon is extremely simple in construction, and consists, essentially, of three parts: a cylinder, for igniting the vegetable matter; bellows, for maintaining a current of air through the burning material; and tubes and cones for directing the stream of vapour.



Dr. Downing's Aneuralgicon.

The cylinder is a silver vessel of a cylindrical shape, about two inches in length, and one inch in diameter. It has a metallic plate at the lower part, perforated with many holes, on which the burning materials lie. Beneath this is an opening for the admission of air, and a socket into which an ivory handle is made to screw. The dome-shaped lid fitting accurately to the top of the vessel, allows the vapour to escape through an orifice and tube at the summit.

The bellows consist of two plates of mahogany, of an oval shape, and about eight or nine inches in length. These are joined together by thin leather, maintained in its proper position by ribs at suitable distances. A strong spring is fixed in the interior, to keep the plates apart, and react against the pressure of the hand. A socket to hold the ivory handle of the cylinder is fixed upon the upper plate. In order to apply the vapour the cones are attached to the cylinder. For different parts of the body cones of various sizes have been constructed. These are tubes shaped like extinguishers, covered with leather, and lined with sheet lead. By this arrangement they retain the shape given them by the hand.

[This apparatus consists of a receptacle for medicinal substances which are kindled, and an air bellows which impels a stream of air through the mass into a tube, by which it is directed upon the painful part. It has been said to give relief in the cases mentioned.—R. E.]

---

635 Pratt, Joseph, 10a *Charles Street, near Middlesex Hospital*—Manufacturer.

Scarificators. Cupping-glasses. Graduated cupping-glasses. Tea-pot spirit-lamp, used in cupping. Portable ball lamp or torch; and portable case of cupping instruments, for general practitioners, with extra sets of lancets.

636 Goddard, Lemuel, 6 *Crescent, Minories*—Importer.

Patent instrument, with shifting spring-jaws, for extracting teeth by means of a fulcrum and lever attached. The invention of Edward Bourne, of New Bedford, Mass.

---

639 Gordon, J., *Bristol*—Producer.

Anatomical figure.

640 Weedon, Thomas, 41 *Hart Street, Bloomsbury*—Manufacturer.

Surgeons' instruments and cutlery.

Various patterns of small knives, scissors, cutting and [illegible]

in the preparation of birds and animals previous to stuffing.

Specimens of tooth forceps, electro-plated and polished steel; also stoppers, scalers, and levers, in agate handles.

Specimens of cutlery, mounted in the Haliotis pearl shell, plain pearl, and agate handles.

641 Philp & Whicker, 67 *St. James's Street*—Manufacturers.

Cutlery and surgical instruments.

---

642 Simpson, Henry, 55 *Strand*—Manufacturer.

Regulation case of instruments, for a surgeon in the Royal Navy.

(Proposed) case of instruments for a surgeon in mercantile passenger ships.

Cases of amputating, trephining, cupping, operating, pocket, teeth, dissecting, post-mortem, eye instruments, &c.

Improved horse and cattle fleams, and various small cases of surgical instruments.

Various specimens of surgical instruments, viz., knives, splints, improved extension splints, stethoscopes, ear-trumpets, trusses, &c.; and fine cutlery, including cases of razors, knives, scissors, and patterns of London-made table-knives, &c.

---

643 Wood, W. R., *German Place, Brighton*—Manufacturer.

A series of mechanical adaptations for regulating and preventing the irregularities of the permanent teeth.

643a Evans & Co., 10 *Old Change*—Manufacturers.

Surgical instruments.

645 Gowing, Thos. Wm., *Camden Town*—Inventor.

Complete set of dental instruments for operations in treating diseases of the teeth of the horse.

Leg apparatus for fractures occurring to race-horses or other valuable animals.

Tracheotomy tube, with adjusting-shield and chain-director.

Neurotomy scissors and knife for dividing nerves.

---

646 Kidston, W., & Co., 18 *Bishopsgate Street Without*—Inventors and Manufacturers.

Mechanical leech, for the purpose of local bleeding, for the gums or any part of the body. It is always available; the mode of using is very simple, and any quantity of blood may be drawn, in much less time than by the natural leech, with diminished risk of erysipelas. It is also important for use on shipboard, and in many parts where the natural leech cannot be procured.

---

647 Evrard, Jean, *Charles Street, Middlesex Hospital.*

Adjusted tooth forceps.

Specimens of the manufacture of these instruments in the various stages.

Enamel cutters, used by dentists for scaling the teeth. Specimen intended to show the hardness of steel necessary for that operation.

Instruments for lithotripsy, with specimens of the various stages of manufacture.

Artificial nose and chin, made of gutta percha.

Sporting knife, fitted up with screws, so as to be taken more easily to pieces, for the purpose of cleaning.

New pattern of nail-nippers.

---

648 Hess, Richard, 16 *Little New Street, Shoe Lane*—Manufacturer.

The registered "Osteotom," a surgical instrument for cutting bones.

---

649 Barker, John, M.D., 45 *Mountjoy Street, Dublin*—Inventor.

Thoracitone, a new medical instrument, for the purpose of rendering more efficient and certain the act of percussion in disease: by using the instrument with one hand, transmitted sounds can be employed in the diagnosis of diseases.

---

651 Small, Thomas, *Boston, Lincolnshire*—Inventor.

Apparatus for restoring suspended animation in persons apparently dead. It consists of a box with a hole in the lid, and bellows. The body is placed in the box, the lid put on, the face exposed through the hole, the mouth kept open, and the India-rubber kept adjusted to the cheeks, forehead, and chin, so that no air can pass by the sides: the bellows are now worked gently upwards and downwards, just as fast as a healthy person breathes, till animation be restored.

The electro-magnetic apparatus, bottles containing restoratives, &c., can be kept fitted ready in the inside, near the feet, and the box may be mounted on wheels. It is peculiarly serviceable for the still-born.

---

652 Jones, P., *High Street, Fulham*—Inventor.

Improved metallic shield for the nipple.

---

653 Blackwell, William, 3 *Bedford Court, Covent Garden*—Inventor and Manufacturer.

Surgical apparatus for fractured clavicle, and apparatus for injuries of the lower extremities, &c.

---

654 Machell, Thomas, 2 *Carlisle Street, Soho*—Inventor.

Patent improved method of raising water and other fluids.

Surgical instruments.

655 Farquharson, James, *Ealing, near Brentford*—Inventor.

Spring stump for a wooden leg, which gradually receives the pressure of the wearer, gives assistance to the next step, and takes off the jerk and jarring usually experienced.

---

656 **JONES, THEODORE**, 28 *Lombard Street*—Inventor and Proprietor.

Registered silent alarum bedstead. The movement of the hand of a common watch will turn any one out of bed at any given hour when attached to this bedstead.

---

657 **BOTTOMLEY, GEORGE**, *Croydon, Surrey*—Inventor.

New splint for fractured thigh, with a leather belt for the chest, perineal band, boot and knee straps. The object of this apparatus is to apply and maintain firm extension, in a line parallel with the axis of the body, which can be exactly regulated by means of the thumb-screw at the end; also by keeping the limb uncovered (as by bandages, &c.) to permit the free use of local applications and adjustments.

Model of the same, upon a lay figure, showing the mode of application.

---

659 **WATKINS & HILL**, 5 *Charing Cross*—Manufacturers.

Three feet plate electrical machine, with all the recent improvements, having positive and negative conductors, on the plan suggested by Sir William Snow Harris.

Very sensitive and delicate galvanometer of the most approved form, for measuring the feeblest currents of voltaic electricity.

Electro-magnetic engine; microscopes; aerometric balance; sextants; rain-gauge; Polariscope; theodolite; levels; &c.

---

660 **COLES, WILLIAM**, 3 *Charing Cross*—Inventor, Patentee, and Manufacturer.

Patent trusses. An internal spring is fixed in the cushions or pads, at every point of bearing.

Medicated band, for the relief of sciatica, lumbago, rheumatism, &c.

---

661 **RENEZYNSKI**, Capt. G. A., *Stirling, Scotland*—Inventor.

Portable telescope stand, with desk for artists, engineers, land surveyors, &c., with various useful improvements and apparatus.

---

663 **SIMONS, WILLIAM VAZIE**, *South Shields*—Designer and Manufacturer.

Electro-magnetic machine, with an improved arrangement of the primary coil and contact breakers, &c.

---

664 **WARD, N. B.**, 14 *Clapham Rise*—Inventor.

Closed cases, by which plants may be grown in any locality, even in the centre of the most crowded cities, or conveyed from one country to another with complete success.

A bottle, in which the experiments accidentally originated in 1829. There are now in this bottle one or two ferns which have not received any fresh water for more than seventeen years. Several seedling ferns may be observed springing up in various places.

Improved travelling case, as at present used by Loddiges.

A case with two palms, phœnix dactylifera and rhapis flabelliformis, planted in it fifteen years ago. The other plants are of recent introduction. This case has always stood in a room with a southern aspect.

A case containing hymenophyllum and other ferns, which have been enclosed between two and three years, has always been placed in a room with a northern exposure.

Irish case, likewise containing ferns planted in 1846, and placed in a shady position in the open air. The bottom of this case is filled with inverted empty garden pots to insure efficient drainage.

Case with two larger roses, which have been enclosed for eight years, five of which were in London. The case has always been in the open air, fully exposed to the south, and the roses have flowered during three or four months in every year. It remains to be seen whether, in the Exhibition Building, they will flower as well, under the adverse conditions of increased heat during the night, and diminished amount of solar light in the day.

New terra-cotta case, manufactured by Mr. Dralton; all the ferns recently planted.

Fern case, lent by E. W. Cooke, Esq., Kensington. When Mr. Cooke first planted this case, in 1848, he found that the ferns planted on the top of his conical mass of stone suffered from want of sufficient nourishment. In remedying this deficiency, the ferns in the lower part of the case suffered from redundance of wet, and some perished. To obviate this, and to ensure a more equal distribution of moisture, Mr. Cooke removed the upper stones to about ⅓ from the case, and inserted a small zinc dish, one inch deep. The stones were then replaced, some resting in the dish, and others packed around it, so as effectually to conceal it from observation. Whenever the plants required water, the dish became full, and thus the stones at the apex were kept as moist as those below.

Fern-case, likewise the property of E. W. Cooke, Esq.

Case, containing cactuses, enclosed in 1848, the property of Mr. Deane, Clapham Common.

The use of these cases was first suggested to the inventor in the summer of 1829. For many years previous he had endeavoured, by a most careful imitation of their natural conditions, to grow various plants, particularly ferns and mosses, at the back of his house in Wellclose Square, a locality surrounded by numerous manufactories, and constantly enveloped in their smoke. Vain was the attempt; the plants perished. New light and fresh impetus were given by the following incident.

Wishing to obtain a perfect specimen of a sphinx, he had buried its chrysalis in some moist mould in a bottle covered with a lid. Two or three days before the insect assumed its perfect form, a seedling fern and a grass made their appearance on the surface of the mould. In this condition all their wants were supplied. They had sufficient light; whilst the lid, at the same time that it excluded the noxious soot, prevented the escape of the moisture. The law which enforces the diffusion of gases secured a constant circulation of the air, and its quiescent state enabled the plants to bear variations of temperature, which in open exposure would have proved injurious. Various experiments carried on with hundreds of plants, and extending over several years, established the conclusion, which has been fully carried out by the results,—that all plants whose natural conditions can be fulfilled, can be grown in these cases in any locality, even in the centre of the most crowded cities, or conveyed from one country to another with complete success. The importance of duly and properly supplying the wants of the plants cannot be too strongly impressed upon the mind of the experimenter, so numerous have been the failures arising from want of thought or of knowledge in the attempts to associate plants of different habits. Many plants require very little light, but need constant moisture and a pure atmosphere, such as the *Trichomanes speciosum* and *Oxalis acetosella*. Others require a large amount of solar light to bring them to perfection.

In June, 1833, the first experimental cases were filled with plants, furnished by Messrs. Loddiges, and sent to Sydney under the care of Capt. Mallard. Placed on the deck of his ship, fostered with a genial atmosphere, fed with proper food, and protected alike from the noxious effects of salt spray and dust, they arrived in perfect health at Sydney, in January 1834. The cases were refilled at Sydney in February, the thermometer then being between 90° and 100° Fahr.; and in their passage to England encountered very varying temperatures. The thermometer fell to 20° in rounding Cape Horn, and the decks were a foot deep in snow. At Rio Janeiro, the temperature rose to 100°, and in crossing the line to 120°. In November, after an eight months' voyage, they arrived in the British Channel, the thermometer having fallen to 40°. The plants were in the most vigorous condition, and the beautiful appearance of the fronds of *Gleichenia microphylla*, then, for the first time, seen alive in Europe, created great surprise. Since 1834, the use of these cases in the transportation of plants has become universal. Col. Reid, whilst governor of Bermuda, made use of them in procuring plants to stock the Bermuda Islands. These were made light enough for two sailors to carry by hand. Double addresses were painted on the boxes, and they were perpetually travelling by sea between different countries, by which their vegetable productions were exchanged.

Mr. Fortune, who was sent out to China with glazed cases by the Horticultural Society, comparing the old and new methods of conveying plants, says that, "in a paper communicated by Mr. Livingstone, of Macao, and published in the Transactions of the Horticultural Society, vol. iii., it is stated, that then only one plant in a thousand survived the voyage from China to England." Mr. Fortune put 250 plants into the cases, and landed 215 in good condition.

The same principle is applicable to the animal kingdom —even to man. For several years gold and silver-fish have been the constant inhabitants of the inventor's fern house, and during his residence in Wellclose Square, they lived and flourished in an earthern vessel, containing about 20 gallons of water, which was never changed, but kept sweet by the aquatic plants growing in it. A robin was likewise an inmate for six months. The same pure and properly-moistened atmosphere which favoured the growth of the most delicate plants in the heart of the most crowded cities would be of incalculable advantage in numerous diseases. (*North Transept.*)

664A **COOKE, E. W.**, *The Ferns, Victoria Road, Kensington.*

Several closed cases for ferns, exotic and British.

665 **BRYSON & SONS**, *Edinburgh*—Inventors and Manufacturers.

Five models, exhibiting the various escapements of watches at present in general use, and a self-registering barometer clock.

666 **ROSS, ANDREW**, 2 *Featherstone Buildings*—Agent.

Bleeding instruments, as substitutes for leeches and cupping instruments, adapted to apply to any part of the body. Invented by Baron Heurteloup; manufactured by J. Scholl, Berwick-street, Soho.

The cutting instrument, consisting of a circular cutter made to revolve by a pulley and cords, makes a slight circular incision of equal depth. The pump, or sucker, is a glass tube, with a piston of cork or felt, worked by a screw, while the effect is observed through the glass. Larger pumps are made to cover three or more small incisions. The glass tubes have metallic ends, of various forms, to apply to different parts of the body, which, in the larger ones, serve as a diaphragm to prevent the skin being drawn into the tube. This invention is perfectly new, and is patented.

667 **TOPPING, C. M.**, 4 *New Winchester Street, Pentonville Hill*—Preparer.

Microscopic objects. Test objects and fossil earths. Fossil and recent vegetable structures. Dissections of insects. Bone, teeth, shell, &c. Injected preparations.

668 **DURHAM, J. D.**, 16 *Linton Street, New North Road, Islington*—Inventor.

Hydrometer, with all the recent improvements, with spirit tube. Thermometer, and book of instructions.

670 **OWEN, H.**, 3 *Somerset Terrace, Bristol*—Producer.

Series of views in Somerset, Wilts, and Devon, by the calotype process, from negatives on paper.

670A **EVANS, SPARKE**, *Hungerford, Berks*—Inventor.

Self-acting instrument, for easily determining the strength of oak bark, valonia, cutch, divi divi, and other tanning materials.

Instrument for determining the heat of newly-made hay-ricks; and when ventilation, or turning over, to prevent firing, are required.

671 **PARKES, JAMES, & SON**, 5 *St. Mary's Row, Birmingham*—Manufacturers.

Rosewood case of mathematical drawing instruments, containing beam compasses, proportional divider, triangular compasses; a set of fine steel spring bows with needle points; full set of 6-inch double jointed instruments, the compasses and bows having improved screw needle points; also tube compasses, pillar compasses with bars, and Napier compasses, each of which combines in itself a complete set of drawing instruments.

Set of 6-inch drawing instruments, electro-plated on German silver, with solid silver cheeks, in rosewood case.

Russia case, of 3½ inch drawing instruments, with very fine spring bows.

Case of new portable drawing instruments, electro-plated on German silver.

Architect's companion—a complete set of portable instruments, in small morocco pocket-book, with silver pencil and gold pen.

Botanist's companion—a double lens microscope, with tweezers, dissecting needle, fine scissors, &c., in neat morocco pocket-book.

Ivory 2-foot slide rule, with spirit level and graduated scale, for taking angles.—Registered.

Self-acting tapes, with improved spring tops, &c.

Surveyor's measure, with multiplying action, by which a hundred turns of the hand are saved, each time th tape is wound up. Invented by J. Parkes.

Assortment of pocket compasses.

Portable sun-dial and pocket compass combined.

Portable compass, with thermometer, in morocco case

A portable galvanic battery, for medical purposes capable of very sustained action.

Gilt watch-keys; and in various states of finish, illustrating the progressive stages of their manufacture.

Watch-keys and seals, containing mariners' compasses.

[Mathematical drawing instruments are used in drawing circles, circular lines, parallel lines, &c. Bow-compasses are of great use in spherical projections, in drawing fine circles. Proportional dividers are of value in dividing circles into any number of sides, or to inscrib polygons in circles, and to reduce and augment figures i a given proportion.—J. G.]

671A **WEBSTER, W. BULLOCK**, 2 *St. James's Place, Hampstead Road*—Inventor and Manufacturer.

Fire escape. Percussion carbine musket, with rotar primer. Omnibus passenger register. A mileometer Small weighing machine. Cannon, with improved percussion-lock.

672 **TAYLOR, T.**, *Dublin*—Inventor.

Hydraulic safety-lamp, to prevent explosion in coal mines: water being used to prevent its becoming heated and mica to give an increase of light.

Revolving self-amalgamating galvanic battery. The zin plate dips into a mercurial trough; motive power is applied to the zinc plate; the gutta-percha shaving i placed between the plates to prevent a superfluous amalgamation on the zinc plate, and also local action.

672A **NEWCOMB, THOMAS**, 17 *Norfolk Place, East Lane, Walworth*—Inventor and Maker.

Brass model of machine, for rolling tanned hides. It objects are, increased speed in drying hides, less powe in working, and a finer finish in the leather. The pressure on the hides may be varied from one cwt. to tw tons.

Brass model of patent furnace for marine or stationary steam engines; it supplies itself with fuel, consumes its own smoke, and burns small coal.

Improved bass strings for pianofortes—the body an covering of the same material, viz., hard-drawn stee wire, which produces a finer tone than either copper c

Lamps, intended to burn common pale seal oil, without smell, smoke, or shadow.

673 **MACFARLANE, G.,** 85 *Newman Street*—Designer.

Improved cornopean (cornet à piston), with short action valves, direct passage of the air, and can be played with ease.

673A **BURSILL, G. H.,** 9 *York Terrace, Hornsey Road, Holloway*—Inventor.

Patent compensating cistern barometer; the mercury, by a self-acting contrivance, is always preserved upon a level within the cistern, notwithstanding any alteration of temperature, or any rise or fall of the barometrical column.

Artificial hand, possessing elastic properties; which enable those who require it to pick up, seize, and even make use of minute objects. Invented by Sir G. Cayley, Bart.; improved and manufactured by Mr. James Buckingham, 13 Judd Place East.

674 **NEWMAN, J.,** 122 *Regent Street*—Inventor and Manufacturer.

Standard barometer. The frame consists entirely of metal; the cistern, when required for long journeys, is all of iron, so arranged as to be made portable for travelling, by the lower part shifting a quarter of a turn; thus obviating the objection so long made to the wood cistern and leather bag. The scale is marked off from an authentic standard scale (verified by the late Mr. Baily), and terminates in a point; it is capable of being adjusted with great accuracy to the surface of the mercury in the cistern, and when the vernier at the upper part of the scale is adjusted to the surface in the tube, the exact length of the column of mercury is in this way measured; the diameter of the tube is 0·6.

Portable mountain barometer; consists of a metal frame, with the iron cistern similar to the standard barometer, and has all the data marked on it for the corrections, for reducing the observations to those of the standard barometer.

Standard thermometer, divided to fifths of a degree.

Maximum and minimum register thermometers.

Maximum thermometer, with black bulb for solar radiation.

Minimum thermometer in the focus of a mirror, for terrestrial radiation.

Daniell's dew-point hygrometer.

Mason's wet and dry bulb hygrometer.

Lind's wind gauge.

The foregoing meteorological instruments are described by the Committee of Physics and Meteorology, in their Report published by the Royal Society, and made by the exhibitor for the various magnetic observatories.

Usual copper rain gauge, with accurately turned circle 12 inches diameter.

Howard's rain gauge and evaporator.

Sykes' thermometer and boiler, for measuring heights by the boiling point.

Miners' safety-lamp, as made for Sir H. Davy.

Miners' safety-lamp, as improved by the exhibitor.

Improved air-pump with metallic valves, and ground glass plate, which exhausts to within $\frac{1}{20}$th of the Torricellian vacuum.

Rain and wind gauge, contrived to register the quantity of rain and direction of the wind, at the precise time, on a cylinder which has motion given to it by a clock; the register paper is replaced at the end of each month.

Self-registering tide-gauge; consists of a cylinder, moved by means of a clock 1 inch to the hour, and a pencil moved by the float 1 inch to the foot. The pencil, by being attached to a chain carried over two small brass cylinders, the one containing a spring, is so contrived that there is no loss of time in marking the change of the tide; so that the exact moment of the commencement of its rise or fall is registered, and its progress for every portion of time, from the highest to the lowest point, is traced on the paper. The paper for this instrument was laid down by the Admiralty, and is used with metallic pencils. On the face of the clock is shown the height of the tide during observation, and it also registers the highest and lowest for the day.

674A **STEPHENSON, R.,** *Great George Street, Westminster*—Inventor.

Machine for tracing.

675 **NEWSON, HENRY,** 18 *Percy Street, Tottenham Court Road*—Inventor.

Patent wire trusses, single and double, the latter passing round one hip only.

675A **OAKEY, H.,** 81 *Dean Street, Soho*—Inventor.

New musical atlas, a work on the theory of music, which consists of a series of moveable diagrams, by the aid of which all the intervals, scales, chords (nearly 700 in number), inversions, &c., are brought to view; and the difficult problems in the science may be solved instantaneously by musical amateurs at any period of their studies.

Guide to harmony, and treatise on the musical atlas.

676 **BIGG, H., & SON,** 29 *Leicester Sq.*, and 9 *St. Thomas's Street, Southwark*—Manufacturers, Inventors, & Proprietors.

Patent artificial leg, constructed without metallic or external springs; colour, that of the natural limb; surface, admitting of ordinary soap and water washing.

Artificial hand with jointed fingers, and apparatus for enabling the wearer to use it as a natural hand.

Spinal supports, for lateral posterior curvature, and anterior curvature; and for vertebral and muscular weakness.

Self-acting spring crutches.

Instruments for fixed contraction of the knee (*anchylosis*); fractured patella; clubbed feet, (*talipes valgus et varus*); and contracted heel (*talipes equinus*).

Trusses:—P. Aston Key's, with pad, whose surface is continually changing; L'Estrange's patent for radical cure of hernia: Bigg & Son's convolute; and for umbilical hernia.

Instrument for support of prolapsus ani.

Aneurism needle; hernia knife; embryotomist; and explorator, invented by the exhibitors.

676A **BROWN, DAVID STEPHENS,** *Alexandria Lodge, Old Kent Road*—Inventor.

Registered barometer, 39 feet high, range of scale 27 feet, manufactured by Casello and Co., 23 Hatton Garden.

677 **READHOUSE, CHARLOTTE,** *Newark-on-Trent*—Designer and Producer.

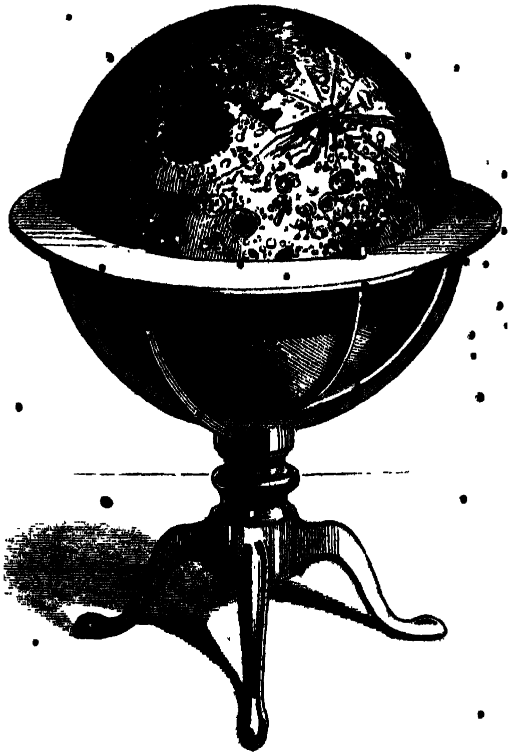
Lunar globe: a model of the moon, giving a general idea of the relative position of the mountains, valleys, and plains of our satellite, in relief.

[The distinctive structural peculiarities of the lunar regions are,—1st. A vast distribution of annular mountains, thrown up like ramparts round plains or valleys, having rugged ridges, and a conical hill rising out from the centre of many of them. Sir John Herschel, who computes the height of the highest of these mountains, at $1\frac{3}{4}$ English miles (though Scroëter gives 5 miles as his calculation), testifies that they offer, in its highest perfection, the true volcanic character, and, speaking from his own observation, says that, "in some of the principal ones, decisive marks of volcanic stratification, arising from successive deposits of ejected matter, may be clearly traced with powerful telescopes."

2. Extensive plains, having the appearance of alluvial soil—relieved, however, with a number of crater-formed mountains (Copernicus, Kepler, Aristarchus, &c.), and small rocky eminences, with here and there circular cavities of various dimensions. These "large regions" (to use Herschel's term) are scattered over with fragments of rock, ashes, &c. They are given in neutral tint on the model.

3. Hundreds of cup-shaped valleys dimpling the general surface in every direction, and giving the idea of a contraction or settling down of the exterior on the receding

interior, according to a theory proposed by Mr. Nasmyth at the last meeting of the "British Association."



Readhouse's Lunar Globe.

The model illustrates the more reflective localities of the moon in dull gold bronze, displaying a number of bright rays, which seem to spread over a large section of the southern regions of the hemisphere, and diverging from a common centre (Tycho).]

677A **SHADBOLT, G.**, 2 *Lime Street Square*—Inventor.

Sphæro-annular condenser, for condensing light in a peculiar manner, on transparent objects while under examination by the microscope. Diagrams and description, illustrative of the action and construction of the condenser.

---

678 **JACK, W.**, 38 *Devonshire Street, Portland Place*, and 14 *Ratcliff Row, St. Luke's*—Manufacturer.

Mr. Clendon's new form of tooth-forceps and elevators. Improved adjusted forceps. Forceps for irregular front teeth. Forceps for roots of teeth. New stopping instrument, invented by the exhibitor.

678A **MORTON, Professor**, *Royal Veterinary College, Camden Town*—Inventor.

Medicated cotton for setons.

Galvano-arsenical apparatus.

679 **BELL, THOMAS**, 19 *Homer Street*—Inventor.

Watches, to go for one or three years, keep correct time, and show the day of the month; some are furnished with centre and others with ordinary seconds and quarter seconds; maintaining power whilst winding; duplex and other escapement; and composition balances.

Time-pieces and clocks, on the same construction.

A turret clock, to strike the hours and quarters; with best gun metal wheels and bosses, or holes; tempered and polished steel pinions of high numbers; dead-beat escapement, with adjusting palletts; tempered steel escape wheel, and tempered steel racks, snails, and hammer tails to the striking work; and improved pendulum, with adjustment of the same.

Interior hour, minute, and seconds hands, and dials for regulating and setting the hands upon clock faces, by patent metal links instead of cords, to suspend weights.

Balanced hands, &c.

679A **BETTLE, PHILIP**, 11 *Regent Street, City Road*—Maker or Producer.

Model of a steam-engine, of new design and workmanship. It is worked by machinery contained in the

680 **OFFORD, D.**, *Great Yarmouth*—Inventor.

The improved truss for hernia.

Improved instruments for the treatment of uterine

681 **RICKMAN, WILLIAM CHARLES**, 21 *Park Side, Hyde Park Corner*, and *Pole Hore, Wexford*—Inventor and Designer.

Road level: two varieties of an instrument for use in agriculture, drainage, and other purposes. This instrument enables a person unacquainted with the practice of levelling, and without calculation, or the aid of an assistant, to know the level of the ground, and also its rise or its fall. Only one observation is necessary, and the result is then found stated upon the dial. J. Peirce, maker, Wexford.

681A **SOMALVICO & CO.**, *Hatton Garden*—Manufacturers.

Wheel barometer; ornamental gilt frame, improved porcelain plates.

Barometer in papier maché inlaid with pearl; ebony cases.

Standard pediment barometer, with extra large tube, and improved glass cistern showing the rising and falling of the mercury in the tube.

Improved mariner's barometer; combined marine tube, siphon tube, and hygrometer, to indicate the changes quicker than the ordinary marine barometer; making a complete and sensitive instrument for ascertaining the variations of the atmosphere correctly.

New siphon pedestal, or pocket barometer, 8 inches long.

Improved engineer's guide gauges, combined with barometer for correction.

Vacuum steam-pressure gauge, on a new principle: a great improvement on the former; prevents the water mixing with the mercury.

Steam-engine indicator: for showing the working quality of the exhibitors' patent brewers' liquid prover; requires no tables. Engines, walking-stick telescopes, with compass and hygrometer, and with double eye-glasses to spring out of the stick.

Improved sextant, with patent universal lunar lamp; which may be set to any angle, the observer being able to read off the sextant during rough weather or at night.

Solid limb sextant.

Model representing the circulation of the blood.

Improved self-generating coffee-pot, and for producing hot water in a few minutes, with an extinguisher which puts out the flame of the lighted spirit at any moment required; and portable cistern for travelling.

Case of mathematical instruments, &c.

---

682 **COXETER, JAMES**, 23 *Grafton Street East*—Manufacturer.

Aneurism needle, for facilitating the tying of deep-seated vessels. Scissors guillotine, for removing the tonsils. Scissors for excising the uvula. Artificial leech without piston or spring. A compound needle for injecting small cysts, designed by John Marshall, Esq., assistant-surgeon to University College Hospital. Forceps, for applying ligatures to arteries. A forceps so constructed that the ligature might be readily slipped over the points on to the vessel, originally designed by James Luke, Esq., improved by the exhibitor by adding Liston's spring catch and tenaculum teeth, and cutting out the head, so as to leave only, as it were, four fine wires for the ligature to slide over. This enables the operator to take up a deep-seated vessel, and tie it without assistance, in cases of emergency.

A new description of India-rubber air-pad trusses. India-rubber dilator, for stricture of the rectum. These instruments are introduced uninflated, by means of a concealed flexible stilette, and when in the stricture, are filled with air; thus the parts are dilated without the pain produced by the usual method. As soon as the dilatation is accomplished, the air is allowed to escape, and the dilator is then easily withdrawn.

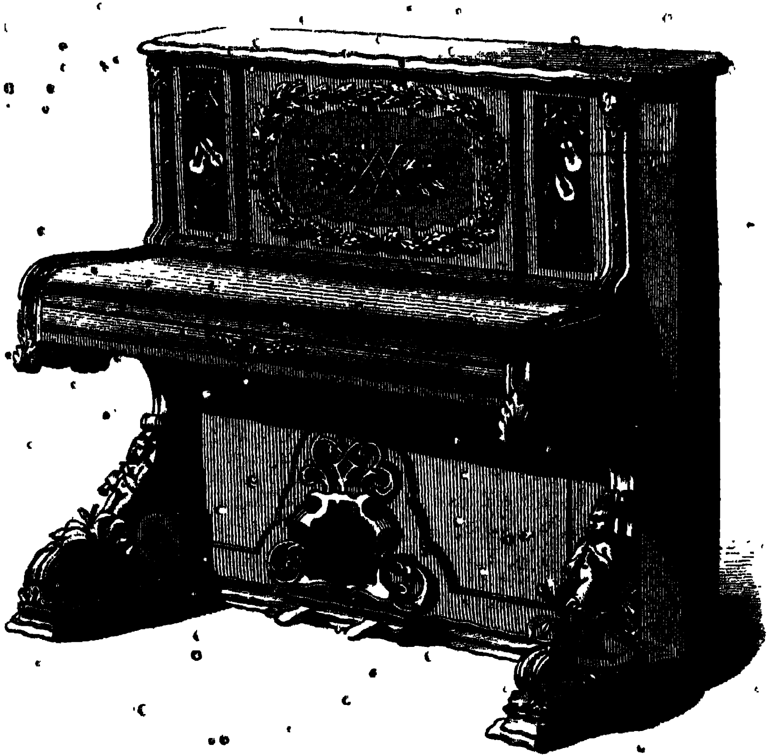
Tubes for stomach pumps and enema syringes. The ordinary tubes (however carefully made) when taken to a warm climate, soon become melted on the surface, and utterly useless. The exhibitor claims the merit of introducing and applying vulcanised India-rubber, having a metal head firmly fixed, as a tube that will bear the heat of any climate, and which will be less liable to receive injury by coming in contact with the teeth. Double action enema syringe. This instrument secures a well supported, continuous stream, is simple in its construction, and does not occupy more space than the syringe in common use.

The stethometer. An instrument for assisting in the diagnosis of diseases of the lungs, by measuring the comparative mobility of opposite sides of the chest, by Dr. Quain, Assistant-Physician to the Hospital for Consumption. Various other useful and important instruments.

---

683 **OETZMANN & PLUMB**, 56 *Great Russell Street, Bloomsbury*—Inventors and Manufacturers.

Cottage and cabinet pianofortes, with newly-invented tubular supporters, patent double repeating check action, and other improvements. This pianoforte is represented in the annexed cut.



Oetzmann and Plumb's Pianoforte.

683A **MUDIE, DAVID** (of the Firm of **GOURLAY, MUDIE, & CO.**), *Dundee, Scotland*—Proprietor & Manufacturer.

A salinometer. This instrument is represented in the following cut (next page).

The apparatus is placed outside the boiler, a pipe from which, A, communicates with the branch on the brine-receiver, B, which is cast in brass, with a solid closed bottom, but open at the top, to receive a slightly convex lid, which is bolted upon it. In this receiver is contained the hollow salinometer float, C, which is also of cast brass, with a solid top, the bottom being fitted in and made tight by a separate disc screwed on. In the centre of the top and bottom of the float are light vertical rods, the ends of which carry the disc piston-valves, D, D, fitted to work accurately in the upper and lower cylinders, E, E, like pistons. The upper cylinder is cast in one piece with the cover of the brine-receiver, into which it opens, to receive the upper piston-valve of the float. The lower cylinder is screwed into the centre of the bottom of the receiver, on which there is a short collar formed to receive it. It projects for a short distance into the receiver, and forms a rest for the float, when the latter is in its lowest position, as shown in the cut. Both cylinders have a series of ports, F, disposed in a ring near the upper ends of each; and it is by these ports that the brine escapes when the valves are open, passing along in the direction of the arrows, by the upper and lower copper branch pipes, G, G. to the main discharge pipe, H. A small spindle, I, passes up from the upper valve, to carry the adjusting weights, as well as to act as the salinometer index, by projecting into a glass index tube, L, carried upon the top of the small chest, which is screwed on to, and covers, the upper cylinder, M.

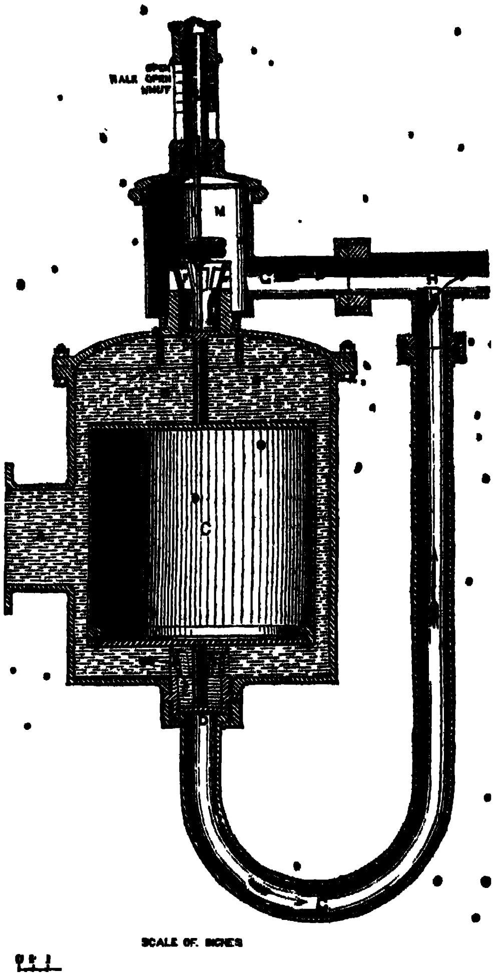
---

684 **HARNETT, JOHN**, 45 *Museum Street, Bloomsbury*—Manufacturer.

Instruments and materials used by dentists.
Specimens of mineral teeth.
Natural specimens showing the growth of the teeth.

684A **MACPHERSON, DANIEL**, 7 *Salisbury Street, Edinburgh*—Inventor and Manufacturer.

A weighing-machine, to be used in the same way as the common balance, the levers on either side of the fulcrum being of equal lengths.



Mudie's Salinometer.

685 **COOK & WILLIAMS**, 10 *Princes Street, Hanover Square*—Inventors and Manufacturers.

Respiratory organ and chest protectors. Registered.

No. 1. For ladies.—Can be raised or lowered at pleasure. In the former case, adjusting itself by an elastic hold over the mouth and nose as required; and in the latter case, assuming the form of a neck-ruff. It is fastened by ribbons drawn from behind and tied in a bow in front.

No. 1. For gentlemen.—Is of a stock configuration and adjustment, and is put on over the ordinary cravat, unless made to answer the double purpose of in and out of door wear.

No. 2. For gentlemen. Is of simpler and lighter construction, but effecting a similar purpose. A curtain, shaped to the configuration of the parts covered, is sustained over and to the mouth and nose as required, by an elastic cord, which passes over the head, resting upon the ears.

No. 3. For clergymen.

These instruments are useful in severe weather, or under sudden transitions of temperature, as affording comfort and protection against colds, and affections of the throat and lungs; enabling those suffering from these affections, or from tooth-ache, to take out-of-door exercise without injury from atmospheric influences, and with certain benefits of convenience and health.

686 **MARSHALL & COMPANY**, 4 *Park Side, Hyde Park Corner*—Inventors and Manufacturers.

"Corset a tous ressorts." An invisible sling for paralysis of leg and foot, with belt. An invention of improved means of supporting and sustaining various parts of the human body.

687 **WHITE, JOHN**, 228 *Piccadilly*—Manufacturer.

Trusses and lacing stockings with moc-main patent lever truss.

687A **GALL, JAMES**, *Myrtle Bank, Edinburgh*—Inventor.

Gall's triangular alphabet for the blind, which, by its similarity to the common Roman alphabet, is easily read by the eye, and may be taught without previous instruction. This alphabet is considered as an improvement on circular alphabets, by its angular form; the letters are rendered more distinct to the touch; and by the exclusion of the capitals, the attention of the blind is concentrated upon 26, instead of 52 letters, and the size of the printing may be reduced.

Volume, containing the Epistle to the Ephesians, printed for the blind, in Gall's triangular alphabet, with the letters serrated.

Gall's apparatus for writing by and to the blind. The blind can, by this invention, readily correspond by post, and can keep books and other memoranda. The apparatus consists of a stuffed frame on which the paper is placed; of a cover with bars to guide the lines, which are written from the bottom upwards; and of small stamps, with the letters formed of common pins, which are pricked through the paper and read on the opposite side. By means of the two register points on each side of the frame, and by shifting the cover one half line up, the paper is written on both sides, each perfectly legible either by the fingers or the eye.

688 **NASMYTH, J.**, *Manchester*—Inventor.

Map of the moon: exhibiting the relative positions and character of the most striking features of its surface, as they appear when seen under the most favourable circumstances in respect to light and shade, with drawings from nature of certain portions of the lunar surface, as seen by the aid of a very powerful telescope.

[The number and magnitude of crater-formed mountains with which every portion of the moon's surface appears to be covered, seems to lead to the conclusion that these are really the craters of extinct lunar volcanoes; the frequent occurrence of the central cone being considered as the result of the last eruptive efforts of an expiring volcano, a feature of volcanic craters on the earth's surface. This central cone has been shown to exist in the majority of the lunar craters; and the conclusion consequently appears probable that they are the result of the same kind of action which has produced them on the volcanoes of the earth.

The cause of the vast numbers of such volcanic mountains with which the lunar surface is covered, has been assigned by some to the rapid consolidation and contraction of the crust of the moon; whose mass, or bulk being only 1-64th of that of the earth, while its surface is the 1-16th, has, in consequence of these proportions, a radiating or heat-dispersing surface four times greater than that of the earth in relation to its bulk. From this consideration it has been suggested by the exhibitor that, by the rapid cooling and collapse of the crust of the moon on its molten interior, the fluid matter under the solid crust has been by this action forced to find an escape through the superincumbent solid crust, and come forth in those vast volcanic actions which in some remote period of time have covered its surface with the myriads of craters and volcanic features that give to its surface its remarkable character.

The vast magnitude of the lunar craters, it has also been suggested, are due to this rapid collapse of the moon's crust on its molten interior,—the action as regards the wide dispersion of the ejected matter being enhanced by the lightness of the erupted matter, seeing that the force of gravity which gives the quality of weight to matter on the moon, as on the earth, is less on the surface of the moon than on the earth—so that the collapse action had to operate on a very light material.

The causes of those vast ranges of mountains seen on the moon's surface has been suggested to be produced by the continued progress of the collapse action of the solid crust of the moon crushing down or following the contracting molten interior, which, by the gradual dispersion of its heat, would retreat from contact with the interior of the solid crust, and permit the crust to crush down and so force a portion of the original surface out of the way, and in consequence of this action, cause such to assume the form and arrangement of mountain ranges. In illustration of this important action, the familiar case of the wrinkling of the surface of an apple, by reason of the contraction of the interior and the inability of the surface to accommodate itself to the change otherwise, has been adduced.

The origin or cause of those bright lines which radiate from certain volcanic centres on the moon's surface (Tycho, for instance) has been illustrated by the experiment of causing the surface of a globe of glass filled with water to collapse on the fluid interior, by rapidly contracting the surface while the water had no means of escape. The result was the splitting or cracking up of the surface of the globe in a multitude of radiating cracks, which bear the most remarkable similarity to those on the moon. This subject is also illustrated by reference to the manner in which the surface of a frozen pond may be made to crack by pressure from underneath—so yielding radiating cracks from the centre of divergence where the chief discharge of water will take place, while simultaneously all along the lines of radiating cracks the water will make its appearance:—thus explaining how it is that the molten material, which had in like manner been under the surface of the moon during that period of its history, appears to have come forth simultaneously through the cracks, and appeared on the surface as basaltic or igneous overflow, irrespective of surface inequalities.]

689 **Oxley, W.,** *Manchester*—Manufacturer.

Smith's patent steam indicator and water indicator.

689A **Dunn, T.** *Edinburgh*—Inventor.

Electro-magnetic machine.

690 **Gobe, G.,** 31 *New St. Birmingham*—Inventor.

Medical galvanic apparatus.

691 **Hughes, J.,** *Queen St., Ratcliffe*—Manufacturer.

Compass.

693 **Pemcal, H.,** jun—Inventor.

Lunarian.

696 **Loot, —,** Manufacturer.

A galvanometer, with the names Brett and Little, patentees, engraved on the dial.

697 **Walker, John,** 48 *Princes Street, Leicester Square*—Manufacturer.

Drawing-room clock, from a design by Mr. C. Grant; with subjects in panels embossed by Mr. G. Abbott. The case of the clock, which is electrotyped, consists of a base and a pedestal of turquoise blue glass, surmounted by figures indicating the progress made in the civilisation of this island. This is illustrated by seven subjects revolving at the base: the savage life of ancient Britons—the Roman governor introducing agriculture—the encouragement given to Flemish weavers to settle in the island—introduction of printing by Caxton—the improvement of the steam-engine by James Watt—the opening of the first railway at Liverpool—and the movement which led to the Great Exhibition. The clock shows the hours and minutes on an open dial, supported by appropriate figures. The signs of the zodiac are made to represent the months, and seven subjects, embossed in silver, facsimiles of those in the pedestal, have been grouped so as to be seen at one view. The accompanying plate represents this clock.

698 **Trotman, S.,** *Notting Hill*—Inventor.

Night clock. A lamp is suspended upon a lever, the light from which is thrown upon each hour as it arrives.

700 **Vulliamy, B. L.,** 68 *Pall Mall*—Inventor.

Model of a peculiar method of suspending the pendulum of a large turret clock.

Model of a method not generally known of suspending a pendulum. Supposed to have been only twice reduced to practice; firstly, in the case of a clock the property of Her Majesty, and now at Osborne; secondly, in the great clock at the Post Office. The suspension of a pendulum upon the bases of four isosceles triangles is probably the best denomination for this method of suspension.

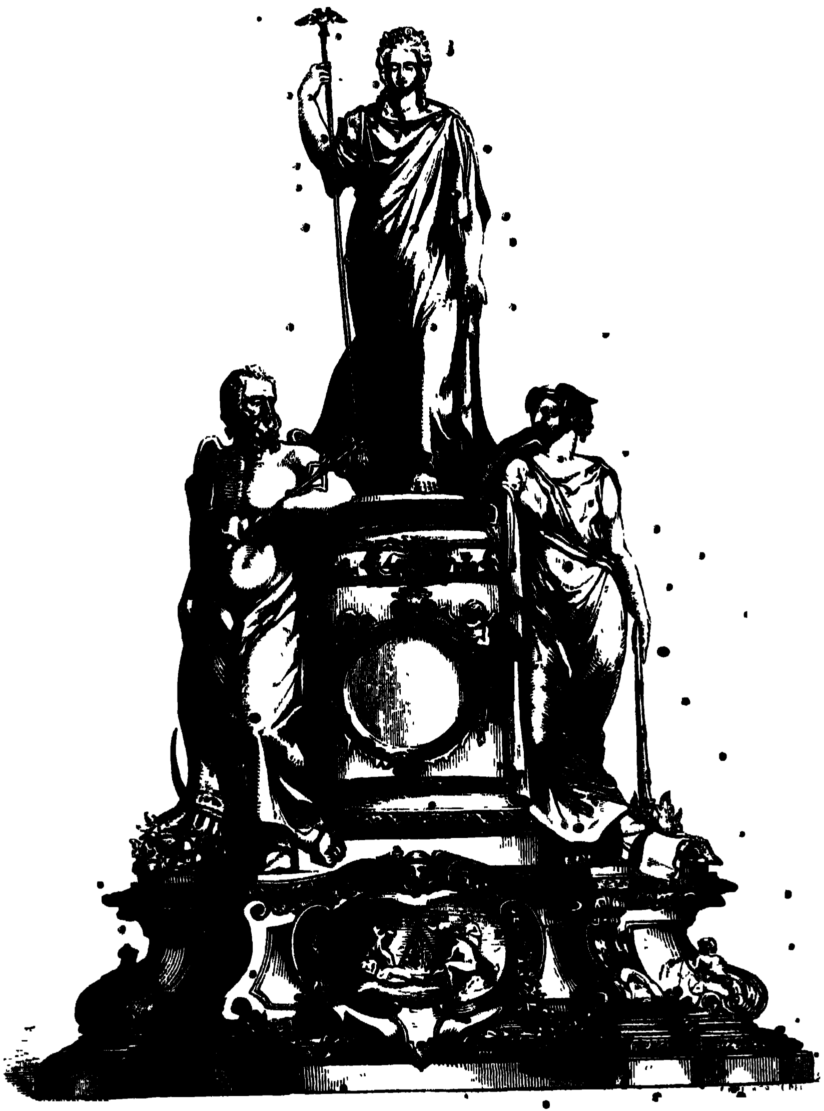
This model is made to a scale of six inches to a foot. It was proposed in this clock to employ a two-seconds pendulum, which is preferable to any other for a large clock. In the model, the length of the pendulum is regulated by the height of the stand from the floor.

The principal pieces forming this suspension are the following:—A base upon which the support rests; four supports connected together two and two; eight steel and the beam to which the pendulum is attached.

As the following description must necessarily be very brief, an attempt is made, first, to describe the construction, and then to point out a few of its advantages.

The apex of the triangles is the centre of motion; this, for the convenience of construction, is made continuous in reference to the two triangles on the same side, of which the centres of motion are in practice very small cylinders, answering the purpose of pivots, prolonged from the one to the other. The reverse ends of the four supports, though very short, are the bases of the triangles, which, when placed in their proper situation relative to each other (which is done by means of the two counter-weights), form the four supports upon which the pendulum rests. The pendulum is itself immediately suspended from a beam, the underside of which terminates in a small cylinder, which in a similar manner, as in the case of the triangles, answers the purpose of two pivots. The pivots of the triangles work in sinks instead of holes, in four pieces of steel made perfectly hard, which pieces of steel are kept in their places by the pressure of the supports. The bearings upon which these four pieces rest are arcs of circles which, should any inaccuracies occur in the execution of the work, secure for the pivots a full bearing upon the four pieces. The tops of the supports (upon which the four pieces of steel are, in which the pivots of the beam rest) are in like manner, and with the same intention, made arcs of circles; the four pieces that rest upon them are also loose pieces made of steel and perfectly hard. By this arrangement, all inconvenience from any inaccuracy in the construction is obviated, and a full bearing given to the pivots of the beam. There is an arm attached to and projecting from the base of each of the supports, terminated by a weight. These weights act as counter-weights, to retain the supports in their proper position. The weights move upon screws, for the greater convenience of regulating their distance from the centre of motion.

The action of the parts will now be very easily explained. The pendulum being set in motion, the pivots of the beam, and the bases of the triangles upon which they bear, roll together, the friction being removed to the



280. ORNAMENTAL CLOCK CASE. MR. WALKER.

pivots of the triangles; but the quantity of motion is so exceedingly small that it would be very difficult to express it by a decimal fraction: it is just perceptible at the points of the arms which carry the counter-weights, and which are of the same length as the supports of the beam.

At first sight, this suspension might be considered as a modification of the well-known application of friction-rollers as supports, to a pendulum; to which mode, however, it bears no resemblance. In the case of the friction-roller, though the motion is alternately both ways, still the wheels ultimately revolve, which sufficiently proves that the motion backwards and forwards is not equal: it follows that the total circumference of the wheels must be of the same material; and as yet, no material has been discovered of sufficient hardness to make friction-rollers, when employed to support heavy weights, or which in practice did not become indented and then wear into hollows: when this commences they cease to be rollers, and friction is speedily engendered to a degree that renders them much worse than useless.

In this suspension, the case is quite different in principle and execution. The triangles which form the supports by which the pendulum is carried have no tendency to revolve, because the places where the pivots of the beam bear (which are geometrical lines at the shortest distance from the centre of the pivots) and the eight bearings, being detached pieces, afford the convenience of being made of steel, and being perfectly hard. When the pendulum is set in motion, two of the supports ascend while two descend, moving an equal quantity each way up and down, those that ascend when the pendulum vibrates in one direction, descending when it vibrates in the other: their motion, expressed by the angle they vibrate, is determined by the arc of vibration of the pendulum. It must be specially noticed that the practical effect of this motion is to raise the beam, and consequently the pendulum, and the longer the arc of vibration, the more it is raised; but the quantity raised would with a long arc of vibration be so exceedingly small that it would be difficult to express it by a decimal fraction, consequently it is not attended with any practical inconvenience. That the pendulum must be raised is evident from the circumstance, that a line supposed to be drawn from the centre of the lower pivot to the termination of the geometrical line on the base, on which the pivot bears when the pendulum is at rest, is necessarily, from the principle of this suspension, the shortest that can be drawn between these two points. It follows that whichever way the supports move, that line must be lengthened, because the sides of an isosceles triangle, however short the base, are necessarily longer than a line that bisects into equal angles, the angle at the vertex or apex of the triangle.

There are many advantages attendant upon this mode of suspension, the principal of which may be briefly enumerated as follows:—

The power of dispensing with the pendulum spring, which renders any compensation for change of temperature in reference to the alterations in the strength of the spring caused by alteration of temperature, unnecessary, and enables a very heavy bob to be carried by a very light rod.

The omission of the crutch, by which the friction of two pivots and other inconveniences are avoided.

The facility afforded to employ a much heavier bob than can safely be suspended by a spring.

The power of giving a pendulum, with a bob of a given weight, a certain arc of vibration with much less maintaining power than would be required to produce the same arc of vibration from a similar pendulum hung by a spring; a circumstance which necessarily reduces the wear and tear of the machine.

The power of determining the exact length of the pendulum hung by a spring.

The avoidance of the whole train of evils which result from the breaking of the suspension spring, an accident which does sometimes occur, and never without great detriment to the machine.

702 **EDGE, THOMAS,** *Great Peter Street, Westminster*—Manufacturer.

Photometer; to ascertain the illuminating power of gas as compared with any other description of light; it is compact and portable, the disc is fixed at a certain distance from the standard light. Diagram to show the instrument in use.

[It is difficult to determine with accuracy the comparative intensity of light. If we suppose the quantity of light falling on a body to be the same as would have fallen on the place occupied by its shadow, it follows that the intensity of light decreases as the square of the distance increases, and therefore the denseness of the shadow of an interposing body becomes a means of determining the comparative intensities of light; for, if they appear of unequal density, it is sufficient to move the luminous bodies to those distances till the densities of the shadows be equal; then the intensities of the light or luminous bodies will be to each other as the squares of their respective distances from the interposing body.

Instruments for the purpose of determining the intensity of one light with another; of one strong light with several smaller lights; the comparative intensities of the light of the moon, and of that of a candle; the light of the heavens by night and by day, &c., have been invented at different times.—J. G.]

703 **LIPSCOMBE & Co.,** 233 *Strand*—Manufacturers.

Two patent pneumatic fountains.

704 **TUDSBURY, R.,** *Edwinston*—Inventor.

A "volta subito" turn-over desk and stand.

705 **BROOKS, GEORGE,** *St. Albans, Herts*—Proprietor.

"Clavic attachment," for facilitating the performance on the violin, violoncello, and double bass, and enabling the student to play with correct intonation.

706 **TOOTAL & BROWN,** 73 *Piccadilly*—Manufacturers.

Pianoforte.

707 **DEARLOVE, M. W.,** *Leeds*—Manufacturer.

Miniature model of an Antonius Straduarius' violin and a miniature double-bass.

708 **BARTON, H. W.,** *The Waterfoot Pettigo, Ireland*—Inventor.

Military sketching compass.

709 **BELOE, W. LINTON,** *Coldstream*—Producer.

Copy of Antonius Straduarius' violin.

710 **MOYLE, SAMUEL,** *Bosvigo House, Truro*—Producer.

Model of a floating breakwater.

Mountain barometer, on an improved plan, for measuring heights by boiling water.

711 **PETERMANN, AUGUSTUS,** *Camden Street, Camden Town*—Producer and Manufacturer.

Geographical illustrations, consisting chiefly of physical and statistical maps of the world.

Specimens in manuscript, drawn with the pen and brush, and comprising plans and maps to show the physical configuration of certain countries.

Specimens engraved on metal (steel and copper). The various shadings and tints produced partly by machine-ruling, partly by aqua-tint: this latter method is very rarely employed for mapping, on account of certain difficulties in the combination of the shading with the outline and writing; when successful, it produces effects correcter and finer than other methods.

Specimens engraved on stone. The process of engraving maps and plans on stone is very little used in this country, although it possesses considerable advantages over drawing them on stone, or engraving them on metal.

712 **Clapham, John Kighley**, 6 *Briggate, Leeds*—Proprietor.

A county map of the United States of America, from a steel plate, on Goodyear's gum elastic.

713 **Brown, Joseph**, 71 *Leadenhall Street*—Inventor and Manufacturer.

Aërial machine.

714 **Mason, Edward**, *Brompton Post Office*—Inventor and Manufacturer.

A model of a navigable balloon, which works by sails, helm, and mariner's compass. Scale ½ inch to a foot.

715 **Bell, Hugh**, *Baltic Wharf, Millbank*—Inventor and Manufacturer.

Model of a "locomotive balloon." The steering apparatus has the motions of a bird's tail; the car is so arranged with buoyant apparatus at the ends, as to be a life boat in case of a descent being made into the sea, and the balloon and machinery may be stowed away in it.

Improved valve for a balloon.

Model arrangement for a "locomotive parachute," equipped for service.

716 **Plummer, H. Lorenzo**, 112 *Powis Street, Woolwich, Kent*—Inventor.

Working model of an aërial machine, with wings, which is put in motion by a clock-spring.

717 **Watt, G. T.**, 2 *William Street, Albert Gate, Hyde Park*.—Inventor.

Dentistry; consisting of specimens of artificial palates, models of the mouth and jaw, and sets of teeth of various construction, of hippopotamus tusk, porcelain, &c.

718 **Dinsdale, Cuthbert**, *Newcastle*—Manufacturer and Inventor.

Model of artificial gums, composed of incorrodible material, showing a metallic artificial alveolar process. Patented in England, Scotland, and France. Wax models of the human head. Model of a dissected human head. Series of wax models, showing the different stages of incubation in the egg of the barn-door fowl.

[The mysterious changes which occur in the egg on the application of the stimulus of heat, and the progress of the germ up to its perfect condition, have long attracted the attention of physiologists.—R. E.]

719 **Rose, J. E.**, 68 *Mount Pleasant, Liverpool*—Manufacturer.

Artificial teeth, with models of the mouth.

720 **Truman, E.**, 40a *Haymarket*—Inventor.

Patent artificial teeth, with gutta-percha gums. Set of mineral teeth, mounted in gutta percha.

Small case, intended to illustrate a further application of the principle.

Specimens of pure gutta percha, such as used in the preceding articles, before the colouring process.

721 **Harrington, G.**, 84 *St. Thomas Street, Portsmouth*—Inventor and Patentee.

New description of patent artificial teeth.

Model teeth for taking the mould and dimensions of the required set.

Gauge for adjusting the set, and machinery for pressing tortoiseshell for the bed and palate.

722 **Lawrence & Co.**, *Islington Place, Park Road, Islington*—Manufacturers.

Patent improved horse-hair flesh gloves and straps, for friction of the skin. Gloves and straps for use in the bath, not injured by wet. Flesh brushes of a new design, with hat, cloth, velvet, and horse brushes.

723 **Bossingham, B.**, *Wisbech*—Inventor.

Artificial leg.

724 **Gray, Peter**, 47 *Hanover Street, Edinburgh*—Inventor.

Model of an invalid bed, made by Thomas Sturrock, 1 Duke-street, Leith.

725 **Kennedy, Evorry, M.D.**, *Merrion Square, Dublin*—Inventor.

Siphon, adapted to green-house or garden watering. The principle is the substitution of an elastic caoutchouc chamber, for the suction pump to procure exhaustion, the water being directed in its course by double ball and socket valves. The pressure of the hand or carriage handle expels the water, and its own elasticity procures the exhaustion. The siphon has a sustained or continuous action, by means of an external exhausted air-chamber.

Siphon adapted to medical purposes, as a substitute for the pumps at present in use for throwing fluids into internal cavities. The exhaustion is produced by the elasticity of the India-rubber bag itself, the fluid being propelled by the pressure of one hand leaving the other free to guide the instrument; the material is not acted upon by the usual chemical agents.

726 **Seltzer, Sophia**, 7 *Upper Ranelagh Street, Pimlico*—Inventor.

Chair for spinal curvature.

727 **Highley, Samuel**, 32 *Fleet Street*—Producer.

An anatomical statuette, height, 27 inches, exhibiting the external muscles of the human figure; carefully modelled, and expressly adapted for the use of artists, and others interested in the study of anatomy; accompanied by a key, containing outline views of the statuette in its several aspects, with references to the names of the muscles.

727a **Titterton**—Inventor.

Instrument for slaughtering cattle.

728 **Lanagan, Francis**, 12 *Brownlow Street, Bedford Row*.

Apparatus and shoes for the cure of bunions.

729 **Ewart, George**, 19 *Quickset Row, New Road, Regent's Park*—Manufacturer.

Zinc spirometers, for ascertaining the capacity of the lungs; zinc mouldings for the decoration of buildings, internal and external; and samples of manufactured zinc.

[The spirometer is an instrument invented in order to determine the capacity of the human lungs. Its principle is extremely simple. It is merely an inverted zinc cylinder, balanced by a weight, and rising and falling within another outer case containing water: it has, consequently, a close resemblance to a gas-holder. The extremity of a tube leading into the inner cylinder is applied to the mouth of the individual, who is directed to expel the air from the chest as far as it is possible to do so. The inner cylinder rises, carrying with it a measured scale, on which the cubic capacity of the lungs is easily read off. When this scale indicates an unusual departure from an ascertained average, disease is *generally* found to exist.—R. E.]

730 **Ritterbrandt, Dr. L. A.**, 7 *Northumberland Street, Strand*—Inventor.

Galvanic bath. The principle of this bath is simple; it consists of a vessel constructed of two different metals, separated by a non-metallic substance which not merely fulfils the purpose of an ordinary bath, but at the same time acts as a perfect battery.

The metals employed are zinc and copper, the latter being plated with silver. This combination, however, is not the only one that may be employed. Any other two metals differing in their electrical relations—that is, positive and negative to each other—will afford in a more or less degree the same result; as, for example, zinc and iron, iron and copper, &c.

This bath is a simple apparatus for causing a current of electricity to pass through the body of the bather. The fluid employed is common water. By connecting the wires attached to the two metals a strong current of electricity will be made to pass through the body of the bather, which will be attested by the deflection of the needle of the galvanometer attached to the bath. If, instead of cold water, warm water be employed, the deflection of the needle will increase in proportion to the temperature of the water. If a small quantity of common salt, or any soluble salt be added, or sea or mineral spring water employed, the current of electricity will still further increase; notwithstanding which, however, it will pass so mildly and imperceptibly through the body as to obviate any unpleasant sensation.

In cases where it is necessary to make use of electricity of greater intensity than that producible by the bath, this may be effected by combining it with one or more cells of an ordinary battery, so as constitute one compound battery. Where it is necessary to pass shocks through the body of the patient it can be effected, in the bath, in several ways:—1. By closing two of the caps of a single coil with a wire, and connecting the other two by wires attached to the bath. 2. By connecting one or more cells of a battery with the caps of a primary coil, and connecting the two ends of the secondary coil with the wires of the bath; care being taken that the direction of the current from the coil coincides with that of the bath. 3. By using a single coil, connecting two of its caps with a battery, and the two others with the two wires of the bath—viz., the positive wire of the coil with the negative wire of the bath, or with the wire attached to the zinc, and *vice versâ*. In this manner the patient will receive shocks from the electricity of the coil, while his body will be affected by the electricity from the bath.

732 BADCOCK, JOHN, *Brighton*—Producer.

Photographic specimens of vaccine, produced by inoculating the cow with small-pox, showing the character of the vesicles in their different stages. The specimens, furnished by Mr. Constable of Brighton, show the genuine vaccine vesicle and its characteristic areola as described by Dr. Jenner.

[The production of vaccine virus is a subject of much importance. The exhibitor states that he has proved the efficiency of virus thus obtained, and suggests that by proceeding in the manner described, a supply of virus may be procured without the loss of time, caused by sending, in some instances, many thousand miles for vaccine.—R. E.]

733 HAMILTON, HENRY G., R.N. 71 *Eccleston Square*—Producer.

Collection of ancient Greek coins electrotyped by the exhibitor.

735 BRYCESON, HENRY, 5 *Tottenham Court New Road, St. Pancras*—Manufacturer.

Powerful church barrel organ of superior construction in a gothic case.

736 GOWING, J. W., *Camden Town*—Inventor.

Instruments for operating on the teeth of horses. Apparatus for fractures, &c. Neurotomy knife, and scissors for dividing nerves.

737 WOOD, J. W., *Manchester*—Inventor.

Trusses. Support for curvature of the spine and surgical instruments.

740 TAYLER, G. R., *Sunderland*—Inventor.

Geographical clock. (*South East Corner, United States Department.*)

741 SIMMS, WILLIAM (surviving partner in the firm of TROUGHTON and SIMMS), 138, *Fleet Street*—Inventor and Manufacturer.

An equatorial instrument, adapted for the latitude of 25°, and mounted generally after the method of Fraunhofer; it is furnished with a clock-work motion, so that the telescope moves so as to counteract the effect of the earth's rotation; the diameter of the object-glass is four inches and nine-tenths of an inch, and its focal length is about 7 feet.

The declination axis is open and exposed between its two supports; its ends are cylindrical, and admit of the application of a spirit-level, by this means the adjustment of the instrument is facilitated, and it is readily brought to the meridian, and thus, observations of transits over the meridian can be made sufficiently near for identifying an object.

The illumination of the telescope is regulated by the application of the throttle valve of a steam-engine, and is as effective as the more elaborate methods hitherto in use.

A best spider line position micrometer, of which extensive use has been made in measurements of the relative position and distance of binary stars. The position circle is divided to one minute of arc, and the reading is by means of opposite verniers upon the edge of the circular plate to which the micrometer is fixed; the value of the micrometrical divisions, however, depend on the focal length of the telescope with which this instrument is employed.

An annular micrometer, and a set of negative eye-pieces are shown with this instrument.

An equatorial instrument adapted for the latitude of London, on the same principle as the preceding, but without clock motion. It has been arranged as an inexpensive, but at the same time an effective instrument. The diameter of the object-glass is 3½ inches, and its focal length is about 45 inches; it is provided with a spider line position micrometer of the second order, in which one screw motion only is given.

The whole is supported upon an iron column with suitable arrangements for its final adjustments.

[An equatorial instrument consists of a telescope fixed to a graduated circle called the declination circle, and of a polar axis, to which is fixed a circle called the hour circle. When the instrument is adjusted the polar axis is parallel to the axis of the earth, and perpendicular to the plane of the hour circle, and to the axis of the declination circle, &c. In its use, the delination circle can be turned about the polar axis, and the telescope can be directed so as to be inclined at all angles to the earth's axis, and by the means of these two motions, the telescope can be directed to any point in the heavens, and if a clock-work motion be applied, an object when viewed through the telescope seems to be without motion, affording the opportunity of examining it minutely.—J. G.]

The altitude and azimuth instrument, known as the "Westbury Circle," so called from the valuable observations made with it at Westbury by John Pond, Esq., the late Astronomer Royal, by which a change of figure in the great mural quadrant at the Royal Observatory was clearly demonstrated.

This instrument was made originally by the late E. Troughton, and subsequently repaired and re-divided by the exhibitor. The re-division was effected by the process invented by Troughton, and described by him in the Philosophical Transactions for 1809.

The diameter of the altitude circle is 30 inches, and of the azimuth 24 inches. The spaces upon the respective circles measure five minutes of arc, which are subdivided to single seconds by two opposite micrometer microscopes. Five revolutions of the micrometer screw being, by the optical arrangement, made to measure five minutes of arc upon the circle; the 60th part of a revolution of the micrometer screw is, therefore, equal to one second of arc. The positions of the azimuthal micrometers are unalterable; those of the altitude circle are fixed to the extremities of an arm which is moveable upon a centre, an arrangement which admits of their positions being altered relatively to the zero of the circle, and hence the readings obtained upon particular objects are changed in every new series of observations. Such errors as are due to the graduation are by these means much diminished if not entirely eliminated. The axes are adjusted by means of spirit-levels, in addition to which the instrument is furnished with a plumb-line apparatus.

A portable altitude and azimuth instrument: each circle is 15 inches in diameter, graduated upon bands of silver to five minutes of arc, upon Mr. Simms' new self-acting dividing engine. There are two micrometer microscopes to each circle showing single seconds of arc. The microscopes have achromatic object-glasses. This instrument is furnished with the nadir point apparatus, or central collimator, the invention of the exhibitor, which consists of a telescope in the interior azimuthal axis, around which the superior parts of the instrument revolve. The spider lines, in the form of an acute cross upon the diaphragm of this central collimator, being placed in the principal forms of its object-glass, can be seen in the telescope of the instrument when it is directed downwards, or towards the Nadir; and their intersecting point serves as an object to which every observation made with the instrument can be referred, and therefore supersedes the use of an artificial horizon, or other extraneous means having the same object in view. The transit collimation can also be adjusted by its means, without reference to any external object, and it supplies the place of the riding level for the transit axis, in the event of its being broken.

A transit circle, 2 feet diameter, with two reading micrometer microscopes having achromatic object-glasses; the divisions upon the circle are sub-divided to single seconds by the micrometers. This circle was also graduated upon the self-acting dividing engine invented by the exhibitor, as were also the circles of the altazimuth and the transit-circle lately made for the Royal Observatory at Greenwich.

The telescope is achromatic and has an aperture of 3¼ inches, and a focal length of about 46 inches. The apparatus by which the field of view is illuminated is the invention of the exhibitor, and has been adapted to the great transit circle at the Royal Observatory. The field of view and the wires interchange the conditions of light and darkness; hence, if the object be a bright one, the field of view can be illuminated, and the wires appear as dark lines upon it; but if the object be a faint one, the field can be made dark, and the wires luminous. This change is brought about instantaneously by either drawing outward or pressing inward a small cylindrical plug placed conveniently for the observer.

The illumination of the divisions upon the circle is effected by the same lamp which illuminates the field of the telescope, as follows:—

A prism adjoining the microscope object-glass receives the light from a lens in the side of the lantern, which is condensed upon the graduated face of the circle as a disc of light, which just covers the extent of the field of the micrometer microscope, and is so arranged that a normal to the face of the circle bisects the angle formed by the incident and reflected rays.

The instrument is supported upon wooden models of the stone piers upon which it will be ultimately fixed, and the whole may be taken as a representative of the class of instrument which is now rising in the estimation of British astronomers.

A transit instrument 3½ feet focal length, and 2¾ inches aperture, with two setting circles upon the telescope tube, axis level, micrometer in the eye-piece, &c., as is usual in the most perfect instruments of this class; but as this instrument has been made for the coast survey of the United States, now being carried on under the direction of Professor A. D. Bache, and is intended for observations both in the meridian and prime vertical, the exhibitor has introduced two additional parts to fit it the better for its work. Firstly, a reversing frame by which the telescope can be lifted from the Y's, turned end for end and again lowered into its bearings without being subjected to any handling, or other operation by which the parts may be unequally expanded and the adjustments deranged; the operation is safe and expeditious. Secondly, both the pivots are perforated, in one of which a diaphragm with cross lines and an eye-piece is fitted, and in the other an object-glass of suitable focal length is fixed, and hence the axis becomes a telescope. Now, if this telescope be directed to any object, such as the cross lines of a collimator or any terrestrial mark that presents itself, or is set up at a considerable distance from the instrument, and the axis be made to revolve, the form of the pivots may be thereby examined, or (which in the instrument exhibited, is its primary purpose) this telescope may be used for turning the principal telescope 90°; that is to say, for changing its meridional to a prime vertical position, or the reverse.

This instrument is supported upon a cast-iron stand.

[The transit instrument consists of a telescope placed in the meridian. It is fixed to two arms, the extremities of which are turned into two equal cylindrical pivots, which turn in Y's on the top of two piers, placed east and west of the centre of the telescope. The centres of the pivots, or their axes are in the same straight line, which is called the axis of the instrument. In order to observe the instant that a celestial object passes the meridian, there is placed in the telescope, at the focus of the object glass, a system of fine cobweb wires perpendicular to the horizon, and one placed horizontal. At the instant an observation is made, the star's image coincides with the intersection of these wires. An arrangement of this kind is absolutely necessary, as the field of view of the telescope is not a mere point.

The transit instrument is used in connexion with an astronomical clock, adjusted to sidereal time. A clock so adjusted that it completes a circuit in a sidereal day, and indicates 0h. 0m. 0s., when the first point of Aries is on the meridian, and having its dial-plate divided into 24 equal spaces; hence, when the transit instrument is adjusted, and the clock goes correctly, at the instant the first point of Aries is on the meridian, the time shown by the clock is 0h.; when this point is 15° or 30° west of the meridian, the time shown by the clock is 1h. or 2h. respectively, and so on.—J. G.]

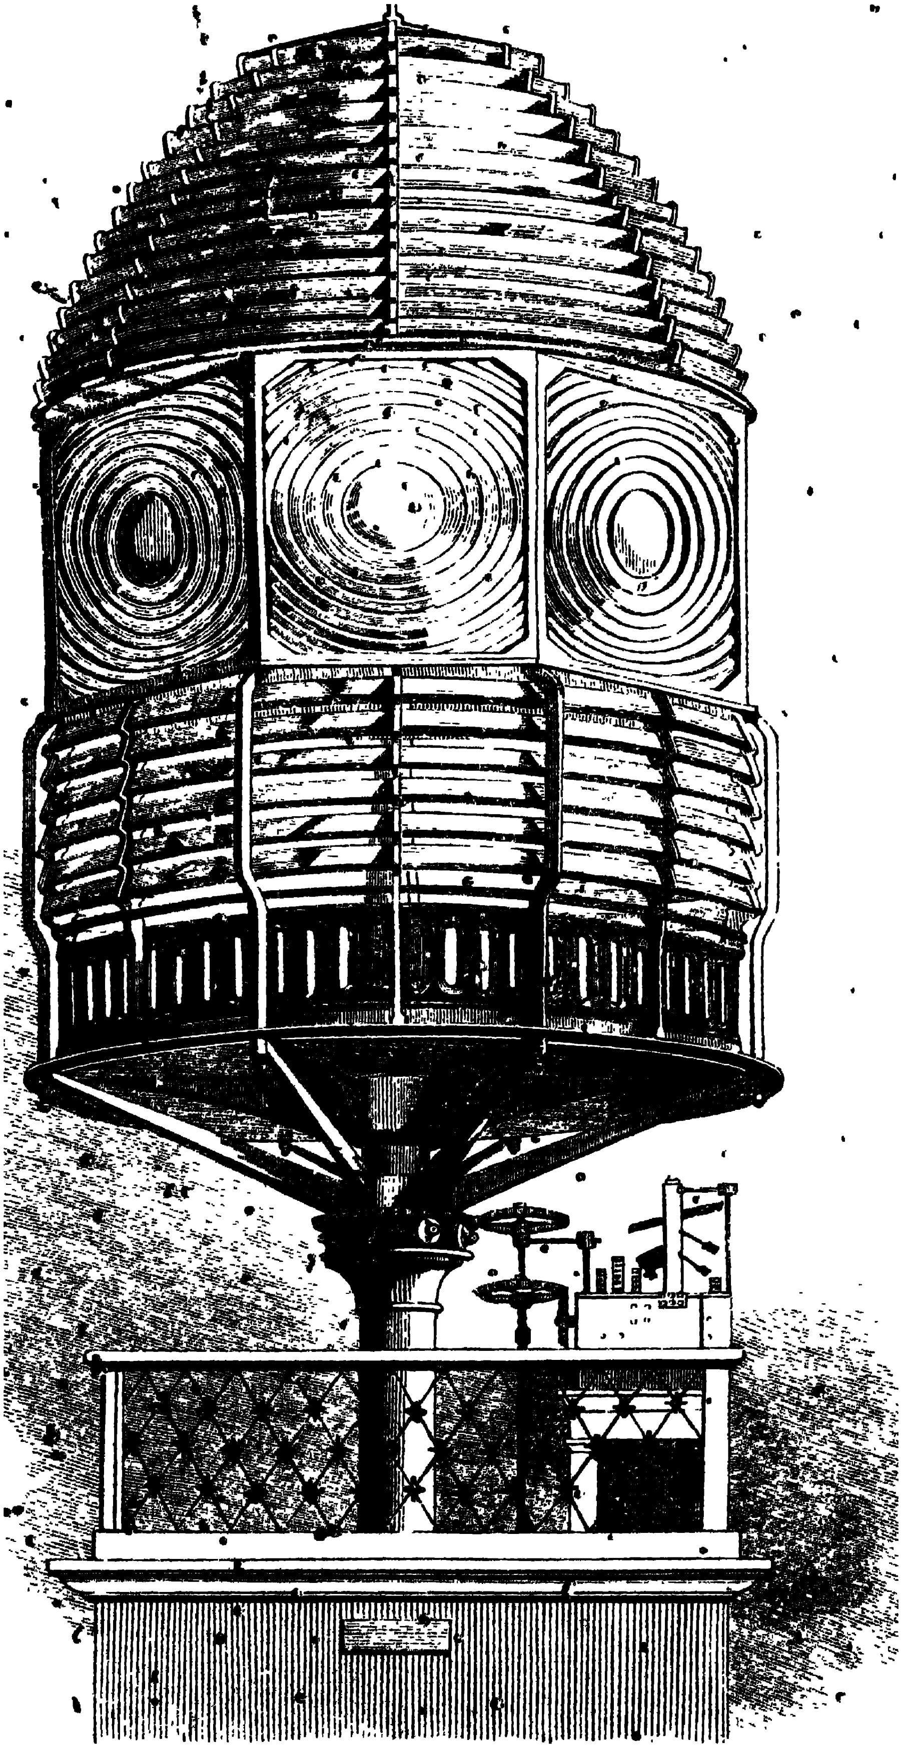
A diagonal transit instrument, in which the means of illuminating the field of view is new in this class of instrument, and is the invention of the exhibitor.

The mode hitherto adopted has been the placing of a reflecting surface in front of the object-glass, and receiving light upon this plate from a lamp or candle placed in a distant part of the observatory. The objections to this mode are, the difficulty of throwing light upon the reflector at all, under such circumstances; besides, for every observation, a new arrangement of the light has to be made; and further, by the reflector being placed in front of the object-glass, part of its light is cut off.

In the instrument exhibited, the light passes through the axis, and this is effected by placing a lens, of which a very large segment, nearly an annulus, projects beyond the edge of the diagonal reflector within the axis. The light, passing through a small lens fixed in one of the pivots in the usual way, diverges upon the open segment of the interior lens, and is thereby converged to the opposite pivot, where the diaphragm is placed.

An isometrical elliptograph invented by the Astronomer Royal, G. B. Airy, Esq., by which ellipses in isometrical perspective can be drawn with great facility and accuracy. The exhibitor is the manufacturer.

Three imperial standard yards, made for Her Majesty's Commissioners for the restoration of the Standard of Weights and Measures, with the supports invented by Professor Miller and the Rev. R. Sheepshanks.



77. APPARATUS FOR A DIOPTRIC LIGHT-HOUSE. CHANCE BROTHERS AND CO., BIRMINGHAM.

The bars, which are one inch square, are an alloy of copper with tin and zinc, the proportions of each constituent is engraved upon the bar, and these proportions were determined by the late F. Baily, Esq., after very careful experiments.

The planes upon which the divisions are cut, showing the standard yard, are at the bottom of cylindrical holes, and in the neutral axis of the bar. The divisions are upon pins of gold, and their situation is well calculated to defend them from everything but wilful injury.

Professor Miller's support consists of a system of levers by which an equal degree of support is given to eight equi-distant points in the bar.

Mr. Sheepshanks' support is simply a trough of mercury in which the bar floats, and is prevented from turning over by means of a stirrup in the middle of its length, with pivots resting in two Y bearings. To this apparatus is added two of Mr. Sheepshanks' recently made thermometers.

A 5-foot standard bar, and the 5-feet tubular scale, No. 4, of the late F. Baily's Report, are the property of the exhibitor, and have been used in the formation and comparison of many existing standard scales, both for this and for foreign countries.

A Troughton's reflecting circle, of the usual kind, the circle being cast in one piece. This circle was arranged as an improvement to that by Borda, and substitutes the reading of six verniers in a complete observation, for the repetition of the angle as practised with the older instrument.

A Troughton's sextant, having the advantage of lightness and strength in its construction.

A transit theodolite in which the ordinary vertical arc is extended to a complete circle, and is read by opposite verniers. The range of the telescope is unlimited, like that of a transit instrument, and by means of a diagonal eye-piece observations can be made even in the zenith.

The axis of the telescope is perforated, and the field is illuminated by a lamp attached to one of the supports, it is, in fact, an altitude and azimuth instrument equally well-adapted for the surveyor and the scientific traveller.

Five achromatic object-glasses, one of 9 inches, two of 8 inches, one of $6\frac{9}{16}$ inches, and one of 4 inches, effective aperture, all worked by the exhibitor. The discs of glass in the first-mentioned being of English manufacture.

[A telescope furnished with an achromatic object glass is termed an achromatic telescope. The distance of the point from the object-glass, where the image of an object is formed, is called the focal length of the telescope. The magnifying power of a telescope depends upon the following considerations,—if it be directed to the sun or moon, and a piece of transparent paper be held in its focus, an image of the object will be formed upon the paper. Now the size of an object depends upon the angle under which it is seen, and the image formed upon the paper will subtend exactly the same angle when moved to that distance from the eye which is equal to the focal length of the telescope, as the object itself, when viewed with the naked eye, or in other words, if held at such a distance from the eye as the focal length of the telescope, it will exactly cover the object itself. Suppose this distance be seven feet, we can with unobstructed vision view an object at the distance of six inches; if then we view the image at this distance it will appear fourteen times larger than the object it represents. By the application of another lens near the eye, termed the eye-glass, the image can be seen distinctly at a very much less distance; in fact, it can be viewed at the distance which is equal to the focal length of the eye-glass; and suppose this to be half-an-inch, then the image will appear twelve times larger than it did to the unassisted eye, and, therefore, fourteen multiplied by twelve, or one hundred and sixty-eight, would be the magnifying power of the telescope. Hence the rule for finding the magnifying power of a telescope is to divide the focal length of the object-glass by the focal length of the eye-glass, and the quotient will give the magnifying power.—J. G.]

(Main Avenue West.)

CHANCE (BROTHERS) & Co., *Glass Works, near, Birmingham*—Manufacturers.

Dioptric apparatus of the first order, for lighthouses, with revolving lenses and catadioptric zones; constructed according to the system of Fresnel. The upper and lower parts consist of a series of prismatic rings, each of which reflects at the internal surface of its base, the incident rays of light. The middle portion is refractive, and produces by its revolutions a succession of flashes or blazes of light, for the purpose of enabling the mariner to distinguish any particular lighthouse. This revolving part consists of eight annular lenses. Each of these great lenses is composed of a number of concentric rings round a central lens, so as to produce all the refractive effect of a single solid lens of corresponding dimensions, but with less loss of light. This apparatus is represented in the accompanying Plate 77.

(Main Avenue West.)

ELECTRIC TELEGRAPH COMPANY, *Office, South Entrance to the Exhibition Building*—Proprietors.

Electric Telegraphs.

1. Original five-needle telegraph invented by Cooke and Wheatstone in 1837, and worked on the Great Western Railway.

2. First complete telegraph for intermediate stations requiring four wires and a return circuit. Cooke and Wheatstone's patent of 1838.

3. Two-needle portable telegraph. Intended to be carried by guards of trains and attached at any required part of the line to the telegraphic wires, thus opening an immediate communication between the spot of an accident and the stations on the line. Cooke and Wheatstone's patent of 1838.

4. Ordinary two-needle telegraph of the construction now in use throughout the whole of England. Constructed under Cooke and Wheatstone's patents of 1837, 1838 and 1845.

5. Two-needle telegraph of the most recent form; constructed under the same patents as the last, but with modifications and improvements of parts.

6. Ordinary single-needle telegraph, used for small and second-rate stations. Constructed under the patents of 1837, 1838, and 1845.

7. Portable galvanometer, or detector used for tracing out faults on the lines. Patent of 1837.

8. Portable single-needle telegraph to be carried by guards of trains. The dial arranged in a sloping position to facilitate the reading of the signals. Patent of 1845.

Electro-magnetic Alarums.

1. Electro-magnetic alarum: patented in 1847 by Cooke and Wheatstone. In this alarum the magnet operated directly to impel the hammer against the bell. A secondary battery was brought into action to excite the magnet.

2. Electro-magnetic alarum of 1837; the magnet only operating to release the striking machinery.

3. Electro-magnetic alarum of 1838. The striking machinery released by the deflection of a magnetic needle.

4. Small decomposition apparatus. This apparatus, or an ordinary magnetic needle, was used to bring into operation a secondary battery at the station where the signal was to be received.

5. Electro-magnetic alarum. The magnet excited by the direct current transmitted, and not by a secondary battery. Patents of 1837 and 1840.

6. Large alarum used for signalling at the entrances of tunnels at railway stations and other places where a loud sound may be required. Cooke and Wheatstone's patents of 1837 and 1845.

7. Another form of the same alarum.

8. Plan proposed by G. Little for sounding a bell by the self-action of an electro-magnet.

Disc Telegraphs.

1. Disc telegraph: the signals given by the step-by-step rotation, and pausing of a disc bearing letters or figures. The rotation produced by the action of an electro-magnet. Wheatstone and Cooke's patent of 1840.

2. Disc telegraph: the letters or figures pointed out by the rotation and pausing of an index or hand operating by electro-magnetic action. Patent of 1840.

3. Disc telegraph: similar to No. 1, except that signals are given by numbers.

4. Modification of the disc telegraph proposed by Nott.

5. Disc telegraph: the communicator, or signal-giving apparatus being conjoined to the instrument.

6. Modification of the disc telegraph arranged for a counter, or register of any successive movements of actions, such as persons passing through a door or gate, strokes made by a steam-engine, fly or other press, &c.

7. Magneto-electric communicator for the disc telegraphs: no battery is required, a permanent magnet furnishing a constant series of induced currents by the rotation of an armature and coils over its poles. Wheatstone's patent of 1841.

8. Second form of the magneto-electric communicator, adapted to work disc telegraph, giving signals by numbers.

Double Index Disc Telegraphs.

1. Double index disc telegraph: the two hands move independently, so that one may be set to give any required permanent signal, while conversation is carried on by the other. This instrument was arranged for working the atmospheric machinery on the South Devon Railway. It requires one wire only. Hatcher's patent of 1847.

2. Double index disc telegraph. The two hands revolve step by step in opposite directions. They would therefore indicate exactly at all stations on a single line the progressive movement and approach of two trains running in opposite directions. Patent of 1847.

3. Single index disc telegraph. The index can be made to rotate in either direction, so that the speed of signalling would be increased by the facility with which any position could be given to the index by a few movements. Patent of 1847.

Printing Telegraphs.

1. Elective magnet printing telegraph. The signals are printed in ordinary type, according to the first arrangement of Wheatstone in 1841. The current when sent in one direction moves the type wheel to the required position, and when reversed brings into operation the printing machinery. Hatcher's patent of 1847.

2. Second form of the elective magnet printing telegraph. Patent of 1847.

3. Third form of the elective magnet printing telegraph: the signals being printed not in type but in combinations of dots or points.

4. Type printing telegraph: the type wheel, after each signal is printed, is released from the machinery and regains its zero or quiescent position at one bound, thereby increasing the correctness of the operation by making each signal wholly independent of the correctness or incorrectness of the preceding one. Barlow and Forster's patent of 1848.

5. Chemical printing telegraph: signals given by dots or spots arranged in two lines. The marks produced by the chemical action of the current on a prepared paper. Alexander Bain's patent of 1846.

6. Chemical printing telegraph: signals given by dots and lines combined in various ways. Bain's patent of 1846.

Magneto-electric Machines.

1. Magneto-electric machine. Currents induced by the permanent magnet can be sent in one direction by this machine. It is used for the sounding of alarums. No battery is required. Wheatstone's patent of 1841.

2. Magneto-electric machine for sending currents in either direction at pleasure. Used for working the double index telegraphs. Hatcher's patent of 1847.

3. Induced current machine: an inducing battery of small power is used with this form of machine. It sends currents in either direction like the last. It was used for working the double index telegraphs on the South Devon line. Patent of 1847.

4. Second form of induced current machine: arranged for working with the code of signals in use by the Admiralty. Patent of 1847.

Galvanometers.

1. Indicator or galvanometer in which the magnetic needle is replaced by a magnetised steel disc. Mapple's patent of 1847.

2. Simple current director for causing the current to ring either of two bells or to actuate either of two instruments.

3. Simple current director for ringing either of two bells as for an office.

4. Current director, for causing the current to sound either of three bells, or actuate either of three instruments.

5. Current director or switch for a line of telegraph with two wires to any one of three other lines of similar telegraph. Switches of this kind are extensively used in England.

6. Punch or stamp used for cutting out in paper the signals or combinations of dots and lines to be transmitted by Bain's chemical telegraph. Bain's patent of 1846.

7. Stick or rule of type used with Bain's printing telegraph.

A series of insulators of various forms constructed under Cooke and Wheatstone's, Ricardo and Clark's, and Mapple's patents.

---

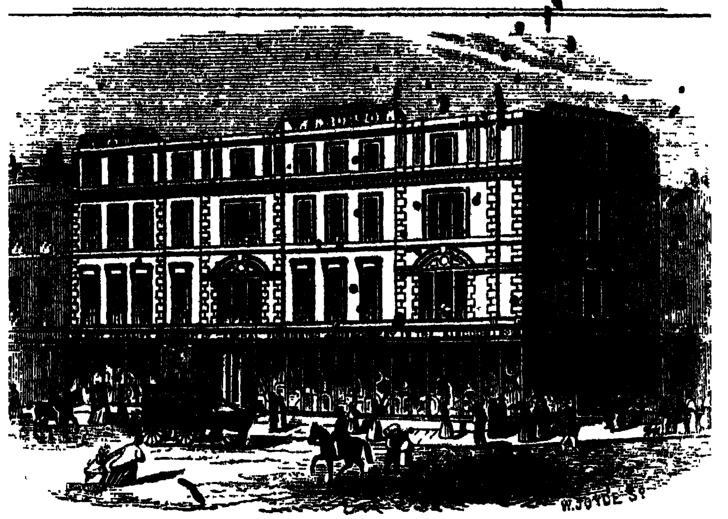
750 **TRACY, W. M.**, 13 *Hill Street, Berkeley Square.*
Bullet extractor.

751 **AIREY, THOS.**, 67 *Dale Street, Liverpool*—
Manufacturer.

Newly-invented sunk centre seconds watches. This invention admits of the seconds hand beating dead. Two seconds hands may be applied—one from the centre, and the other in the usual place.

EXHIBITION
Official Illustrated Catalogue Advertiser.

[*For Classified Contents of the Advertiser see last Page.*]



WILLIAM S. BURTON'S GENERAL FURNISHING IRONMONGERY WAREHOUSE,
39 Oxford st. (corner of Newman st.), Nos. 1 and 2 Newman st., and Perry's Place, London.

THE PERFECT SUBSTITUTE FOR SILVER.

The REAL NICKEL SILVER, introduced 16 years ago by WILLIAM S. BURTON, when PLATED by the patent process of Messrs. Elkington and Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

		Fiddle Pattern.		Thread Pattern.		King's Pattern.
Tea Spoons, per dozen	....	18s.	..	32s.	..	36s.
Dessert Forks	„	30s.	..	54s.	..	58s.
Dessert Spoons	„	30s.	..	56s.	..	62s.
Table Forks	„	40s.	..	65s.	..	70s.
Table Spoons	„	40s.	..	70s.	..	75s.

Tea and coffee sets, waiters, candlesticks, &c., at proportionate prices. All kinds of re-plating done by the patent process.

CHEMICALLY PURE NICKEL, NOT PLATED.

	Fiddle.		Thread.		King's.
Table Spoons and Forks, full size, per doz.	12s.	..	28s.	..	30s.
Dessert ditto and ditto	10s.	..	21s.		25s.
Tea ditto	5s.	..	11s.		12s.

ALL THE NEW SHOWER BATHS.

Portable Shower Bath, with curtains, from 7s. each; Pillar Shower Baths, with copper conducting tubes, brass force-pump and top, complete, with curtains, and japanned, from 60s.; Hand Shower Baths, japanned, 3s.

IRON BEDSTEADS AND CHILDREN'S COTS.

A very large assortment of these Bedsteads in Iron and Brass, from 16s. 6d. each, and Cots from 20s. each, fitted with dovetail joints and patent sacking, and entirely free from screws, nuts, or pins.

The new Patent Portable Bedstead, 15s. 6d. each. Common Iron Bedsteads at 12s. 6d. each. Bedding of every description.

LAMPS OF ALL SORTS AND PATTERNS.

The largest as well as choicest assortment of PALMER'S MAGNUM and other CANDLESTICKS, CAMPHINE, ARGAND, and SOLAR LAMPS, with all the latest improvements, and of the newest and most recherché patterns, in ormolu, Bohemian and plain glass, or papier maché, in existence, is always on sale, at prices ranging from 6d. to 6 guineas.

FENDERS, STOVES, AND FIRE-IRONS.

Bright stoves with bronzed ornaments and two sets of bars, £2 14s.; ditto with ormolu ornaments and two sets of bars, £5 10s. to 20 guineas; bronzed fenders complete, with standards, from 7s. to £6; steel fenders, from 55s.; ditto with rich ormolu ornaments, from £2 15s. to 10 guineas; fire-irons, from 1s. 9d. the set to £4 4s. Sylvester and other Patent Stoves, with radiating hearth plates.

PAPIER-MACHÉ AND IRON TEA-TRAYS.

An assortment of Tea-Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

Gothic-shape Papier-maché Trays, per set of three	from 20s. 0d. to 10 guineas.
Ditto Iron ditto	from 15s. 6d. to 4 guineas.
Convex shape, ditto	from 7s.

CUTLERY, WARRANTED.

Three inches and a half ivory-handled table knives, with high shoulders, 10s. per dozen; desserts, to match, 9s.; if to balance, 1s. per dozen extra; larger sizes, in exact proportion, to 25s. per dozen; if extra fine, with silver ferrules, from 36s.; white bone table knives, 6s. per dozen; desserts, 4s.; black horn table knives, 7s. 4d. per dozen; desserts, 6s.; black wood-handled knives and forks, 6s. per dozen; carvers, from 2s. per pair; table steels, from 1s. each. The [illegible]est stock of plated dessert knives and forks, in cases and [illegible]herwise, and of the new plated fish carvers, in existence. Also, a large assortment of RAZORS, PENKNIVES, SCISSORS, &c., of the best quality.

DISH COVERS AND HOT-WATER DISHES,

In every material, in great variety, and of the newest and most recherché patterns. Tin Dish Covers, 6s. the set of six; Block Tin, 11s. 6d. to 25s. the set of six; elegant modern patterns, 22s. to 53s. the set; Britannia Metal, with or without silver plated handles, 68s. to 102s. the set; Sheffield plated, £10 to £16 10s. the set; Block Tin Hot-Water Dishes, with wells for gravy, 11s. to 25s.; Britannia Metal, 18s. 6d. to 73s.; Sheffield plated, full size, £9 10s.

Detailed Catalogues, with Engravings, as well as of every Ironmongery article, sent per post free.

WILLIAM S. BURTON'S Stock of General Furnishing Ironmongery is literally the largest in the world; and as no language can be employed to give a correct idea of its variety and extent, Purchasers are invited to call and inspect it.

THE MONEY RETURNED FOR EVERY ARTICLE NOT APPROVED OF.

On a **THIRD SEPTENNIAL INVESTIGATION** into the affairs of this Company, to the 25th March, 1846, a BONUS, amounting on the average to 31 per cent. on the Premiums paid for the preceding Seven Years, was assigned to all Policies of at least Three Years' standing, and effected for the whole duration of life.

To similar Policies the following BONUSES were declared at former Divisions, viz. :—

FIRST DIVISION, in 1832. On the average, upwards of 26 per cent. on the Premiums paid.

SECOND DIVISION, in 1839. On the average, 33 per cent. on the Premiums paid for the preceding Seven Years.

The true principles on which Life Assurance ought to proceed have been maintained by this Company, and are comprised,

IN PERFECT SECURITY to the assured.

A RATE OF PREMIUM graduated fairly to the risk at every age.

A DIVISION OF THE SURPLUS of the Company periodically to the Assured, strictly proportioned to their interest therein.

A FAIR AND LIBERAL PERMISSION to the Assured to proceed to all parts of the world, on due notice, and the payment of a premium equitably adjusted to the risk incurred.

GENERAL FACILITIES for the taking out, renewal, or purchase of Policies, the honourable settlement of Claims, and an exemption from all charges or deductions except for Government Stamps.

The accumulated Capital of the Company actually invested exceeds £650,000.

The Bonuses already allotted to the Assured exceed £210,000.

The Prospectus, Tables of Rates, &c., to be had at the Office in London, or of the Company's Agents.

Solicitors—Messrs. Tatham, Upton, Johnson, & Co.
Actuary—John King, Esq.
Secretary—Patrick Macintyre, Esq.

This Company was established in 1834, by a Special Act of Parliament, and affords the most perfect security in its large paid-up Capital, held by a large, numerous, and wealthy Proprietary.

The Tables have been formed on the lowest scale compatible with security, and constructed to meet the various wants of Assurers, and every risk to which protection by Assurance can be extended.

EXTRACT OF TABLE OF RATES.

Age.	Without Profits.	With Profits.	
20	£1 13 10	£1 18 8	per Cent.
30	2 3 10	2 8 2	ditto
40	2 19 1	3 3 4	ditto

Premiums may be paid in almost any way to meet the convenience of the Public.

One-half the Annual Premium need only be paid for the first five years, the other being allowed to remain at five per cent. interest, thus affording parties desirous of effecting SHORT TERM POLICIES the advantage of having a LIFE POLICY at a scarcely increased outlay.

Parties insured with this Company are not restricted in their limits of travel, as in most other Offices, but may proceed from one part of Europe to another, in decked vessels, without licence, and to British North America, and many parts of the States, without extra Premium, by merely giving the ordinary notice of the intended visit.

Whole World Life Policies are granted at slightly increased Rates of Premium, thus rendering a Policy in Money Transactions a real Security.

SECOND SEPTENNIAL DIVISION OF PROFITS AMONG THE ASSURED.

In 1841 the Company declared a Bonus of £2 per Cent. per Annum on the Sum insured, to all Policies of the Participating Class, from the time they were effected to the 31st December, 1840; and from that date to 31st December, 1847, 2½ per Cent. per Annum was added at the General Meeting on 6th July, 1848. The Bonus thus added to Policies from March 1834, to 31st December 1847, is as follows:—

Sum Assured.	Time Assured.	Sum added to Policy in 1841.	Sum added to Policy in 1848.	Sum payable at Death.
[illegible]	14 Years	£683 6 8	£787 10 0	£6470 16 8
[illegible]	[illegible] Years	100 0 0	157 10 0	1257 10 0
[illegible]	7 Years	..	157 10 0	1157 10 0
500	12 Years	50 0 0	78 15 0	[illegible] 15 0
500	1 Year	..	11 5 0	511 5 0

* EXAMPLE.—At the commencement of the year 1841, a person aged thirty effected a Policy for £1000, the Annual Payment for which is £24. 1*s*. 8*d*.; in 1847 he had paid in Premiums £168. 11*s*. 8*d*.; but the Profits being 2½ per cent. per annum on the sum insured (which is £22. 10*s*. per annum for each £1000), he had £157. 10*s*. added to his Policy; almost as much as the Premiums paid.

Parties desirous to Participate in the **forthcoming Bonus should lose no time** *in applying for immediate information to the Resident Director, Waterloo-place, London, or to the following Agents:*

Paris	C. Hertwieg, Esq., 18, Rue Vivienne
Brussels	Messrs. Salter and Bigwood
Amsterdam	James Annesley, Esq., H.B.M.C.
Rotterdam	Sir J. H. Turing, Bart., H.B.M.C.
Malta	George Dalzell, Esq.
Oporto	Dr. Rumsey (Medical Referee)
New York	W. C. Maitland, Esq.
Halifax, N.S.	A. G. Frazer, Esq.
St. John, N.B.	A. Balloch, Esq.
Montreal	Messrs. Edmonstone and Allen
Quebec	Peter Sheppard, Esq.
Naples	Dr. Cox (Medical Referee).

Besides Agents in every important Town in England, Scotland, and Ireland.

ANNUAL DIVISION OF PROFITS AND LARGE REDUCTION OF PREMIUMS.

HAND-IN-HAND
FIRE AND LIFE INSURANCE SOCIETY,

1, NEW BRIDGE-STREET, BLACKFRIARS, LONDON.
Instituted in 1696; extended to Life Insurance 1836.

Immediate, Deferred, and Survivorship Annuities granted.

DIRECTORS.

The Hon. William Ashley.
The Hon. Sir Edward Cust.
John Lettsom Elliot, Esq.
James Esdaile, Esq.
Harvie M. Farquhar, Esq.
John Gurney Hoare, Esq.
E. Fuller Maitland, Esq.
The Hon. Charles John Murray.
William Scott, Esq.
John Sperling, Esq.
Henry Wilson, Esq.
Robert Winter, Esq.

AUDITORS.

The Hon. Colonel Cust.
Thomas Fuller Maitland, Esq.
James Esdaile, Esq.

Bankers—Messrs. Goslings and Sharpe, 19, Fleet-street.
Physician—Thomas K. Chambers, M.D., 1, Hill-street, Berkeley-square.
Solicitors—Messrs. Lumley, Nicholl, and Smyth, 18, Carey-street.
Actuary—James M. Terry, Esq. **Secretary**—Robert Steven, Esq.

FIRE DEPARTMENT.

Although the lowest rates of premium, consistent with security, have been charged by the office, it has for many years been enabled to make very large returns to septennial insurers.

LIFE DEPARTMENT.

The important advantages offered by the plan and constitution of the Life Department of this Society are—

That insurers are protected by a large invested capital upon which there is no interest to pay, and for which no deduction of any kind is made, which enables the Directors to give the whole of the profits to insuring members.

That the profits are divided annually amongst all members of five years' standing, and applied towards reducing life insurance to the lowest possible rates of premium.

The following table exhibits the abatement of premium that has been made for the past nine years to members of five years' standing:—

Years of Division.	Rate of Abatement.	Years of Division.	Rate of Abatement.
1842	£45 per cent.	1847	£50 per cent.
1843	45 ,,	1848	50 ,,
1844	45 ,,	1849	52½ ,,
1845	50 ,,	1850	52½ ,,
1846	50 ,,		

A policy taken out on or before the 24th of June, 1845, at an annual premium of £100, will consequently be charged £47. 10*s.* as this year's premium; and it is expected that an equal abatement will in future be annually made.

That persons insuring their own lives, or the lives of others, may become members.

That persons who are willing to forego participation in the profits can insure at a lower rate than that charged to members.

The following table will show the effect of the reduction of premium made by the Society on members' policies that have been five years in force:—

Age when Insured.	Sum Insured.	Annual Premium for first Five Years.			Reduced Premium.		
	£	£.	s.	d.	£.	s.	d.
30	100	2	13	5	1	5	6
40	100	3	7	11	1	12	8
30	500	13	7	1	6	7	0
40	500	16	19	7	8	1	3
45	1,000	38	19	2	18	10	1
40	2,000	67	18	4	32	5	2
45	5,000	194	15	10	92	10	6

This system of reducing the premiums affords immediate benefit to the members, or enables them to insure a further sum upon their lives equal to more than one-third of the present policy, without any additional outlay.

Bankers—The Bank of England; Messrs. Willis and Co.

LIFE DEPARTMENT.

THIS CORPORATION has effected Assurances on Lives for A PERIOD OF ONE HUNDRED AND THIRTY YEARS; their first policy having been issued on the 7th June, 1721, to William, Lord Bishop of Sarum.

Two-thirds of the entire gross profits are appropriated to the Assured,—the Corporation retaining the remaining one-third, out of which they PAY THE WHOLE EXPENSES OF MANAGEMENT; thus affording to the public advantages equivalent to those derived from Mutual Assurance, WITHOUT LIABILITY OF PARTNERSHIP, and with ALL THE SECURITY afforded by AN OLD AND OPULENT CORPORATION. Policies may be opened under any of the three following plans, viz.:—

The Old Series, under which Assurers are admitted at very moderate Rates of Premium, without participation in Profits.

The Series 1831, under which Assurers are entitled, after the first Five Years, to an annual Abatement of Premium. The abatement at the last valuation was equivalent to a return of more than one-fourth of the Premium.

The Series 1846, under which Assurers are entitled to participate in the ascertained profits at the end of every five years, and to appropriate their share thereof, either as an immediate Cash Bonus, as an addition to the sum Assured, or it may be made a matter of special arrangement, and applied in any manner most convenient to the parties Assured. THE FIRST DIVISION under this Series took place on the 31st DECEMBER, 1850, and amounted, on an average, to A REVERSIONARY BONUS equivalent to about FIFTY-THREE PER CENT. upon the amount of Premiums paid.

TABLE showing the Actual CASH and REVERSIONARY BONUS added on the 31st December, 1850, to Policies effected in the Years 1846, 1847, 1848, 1849, and 1850:—

Year.	Present Age.	Sum.	Cash Bonus.	Reversionary Bonus.
1846	35	1,000	£42 12 0	£87 0 0
	50	1,000	59 4 0	98 6 0
1847	35	1,000	35 0 0	71 10 0

FIRE DEPARTMENT.

Fire Insurances may be effected at Moderate Rates upon every description of Property.

MARINE DEPARTMENT.

Marine Insurances may be effected at the Head Office of the Corporation. Policies for Sea Risks are also granted, claims on which are made payable in India and China, by the Corporation's Agents, at the following places:—Calcutta, Bombay, Madras, Canton, and Shanghai.

JOHN LAURENCE, Secretary.

SCOTTISH WIDOWS' FUND LIFE ASSURANCE SOCIETY.

FOUNDED A.D. 1815.

ON THE PRINCIPLE OF MUTUAL CONTRIBUTION.

THIS Institution, notwithstanding its local name, has long been favourably known to all classes in Great Britain and Ireland, and a better proof of the confidence reposed in it by the public could not probably be wished, than the fact that the **Average Amount of ASSURANCES effected during the last THIRTEEN YEARS has exceeded**

HALF A MILLION STERLING per Annum.

Being a Mutual Assurance Society, the Members are the only parties in any way interested in the Funds; they are, in point of fact, their own assurers, and whatever is paid by way of Premium, over and above what is actually required for [illegible] divided among the Assured—each member being entitled to elect whether he will have the value of his share handed over to him at once *in cash*, or have it applied as an addition to his Policy, or towards reduction of the future Annual Premiums.

As a proof of the working of this system it may be stated, that in the case of a Policy opened with this Society in the year 1819, and emerging in the present year (after payment of the Premium), the representatives of the Member would receive **more than double the amount of the original Assurance.**

THE CAPITAL OF THE SOCIETY, arising from the Accumulation of the Members' Premiums, amounts at this time to upwards of **TWO MILLIONS AND A QUARTER STERLING.**

ANNUAL REVENUE, upwards of THREE HUNDRED THOUSAND POUNDS.

Every information can be readily obtained by application at the Society's Head Office, or at any of the Agencies.

George Capron, Esq.

Policies do not become void by the Life Assured going beyond the prescribed limits, so far as regards the interest of third parties, provided they pay the additional Premium so soon as the fact comes to their knowledge.

"Free Policies" are issued, at a small increased rate of Premium, which remain in force, although the Life Assured may go to any part of the world.

The Tables are especially favourable to young and middle-aged Lives; and the limits allowed to the Assured, without extra charge, are unusually extensive.

Eighty per cent. of the Profits is divided at the end of every fifth year among the Assured.

At the First Division to the end of 1849, the addition to the amount assured averaged above 50 per cent. on the Premiums paid. [1 59

SOLICITORS.

Messrs. WATSON & SONS, Bouverie-street, Fleet-street.

This Company is founded on purely mutual principles: there is no proprietary under any form to absorb any portion of the profits, which all belong to the Members at large, by whom also the Directors are appointed.

During the year 1850 the following new Policies were executed, in addition to the old business:-

	No.	Amount.	Yearly.
Life Assurances . . .	809	£136,365	
Annuities	14	. . . . .	£202
Investments	410	27,964	
Total . .	1233	£164,329	£202

There were advanced to the Members in the same period, on various descriptions of available security, 7220l.

This Company is adapted to meet all the varied wants of its Members. By its Life Policies provision may be made for the evils anticipated from the death of the party assured. By its Deferred Annuities a certain income may be secured when advancing years render labour less remunerative. By its Immediate Annuities a sum of money which now yields an inadequate support in the shape of interest may be rendered much more productive; while the Investment Assurances enable every one to make provision for the time of sickness or other calamity requiring pecuniary aid. The employment of the funds in advances to the Members places within their reach the means of enlarging their trade capital, or of making advantageous purchases as opportunities offer.

As there are many important towns in which Agents are not yet appointed, the Directors are open to receive applications from respectable persons in such places. If not already Members of the Company, they will be required to become so by effecting a life assurance.

Upon receipt of two postage stamps the Prospectus, with Forms, &c., will be forwarded, in which some important and novel applications of Life Assurance will be found.

W. S. GOVER, *Actuary and Secretary.*

This Society (although entirely distinct in its funds and management) is conducted at the same Offices, and on the same principles, as the BRITISH EMPIRE MUTUAL LIFE ASSURANCE COMPANY.

It is designed to extend to Fire Assurance the Mutual principle which has been found so successful in its application to Life Assurance.

During the year 1850, 1680 new Policies have been issued, assuring property to the amount of £656,423. A large amount of business was obtained in former years.

The Profits are divided every three years.

Less than One-Third of the Premiums have paid all the Losses.

Assurances can be effected daily at the Chief Offices, or at any of the Agents of the Society throughout the Empire.

January 15*th*, 1851.

SOLICITOR—WILLIAM HENRY COTTERILL, Esq.
PHYSICIAN—G. BURROWS, M.D., F.R.S., 18, Cavendish-sq.

The principle adopted by the Universal Life Assurance Society, of an annual valuation of assets and liabilities, and a division of three-fourths of the profits among the assured, is admitted to offer great advantages, especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums. This practice of an annual division is especially advantageous to persons of advanced years, who cannot hope to participate in many septennial or decennial divisions.

The ANNUAL REDUCTION has averaged considerably **ABOVE 40 PER CENT.**, and in no one year has it fallen below that amount.

The attention of gentlemen connected with India is particularly requested to the regulations of this Society; as, on comparison with other offices, its terms will be found peculiarly advantageous, especially as regards the liberal plan adopted on the return of Indian Assurers to reside permanently in this country; and the Indian rates have been calculated from extensive data and tables, exclusively in the possession of this Society, by which the true risk of life during residence in India has been most accurately ascertained.

The Society is constituted on *purely mutual* principles, the *entire profits* being divided amongst the Members.

The total number of policies effected up to the 31st December, 1850, was 1786, for assuring 1,256,628*l.*

In the past year 200 proposals were made for assuring 120,213*l.*, of which number 155, for assuring 86,015*l.*, were accepted and completed.

The Divisions of Profit are made annually on the 31st December. Every Member participates therein who has paid two annual premiums on his policy.

Every Member shares in the Profits in proportion to the number and amount of the premiums paid, accumulated at compound interest.

At 31st December, 1850, the Society had been established nearly seventeen years, and the additions then allotted to the three oldest policies were as follow:—

Policy No.	Age at Admission.	Amount assured.	Premiums paid.	Additions.	Payable in case of death during 1851.
		£.	£. s. d.	£. s. d.	£. s. d.
	29	1000	408 0 0	306 3 0	1,306 3 0
	42	2000	1,218 6 8	757 3 0	2,757 3 0
	50	2000	1,541 6 8	858 4 0	2,858 4 0

ADVANTAGES OFFERED BY THIS OFFICE.

Long standing—Established 1819. Undoubted security from a large paid-up capital and accumulated premiums. Diseased lives assured at equitable rates.

The participating or non-participating scales of Premium: if participating, 80 per cent. is appropriated to Policy-holders every fifth year—if non-participating, the rates are as low as can with safety be charged. Liberty to the Insurer to proceed to, and reside in, places beyond the limits of Europe. Premiums on Policies receivable yearly, half-yearly, or quarterly, or on a descending scale; or Half Premiums received for five or seven years.

Loans granted on Policies, or on Freehold, Leasehold, or Copyhold Securities, accompanied by Policies of Life Assurance. Loans granted on undoubted Personal Security.

Policies granted to meet every contingency. Medical men remunerated for their reports. A liberal commission to solicitors and others bringing business to the Society.

By the condition of the Policies issued by this Company, it is agreed "that the documents upon the faith whereof the Policy is granted shall be conclusive evidence of the age and state of health of the party assured, unless fraud or wilful misrepresentation be discovered therein." *No probability of Claims being disputed, the Company having paid to Policy-holders nearly* 600,000*l. without dispute or litigation.*

Examples of Premiums for Insuring 100*l. on a single Life.*

WITHOUT PROFITS.									Age next Birthday.	WITH PROFITS.								
Quarterly.			Half-yearly			Yearly.				Yearly.			Half-yearly			Quarterly.		
£.	s.	d.	£.	s.	d.	£.	s.	d.		£.	s.	d.	£.	s.	d.	£.	s.	d.
0	9	4	0	18	1	1	14	5	20	1	18	3	1	[illegible]	0	0	10	3
0	12	0	1	3	2	2	4	0	30	2	8	1	1	5	3	0	13	0
0	15	8	1	10	6	2	18	0	40	3	3	6	1	13	4	0	17	3
1	2	0	2	3	0	4	2	0	50	4	8	8	2	6	3	1	3	9
1	14	6	3	7	6	6	8	6	60	6	13	6	3	10	0	1	16	0

The next Bonus will be declared in 1855, and afterwards at the expiration of every fifth year. Every Bonus will be added to the sum insured; but the person entitled thereto may arrange with the Company at any time within three months after the declaration thereof to receive the value—In cash: *or* In an equivalent reduction of future Premiums: *or* If the Bonus amount to 50*l.* or upwards, may have a new Policy on the life, free from the payment of any Premium: *or* The Bonus may be dealt with as shall be specially agreed upon.

William Barton Ford, Secretary. [1 149

HOLDERS of LIFE-ASSURANCE POLICIES, *and those who wish to effect* Life Assurances, are invited to write to HENRY AGGS, of 1a, Bishopsgate Street Within, London, who, without charge, will communicate important information. All letters are expected to be prepaid, but replies will be unstamped, unless provided. [1 299

BRITISH LYING-IN HOSPITAL
FOR MARRIED WOMEN.

FOUNDED IN BROWNLOW-STREET, 1749.
REBUILT IN ENDELL-STREET, LONG-ACRE, 1849.

SUPPORTED BY VOLUNTARY CONTRIBUTIONS.

THIS HOSPITAL (which was the first Institution of its kind) is capable of accommodating from 30 to 40 Patients; but to have the wards always occupied, additional support is necessary, as its resources are seriously reduced by the great and unavoidable expenses incurred in erecting the new building. Medical Attendance and Medicines are also provided for a large number of Patients at their own homes.

MEDICAL OFFICERS.

Consulting Physician.—Dr. HENRY DAVIES.
Dr. ROBERT LEE, 4, Saville-row.
BENJAMIN BROOKES, Esq., 37, Bedford-street, Covent-garden.
Dr. JOHN CLARKE, 3, Clifford-street.

Secretary.—Mr. R. S. DAVIES, at the Hospital.

Bankers.—Messrs. HOARE, 37, Fleet-street.

By all of whom Subscriptions and Donations will be thankfully received. [I 21

PRAYER-BOOK AND HOMILY SOCIETY.

Established 1812.

OFFICE, 18, SALISBURY-SQUARE, FLEET-STREET.

Patron.

His Grace the Archbishop of Canterbury.

President.

The Most Noble the Marquis of Cholmondeley.

THIS Society is instituted for the circulation of the various Works which have been set forth by authority of the United Church of England and Ireland, both in the original and by means of translations.

Its funds, which arise from voluntary contributions, are employed in the active distribution of its various publications amongst those who are unable to procure them through the usual channels, either by free grant or by sale at less than the original cost.

Frequent testimonies are borne by Christian Missionaries, in various parts of the world, to the usefulness of the Society's labours, especially in the improvement and establishment of converts from heathenism, and in raising the tone of devotional feeling in congregations of native Christians.

The Society's labours at home may be exemplified by reference to its operations amongst Seamen and Emigrants. The agents visit almost every emigrant ship and large numbers of trading vessels in the port of London: the nature of the books which are offered is fully and candidly explained, and their use both individually and socially is affectionately urged upon the people. Social worship is frequently established on board in consequence of these persuasions, and by the help of the books supplied. A few years ago it was a very rare thing to hold divine worship on board ship; but now the crews of *considerably more than half* the ships visited in the port of London are assembled for that purpose on the Lord's Day.

The Society's *General Fund* is available for the expenses of translations, &c.

The operations on ship-board are supported by the *Special Fund for Emigrants and Seamen*; whilst the *Special Fund for Ireland* is devoted to efforts for spreading the light of the Gospel in that country.

Subscriptions and donations in aid of either of these funds will be thankfully received by the Secretaries.

The following list will give a general idea of the nature of the Society's publications :—

Arabic: Portions of Liturgy; Articles of Religion; Homily, 'On Reading the Scriptures.'
Bullom: Portions of Liturgy.
Chinese: Portions of Liturgy.
Danish: Homilies, 'On Reading the Scriptures,' &c.
Dutch: Prayers; Homilies, 'Of Faith,' 'Of Repentance,' &c.; also for Christmas Day, Good Friday, &c.
English: Prayer-Books of all sizes and prices; Arranged Services for Sundays; Family Prayer-Books; Collects and Catechism; Homilies, in volumes and tracts; Jewell's Apology; Nowell's Catechisms, &c. &c.
French: Prayer-Book; Selection of Prayers; Homilies in tracts—various subjects.
Gaelic: Family Prayers, and Homilies (in preparation).
German: Prayer-Book; Arranged Services; Homily tracts on various subjects.
Greek and Modern Greek: Prayer-Book.
Hebrew: Prayer-Book; and (in Rabbinical Heb.) Homilies, 'On Reading the Scriptures,' and for Christmas Day.
Indo-Portuguese: Prayer-Book; and Homilies, 'On Reading the Scriptures,' &c.
Irish: Portions of Liturgy; Prayer-Book reprinting; Homilies in preparation.
Italian: Prayer-Book (improved translation); Homily, 'Of Faith,' 'Of Prayer,' for Christmas Day, &c.
Latin: The Thirty-nine Articles of Religion.
Maori (New Zealand): Arranged Sunday Services; Family Prayers, nearly ready.
Persic: Portions of Liturgy.
Polish: Prayer-Book.
Portuguese: A Manual of Prayers; Homily, 'Against the Fear of Death,' &c.
Spanish: Prayer-Book; Selection of Prayers; and Homilies, 'Against the Fear of Death,' &c.
Swedish: Homilies, 'Of the Misery of all Mankind,' &c.
Welsh: Prayer-Book; Homilies, 'Of Salvation by only Christ our Saviour,' &c. [1 180

Auditors—Thomas Hunt, Esq.; Henry Kingscote, Esq.; Capt. the Hon. Francis Maude, R.N.

Treasurer—Benjamin Bond Cabbell, Esq., M.P., F.R.S., F.S.A. **Honorary Secretary**—The Rev. David Laing, M.A., F.R.S.

Bankers—Sir S. Scott and Co., 1, Cavendish-square; Messrs. Strahan and Co., Temple-bar.

Secretary—C. W. Klugh, Esq., 32, Sackville-street. **Secretary to the Provident Fund**—Thomas Bayly Parker, Esq.

Membership consists in the payment of an Annual Guinea, or of Ten Guineas in one sum. Subscribers are entitled to vote for Annuities in the proportion of one Vote for each Annual Half-Guinea, not in arrear, and for each Donation of Five Guineas. Subscriptions are due on the 1st of January, and can always be remitted by Post-office order, or by a cheque crossed "Sir S. Scott and Co."

THE GOVERNESSES' INSTITUTION has been established to raise the character of Governesses as a class, and thus to improve the tone of Female Education; to assist Governesses in making provision for their old age; and to assist in distress and age those Governesses whose exertions for their parents or families have prevented such a provision.

To facilitate the operations of the Institution, its proceedings are subdivided into the following branches; and every gift is devoted solely to the object for which it is given.

TEMPORARY ASSISTANCE to Governesses in distress, afforded privately and delicately through the Ladies' Committee.

ANNUITY FUND.—Elective Annuities to aged Governesses, secured on Invested Capital, and thus independent on the prosperity of the Institution.

It is necessary that a capital should be raised, from the interest of which Annuities may be given; as to profess to grant Annuities from annual subscriptions—from a fluctuating income, which any change of public opinion, or accidental circumstances, might destroy—would be to risk disappointment to the aged annuitants at (perhaps) the most painful and inconvenient time. Many Annuities have been founded by investments in the three per cent. Consols; and it is intended to elect at least two Annuitants in each succeeding May and November, should the funds be received. The candidates, who must be Governesses above fifty years of age, require to be approved by the Committee.

To carry out this design—the establishment of permanent Annuities, granted from funded capital—the Committee invite benevolent individuals of large fortune to found Annuities bearing their own name. Fellowships and scholarships are thus founded for those of the other sex who labour with the mind; and surely we should not be forgetful of those whose minds labour to mould the characters of English wives and mothers.

The Hon. Mrs. Ashley has most kindly opened a Fund to raise all the Society's Annuities to 20*l.*; and has already received 800*l.* towards this desirable object. Any donations which may be kindly given may be addressed "The Hon. Mrs. Ashley, to the care of the Secretary."

PROVIDENT FUND.—Provident Annuities purchased by ladies in any way connected with Education, upon Government Security, agreeably to the Act of Parliament.

This branch of the Institution has been very successful. Any lady can have the Tables of Rates and other particulars forwarded to her, on application to the Secretary at the Office; and, if she will consult any gentleman connected with monied details, she will learn that she cannot otherwise have such terms with such security.

This branch includes a Savings-bank; each lady's money standing in her own name, and removable only by her own order.

A HOME for Governesses during the intervals between their engagements.

The Home—in Harley-street—is principally self-supporting, the ladies paying a certain weekly sum for board and lodging. The admission is by a Committee of Ladies, on written introductions. The facilities for re-engagements are so great to ladies from the country, and the arrangements are so private and comfortable, that the Home is in much request.

REGISTRATION FREE OF EXPENSE.—Books being provided at the Home, with lists both of vacant engagements and of disengaged Governesses, the nobility and gentry find the benefit of such opportunities for selection; whilst the immense connexion of the Society affords great advantages to the Governess, without the slightest expense.

A COLLEGE for Governesses has been established, named Queen's College, by Royal Permission. A Committee of Education has been formed of gentlemen of high standing and experience, by whom certificates of qualification are given to Governesses in any branch of instruction without fee. Any lady sending in her name, and stating in what subjects she seeks examination, will have an immediate appointment for the purpose. It will now rest with parents to make engagements contingent, if they please, upon the production of certificates. Classes are open in all subjects of instruction.

About 340 certificates have been issued since the opening of the College; arrangements have been made for the Free Education of a certain number of Pupils, dependent on Governess-relatives; and large evening classes have been established, with Free Lectures, for Governesses engaged during the day.

AN ASYLUM FOR AGED GOVERNESSES, built for Eighteen, but capable of enlargement to any extent. Additional apartments for two are estimated at 200*l.*; Endowments for each, 500*l.*, or 15*l.* per annum, legally and permanently secured. Age for admission, Sixty: Election, as for Annuitants. The inmates are wholly maintained. [1153

RELIGIOUS TRACT SOCIETY,

INSTITUTED A.D. 1799.

Treasurer—JOHN GURNEY HOARE, ESQ.
Honorary Secretaries—Rev. W. W. CHAMPNEYS, M.A., *Rector of Whitechapel*, and Rev. EBENEZER HENDERSON, D.D.
Corresponding Secretary and Superintendent—Mr. WM. JONES. *Assistant Secretary and Cashier*—Mr. WM. TARN.

THE Society has issued works in about 110 different languages and dialects; specimens of some of which are shown in the Great Exhibition.

The present annual circulation of the Society's works amounts to about TWENTY-FOUR MILLIONS; its receipts to about 61,000*l.*; and its total distribution, to March, 1850, including the issues of its foreign Societies, to about FIVE HUNDRED AND TWENTY-FOUR MILLIONS of copies.

The sale of the publications is made to cover all the expenses of production and distribution. Thus *the whole of the subscriptions, &c., are applied to the gratuitous circulation of its works, without any deduction or charge whatever.*

THE INDUSTRIAL EXHIBITION.

Extensive supplies of books and tracts, in many of the Continental languages, have been prepared for circulation among the foreign visitors to the Great Exhibition. To facilitate this object they have reduced the price of all tracts in foreign languages to the same scale as English Tracts—equal to a reduction of one-fourth. All persons purchasing foreign tracts, for gratuitous circulation, to the amount of 20*s.*, will be supplied at half the *Catalogue* prices. The Committee have engaged eligible premises at No. 164, PICCADILLY, as their WESTERN DEPOSITORY.

PUBLICATIONS.

THE MONTHLY VOLUMES: a Series of Popular Works, elegantly written, on History, Biography, Science, Religion, &c. Sixty-six volumes are already published. Each vol. contains 192 pages of good bold letterpress, and occasionally illustrated with engravings;—6*d.* in fancy covers; and 10*d.* in cloth boards, gilt edges.

EDUCATIONAL SERIES, for Schools and Families, consisting of the HISTORY OF GREECE to A. D. 1833, 12mo., with map, cloth, 2*s.* 6*d.*—HISTORY OF ROME, to the Fall of the Empire, 12mo., with three maps, 3*s.*—LIVES OF ILLUSTRIOUS GREEKS, 12mo., 3*s.*—A UNIVERSAL GEOGRAPHY, in four parts, Historical, Mathematical, Physical, and Political, with ten coloured maps, 12mo., boards, 5*s.*—PALEY'S HORÆ PAULINÆ, with notes and supplementary treatise, by Rev. T. R. Birks, A.M., with maps, 3*s.*—PALEY'S EVIDENCES OF CHRISTIANITY, with introduction, notes, and supplement, by Rev. T. R. Birks, A.M., with Map, 3*s.*

THE ANNOTATED PARAGRAPH BIBLE: containing the Old and New Testaments, according to the authorised version, arranged in paragraphs and parallelisms; with explanatory notes, prefaces to the several Books, and an entirely new selection of references to parallel and illustrative passages. Part I. The Pentateuch. Super-royal 8vo. 3*s.*, neat cover.
[To be completed in six parts.]

POCKET PARAGRAPH BIBLE. With maps. 4*s.* cloth boards; 5*s.* roan gilt; 6*s.* morocco; 7*s.* Turkey morocco.

COMMENTARY, WITH THE HOLY BIBLE: The Text according to the authorized version. The Comment from HENRY and SCOTT, and from other authors; with marginal references, maps, and various useful tables. Super-royal 8vo. Complete in six vols. 2*l.* 14*s.* boards; 3*l.* 18*s.* half bound; 4*l.* 14*s.* calf; 5*l.* 6*s.* calf extra. With numerous engravings, portraits, &c. 60*s.* boards.

COMMENTARY: the same as above, without the Text. 12mo. 6 vols. neat, in cloth, 32*s.*; half bound 38*s.*; calf 44*s.*

HISTORY OF THE REFORMATION. By Dr. MERLE D'AUBIGNE. Demy 8vo. 4 vols in 1. With new preface, and numerous additions. The 4th part being the English original. Cloth bds. 6*s.*; or in two vols. 7*s.*
The Library Edition, in 4 vols., price 14*s.* boards.

ANTIQUITIES OF EGYPT: with a particular notice of those that illustrate the Sacred Scriptures. Many engravings. 8vo. 10*s.* cloth boards.

HISTORY OF THE VAUDOIS CHURCH. By ANTOINE MONASTIER, formerly Pastor in the Canton de Vaud. 12mo., with a map of the valleys, 4*s.* boards.

LUTHER: his Mental and Spiritual History: with special reference to its earlier periods, and the Opening Scenes of the Reformation. By BARNAS SEARS, D.D. 12mo. 4s. boards.

THE HISTORY OF THE JEWS, from the Call of Abraham to the Birth of Christ. Illustrated with steel and wood engravings. In 2 vols. 12mo., 8*s.* boards; 10*s.* half bound.

THE JUBILEE MEMORIAL of the RELIGIOUS TRACT SOCIETY: containing a record of its Origin, Proceedings, and Results. A.D. 1799 to A.D. 1849. By WILLIAM JONES, Corresponding Secretary. 8vo. with portraits engraved on steel, 7*s.* extra cloth boards.

Catalogues of the Society's Tract, Book, and Foreign Publications may be obtained at either of the above Depositories, or forwarded by post. Applications in reference to the funds and publications may be addressed to Mr. WILLIAM JONES, 56, *Paternoster-row.*

Published Monthly, Price 1s.,

The Journal of Design and Manufactures,

CONTAINING

ACTUAL FABRIC PATTERNS AND ENGRAVINGS.

THE JOURNAL OF DESIGN AND MANUFACTURES is addressed to the PRODUCERS and CONSUMERS of all DECORATIVE MANUFACTURES, as well the MERCHANT, the MANUFACTURER, the DESIGNER, the ART WORKMAN, as the GENERAL PUBLIC.

The JOURNAL of DESIGN and MANUFACTURES advocates—

The Recognition of Sound Principles of Design, and the Necessity for a Faith in them.

The Application of these Principles to Manufactures and Purposes of Utility.

The Progress of Design in accordance with the Wants and Sentiments of the Present Age rather than a Slavish Repetition of the Ancient or Mediæval Art of Past Ages.

The Improvement of the Laws regulating Copyright of Design and the Extension of the Period of Copyright.

The Diffusion of Art-Education through all Classes, and the Increased Efficiency of Schools of Design. And

The Establishment of Public Exhibitions of Decorative Manufactures.

Four Volumes of the JOURNAL OF DESIGN AND MANUFACTURES are now completed, price 7*s.* 6*d.* each, bound. During their progress, the effect and soundness of the principles advocated in them have been signally shown in the extension of Copyright of Design, in the amendment of the Schools of Design, in the general improvement of Decorative Manufactures; but, above all, in the success of the Great Exhibition of the Works of Industry of all Nations, which the JOURNAL OF DESIGN AND MANUFACTURES consistently supported as a theory, long before it became a great fact.

THE JOURNAL OF DESIGN AND MANUFACTURES is the only publication in Europe which inserts in its pages SPECIMENS OF ACTUAL FABRICS.

DURING THE EXHIBITION the *Journal of Design and Manufactures* will insert **SPECIMENS** of the finest woven fabrics, &c., exhibited.

PUBLISHED BY

CHAPMAN & HALL, 193, PICCADILLY, LONDON;

H. MANDEVILLE, PARIS; BOHAIRE, LYONS; LEBRUMENT, ROUEN; C. MUQUARDT, BRUSSELS.

FIRE-PROOF WAREHOUSE,

For Deposit of Books and Printed Papers.

J. BIGG AND SONS have recently erected, IN THE NEIGHBOURHOOD OF PARLIAMENT STREET, a capacious WAREHOUSE, constructed solely of Brick, Iron, and Slate, with the view of providing a BUILDING where BOOKS and PRINTED PAPERS may be DEPOSITED in perfect SECURITY against ACCIDENT BY FIRE, and in which any quantity of Books and Papers can be so ARRANGED that any Volume or Paper may be immediately referred to without the slightest delay.

THE TERMS (per annum) for Warehousing Books and Printed Papers (such as Parliamentary Reports, &c.,) are as follow:—Any quantity not exceeding 5 cwt., 20s.; exceeding 5 cwt., and under 10 cwt., 36s.; exceeding 10 cwt., and under 15 cwt., [illegible]; exceeding 15 cwt., and under 20 cwt., 63s.; and for each additional 5 cwt., 16s. The Warehouse Charges to be paid half-yearly, in June and December.—Any fractional part of 5 cwt. to be charged as 5 cwt., and any period less than twelve months to be charged as one year.

Acts of Parliament.—The Public, Local, and Private Acts (either in Volumes or separate Acts) constantly on sale. Indexes to all the Acts passed from 1800 to the present time can be consulted at 53, Parliament Street, by any gentleman desirous of obtaining the Statutes on any particular subject.

New Works and Periodicals PUNCTUALLY SUPPLIED ON THE DAY OF THEIR PUBLICATION.

C. COX, 12, KING WILLIAM STREET, STRAND.

PICTORIAL WORKS

ORIGINALLY PUBLISHED BY C. KNIGHT, AND NOW SOLD BY

C. COX, 12, KING WILLIAM STREET, STRAND.

1.

EXHIBITION OF 1851.—INSTRUCTIVE COMPANION.

PICTORIAL GALLERY OF ARTS.

The Volume of "**THE USEFUL ARTS,**" complete, with **1570 ENGRAVINGS,** *elegantly bound in cloth*, price 16s. 6d.

"**THE FINE ARTS,**" *elegantly bound in cloth*, price 18s. Architecture—Sculpture—and the History of Painting, by Ralph N. Wornum, with 1650 Engravings.

2.

With **4000 WOODCUTS,** *in 27 Shilling Parts, or 34s. 6d. in 2 handsome volumes, cloth.*

THE PICTORIAL MUSEUM OF ANIMATED NATURE.

The reader, at the very smallest price, is put in possession of, by far, the most extensive collection that has ever been produced, of pictorial representations of all the important quadrupeds, birds, fishes, reptiles, and insects which fill the earth; with a corresponding description of the animal, its structure, its habits, its localities, its use; not given in a dry and repulsive form, but with that simplicity which may furnish just conceptions to all, but especially to the young, of the wonders and beauties of God's creation.

3.

With **1500 WOODCUTS** *and* **13 COLOURED MAPS,** *forming a* SCRIPTURE ATLAS; price 20s. *in Parts, or in handsome cloth* 24s.,

THE PICTORIAL SUNDAY-BOOK.

By JOHN KITTO, D.D., F.S.A., Editor of the Pictorial Bible.

The publication now submitted to Christian families is intended to present, at the very cheapest rate, a series of Engravings illustrative of the Bible History, the Prophecies, the Psalms, the Life of Our Saviour, and the Acts of his Apostles; exhibiting the Scenes of the great Events recorded in Scripture, the Customs of the Jews, the Natural History of the Holy Land, and the Antiquities which throw a light upon the Sacred Writings, with a body of Scriptural Narrative and Explanation, continuing from number to number; each number forming, as it is judged, a fitting portion for a Sunday's leisure.

THE SCRIPTURE ATLAS, with the Geography of the Holy Land, is sold separately, price 7s. *sewed, or* 9s. *cloth.*

A PICTORIAL COMPANION AND KEY TO EVERY HISTORY OF ENGLAND

With **3000 WOODCUTS** *and* **24 COLOURED ENGRAVINGS,** price 36s. *in Twenty-four Parts, or* 2 *handsome Volumes, cloth,* 2*l.* 5s.,

OLD ENGLAND.

A PICTORIAL MUSEUM OF NATIONAL ANTIQUITIES.

This Work opens to all ranks, at the cheapest rate, a view of the regal, ecclesiastical, baronial, municipal, and popular antiquities of England, given in a chronological order; and thus the Work is a Companion and a Key to every English History. The Engravings embrace the most remarkable of our buildings from the earliest times—Druidical Remains, Cathedrals, Abbeys, Churches, Colleges, Castles, Civic Halls, Mansions, Sepulchral Monuments of our Princes and Nobles; Portraits of British Worthies, and representations of localities associated with their Names; ancient Pictures and Illuminations of Historical Events; the Great Seals and Arms of the Monarchy; Coins and Medals; Autographs; with the fullest Pictorial indications of the Industry, the Arts, the Sports, the Dresses, and the Daily Life of the People.

5.

Price 18s. *in Parts, or* 1*l.* 2s. 6*d. in handsome cloth,*

OLD ENGLAND'S WORTHIES.

A Gallery of 72 Portraits on Steel, and 12 Splendid Illuminated Engravings of some remarkable place or monument associated with the Life of some one of "OLD ENGLAND'S WORTHIES," arranged in a chronological order, thus enabling the reader to become familiar with the greatest names of his countrymen, in illustrative succession.

STANDARD FRENCH SCHOOL-BOOKS,

BY THE LATE M. DE ROUILLON.

1. GRAMMATICAL INSTITUTES OF THE FRENCH LANGUAGE; or, the Teacher's French Assistant: containing a Series of Theoretical, Practical, and Progressive Lessons, in which every difficulty is explained, either in Notes at the end of each Exercise, or by References to preceding Rules. 8th Edition, 5*s.* half-bound.—Key to the same, 3*s.*

2. EXERCISES ON FRENCH CONVERSATION; or, a Selection of English Sentences to be translated into French; and in which the difference of the Idioms, Genius, and Phraseology of the French and English Languages may be readily distinguished. 6th Edit. 18mo. 3*s.* 6*d.* half-bound.—Key to the same, 2*s.*

3. THE TOURIST'S FRENCH COMPANION; or, Familiar Conversations on every subject which can be useful to the Continental Traveller or the French Student in general. 13th Edit. 18mo. 4*s.* 6*d.*

*** The sale of more than 30,000 copies of this work strongly attests its value. The sentences are expressed in elegant language, and, in order to facilitate the pronunciation, the *silent letters* are printed in italics.

London: LONGMAN and Co.; HAMILTON and Co.; SIMPKIN, MARSHALL, and Co.; WHITTAKER and Co.; W. ALLAN; and AYLOTT and JONES. Norwich: CHAS. MUSKETT. And all Booksellers. [I 157

THE HANDBOOK

To the County Courts,

Price 3*s.* *bound in cloth, with Coloured District Map,* 4*s.* 6*d.*

By D. E. COLOMBINE, Solicitor, 87, St. Martin's-lane,
and 3 (a), John-street, Brompton. [I 114

Published by SIMPKIN, MARSHALL, and Co., Stationers'-court.

NEWSPAPER FOR THE FARMING AND GARDENING INTEREST.

Every Saturday is published, price Sixpence, free by Post, each Volume complete in itself,

Enlarged to Twenty-four Folio Pages,

THE GARDENERS' CHRONICLE

AGRICULTURAL GAZETTE;

A Weekly Record of Rural Economy and General News.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

THE FARMING PART (under the Editorship of a practical Farmer) treats of-

The Practice of Agriculture
Agricultural Science
Animal and Vegetable Physiology
Improvements in Implements, described by Woodcuts whenever requisite
Better modes of Husbandry
Results of Experimental Farming
Growth and Rotation of Crops
Management of Stock
Veterinary Science
Drainage
Irrigation
Foresting
Road-making
Farm-Buildings
Labourers
Treatment of Poultry
Agricultural Publications

In short, whatever affects the beneficial employment of capital in land.

Reports are regularly given of the English, Scotch, and Irish Agricultural Societies and Farmers' Clubs—London Market Prices of Corn, Hay, Cattle, Seeds, Hops, Potatoes, Wool, Coal, Timber, Bark, &c., and the Weekly Averages.

AS REGARDS THE GARDENING PART (under the Editorship of Dr. Lindley), the principle is to make it a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Garden Botany, and such Natural History as has a relation to Gardening, with Notices and Criticisms of all Works on such subjects. Connected with this part are

WEEKLY CALENDARS OF GARDENING OPERATIONS,

given in detail, and adapted to the objects of persons in every station of life; so that the Cottager, with a few rods of ground before his door, the Amateur who has only a Greenhouse, and the Manager of extensive Gardens, are alike informed of the routine of Operations which the varying seasons render necessary. It moreover contains Reports of Horticultural Exhibitions and Proceedings—Notices of Novelties and Improvements—in fact, everything that can tend to advance the Profession, benefit the condition of the Workman, or conduce to the pleasure of his Employer. Woodcuts are given whenever the matter treated of requires that mode of illustration.

REPLIES TO QUESTIONS connected with the object of the Paper are also furnished weekly.

Lastly, that description of **DOMESTIC AND POLITICAL NEWS** is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any Party; their earnest endeavours are to make THE GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE a full and comprehensive *Record of Facts* only—a Newspaper in the true sense of the word—leaving the Reader to form his own opinions: their object being the elucidation of the laws of Nature, not of Man. The reader is thus furnished, **IN ADDITION TO THE PECULIAR FEATURES OF THE JOURNAL**, with such information concerning the events of the day as supersedes the necessity of his providing himself with any other Weekly Paper.

A PROSPECTUS, WITH LIST OF CONTRIBUTORS, may be had on application, or by letter, at the Office, 5, Upper Wellington Street, Covent Garden, London. [I 76

MEDICAL WORKS LATELY PUBLISHED.—1. On Neuralgic, Rheumatic, and other Painful Diseases. 2. On Headache. 3. On Cancer. 4. On Indigestion. 5. On Stricture of the Urethra. 6. NISSEN & PARKER,

STATIONERS, ENGRAVERS, AND PRINTERS,

43, MARK LANE,

Corner of Great Tower-street, London.

CHEMICALLY PREPARED PAPER FOR BANK CHEQUES.

NISSEN AND PARKER solicit inspection of their Printing for BANK CHEQUES on terms considerably lower than usually offered by the trade. *The enormous prices* that have been kept up by the London houses have long been an objection in establishments where the consumption of Cheques and Credit Letters is extensive.

The PAPER for Bank Cheques prepared by NISSEN and PARKER has proved to be the most effectual ever discovered for prevention of alteration by acids or alkalis; and during the past four or five years upwards of *Six Millions* of these Cheques have been supplied.

CHEQUES, on tinted paper, (*secure from any alteration by the application of acids*), per ream of 4800, including all charges for engraving, &c. . . . . 2*l.* 15*s.*

[Bound in slip books 1*d.* each, and numbered consecutively at a small additional charge.]

CONTRACTS ON A REDUCED SCALE FOR PUBLIC COMPANIES.

Specimens and Designs free to all parts of the Kingdom.

[COPY.]

s to insure detection.

price 1*l.* 5*s.* each,

THE ROYAL PHRASEOLOGICAL

French-English and English-French Dictionary.

By J. C. TARVER, French Master, Eton College.

"Most readily do we acknowledge the flood of light which has been thrown on French phrases by M. Tarver. . . . His work is really a valuable addition to our Dictionary shelf—the most important shelf in every man's library. The nice skill with which he has compared and contrasted the *phrases* of the two most influential of modern tongues can hardly be over-praised."—*Quarterly Review, September*, 1850.

Dulau & Co., Soho-square.

Dedicated, by Royal Authority, to H. M. the Queen.

This day is published, one vol. royal 8vo., price Two Guineas,

O'Byrne's Naval Biography

OF ALL LIVING OFFICERS,

FROM THE RANK OF ADMIRAL OF THE FLEET TO THAT OF LIEUTENANT, INCLUSIVE.

"The Admiralty have awarded the compiler of that eminently useful and valuable book of reference, O'Byrne's Naval Biography, the sum of 100*l.*, as a mark of their Lordships' appreciation of the labour and perseverance therein exhibited."—*Times, Dec.* 24, 1849.

Price 3*s.*, *Third Edition of* 3000 *copies, with*

A NEW CHAPTER ON POISONS

Household Surgery;

OR, HINTS ON EMERGENCIES.

With many additional Hints.

By JOHN F. SOUTH, Surgeon to St. Thomas's Hospital.

Extract from Preface to the Third Edition.

"It having been suggested that it would be advantageous in a little book, now on most folks' table, to add some hints of what should be done when poison has been accidentally or purposely taken, and the prompt determination and counter-action of which is of the first importance, I prevailed on my friend Dr. Gladstone to furnish me with a short notice of the more common poisons, and the mode in which they may be managed forthwith, in the *absence or during the delayed attendance* of a doctor of either of the three denominations; and he has executed his task with much ability and plainness, so that the most simple person may easily follow out his directions."

Price 13s. cloth, or in Twelve Shilling Parts, the

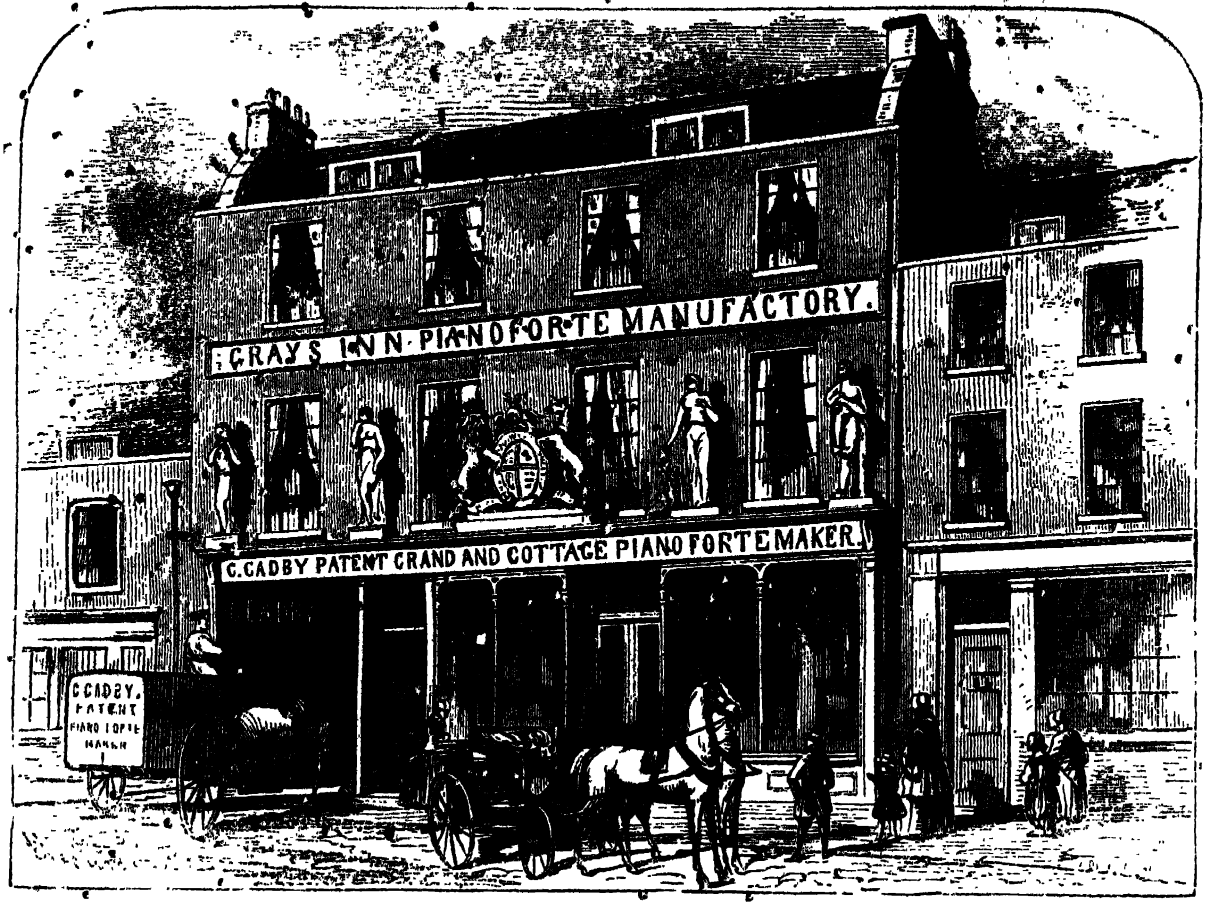
Works of William Shakspere.

Illustrated by W. HARVEY.

Containing his Plays and Poems, from the Text of the Editions by Charles Knight;

With Explanatory Notes and Facts connected with his Life and Writings.

C. Cox, 12, King William-street, Strand.



GRAY'S INN PIANOFORTE MANUFACTORY.
C. CADBY PATENT GRAND AND COTTAGE PIANO FORTE MAKER.
C CADBY.
PATENT
PIANO FORTE
MAKER

C. CADBY, 33½, Liquorpond Street,

IS THE ONLY MAKER IN LONDON OF THE

PATENT IRON TRUSS BRACED PIANOFORTE,

WHICH IS SO SUITABLE FOR SHIPPING.

The great improvement in these Pianofortes consists in the construction of the Sounding-board, which, in place of being, as in the ordinary mode of construction, tightly glued to the wooden framing of the instrument, is in this patented method suspended by metallic clamps, springs, or screws, so as to admit of being wholly or partially tightened. Instead of the tone being partially absorbed and deadened by the attachment on ordinary sounding-boards to the framing, a defect inseparable from the old construction, the Patent Sounding-board, by its isolation, and by the arrangement of the springs or clamps, retains a much greater and longer vibration, and the tone is not dissipated, but flows on clearly and distinctly, giving to the ordinary Pianoforte much of the clearness and effect of the flageolet and diapason stops of the Organ. It is important to observe, that the usual arrangement of the Piano is in every other respect followed. There is no change in the method of playing, no difference is observed in fingering, and the pedal movements are identical with the ordinary instrument.

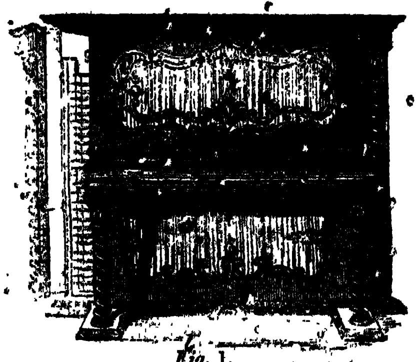


Fig. 1.

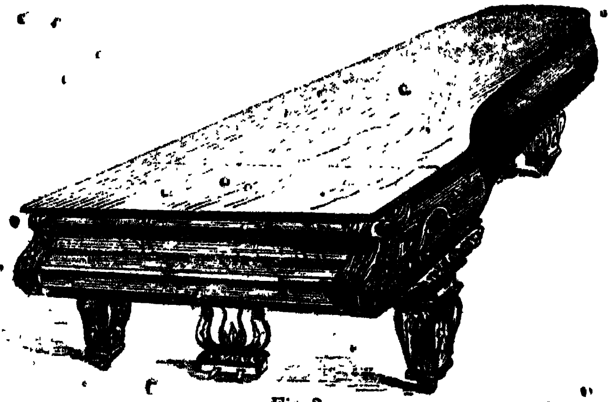

Fig. 2.

Fig. 1 shows a Semi-cottage Pianoforte with the left-hand side open, which presents a perfect view of the suspension principle. *Fig.* 2 is a drawing of a Grand Pianoforte upon the same principle, though not shown in this as in *Fig.* 1.

PIANOFORTES MADE AT THE SAME ESTABLISHMENT FOR THE MILLION,

Price, in MAHOGANY, *for* 6¾ OCTAVES, 25 *Guineas ; in* ROSEWOOD *or* ZEBRA, 26 *Guineas.*

OPERA BOX OFFICE,

New Burlington-street, London. [1 111

T. C. JONES and Co., MAKERS and INVENTORS of the TWIN or FAMILY PIANO for Two, Four, or Six Performers, provisionally Registered for the Great Exhibition of 1851; also of the New Twenty-Guinea Piano, unsurpassed at the price.

21, Soho Square. (*See Catalogue.*) [1 95

MESSRS. TOWNS & PACKERS, 20, OXFORD STREET.—HORIZONTAL SEMI-GRAND TRANSPOSING PIANOFORTE.—To transpose Music by semitonic progression two whole tones higher or lower than the original Scale or Key in which it was composed, for the accommodation of Singers. Its novelty is attributable to the introduction of a power by which *the key-board is moved* for the purposes of transposition, and its superiority is the fact that the tone and touch are not in the least affected by the use of this moving power. This Instrument has *the repetition touch* so much approved of by the Profession in the Grand Pianofortes. [1 100

SACRED HARMONIC SOCIETY,

EXETER HALL.

Conductor . . . . **Mr. COSTA.**

THE COMMITTEE beg to announce, that, in order to afford Visitors to the Great Exhibition the opportunity of witnessing the grand performances of this Society, the usual season will be extended, and a series of popular Oratorios be given on several FRIDAY EVENINGS during the months of MAY and JUNE, commencing with Mendelssohn's 'ELIJAH,' on the 2nd and 16th of May.

The most efficient Vocalists will be engaged, and the entire Orchestra, the *largest* available in Exeter Hall, will consist of (including Sixteen Double-basses) nearly

SEVEN HUNDRED PERFORMERS.

Prices of Tickets of Admission, *which should be secured early.*

For the body of the Hall	*Three Shillings.*
For Reserved Seats in Area or Gallery .	*Five Shillings.*
For Central Area do. numbered as Stalls	*Ten Shillings and Sixpence each.*

To prevent disappointment and imposition, strangers are cautioned to observe that the headings of this Society's announcements are precisely as above; that the price of each saleable Ticket is legibly printed upon it; and that the Agents of the Society are prohibited from making any increased charge—the Honorary Secretary's name, as under, being engraved upon each Ticket.

The Society's sole Office is No. 6 Room, within Exeter Hall (at the end of the right-hand side of the passage entering from the Strand), where, or of Mr. Bowley, 53, Charing-cross, full particulars and Tickets may be obtained.

T. BREWER, *Hon. Sec.*

A model of the arrangement of the Orchestra has been placed in the Exhibition, *and will be found in the Western Nave.* [1 234

MUSIC.

MESSRS. ROBERT COCKS & CO., EXHIBITORS,

Music Publishers (by Special Warrant) *to*

HER MOST GRACIOUS MAJESTY THE QUEEN,

NEW BURLINGTON-STREET, LONDON.

"The Messrs. Cocks and Co.," says the *Court Journal*, speaking of the above firm, "commenced as music publishers some twenty-five years back. From that time they have been publishing standard works and novelties by the first professors of the age, both native and foreign, until their leviathan catalogue has reached to a number of plates exceeding 250,000. No other music publishers in England—we should say, in Europe—possess a catalogue containing such variety, or such sterling, standard, and popular works, for every description of musical instrument, and for the science of music generally."

The following works may be cited as constituting a small portion of their valuable stock:—

Boyce (Dr.), Collection of Cathedral Music, edited by Joseph Warren, 3 vols. large folio. (*Exhibited—see* Catalogue.)

Albrechtsberger's, Cherubini's, & Weber's Theoretical Works.

Czerny's Royal Pianoforte School and School of Practical Composition.

Warren's Church Service, 373 Chants, Psalmody, and Organ Works.

Beethoven, Haydn, & Mozart—All their Quartetts, Quintetts, Trios, Overtures, Symphonies, &c. &c.

Handel's Oratorios—Messiah, Israel in Egypt, Samson, Judas Maccabæus, Acis and Galatea, &c., in Vocal Score, with Piano or Organ Accompaniment, by John Bishop.

Bach (J. S.)—All his Organ and Pianoforte Works, by J. Bishop.

Rinck's Organ School and Organ Works, by J. Bishop.

Hamilton's Celebrated Pianoforte Tutor, and all his Catechisms, and Dictionary of 3500 Musical Terms.

Spohr's and Campagnoli's Methods for the Violin. Also, Otto and Dubourg on the Violin, &c &c. By J. Bishop.

Catalogues of Music and Musical Instruments forwarded gratis and postage free. (*See* Catalogue.) [1 99.

Pianofortes at 20 Guineas,

HONI SOIT QUI MAL Y PENSE

DIEU ET MON DROIT

MESSRS. MILLER & RICHARD, OF EDINBURGH AND LONDON,

TYPE FOUNDERS TO HER MAJESTY FOR SCOTLAND,

Beg leave to call the attention of Printers to the BREVIER (Roman capitals and lower case) Type cast by them for the Metropolitan Division of the Great Exhibition Illustrated Catalogue; and also to their Specimen of the "BRILLIANT" Type in this Exhibition, which is the smallest Type ever manufactured in this country. Upon examination, it will be found the most perfect and most highly finished as yet produced, being cast by their improved and Patented process.

MILLER & RICHARD would direct the attention of Newspaper Proprietors to their Founts cut expressly for Newspaper work, which have long enjoyed the reputation of being the most durable that are produced. Their Type has been used for many years in "THE TIMES," "THE MORNING HERALD," "THE MORNING ADVERTISER," "THE MORNING CHRONICLE," and several other leading London journals; also in many of the principal Provincial papers, in England, Scotland, and Ireland.

They have, further, satisfaction in alluding to their Type in the Bibles, Testaments, and Prayer Books printed at the Clarendon Press, Oxford, which form beautiful Specimens of their Book Founts.

LONDON WAREHOUSE, 22, BARTLETT'S BUILDINGS, HOLBORN.

EDINBURGH, MARCH, 1851. [1 112

LITHOGRAPHY.—STANDIDGE and CO., of the OLD JURY, LONDON, in acknowledging the liberal support they have for so many years received from Architects, Engineers, Surveyors, the Patrons of Art, and the Public generally, beg to inform them they continue to execute with increased facility Drawings and Plans of every description, in Chalk, Chrome, and Ink Lithography, in the first style of the Art, and on the most reasonable terms. Facsimiles, Circulars, Show Cards, Certificates, Bill Heads, &c. &c., with the greatest despatch. Country communications promptly attended to. [I 161

TO PRINTERS, PUBLISHERS, AUTHORS, &c. —Mr. THOMAS GILKS, DRAUGHTSMAN and ENGRAVER on WOOD, begs respectfully to announce that he continues to execute all orders intrusted to his care with promptness and a due regard to moderateness in charges. Specimens of every variety of work may be seen at his offices; and estimates forwarded to any part of the kingdom.—170, Fleet-street, London. [I 193

TO SURVEYORS and ENGINEERS.—PLATOMETER—Self-acting Calculator of Surface. This elegant Instrument calculates, with the utmost rapidity and without the risk of arithmetical errors, the area of any figures drawn on a plan, by merely carrying the point of a tracer round their boundaries, however crooked or irregular they may be. Price 20*l*. Apply to John Sang, *Kirkaldy*. [I 202

LONDON SACRED HARMONIC SOCIETY, EXETER HALL.

President . . Rev. George Roberts.
Secretary . . Rev. W. S. Austin.
Vice-President Rev. F. J. Stainforth.
Leader, Mr. H. Blagrove. *Organist*, Mr. Jolley.
Conductor . . . Mr. SURMAN,
Founder of the Exeter Hall Oratorios.

THE object of this Society is to encourage the practice and performance of Psalmody, Chanting, Services, Anthems, Oratorios, &c., and to afford the Religious Public an opportunity of hearing the best Sacred Music of every description.

The Subscription is 1*l*. 1*s*. per annum, or for Reserved Seats 2*l*. 2*s*., commencing upon any Quarter Day. Each Subscriber will be entitled to two transferable Tickets to each Subscription Concert.

Reserved-Seat Subscribers are presented annually by the Conductor with a copy of Handel's "Messiah," "Judas Maccabeus," or Haydn's "Creation," arranged for the Organ or Pianoforte, with Vocal Score, bound in cloth, folio.

Members' and Subscribers' names will be received at the Office of the Society, No. 9, Exeter Hall, where may be had the Music as performed at Exeter Hall, printed by W. Clowes and Sons. W. Stanton Austin, Hon. Sec. [I 221

A. PINTA, FRENCH LAWYER, No. 8, Cornhill.—Advice on French and other Foreign Law. Acts and Documents prepared in Foreign Languages. Notaries' Legal Business attended to. Languages translated. [I 257

EARLY DISCIPLINE and SOUND TEACHING the surest Foundation of Success.—PUPILS from their sixth year are received and indefatigably prepared to encounter the difficulties and reap the benefits of our best Public Schools and Colleges, by a Clergyman, who, earnestly and wholly devoted to his task, confidently invites the attention and patronage of Parents, being himself gratefully sensible of the inestimable advantage he possesses in having been early trained to teach under a most able master, educated at and long connected with Winchester College. Number limited, Terms moderate, and arranged on a *new plan*.—Apply to Messrs. Boone, 29, *New Bond-street*, or to the Principal, 55, *Westbourne-grove, Bayswater*. [I 246

EDUCATION.—SOUTH OF DEVON.—OTTERY ST. MARY SCHOOL.—The course of study pursued in the School embraces—

1st. A sound Religious Education, in accordance with the articles and liturgy of the Church of England.

2nd. A good Classical and Mathematical Education, to those who are preparing for the Universities, public Schools, Naval and Military Colleges, and Professions.

3rd. A superior commercial Education to those who are preparing for the counting-house and the several departments of commercial pursuits; embracing the modern European Languages, English Grammar and Composition, Writing, Arithmetic, Merchants' Accounts, Geography, History, &c: in fact, a sound and liberal Education, keeping pace with the requirements of the age.

Terms 20 to 25 Guineas per Annum.

Ottery St. Mary is situated in one of the most beautiful vales of Devon. For young gentlemen of a delicate constitution, or coming from abroad, it possesses peculiar advantages, as it may be seen that the climate of Devonshire is most favourable for promoting the life and health of the young.—*Prospectuses forwarded on application.*

WILLIAM REED, *Principal*,
Member of the Royal College of Preceptors. [I 152

KENSINGTON HALL,

NORTH END, FULHAM, NEAR LONDON.

AN EDUCATIONAL ESTABLISHMENT for YOUNG LADIES, particularly the daughters of professional and mercantile men, and of the more opulent members of the commercial community.

Lady Superintendent, Mrs. Johnson.

It is the object of this Institution to combine the advantages of the most efficient School and College instruction with the comforts and educational privileges of a well-regulated home. The various departments of knowledge are taught by professors of the highest eminence. Conversational and Musical Meetings are frequently held; Lectures upon Literature, Science, and the Scriptures are regularly delivered; and to explain and illustrate the more substantial duties of life, there is an applied course on Household Economy, the Preservation of Health, and the Education of Children.

The terms are moderate, but at the same time sufficient to insure the utmost liberality in every department. Prospectuses forwarded to any address.—Mr. Johnson's Inaugural Lecture, developing the system, is published by Whittaker and Co., Ave-Maria-lane. [I 129

THOMAS HARRY SAUNDERS, PAPER MANUFACTURER, DARTFORD, KENT. All descriptions of writing and drawing papers made upon the most modern and improved principles both by hand and machines. Manufacturer of Bank-note and patent Cheque papers. Warehouses, Maidstone Wharf, and 10, Queenhithe, Upper Thames-street, London. [1 36

Highly Improved Copying, Writing, and other Inks.

MESSRS. BLACKWOOD & CO.

BEG to call attention to these superior INKS, adapted to Steel and other Metallic Pens, together with their clean Conducting Bottles, with durable Cork. A beautiful bottle in purple glass made expressly for the use of ladies. Messrs. BLACKWOOD & Co.'s registered 'READY REFERENCE FILE' will be found invaluable to all who wish a ready reference to their private papers, letters, receipts, &c., with the advantages of being kept clean, orderly, and not damaged as by the ordinary Wire File. May be had of all Stationers and Booksellers. *Trade and Export Orders executed at the Manufactory, 26, Long Acre.* [1 148

JOSIAH WESTLEY
JOSIAH WESTLEYS BOOKBINDING ESTABLISHMENT PLAY HOUSE YARD
ADJOINING THE TIMES' OFFICE LONDON

JOSIAH WESTLEY,

OF

PLAYHOUSE-YARD, adjoining "THE TIMES" OFFICE,

LONDON,

IS DESIROUS TO DIRECT THE ATTENTION OF

WHOLESALE HOUSES, LITERARY INSTITUTIONS, LIBRARIANS, AND GENTLEMEN,

TO HIS

BOOKBINDING ESTABLISHMENT,

WHERE EVERY BRANCH OF THE BUSINESS IS CARRIED ON WITH ACCURACY, TALENT, AND DESPATCH.

J. W. has recently made several important additions to his Establishment, which combine every improvement that mechanism and artistical skill can produce; thus he is enabled to offer great advantages to the proprietors of literary works, and is most anxious to obtain their valuable patronage.

E. WOLFF & SON'S

NEWLY INVENTED

CRETA LÆVIS, OR PERMANENT DRAWING CHALKS,

IN CEDAR, IN EVERY VARIETY OF COLOUR,

23, CHURCH-STREET, SPITALFIELDS, LONDON.

E. Wolff and Son beg to state that they have, by the introduction of great improvements in their Creta Lævis, enabled it to be used the same as the ordinary pencils; and effects can now be produced equal to Water Colour Drawings, without the use of water or any other fluid, the various colours blending together with perfect harmony, beauty, and richness. It can be cut to a fine point, and is thus capable of giving a very delicate outline.

For Sketching from nature, the great advantages resulting from the adoption of the Creta Lævis must be obvious, as, without the use of water, palette, brushes, &c., all the various tints can be obtained with a truthfulness that cannot be surpassed, and by their compact form may be carried any distance without the slightest inconvenience; thus superseding every other method in general use.

The drawings may be carried in a portfolio with safety, as, unlike other Crayons, they will neither rub off nor suffer injury by coming in contact with the usual contents of a portfolio.

The Creta Lævis, unlike the indelible or wax Crayons, *will not be affected by heat or change of climate.*

Wolff & Son's Improved Crayon Paper is the best for the Creta Lævis.

To be had of all Artists' Colourmen and respectable Stationers, in leather boxes, containing sets of 12, 18, 24, 36, 48 assorted colours. A pattern card containing the whole of the shades and colours, with their names and numbers attached to each shade, price 1*s.* each. Caution.—As there are several spurious imitations, it is necessary to observe that every pencil is stamped "Creta Lævis, E. Wolff and Son, London," with the name of the colour. Creta Lævis Drawings lent to copy. (*See Specimens at the Great Exhibition, Hyde Park, Class* 30.)

E. WOLFF & SON'S PURIFIED CUMBERLAND LEAD PENCILS,

PERFECTLY FREE FROM GRIT, MAY BE ENTIRELY ERASED, AND WILL MAINTAIN A FIRM POINT.

E. Wolff and [illegible] their Black Lead [illegible] easily yield to Indian R[illegible] tain a firm point. They have attained to so great a perfection in the manufacture of this Lead, as to be able at all times to make the same strength and colour when once found to be suitable for any particular purpose, and have produced a pencil fully equal to those used in former years, when they were made of the finest Cumberland lead, which at the present time cannot be obtained from the mines sufficientl[illegible] ure for the best pencils. The following are the degrees:—H, HH, HHH, HHHH, F, FF, HB, EHB, B, BB, BBB, [illegible] W.* * This pencil is particularly recommended for writing and counting-house use.

E. WOLFF and SON have the honour of supplying their PURIFIED BLACK LEAD PENCILS to Her Majesty's Stationery Office, the Admiralty, the Bank of England, several Railway Companies, and many other Public Establishments.

Manufactory, 23, CHURCH-STREET, SPITALFIELDS, LONDON. [1 269

DIXONS & TOOKE,

WHOLESALE GOLDSMITHS, JEWELLERS, &c., DEALERS in ENGLISH WATCHES, 28, Ely Place, Hatton Garden, London.

Importers of Geneva Watches, French Goods, &c. [1 297

JAMES'S STREET, PICCADILLY, invites the Nobility and Gentry requiring their Houses decorated to inspect his splendid patterns of Decorations and Paper-hangings. Bed-room Papers 1d. a yard, and upwards.—Designs and Estimates given for Decoration of Rooms, Glass Frames, Consoles, &c.—Old Frames cleaned, re-gilt, and restored.—Estimates for general repairs. [1 23

JACKSON'S CHINESE DIAMOND CEMENT, for restoring to their original beauty and use China, Glass, Marble, Ivory, Ornaments, Toys, Cabinet Work, Earthenware, &c. For cementing Cabinet Specimens, Ladies' Fancy Work in Cardboard, Paper, &c., it is superior to any preparation hitherto used. In bottles, at 6*d.* and 1*s.* each.

LESSEY'S MARKING INK, so long and justly celebrated for its intensely black colour, has lately been tested by Dr. Ure, Analytical Chemist to H.M.'s Board of Excise, and by him declared to be both durable and safe, incapable of being washed out or injuring the fabric to which it is applied.

Sold, 1*s.* each, by all Chemists and Stationers. [1 261

GLOVER'S ENCRE à la VIOLETTE.—THE LADY'S WRITING INK.—This beautiful preparation, from its exquisite colour resembling the flower whose name it bears, is the most elegant and unique appendage to the fashionable writing-desk.—Sold in bottles, 6*d.* and 1*s.* each, by Glover & Co., 19, *Goodge-street, Tottenham-court-road, London, and all Stationers.* [1 213

T. J. & J. SMITH,

METALLIC BOOK MANUFACTURERS,

WITH PATENT EVER-POINTED PENCILS,

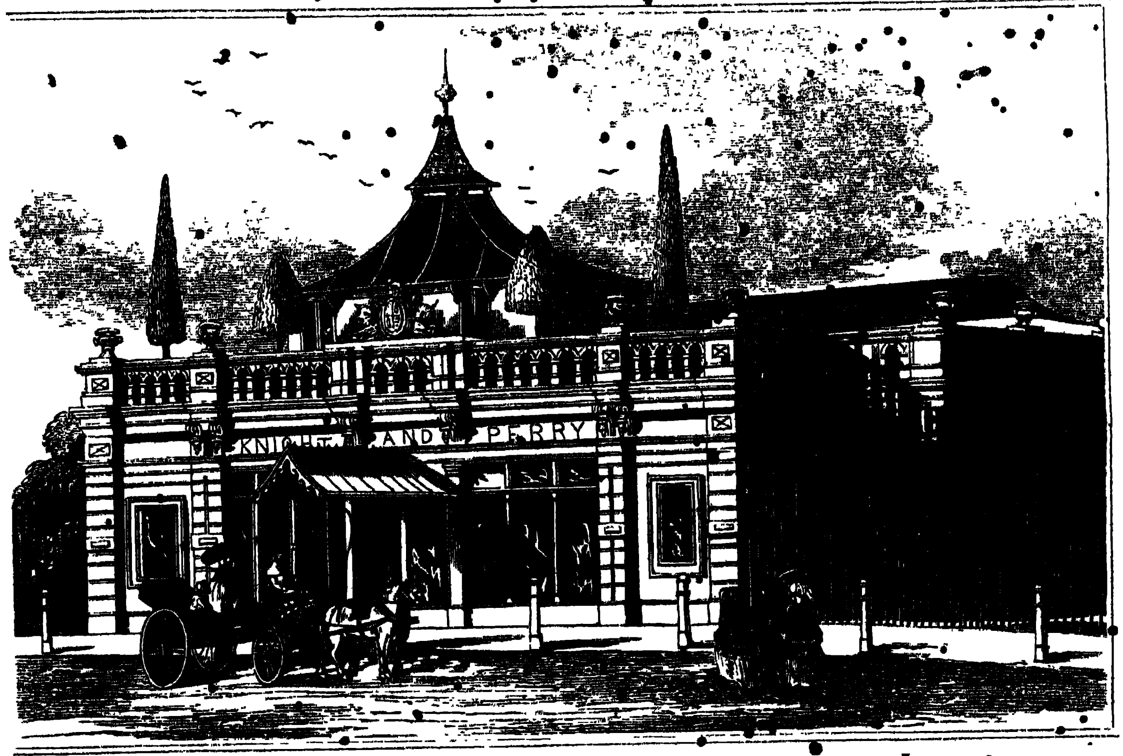
WHOLESALE AND EXPORT STATIONERS,

83, Queen-street, Cheapside, London. [1 212

H. DELOLME, CHRONOMETER & WATCHMAKER, 48, Rathbone-place, Oxford-street, London, begs to draw the attention of those who value a superior timekeeper to the Watches of his own peculiar construction, manufactured entirely in England under his own personal direction, in which every advantage of modern watchmaking is combined with additional solidity; the prices of which will also be found comparatively moderate. [1 295

EXOTIC NURSERY, KING'S ROAD, CHELSEA.

We regard this as a peculiarly favourable opportunity, and therefore avail ourselves of it, to thank our Patrons with sincere gratitude for the continued patronage with which this house, first under the Proprietorship and Management of **JOSEPH KNIGHT**, and more recently under that of **JOSEPH KNIGHT & THOS. A. PERRY**, has been honoured for nearly half a century, and to say that, during the whole of that period, increasing efforts have been made, by the extension of our various Collections, to enable us to supply every article connected with Gardening, of the *best* description. We have now too the satisfaction of adding that our prices, during the last few years, have been *very much* reduced, and that they are at present as low as a very moderate remuneration will admit of.



In soliciting the countenance and support of our Patrons, we beg respectfully to call their attention to the following, as being worthy of their notice:—

We shall be proud to furnish detailed Lists of these.

1. **HARDY ORNAMENTAL TREES AND SHRUBS**, in which are many novelties.
2. **RHODODENDRONS AND AZALEAS**, as well as other **AMERICAN PLANTS**, of the finest kinds known.
3. **CONIFERS.** Our collection of these may be seen from the work we have published on them.
4. **FRUIT-TREES**, of the finest kinds, founded on the Horticultural Society's Collection, and on those of the first Continental Pomologists.
5. **GREENHOUSE AND HOTHOUSE PLANTS**, of the most select and beautiful kinds.
6. **HARDY HERBACEOUS PLANTS, ROSES, &c.**, of the most admired sorts.
7. **VASES**, of the most Gardenesque forms; and **GARDEN IMPLEMENTS**, of such construction as experience has proved to be most useful.
8. **CULINARY, AGRICULTURAL, AND FLOWER SEEDS**, of the first quality, and true to name.
9. **BULBS**, as imported, from the first Growers in Holland.

It is proper for us also to observe that we still continue, when applied to for **GARDENERS, FORESTERS**, and **LAND STEWARDS**, to recommend such only as we have substantial reasons to believe of blameless reputation and of first-rate professional ability.

KNIGHT AND PERRY. [1 106

ORRERY GLOBE.

Challenge to all the World!

JOHN D. HAILES' ORRERY GLOBE, registered May 17, 184[illegible], which practically displays Joshua's Mi-

the magnet

meridian eastward to Europe, with increase and decrease of latitude at different times and places, and that the magnetic point is the fixed pole of the terrestrial globe, and therefrom, with the centre of sun and pole of world, is obtained the true principle equation of time, which time varies a little nearly at every longitude around the earth. The said globe is now (and has been since June, 1848) exhibited at the Royal Polytechnic Institution, Regent-street, London; and J. D. H. CONTINUES TO CHALLENGE THE LEARNED OF THE WORLD TO DISPUTE ITS PRINCIPLES WITH JUSTICE.—JOHN DAVEY HAILES, Wigford House, Kingsbridge, Devon.

The above was inserted in the *Times* of April 10th, June 2nd and 16th, 1849, and *Exeter Gazette*.

SCIENCE, the *Lock* of Bible Truth, all the *Works* Divine,
Magnetic Key—unlock the Truth—Sun, Moon, and Earth give *Time*.
Joshua records the *Sun* vertical to *Gibeon*—*Strabo* after a time to *Syene*.
I say Europe increases in Latitude—Eclipses give past and *future Time*.

I have reason to believe that Solar with Mean Time varies a little nearly at every Degree of Longitude around the Globe. For instance, in London they agree with each other April 16th, September 1st, and about the time of Summer and Winter Solstices. Not so I think in Ireland. I apprised the Earl of Rosse (who erected the large telescope in Ireland) on November [illegible]th, 1844, and the Royal Society, London, on February 1st, 1845, that I considered these times to agree at the West of Ireland about April 23rd, August 25th, and also near the time of Solstices; but to this date I have received no reply from either party as to correctness or incorrectness.—*May*, 1851.

England is attaining a greater latitude, exactly in the same proportion as the solstices of the *sun are* retreating from England, which is yearly, a very small quantity.

is the true cause of the alteration in the variation of the magnet. JOHN D. HAILES.

M. BALL,

JEWELLERS' PLAIN AND FANCY PAPER BOX MAKER,
No. 35, Duncan-place, London-fields, Hackney.

(*See Catalogue.*) [1 37

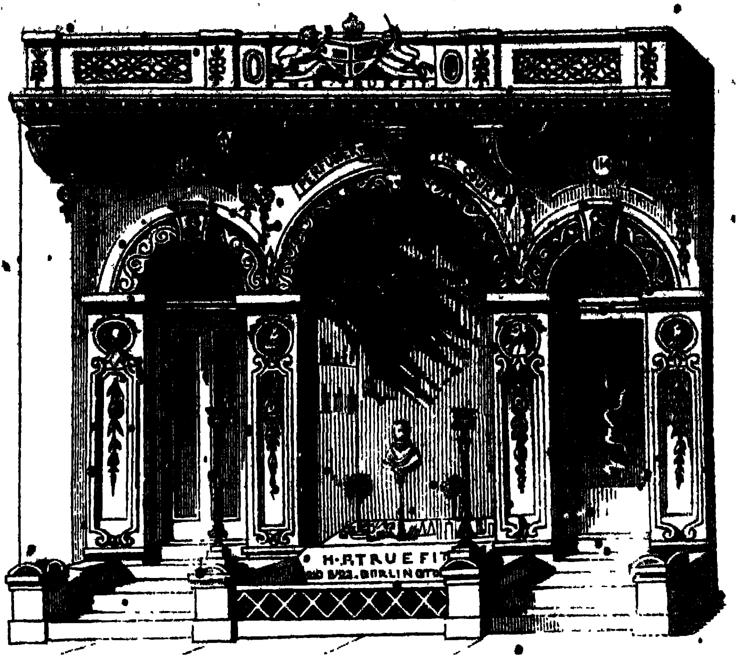
TO FOREIGNERS AND VISITORS
TO THE
GREAT EXHIBITION.

Among the number of objects of interest besides the Exhibition which will engage the attention of the Visitors to the "World's Fair," London shops and their decorations are certain to challenge their notice when perambulating the metropolis. Pre-eminent among these, and in a direct line from the Crystal Palace, stands the extremely elegant Establishment lately opened by

H. P. TRUEFITT,

AT 114, PICCADILLY;

being a branch of his far-famed Establishment at Nos. 20 and 21, Burlington-arcade (established upwards of thirty years). The Front, unequalled, it is believed, in any capital of Europe, is elaborately carved in Caen stone; whilst the spacious saloons for Hair-cutting, and private rooms for Hair-dressing, dyeing the Hair, and washing the head, are arranged with exquisite taste, and replete with every convenience. None but Assistants of first-rate talent are engaged; and in the shop will be found a splendid selection of every requisite for the toilet. The prices are in strict conformity with the economical spirit of the times. The charge for Hair-cutting is One Shilling. Everything in the same proportion.



LADIES' HAIR-DRESSING.—In this department H. P. TRUEFITT can now challenge the world, having secured the assistance of artists who are allowed to be unequalled; whilst his frequent visits to Paris secure every novelty in style, without the enormous prices charged by foreigners in this country. Lessons in Hair-dressing, without any extra charge for court hair-dressing. A splendid assortment of Ladies' fancy Twist Combs.—20, 21, *Arcade*; 114, *Piccadilly*.

CERTAINTY IN DYEING THE HAIR has at last been thoroughly effected by the "TINCTURA," a fragrant extract, by which any shade in brown or black is produced instantly and permanently. Those who have been deceived by any of the dyes in use at present will appreciate the value of this important discovery. Private rooms, replete with every convenience, are reserved expressly for its application.—114, *Piccadilly*.

PERFECTION IN WIG-MAKING is accomplished by the introduction of H. P. TRUEFITT's NEW DIVISION, which combines the durability of the skin with the transparency of the net parting, and perfectly avoids that great objection to ornamental hair, the DARK LINE ON THE FOREHEAD, it being now impossible to discover where the wig commences. This valuable discovery is applicable to ladies' bands, fronts, &c.—114, *Piccadilly*; *and* 20, 21, *Arcade*. [I 195

BROWN BROTHERS, 165, Piccadilly, Manufacturers. Patent Suspensory Chair, forming Couch or Bed, extremely portable and luxurious, eminently serviceable for invalids, the camp, or drawing-room. [I 47

RICHARD GUNTER'S BRIDE-CAKE ESTABLISHMENT, corner of Motcomb and Lowndes street, Knightsbridge. Wedding Breakfasts, Dinners, Balls, and Parties furnished complete, with wines and attendants. [I 30

JAMES LAPTHORN, SAIL-MAKER, GOSPORT.—A Suit of SAILS, on an inch scale, of the Brig Yacht "Anonyma," 450 tons. Also MODEL of same from the Water Line up.

(*See Catalogue.*) [I 116

JAMES TOWNSEND, Manufacturer of every description of AIR GUNS and CANES on the most improved principles, and POWDER WALKING-STICK GUNS in every variety.

11 *and* 12, *Sand-street, St. Mary's-square, Birmingham.* [I 162

JOHN SANDERS, Manufacturer of the PATENT INDIAN RUBBER WATERPROOF UMBRELLA TENT, Registered, 11, Fore-street, Cripplegate, London. Suitable for gentlemen's gardens, lawns, and pleasure-grounds, and to all climates. [I 124

CLASS 28. — SPECIMENS.—GUTTA PERCHA ESTABLISHMENT.—A. THORN and Co., by Appointment, 98, New Bond-street, London. Looking-glass, Picture, and Print Frames, Console Tables, and House Decorations, are now manufactured of Gutta Percha, gilt and ungilt, resembling the finest Wood Carving, which will not break or crack. Inkstands, Card-trays, and many other fancy goods. Also every other article manufactured by the Gutta Percha, Company, as at their Works, 18, *Wharf-road, City-road, London.* [I 279

---

by a decided prefe

JESTY, 12 and 13, TICHBORNE-STREET, QUADRANT. [I 150

See Catalogue.

RYDE, ISLE OF WIGHT.

HOPGOOD'S CELEBRATED HAIR-CREAM is forwarded to any part of England, in 1*l.* packages, free of carriage. May be had in London of the following Agents: G. W. COURT, 282, Regent-street; J. GOSNELL and Co., 12, Three King-court, City; J. H. DONAGAN, 58, Edgeware-road; and DIETRICHSON and HANNAY, 63, Oxford-street. Communications respecting the hair or scalp answered. [I 278

MR. HAYES, SURGEON DENTIST, 42, ST. MARTIN'S LANE, begs to announce that he supplies every description of Artificial Teeth at moderate charges, and can *only* be consulted at 42, *St. Martin's Lane.* [I 225

ANGLERS of the FOUR QUARTERS of the WORLD visiting LONDON will find the best-selected stock of Fishing-rods, Flies, and Tackle, suitable for their various climates, at JOHN KING FARLOW'S Fishing Tackle Manufactory, 5, *Crooked-lane, London Bridge.* Catalogues of Prices gratis. [I 252

VISITORS TO THE EXHIBITION are respectfully informed that MADAME TUSSAUD and SONS' HISTORICAL GALLERY having been enlarged, by desire of the Public, to double its original size, in honour of the Exhibition, no one need fear paying the Promenade a visit, as both space and ventilation are provided. The Collection, the largest in Europe, consists of 160 Public Characters, and has been established fifty years.

"This is one of the best sights in the metropolis."—*Times.*

VICKERS'S GINGER BRANDY.

ON this Article public favour has impressed the stamp of perfection. It is a medicine without nausea, a LIQUEUR exhilarating and beneficial; it is an instant remedy for spasms, and causes nervousness to vanish away.

VICKERS'S GINGER BRANDY

was intended for the Exhibition, but is excluded because it cannot be judged of by the eye; the Visitors are therefore informed that it will be found serviceable to many, before going to the Exhibition, as it will render fatigue endurable, and prove there are merits which do not appeal to the sight. It may be obtained, as well as their renowned CURACAO PUNCH, at 3*s.* 6*d.* per bottle, of every Spirit Merchant in the kingdom. Also the ORANGE GINGERETTE, and IMPERIAL LIQUEUR GENEVA (a very superior specimen of English Gin), in capsuled bottles, at 2*s.* 8*d.* each.

Wholesale at the Borough Market Distillery. [1 90

Whittakers & Co., London. The Fifth Edition of

THE BRITISH WINE MAKER AND DOMESTIC BREWER,

By WILLIAM HENRY ROBERTS,

Author of "*The Scottish Ale-Brewer and Practical Maltster.*"

THE ART OF MAKING CHAMPAGNE, HOCK, MADEIRA, and every HOME WINE, without possible chance of failure, as well as LIQUEURS, ALES, BEERS, and PORTER. Describing the SACCHAROMETER and its utility in WINE-MAKING. Containing also a SUPPLEMENT, showing the juice of the Rhubarb-plant to be as valuable as a basis for the above Wines as that of the Grape.

ROBERTS'S FERMENTED BRITISH WINES.

THESE WINES are made on the same principle as Foreign, and Specimens have been admitted to the EXHIBITION. ROBERTS'S CHAMPAGNE and sparkling HOCK, at 28*s.* per dozen, are incomparably superior to any sold under 60*s.* ROBERTS'S HOCK, with *twenty* other kinds, is unrivalled.

Assorted sample cases sent *direct* from the BRITISH WINE WORKS, Edinburgh, *free*, to Hull, for cash.

GELATINE and GLUE for every purpose, of the purest kind: also Coloured Sheets. Manufacturer, F. Müller, *Hackney*: Agent, J. Maine, 7, Union Court, Old Broad Street, City. [1 93

By Her Majesty's Letters Patent.

G. NELSON, DALE & Co.

14, *BUCKLERSBURY, LONDON,*

AND EMSCOTE MILLS, WARWICK.

Manufacturers of

The Patent Opaque Gelatine,

Patent Refined Isinglass

Perfect substitutes for Russian Isinglass, for all culinary purposes.

Brilliant Gelatine, Gelatine Lozenges,

And every other description of Gelatines.

Extract from Dr. URE'S Testimonial.

"I find Mr. G. Nelson's **Patent Opaque Gelatine** to be at least equal in strength and purity, IF NOT SUPERIOR to the BEST ISINGLASS, for every culinary purpose; it is entirely free from any impregnation of ACID, such as I have found to exist in the OTHER KINDS of Gelatine in the London Markets."

In Packets from **6d.** to **10s.** each.

A Sixpenny Packet makes One Quart of Jelly.

As these Articles will keep in any Climate, they are strongly recommended to Merchants, Captains and others; for exportation, also for the use of the Army and Navy Mess Tables, Club Houses and Hotels.

To be had of most respectable Chemists, Grocers and Oilmen, in the United Kingdom.

Norwich Barracks, 5 March 1851.

Sir,

As I constantly require to use your *Opaque* Gelatine, I have daily more and more admiration at the beauty, the quality, and the economy it possesses.

The Officers of the Regiment have assured me, that they never tasted any thing so delicious as the Jellies, Blancmange, and every thing else which I make from your ingenious Composition; and to have insured the testimony of *their* approval, is indeed much to gain. From my own experience in America, France and England, I have no hesitation in saying that I never found Jellies, &c. appear to have half so much brilliancy, as those I can produce from your *Opaque Gelatine*. The general want of cleanliness in the preparation of Calves' Feet for Jelly, which must leave a dullness in the Jellies, is guarded against by adopting the use of your *Opaque Gelatine*.

Yours very truly,
JULIEN SUZANNE,
Messman 11th Hussars.

Mr. G. Nelson.

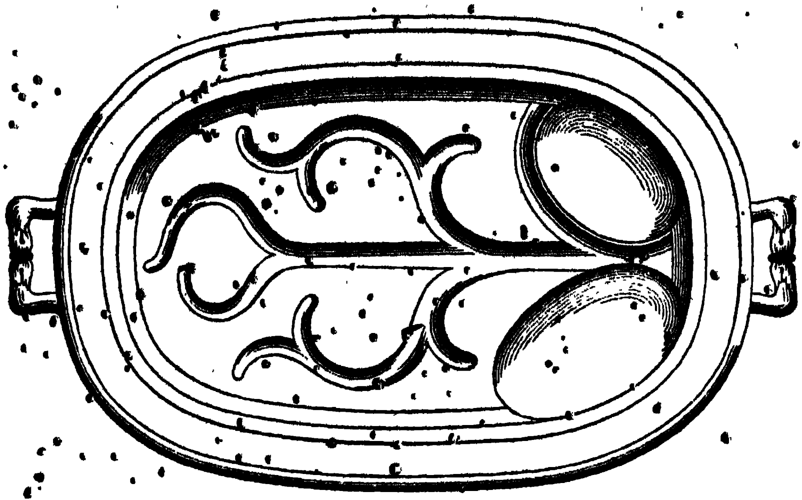
IN THE SEVERAL DEPARTMENTS OF THEIR VARIOUS MANUFACTURES THE **CYCLOPS STEEL WORKS** STAND UNRIVALLED.

CORPORATION MARKS—THE "**CAMEL**," AND "**CYCLOPS**." [1255

THE IMPROVED WELL OR GRAVY DISH,



DULY REGISTERED, IN TERMS OF THE ACT OF PARLIAMENT

Possesses the peculiar merit of **ENTIRELY SEPARATING** *the liquid fat of roasted or boiled meat from the gravy, and of thus rendering* **THE GRAVY** *as it flows from the meat* **AS PURE** *as if the fat had been lifted off it whilst both were in a cold state.*

MANUFACTURED

In SILVER and PLATED METAL, by Elkington, Mason, & Co., of Birmingham;
In BRITANNIA METAL—of which the one in the Great Exhibition is a specimen—by Shaw & Fisher, of Sheffield; and
In CHINA and STONEWARE, by Minton & Co., and some other houses, in the Potteries.

To obtain these dishes retail, *the public will please apply to the respective tradesmen with whom they are in the habit of dealing.*

OPINION OF M. SOYER.—"Reform Club, 10th May, 1850. I certainly consider the Dish a great improvement and boon for epicures. I shall use it to-morrow for some of the first gourmets in the world, and let you know their opinion. "A. SOYER."

Written afterwards.—"The Dish was highly approved of. Two or three of the party would have them. They should be extensively made known by advertisement, as no epicure would be without one. "A. SOYER."

DIRECTIONS FOR USE.—Shut the communication between the two Receivers. Dish your meat, place it on the dinner-table, and begin to carve; by which time all the *fat* collected in the first receiver will be floating on the *top* of the gravy therein, whilst the second receiver will be—*and you must see that it really is*—quite empty. Now open the communication between the two receivers, when *the gravy only* will run into the second; which done, *again shut* the communication between them, until *another accumulation* of gravy and fat, flowing from the meat, shall have taken place in the first receiver, when again proceed to separate them as before. The *only* caution of any kind requiring attention being, not to overfill the first receiver, and thereby to overflow the fat into the second. Exhibited by the Inventor, JOHN GRAY.

Edinburgh, No. 11, *Inverleith-row, March*, 1851. [1 158

The Patent Portable Suspension Stove consumes the least Fuel, gives a genial warmth, and thoroughly *ventilates* the apartment; it is the cheapest of any, and is suited for Bedrooms, Nurseries, Halls, Schools, Libraries, Greenhouses, Chapels, Churches, &c.—Manufactory, *Luton, Beds*; Wholesale Agents, R. W. Kennard and Co., 67, *Upper Thames-street, London.* [1 249

CHARLES FARROW,

IRONMONGER, SMITH, BRAZIER, TINMAN, AND GAS-FITTER,

Manufacturer of Machines, Tools, and Utensils for the Wine and Spirit Trade,

18, GREAT TOWER-STREET, LONDON.

(See Illustrated Catalogue.)

WROUGHT-IRON WINE-BINS AND SCANTLING.

Copper Measures, Pumps, Cranes, and Funnels.
Corking Machines. Stools, Boots, Drivers, and Floggers.
Masterman's Patent Bottling Apparatus and Corking Machine.
Bottling Pliers and Wires. Braces and Bits.
Bung and Cock Borers.
Coopers' Adzes, Drivers, Beak Irons, and Hammers,
Chisels, Punches, Flagging and Chincing Irons.
Haunches, Shive Vices, Ticklers, Corkscrews of all kinds.
Frets, Nippers, Marking Irons. Shot, Shot Rakes, Cork Drawers.
Shives, Tits, Spiles. Bung Tins, Tacks, Nails, Hamper Cord.
Sampling Irons. Oil Searchers. Glass Tubs and Spitting Pans.
Betts' Patent Metallic Capsules. Stocker's Patent Beer-Engines.
Automaton Funnels with self-closing Valves.
Bottling, Racking, and Screw Cocks. Electro-Plated Cocks.
Brand Irons for casks and corks. Stanfoil Plates, Ink, and Brushes.
Bottle Seals, with shifting centres. Sealing Wax. Tinfoil.
Wax Furnaces, Cement Pots, and Stoves. Filtering Bags and Irons.
Bottle Gauges, Bottle Sinkers, and Bottle-Washing Machines.
Cellar Lamps, Oil and Cotton. Cellar Candlesticks, in great variety.
Wood Cans, Cellar Tubs, and Bottling Trays. Bottle Guards.
Velinchers, Filling Cans, Waste Pots, Champagne Knives.
Bin Laths. Slate, Porcelain, and Painted Bin Labels.
Glass Velinchers and Syphons. Porcelain Funnels and Tap Troughs.
Leather, Indian Rubber, and Patent Woven Hose Pipes.
The Registered "Porte Flacon" or Wine Handle.
Bottle Carriers, or Portable Cellarets.

MONTEBELLO'S CORKING MACHINE.

(See Illustrated Catalogue.)

This machine, the invention of the Marquis Alfred de Montebello, of the firm "Duc de Montebello," Mareuil-sur-Ay, Champagne, obtained a prize at the French Exposition of 1844, as may be seen from the following:—

Extrait du "Rapport du Jury central sur l' Exposition des Produits de l' Industrie Française en 1844," *tome* 2, *page* 839. *M. Montebello (Alfred de) au Château de Mareuil-sur-Ay (Marne), et à Paris, Rue Laffitte*, 17.

"M. de Montebello a présenté un appareil d'une extrême simplicité destiné au bouchage des bouteilles. Cette machine, exempte de tout engrenage et ressort, agit à l'aide d'un contrepoids qui maintient la bouteille, d'un levier qui ouvre et ferme plus ou moins un cône creux, sorte de virole brisée, enfin d'un boulon à tête arrondie qu'il suffit de pousser pour faire pénétrer, dans le goulot de la bouteille, le bouchon allongé et rétréci entre les viroles du cône creux.

"On évite ainsi de tordre et de rompre la tête des bouchons ; il en résulte une économie notable, et un service plus facile et plus prompt. Aucune altération n'est à redouter dans les organes d'un méchanisme aussi simple.

"Pour un perfectionnement sur lequel la pratique a déjà prononcé, le jury central décerne à M. de Montebello une médaille de bronze."

C. Farrow has much pleasure in referring to the annexed letter from the inventor to his correspondents in London:—

"Château de Mareuil-sur-Ay, Feb. 6, 1848.

"Dear Sirs,—I am gratified by Mr. Farrow's approval of my Corking Machine, and you may give him my full permission to make and sell as many as he can. I have little doubt but that it may prove as useful in England as we find it in Champagne. Herewith I send you the published proceedings of our last 'Exposition' when the medal for this machine was decreed to me. A full specification of it is there given, which you may let Mr. Farrow copy.

"I am, dear Sirs, with known regard,
"Your obedient humble servant,
"ALFRED DE MONTEBELLO.

"*Messrs. Richard Symonds & Son,*
"2, *Ingram-court, Fenchurch-street, London.*" [1 96

GARNKIRK WORKS, NEAR GLASGOW.

THE GARNKIRK COAL COMPANY,

MANUFACTURERS OF

FURNACES for SMELTING IRON, GLASS, &c., and SMALL FIRE-BRICKS for MALLEABLE IRON WORKS—for home sale and exportation.

Fine selected and prepared CLAY for Glass-house Pots, Crucibles, &c.

Also, ORNAMENTAL VASES and FOUNTAINS, to stand any climate, salt glazed TUBES for Water and Sanitary purposes.

From the great extent of the Works, large Foreign orders can be speedily fulfilled. Nearly Eight Millions of Fire Bricks are manufactured annually.

Office, 5, CATHCART-STREET, GLASGOW.

February, 1851. [1 79

BIDDULPH, JOHN, MANAGER.

CWM AVON

IRON, COPPER, AND TIN-PLATE WORKS.

IRON.—Railway Bars, Angle, Tyre, and Knee Iron, Cable, and all other descriptions of Bars, Bolts, Sheets, Boiler-plates, and ("Glamorgan") Canada plates.

TIN PLATES.—Tin, Tole, and Terne Plates.

COPPER.—Tiles, Cakes, and Ingots.

Naphtha, Limesalt, Sugar of Lead, &c. &c. also manufactured here.

All Orders to be addressed as above.

The character of these Works for the superiority of their Tin, Tole, and Terne Plates has been established for thirty years, and the quality of the Canada Plates, Sheets, Cable Iron, and Railway Bars, having been submitted to the most severe tests by eminent Engineers, is admitted to be equal to any manufactured in South Wales. [1 44

TURNIP AND GRASS-SEEDS.

J. MORRISON and SON, NURSERYMEN and SEED FARMERS, MONTCUFFER, ABERDEENSHIRE, and of BANFF, BANFFSHIRE, SCOTLAND, continue to execute orders for their celebrated GOLDEN YELLOW and other Turnip Seeds; as also GRASS SEEDS for Lawns and Pastures. [1 15

M. WEDLAKE and CO.'s NEW MACHINE for Cutting Straw into Chaff, and Bruising Oats, at same time or alternately, 42*s*. Plough Turnip-cutter; Oil-cake Breakers; Haymaking Machine; Horse Hay-rake; Chaff Machine; Bean Mills; Gorse or Furze bruising Machine; Subsoil Plough; Seed and Manure Drills; Dressing or Winnowing Machines; Flour Mills; Threshing Machines; Scarifier or Grubber; Seed Machine; Iron Field-Rollers; Barley Machines; Smut-cleaning Machines; Scotch Carts; Waggons; Harrows; Horse Hoe; Churns.—Liberal discount for cash.—On receiving six stamps, an illustrated list in English (1*s*. in French, Italian, or German) will be sent.

118, *Fenchurch-street.* [1 182

PATENT MACHINES for PLANING, MOULDING, MORTISING, TENONING and BORING, either in hard or soft wood, which entirely supersede hand-labour for these purposes and make superior work at a greatly reduced cost. They are suitable for and used by Carpenters, Joiners, Builders, Coachmakers, Railroad Carriage and Waggon Builders, Cabinet Manufacturers, Pianoforte-makers, Engineers, &c. &c.

These very valuable Machines have been used in constructing the Exhibition Building, the Houses of Parliament, St. George's Hall, Liverpool, and also by the Honourable Board of Ordnance at the Woolwich Dockyard, and by most of the first Builders, Engineers, and Machinists in the Kingdom, which is considered a sufficient guarantee of their great utility, simplicity, and worth.

Sold by the Patentee,

WILLIAM FURNESS,

20, LAWTON STREET, LIVERPOOL, and at the GREAT EXHIBITION BUILDING, where all the Machines may be seen in daily operation. [182

DR. ARNOTT'S STOVE.

OF the many new plans and devices that have from time to time been brought before the Public for Warming Rooms and Buildings, it may be said that not one in point of efficiency and economy has come up to the ARNOTT STOVE;—not the so-called Arnott Stove, that has been as extensively abused as manufactured by various makers in the trade, but the Stove made upon the original simple and sound principles of Dr. Arnott; which, with the addition of the improvements made by the Doctor about eight years since, has become established as the most serviceable and efficient invention for Warming that the Public have yet seen. The peculiar advantages which the Stove possesses may be just stated. The temperature of the heat diffused by the Stove is comfortably warm and uniform, rendering every portion of the place perfectly and equally agreeable. There is very little trouble connected with the management of the Stove: it only requires replenishing with fuel twice in the twenty-four hours. The cost of the consumption of fuel is exceedingly moderate—more so, indeed, than that of any other Stove, especially considering the amount of heat diffused.

The Stove has been manufactured and in extensive use for many years in all parts of the country, and the truth of its superiority has become incontrovertibly tested; an evidence of which is in the large number of testimonials which F. E. possesses from parties who have had several years' experience with the Stove. One or two will here be presented:—

From Messrs. S. Courtauld, Taylor, *and* Courtauld, *Bocking, Essex, and Carey-lane, Cheapside, London.*

"Bocking, Oct. 17, 1850.

"Sir,—Absence from home and many pressing engagements have prevented our replying to your letter before. In respect to the Arnott Stove, we have no hesitation in saying that we consider it very far superior to any other description of close stove we have ever seen, when so constructed as to carry out Dr. Arnott's principle; and we have pleasure in stating that your Stoves on this principle, of which we have had several in constant use through many winters, seem exceedingly well made, and have given us great satisfaction.

"We are, Sir,
"Your obedient servants,
"S. Courtauld & Co.

"Mr. F. Edwards."

From the Rev. Dr. Brown, *Chepstow.*

"Chepstow, Aug. 17, 1850.

"Sir,—After trying various Stoves, said to be of Dr. Arnott's invention, all of which were more or less imperfect and unsatisfactory, I was directed by Dr. Arnott to those made by you. For about six years I have had your Stoves in use during the winter months, and have found them, for economy of fuel, cleanliness, safety, saving of time, and equality of healthy delightful temperature, all that I had looked for. Hence I have recommended Arnott Stoves, as made by you; and continue to recommend them to my friends with greatest confidence.

"I remain, Sir,
"Your faithful servant,
"T. J. Brown.

"Mr. F. Edwards."

F. Edwards has models for 40 different sizes and patterns of Arnott Stoves.

A prospectus containing full particulars, with list of prices and sizes, &c., with some testimonials, to be had on application.

DR. ARNOTT'S CHIMNEY VENTILATING VALVE.

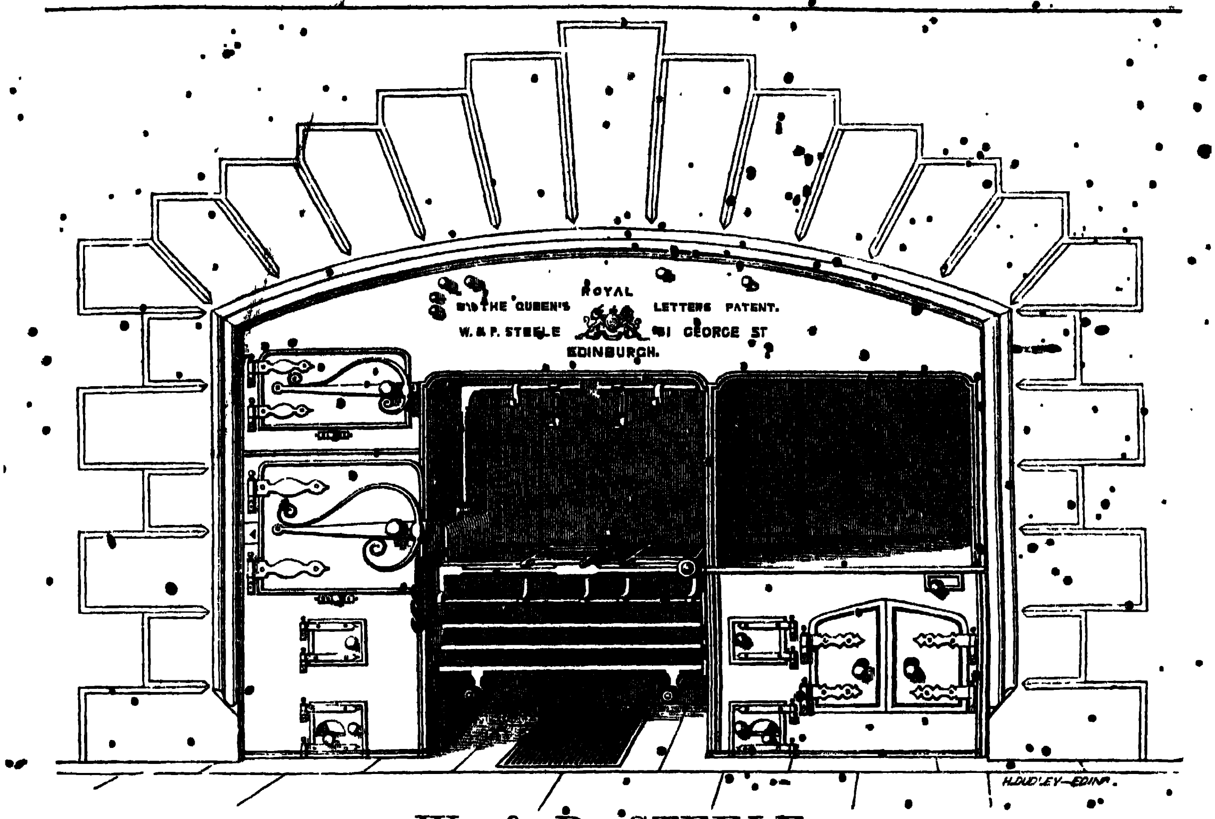
The attention of the Public has been of late much drawn to the subject of Ventilation; and Dr. Arnott's VENTILATING VALVE is becoming universally applied as the most complete and efficient means that can be adopted to effectually ventilate rooms. But while great advantage has arisen through the use of Dr. Arnott's Ventilator, many persons have met with great disappointment through having purchased articles which, through being imperfectly made, have become a nuisance by admitting smoke into the room, instead of being an absolute benefit. This misfortune has arisen through many in the trade (and some of them most respectable parties) having taken up the Ventilator, and have not fully understood, or have not paid sufficient attention to, its construction. The Public can only rest assured that they are having perfect articles by applying to F. Edwards, who has paid much attention to the Valve, and is the party who has made them under Dr. Arnott's immediate direction. In most of the public buildings in London the Valve has been extensively applied, and carried out by F. Edwards with the greatest success. He has also put up many thousands in the private residences of all classes; and he has always found it to give universal satisfaction. Prices from 6s. to 35s. Prospectuses, with particulars and prices, to be had on application.

SMOKEY CHIMNEYS. NO CURE, NO PAY

With many years' experience in every branch of his business, F. Edwards is enabled to undertake the Cure of Smoky Chimneys on the above satisfactory terms, estimates for which would be previously given.

Parties furnishing houses would find it much to their advantage to purchase their Stoves and Kitchen Ranges of F. E., as all that are sold by him are fitted up in the most perfect manner, relative alike to the principles of radiation and economy as to the prevention of any chance of the escape of smoke.

FREDERICK EDWARDS,
STOVE-MAKER TO HER MAJESTY,
42, POLAND-STREET, OXFORD-STREET, LONDON.
(See Exhibition Official Catalogue.)



BY THE QUEEN'S ROYAL LETTERS PATENT.
W. & P. STEELE 61 GEORGE ST
EDINBURGH.
H. DUDLEY—EDINR.

W. & P. STEELE,

MANUFACTURING AND FURNISHING IRONMONGERS TO THE QUEEN;

Patentees and Manufacturers of Improved Kitchen Ranges, Bath, Heating, and Culinary Apparatus, Stove Grates, &c.;

61, GEORGE-STREET, EDINBURGH.

IMPROVED KITCHEN RANGES.

By the QUEEN'S *Royal Letters Patent granted to*

W. & P. STEELE, of 61, GEORGE-STREET, in the city of Edinburgh, for IMPROVEMENTS in KITCHEN RANGES for CULINARY PURPOSES, and APPARATUS for RAISING the TEMPERATURE of WATER for BATHS and other uses.

The PATENTEES beg leave to state that many of their PATENT RANGES are now in full operation; and wherever the Apparatus has been put up, it continues to give the most unbounded satisfaction. The Patentees have had the honour to receive several very flattering letters from families of distinction, for whom Ranges have been fitted up, bearing testimony, in the most unqualified terms, as to the EFFICIENCY, USEFULNESS, and ECONOMY in the CONSUMPTION OF FUEL, by the use of the Patentees' Improved Apparatus.

The Patent Range is constructed in all its parts on Scientific Principles, and contains ample Range Bars for Roasting and Boiling, with one or more Ovens, and a SPACIOUS BOILING-TABLE or HOT HEARTH—all of which are fitted up on the principle of PERFECT VENTILATION. A large Boiler in the Range affords a constant and ample supply of Hot Water, and is suited to Cook by Steam; also, APPARATUS WHICH GIVES THE POWER OF HEATING A RESERVOIR of Water at the Top of the House, one hundred feet more or less above the level of the kitchen, from which Reservoir HOT WATER can be distributed all over the house, and by means of which A BATH MAY BE GOT READY FOR USE AT A MOMENT'S NOTICE, during any hour of the day, or even at midnight, in cases of sudden indisposition. Means are also provided for effectually and speedily CLEANSING OUT THE BOILERS, without further trouble to servants than merely turning one or two stop-cocks, so that Hot Water may at all times be had FREE of SEDIMENT AND PERFECTLY PURE. The whole is effected BY ONE OPEN FIRE, before which Meat may be Roasted in the usual manner, besides effecting a saving of at least Half the Quantity of Fuel used in apparatus of ordinary construction.

The above Culinary Apparatus is therefore confidently recommended to public notice as the best and most economical Range at present in use, and will be found admirably adapted for the *Mansions of Nobility and Gentry*, Club-houses, Hotels, or other similar establishments.

A Prospectus, containing a fuller detail of the Range, may be had, and every information furnished, on application at the Patentees' Works, No. 61, George-street, Edinburgh.

Plans furnished for all the requisite Fireplaces and Fittings in the Culinary, Still-room, Laundry, and Bath-room departments, or for the supply of Hot Water for Bath-rooms and other domestic purposes throughout the mansion. Alterations, Erections, and general arrangements connected therewith, superintended by one of the Partners in town or country.

Warming and Ventilating of Mansions, Dwelling-houses, Conservatories, &c., on an improved principle, by Hot Water or Heated Air.

W. &. P. S. manufacture every description of Improved Culinary Apparatus, including KITCHEN RANGES, with or without Boilers and Ovens; SMOKE, WATER, and WIND-UP JACKS of Improved Construction; BOILING TABLES, with or without Grilling Stoves and Hot Press. Steam-cooking Apparatus in sets or single. Hot Closets, Charcoal Tables, &c.

W. & P. STEELE'S extensive stock includes many very beautiful designs in Drawing-room, Dining-room, and Parlour Grates, &c., fitted up as Registers, or as Kinnaird Grates, so much recommended for Curing Smoky Vents and throwing out Heat, together with every requisite in General Ironmongery. HOUSE FURNISHING, all of first-rate quality, and moderate in price.

W. & P. S. beg also to state that, from their long experience and extensive practice in every department of House Furnishing, they are enabled to execute all orders intrusted to their care in the most prompt and satisfactory manner.

Experienced Workmen sent to any part of the United Kingdom. Country Orders promptly attended to.

Self-heating, Plunge, Shower, Vapour, Nursery, and Chamber BATHS in great variety.

AGRICULTURAL
IMPLEMENT
MAKERS

TO
HIS ROYAL HIGHNESS
PRINCE ALBERT.

R. GARRETT AND SON,

LEISTON WORKS, NEAR SAXMUNDHAM, SUFFOLK,

MANUFACTURERS OF
AGRICULTURAL IMPLEMENTS AND STEAM ENGINES
OF EVERY DESCRIPTION,
IRONFOUNDERS, ENGINEERS,
AND EXPORTERS OF MACHINERY TO ALL PARTS OF THE WORLD.

R. Garrett and Son beg reference to the Official Catalogue for descriptions of their Implements and Machinery exhibited at the Great National Exposition of 1851. They will have pleasure in supplying their Illustrated Catalogues, in the English and French languages, containing particulars and prices of all Implements and Machines required for Agricultural purposes, together with any further information that may be required, on application, by post or otherwise, at the Works, as above.

All implements delivered carriage free to London, Hull, or Newcastle-on-Tyne, or to any station on the Eastern Counties Railway.

Implements packed and shipped from any port in England for abroad. (*See Catalogue.*) [1 137

PHŒNIX IRON WORKS,

NEAR STROUD, GLOUCESTERSHIRE.

JOHN FERRABEE AND SONS,

ENGINEERS, MILLWRIGHTS, MACHINISTS, IRON AND BRASS FOUNDERS, AND MANUFACTURERS OF AGRICULTURAL IMPLEMENTS,

UNDERTAKE THE CONSTRUCTION AND ERECTION, IN THE BEST STYLE, OF

STEAM ENGINES,—Boilers and their appendages, Cast and Wrought Iron Cisterns and Tanks.

WATER WHEELS.

MILL GEARING,—Cast and Wrought Iron Shafting; Couplings; Spur, Bevil, and Mitre Wheels; Hangers, Pedestals, Fixings, Drums, Strap Wheels, &c.

CORN-MILL WORK,

Mill Hursts and Stones, Flour Machines, Smut Machines, Separators, Dusters, Meal and Corn Worms and Elevators, Hoisting Tackle, Mill-stone Provers and Picks, Iron Sack Barrows, &c.

MACHINES FOR THE MANUFACTURE OF WOOLLEN CLOTH,

Carding and Scribbling Machines, Spinning Machines (Mules), Power Looms, Fulling Stocks, Iron Washer Rollers, Iron Boiling Rollers & Cisterns, Gig Mills, Shearing Machines, Brushers, Grinding Machines, Indigo Mills, Hydraulic Presses, &c.

MACHINES, PUMPS, TOOLS, ETC.,

Leather Levelling Machines, Carpet and Hearth-Rug Shearing Machines, Hot-water Apparatuses, Lifting and Force Pumps, Circular-saw Benches, Cranes, Crabs, Windlasses, Lifting Jacks, Fan Blowers, Lock-gate Paddle Winders, Cart and Waggon Arms, Cart Axles, Screw Wrenches, Strap Punches, Strap Screws, Straps, &c.

AGRICULTURAL MACHINES AND IMPLEMENTS.

An improved and complete system of Machinery for Thrashing and Dressing all kinds of Corn, the whole of which may be worked in combination so as to deliver a perfectly clean and uniform sample of grain into the sacks at one operation, or the thrashing and dressing may be performed separately; Patent serrated Knife Machines, for cutting chaff or litter; Grinding Mills, with Stones made from French Burrs; Corn Crushers, Oil-cake Breakers, Turnip Cutters, Iron Ploughs, Subsoil Ploughs, "Ducie" Cultivators, Wrought-iron rhomboidal Harrows, Land Rollers, Presser and Clod-crusher Rollers, Horse Hoes, Haymaking Machines, Cast-iron Pig and Water Troughs, Mangers, Hay Racks and Pillars for Corn-rick Stands, One-horse Carts, Wheels and Axles for Carts.

BUDDING'S PATENT MOWING MACHINE,

for Lawns, Pleasure-grounds, Bowling-greens, &c. J. F. and Sons *have manufactured and sold between* 3000 *and* 4000 *of these Machines—a conclusive proof of their utility.* Messrs. Ransomes and May, of Ipswich, are the sole wholesale Agents for the sale of them in London and the Eastern Counties. [1 122

R. W. WINFIELD,

CAMBRIDGE-STREET WORKS, BIRMINGHAM.

PROPRIETOR OF THE ORIGINAL PATENT FOR

METALLIC MILITARY BEDSTEADS;

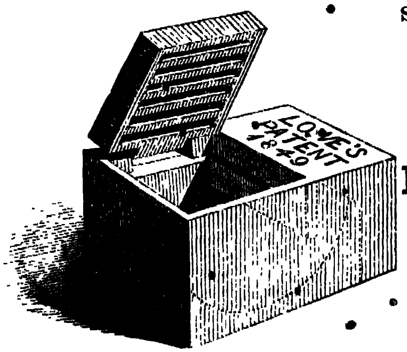
Patentee and Manufacturer of others upon improved principles; also Manufacturer of Brass Desk, Pew, Organ, and other Railing; Window Cornices, Patent Curtain Bands and Ends; Glass Cornice Rings; Locomotive Railings and Mouldings; Brass and Zinc Name Plates for Shop Fronts; Sash Bars and Window Guards; Candle Chandeliers and Sconces; Patent Tubes, by the New Patent Process, whether Taper or Double; Picture, Pulley, Curtain, Wardrobe, and Stair Rods, Astragals, and Beading; Window Fronts, Mouldings, Plates, and Guards; Balustrades; Fire Screen Stands and Arms; Bonnet, Hat, Cloak, and Umbrella Stands; Brass and Iron Reclining and other Chairs; Gas Chandeliers, Pillars, Branches, and Fittings of all kinds; Tubing of every description, rough and finished; Brass and Copper Wire, and Rolled Metals.

SHOW ROOMS:

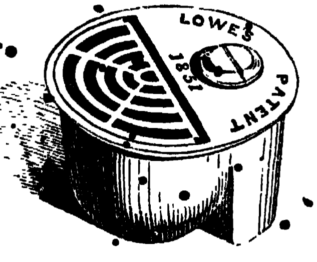
Cambridge-street Works, Birmingham; London, 141, Fleet-street; and Brussels, Corr Vander Maeren & Co.

R. W. WINFIELD'S Show Rooms contain Specimens of his Patent Metallic Military, Travelling, and House Bedsteads, so much in use at Home and Abroad; with many other Articles of Furniture in Brass, Bronze, Or-molu, and imitation of Silver; together with Gas Fittings of every Description, and a variety of other Articles of his Manufacture. The Portable Bedsteads are admirably adapted for use in the Camp, or for Travelling; and are also well suited for Officers in the Army and Navy. [1 291

SANITARY IMPROVEMENTS.



LOWE'S
PATENT
EFFLUVIA-TRAP GRATINGS,



FOR

PUBLIC SEWERS, AND DRAINS IN HOUSES, WORKS, YARDS, COURTS, PASSAGES, CELLARS, AND SINK-STONES.

Patronized and used at the Model Cottages in Hyde Park (opposite the Exhibition Building) now being erected for His Royal Highness Prince Albert, under the direction of Henry Roberts, Esq., F.S.A., Honorary Architect to the Society for the Improvement of the Condition of the Labouring Classes.

The advantages of the Effluvia-Trap Sewer Gratings, over the Bell, Syphon, Flap, or Drop Traps, consist in their combining, in a simple, cheap, and compact form, *a Sewer or Sough Grating, an Effluvia-Trap, a Sediment-Trap*, and *a Vermin-Trap, all together;* they are the only Effluvia-Trap which can be cleansed without allowing the effluvia to escape.

The simplicity of their construction, their general applicability, the ease with which they are examined and cleansed, their solidity of form and durability, perfect efficiency and cheapness, recommend them to the notice of Corporations, Architects, Surveyors, Builders, Contractors, the Trustees of Public Hospitals and Institutions, and all persons interested in the Sanitary Improvement of Towns, and to the Occupiers of all Houses where the Drainage is connected with the Main Sewers.

Upwards of twenty thousand of the Patent Grids are now in use by the Corporations, Surveyors, Commissioners of Sewers, or Local Boards of Health, in London and the principal Cities and Towns in the Kingdom.

THE NUMBERS, SIZES, WEIGHTS, AND PRESENT PRICES, IN CAST IRON, ARE AS FOLLOW, viz.—

	In.		In.	In.		Weight.	£.	s.	d.
No. 1 Size,	30	by	18;	—16	deep,	about 5 cwt.	2	5	0

No. 3 ,,	14	by	9;	— 9	,,	about 1 cwt.	0	10	0
No. 4 ,,	11	by	7;	— 7	,,	56 lbs.	0	7	6
No. 5 ,,	9	by	5½;	—[illegible]	,,	25 lbs.	0	4	9
No. 6 ,,	6¼	by	4;	— 4	,,	10 lbs.	0	3	6

No. 7 Size (for Sink-stones), viz.—	s.	d.
In Iron	2	0
In White Metal, with Brass Top	2	9
All Brass	3	6
Round Pattern, all Brass, with screw plug to open in case of the stoppage of the pipe	3	9

Any larger or intermediate sizes made to order, with either square or round bottoms, flat, concave, or convex tops, with or without flanges, and also with combined horizontal and perpendicular gratings. *The usual trade allowance to Ironmongers; and a liberal discount to Corporations, Local Boards of Health, Contractors, and Architects.*

Licensed Makers in London:—R. W. Kennard and Co., 67, Upper Thames Street.

Wholesale Agent, London:—W. K. Whytehead, Civil and Mechanical Engineer, 69, Cornhill.

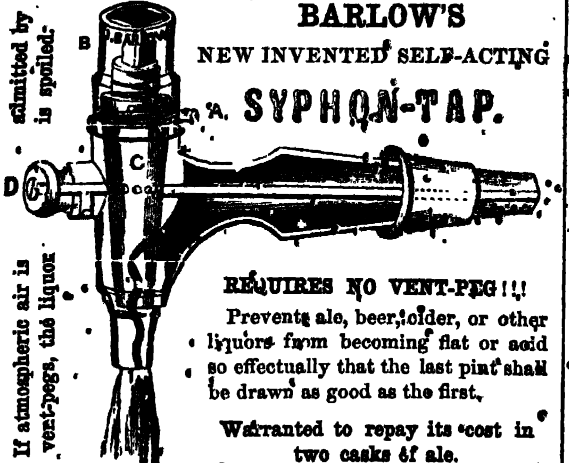
Printed Lists of Testimonials and further particulars forwarded on application.

Salford, Manchester, April 12th, 1851. *(See Catalogue.)* A. LOWE and Co., *Patentees.* [1 294

BARLOW'S

NEW INVENTED SELF-ACTING

SYPHON-TAP.



If atmospheric air is admitted by vent-pegs, the liquor is spoiled.

REQUIRES NO VENT-PEG!!!

Prevents ale, beer, cider, or other liquors from becoming flat or acid so effectually that the last pint shall be drawn as good as the first.

Warranted to repay its cost in two casks of ale.

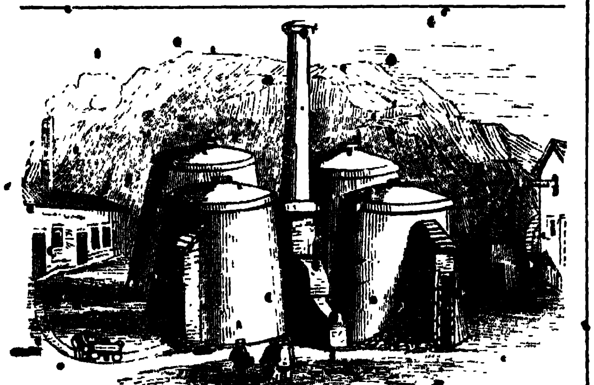
Price 4*s.* 6*d.*, or sent free to any part of England (if two are taken) at 5*s.* 3*d.* each. Ditto, electro-plated, much used for Sherries, &c., on tap, 8*s.* 6*d.* each.

The above engraving will explain its action. When the loose key is fitted on the top of the plug C (which has a hole opposite the air-tube H), sufficient air rushes through it into the cask to cause the liquor to run off freely; when the tap is turned off no more air can enter.

JAMES BARLOW,
14, KING WILLIAM-STREET, MANSION-HOUSE.
ESTABLISHED 1820.

None are genuine except stamped with his name and address.

N.B.—This tap is the most simple and least liable to get out of order of any yet invented. [1 126



RIDGWAY'S

PATENT KILNS,

FOR BURNING

POTTERY, BRICKS, TILES, &c.,

COMBINE ECONOMY of FUEL with the production of first-rate goods, at a reduced less and less cost in wear and tear. The construction differs materially from that of the old kilns. There is only one fireplace, which is beneath the kiln: the heat ascends by means of a central tube and the internal walls; and, as there is no opening at top, descends, thoroughly burning the goods, and passing off by wall vents. The smoke is consumed, the management easy; and when built in pairs, or sets of four, the spare heat passes from one to the other, thereby still further increasing the saving.

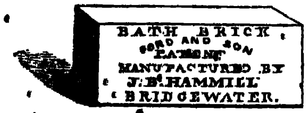
For particulars apply to Mr. RIDGWAY, Cauldon-place Wharf Staffordshire Potteries. [1 134

CROSSKILL'S WHEEL AND MACHINE WORKS.

NEW ILLUSTRATED CATALOGUES may be had (per post) on enclosing six penny postage stamps. Address—MR. CROSSKILL, BEVERLEY. [1 138

BELL and BLACK, 15, BOW-LANE, CHEAPSIDE, LONDON, Manufacturers of WAX VESTA MATCHES, CAMPHORATED ROUND WOOD and new PATENT CONGREVES, warranted not to be affected by climate, time, or exposure to damp.—Beware of spurious imitations. [1 73

PATENT BATH

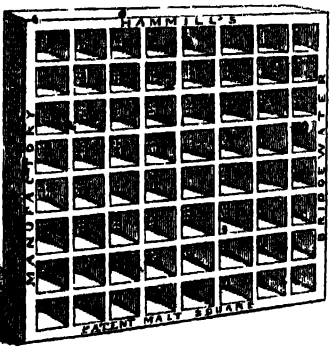


SCOURING BRICKS,

R. FORD & SON'S PATENT; AND

PATENT MALT-KILN TILE,

MANUFACTURED BY J. B. HAMMILL,



BRICK, TILE, & TIMBER WORKS, BRIDGEWATER.

J. B. HAMMILL'S PATENT.

N.B.—*Foreign Orders punctually executed.* [1 222

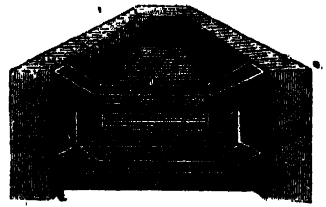
GAS COOKING STOVES.

THIS superior method of Cooking being now generally recognised, Messrs. GRIGG and JENKINSON have devoted much time and expense to bring forward an apparatus embracing all the excellences and requirements of a complete GAS COOKING STOVE. It accomplishes to perfection *Roasting*, *Baking* (of Meat, Bread, Pastry, &c.), *Boiling*, or *Broiling*, and can be had either with or without a Boiler. If with a Boiler, steaming or warming any part of the house by hot-water circulation can be effected, or a warm bath had instantaneously, without additional trouble or expense. They are made of various construction, so as to meet the means and uses of all classes; and the prices range from a very low scale upwards.

The Public are respectfully invited to inspect the Stove in operation every day at the Manufacturers',

GRIGG & JENKINSON,
FINSBURY IRON-WORKS,
119 & 120, BUNHILL-ROW. [1 98

REGISTERED IMPROVEMENTS IN STOVE GRATES.—PIERCE'S newly invented PYRO-PNEUMATIC STOVE GRATE, the UNIVERSAL FIRE-LUMP GRATE, which requires no fixing, being made in one entire piece, having capacious and safe hobs, strong octagon-shape bars, and double table-bar trivet.



Also PIERCE'S IMPROVED COTTAGERS' GRATES, for warming two rooms with one small fire.

The above are the BEST AND CHEAPEST Grates for all useful purposes ever submitted to public notice, and are most strongly recommended by the entire public press.

Prices, from* 11*s.* 6*d.* to 30*s.

Prospectuses and every information afforded at the Warehouse and Manufactory, 5, JERMYN-STREET, REGENT-STREET.

Detailed particulars of the above improvements will be found in the body of this work. [1 205

STANLEY, AGRICULTURAL IMPLEMENT MAKER, Peterborough, has for disposal 3 Brass Chandeliers for Candles, 2-Tier high, 6 Lights in each Tier, 4 feet by 4 feet; one Chandelier as above, with 16 Lights, 4 feet 6 inches; eight Chandeliers as above, with 8 Lights each, 3 feet 6 inches. The above are modern, in good condition, and suitable for a Church or Chapel. [1 215

CHAMPION PRIZE

TILE, PIPE, AND BRICK MACHINE

OF THE

ROYAL AGRICULTURAL SOCIETIES OF ENGLAND (1850), SCOTLAND, IRELAND,

North Lancashire, Great Yorkshire, North Staffordshire, &c., combining the practical advantages of the Vertical and Horizontal principles of working in one machine—least draught, most rapid and greatest scope of manufacture, as proved by Dynamometer. Vide *Jour. Roy. Ag. Soc. Eng.*, Dec. 1850. Also PRIZE PUGING MILLS, DRAINING TOOLS, and Implements, of

H. CLAYTON, PATENTEE,

SECTION 2, CLASS 9, STAND No. ,

where full particulars may be obtained, and at the Manufactory, Atlas Works, Upper Park-place, Dorset-square, London, where the machines *may be seen in operation* daily, from 10 A.M. to 4 P.M.

Price of Machines from £13. (*See Catalogue.*) [1 119

DUTTON & CO., RUNCORN, CHESHIRE,

MANUFACTURERS OF SCHOOL SLATES,

FOR HOME USE AND EXPORTATION. [1 31

NEW and WONDERFUL PORTABLE GAS-LIGHT.—The Patentee has invented a Self-generating Gas Apparatus, producing a light of surpassing power and brilliancy, which, for economy and utility combined, has never yet been equalled.

This extraordinary Lamp, without wick or glass, is constructed to generate Gas from a cheap liquid, by a self-acting and simple process, producing a PURE BRILLIANT LIGHT, equal to the BEST GAS-BURNER, at the small expense of one farthing per hour. Can be carried about with perfect safety, and the light can be increased or reduced at pleasure by a stop-tap.

The tenacity of its flame renders it peculiarly available for Shops, Railways, Places of Worship, Mills, Streets, Booths, Market-stalls, Stables, Dye-houses, Breweries, Inns, Workshops, Schools, Steamers, Ships, &c. Its superiority over every other description of Lamp is beyond comparison, both in cost, simplicity of management, and quantity of light.

Though 20,000 have been sold the first winter, it still has the merit of novelty and utility; and is well worth the attention of Gas-fitters, Lamp-dealers, &c.

The original cost of Holliday's Apparatus, patented 1850, is from 6*s.* each (complete) and upwards, according to size and ornamental embellishments. It requires no connection to pipes or meters, thus avoiding the first expense of gas-fittings, and the misunderstandings which frequently take place between gas companies and gas consumers. The new Lamp is free from smoke, smell, or danger, and will burn for 14 hours *without attention.* In short, its cheapness, its utility, its brilliancy, and its simplicity of management, at once combine to render the invention one of the greatest acquisitions and triumphs in this department of modern science.

To be seen in every style, as well for the cottage as the mansion, and prospectus with engravings had, at READ HOLLIDAY and Co.'s Works, HUDDERSFIELD, and 128, HOLBORN-HILL, LONDON. [1 190

HYDRO-EXTRACTOR, OR CENTRIFUGAL DRYING MACHINES.

MANLOVE, ALLIOTT, AND LEYRIG, PATENTEES,

LENTON WORKS, NEAR NOTTINGHAM.

THESE MACHINES are made to revolve at great speeds, and the centrifugal tendency thereby imparted to the materials intended to be dried causes the moisture contained therein to be nearly instantaneously extracted, without heat, wringing, or strain of any kind, so that the very finest fabrics that can be manufactured are not in the least injured by the process. The introduction and use of these Machines have caused very great improvements to be made in many of the most important branches of Manufactures, and almost every day develops new and valuable applications of their principle of action. They are now considered indispensable to Bleachers, Printers, Dyers, Silk-throwsters, Woollen Manufacturers, and in finishing fabrics of almost every description, and are also applied with great advantage to the extracting of moisture from Starch and other crystalline and drainable substances. The Machines have also been applied with great success to the cleaning of Wool, Corn, or other substances, by passing water through the wool or other substance whilst in the Machine, previous to the drying operation, when the great force given to the water by the action of the Machine is by centrifugal tendency caused to pass with immense speed through the materials, and thus carries away with it all impurities. The Machines are adapted to work by hand as well as by steam-power, and have been found most economical, safe, and invaluable for the use of Baths and Washhouses, Laundries, Asylums, Hospitals, and Union Workhouses, as by their use the wear and destruction of clothes produced by ordinary wringing is entirely avoided. For Asylums and Workhouses the remark made in reference to cleaning Wool applies with great force, as the clothes are thus entirely freed from all impurities, some of which can scarcely be removed by any other process. Further particulars may be had from the Patentees, who are the sole makers of the Machine.—Address, MANLOVE, ALLIOTT, and LEYRIG, *Lenton Works, Nottingham.* [1 209

COWLEY and JAMES, MANUFACTURERS of PATENT WELDED WROUGHT-IRON TUBES, and every description of GAS-FITTINGS, CHANDELIERS, &c. Sole makers of Cowley and Hickman's Patent Metallic Bedsteads.—WALSALL, STAFFORDSHIRE; London Warehouse, HATTON-GARDEN.—JAMES MELROSE, Agent.

These Patent Soda-Water Machines are warranted superior in workmanship to any hitherto manufactured, and for solidity of construction, power, and simplicity, stand unrivalled. They are admirably adapted for exportation, as they could be packed in one case without taking them to pieces, and can be set to work, and Soda-Water made from them, in an hour after arrival at their destination.

Every other description of Soda-Water Machines, Improved Bottling Machines, Cylinders and Pillars for Soda-Water Fountains, &c. &c.

Diagrams sent to any part on application at the Manufactory.

To prevent disappointment and loss by the substitution of inferior and pirated imitations of their Machines, Hayward Tyler and Co. beg respectfully to request particular attention in copying *the Address,* 85, UPPER WHITECROSS-STREET, LONDON.

Extract from an Unsolicited and Spontaneous Report of the Working of one of Hayward Tyler and Co.'s Machines.

"*Bombay, Aug.* 31, 1850.

"The Double Soda-Water Machine which we got from you through Messrs. E. and Co. is still working beautifully, and has never required the least repair, though in constant use for upwards of four years, and left almost entirely to the management of natives." *(See Catalogue.)*

Hydraulic Presses, Steam Engines, &c. [1 241

BRYMBO COAL (on the Admiralty list) is considered to be the largest and finest that can be obtained in Great Britain. It is shipped with despatch from BIRKENHEAD, on the River Mersey (where the largest-sized ships lie afloat), and at SALTNEY, near Chester, at very moderate prices.

FIRE CLAY and BRICKS, of a very superior quality,
also on sale.

BRYMBO COLLIERY, WREXHAM, NORTH WALES.

Office in Liverpool, 2, Sweeting-street, near the Exchange. [I 199

HORSES' FEET.—CHERRY'S (*Her Majesty's principal Veterinary Surgeon*) ELASTIC STOPPINGS for HORSES' FEET have stood the test of 25 years' experience, and their usefulness in supporting and preserving the Feet of Horses has led to imitations that are deficient in the most essential properties. The original efficacious Stoppings have the Inventor's name branded on them, and are made only by WARD, Saddler, *Queen-street, Cheapside*, Manufacturer of every description of Saddlery, Harness, &c. &c., at the lowest possible prices. [I 248

FIRST-CLASS STEAMERS FROM HULL to Hamburgh, Antwerp, Bremen, Kampen, Yarmouth, Goole, and Gainsbro'. Also to London thrice a-week, at reduced fares; and to Copenhagen and St. Petersburg during the season. Inquiries by post, addressed to BROWNLOW, PEARSON, and Co., General Forwarding Agents, Hull, will have prompt attention. [I 6

BELFAST and the NORTH OF IRELAND *viâ* FLEETWOOD.—The Royal Mail Steamers "PRINCE OF WALES" and "PRINCESS ALICE" leave FLEETWOOD for BELFAST every MONDAY, WEDNESDAY, and FRIDAY Evenings, after the arrival of the 10 A.M. Train from London. See *Bradshaw's Guide*, p. 120; or apply to

KEMP & Co., *Fleetwood.* [I 206

ELECTRIC TELEGRAPHS

OF ANY KIND, and of very Superior Workmanship, supplied by W. T. HENLEY, Telegraph Engineer, Magnet Manufacturer, and Mechanician, and Patentee of the Magneto-Electric Telegraph, 46, ST. JOHN'S-STREET-ROAD, CLERKENWELL, LONDON.

W. T. H. undertakes to erect Telegraph Works, in this country or abroad, at a very reduced charge, and, if required, keep them in order; or when Railway Companies or others wish to erect their own Wires, he will supply them with Instruments of first-rate quality, as he has lately done (on Cook and Wheatstone's principle) to the South-Eastern Railway Company, for the Reading, Reigate, and Guildford and Hastings and Ashford Lines—the Telegraph Company being paid for a Licence for using the Patent. W. T. HENLEY also calls attention to his Magneto-Electric Telegraph, the Patents for which he has assigned to the Magneto-Electric Telegraph Company. This Instrument requires no battery, and is the only Telegraph not affected by wet weather or bad insulation of any kind.

W. T. H. also manufactures Magnets, Magnetic, Magneto-Electric, or other apparatus, of any dimensions; also all descriptions of Clock-work Trains and other Machinery.

Wire, covered with Silk, Cotton, Gutta Percha, or India-rubber, of any size or in any length. [I 260

ELECTRIC TELEGRAPHS.

WILLIAM REID,

ELECTRIC TELEGRAPH ENGINEER,
25, UNIVERSITY-STREET, LONDON,

HAS always on hand a large Assortment of ELECTRIC TELEGRAPH INSTRUMENTS, in various designs, for giving signals and sounding alarums.

Also an extensive stock of materials for erecting POLE and SUBTERRANEAN TELEGRAPHS, consisting of Wire coated with Zinc, Gutta Percha prepared in various forms, Insulators of the most approved kind in Earthenware, Glass, Gutta Percha, &c.

Patent prepared WIRE, for Submarine and other Telegraphs.

W. R., having been engaged in making Instruments and erecting Telegraphs for the last 13 years, is prepared to furnish tenders for the cost of Lines, and erect Telegraphs to any extent with the greatest possible despatch. [I 121

CONSTRUCTION OF RAILWAYS.

RANSOMES & MAY, Ironfounders, Engineers, and Manufacturers of Agricultural Implements, *Ipswich*, and *No.* 3, *Great George-street, Westminster:* where may be had particulars respecting Barlow's Patent Wrought-iron Railway Turntables and Cast-iron Sleepers; Wild's Patent Turntables and Switches; R. & M.'s own Registered Water-Crane; R. & M.'s Patent Compressed Tree-nails and Keys, &c., for Railways; Leggett's Queen Printing Press, with self-acting Inking Apparatus.

For Agricultural Implements, and for Turntables, &c. &c., see Official Illustrated Catalogue.

Also their Illustrated Catalogue of Implements and Machines, on application to their London Office as above, or post-free by enclosing Six Postage Stamps. R. & M. call particular attention to their Patent Trussed Beam Iron Plough, marked Y. F. L., price as a swing 2*l.* 10*s.*; and to their new Broad-share, Scarifying and Subsoil Plough; and their new Seed-dropper, Agricultural Steam-engines, and Thrashing Machines. R. & M. continue to undertake the construction of Railway Bridges, and to supply Cast-iron Girders, Columns, &c. &c.; also the building of Cattle and Goods Trucks. Ipswich is about 69 miles from London by Railway.

INSTRUMENTS D'AGRICULTURE.

RANSOMES et MAY, Ingénieurs, Fondeurs en Fer, et Fabricants des Instruments d'Agriculture, à IPSWICH, ANGLETERRE. Avis au public:—On peut obtenir un Catalogue Illustré des Machines et des Instruments d'Agriculture à *No.* 3, *Great George-street, Westminster*, ou affranchi à tous les Départements de la France, en envoyant une douzaine d'estampes de poste. Ipswich est éloigné de Londres de 28 lieues (environ), partant de Shoreditch, par le Chemin de Fer des Eastern Counties, et y arrivant en trois heures et demie. On peut y aller et revenir le même jour sans se gêner, et on donne des billets de retour pour la journée à prix reduit. Ils fabriquent aussi des

PAYNE'S OSBORNE SAUCE

ROYAL OSBORNE SAUCE,

PREPARED by HER MAJESTY'S CHEMIST in the Isle of Wight, specially patronised by the ROYAL YACHT SQUADRON, is decidedly the best and cheapest Sauce extant, greatly excelling all in extraordinary richness, piquancy, and fine goût. There is none like it for creating appetite, assisting digestion, and imparting relish the most exquisite to fish, game, chops, hot and cold meats, gravies, &c.; and, being quite clear, there is no waste with sediment. *Agent*—RUMSEY, 3, *Queen-street-place, Cheapside, London.* Retailed by Sauce-vendors generally.

(*See Catalogue.*) [I 275

NEEDLEWORK.

It is of the first importance to a nation that its requirements should be thoroughly understood; and every stride made towards better government is effected by a new ray of light having penetrated the darkness which originally covered the face of the whole earth. The more civilized a nation becomes, the more diversified are its legislative wants; and that which may with safety be left to adjust itself in the infancy of society, becomes, at a more advanced period, a paramount consideration. This is precisely the case with Needlework at the present day; it is impossible to overrate its importance. Even the boon of a thoroughly satisfactory poor-law must dwindle into comparative insignificance beside an arrangement whereby tens of thousands of paupers would be enabled to maintain themselves without taking one shilling out of the pockets of the public. Class legislation is a word of retort in the mouths of all parties; but when one class seizes upon the labour of its inferior, and, through the overpowering agency of capital, buys up an extensive branch of native remunerative industry, turning tens of thousands of able-bodied and highly artistical producers into poverty-stricken paupers,—when the monopolised trade, far from flourishing under the talismanic influence of capital, yearly deteriorates through the waning energies of the producers,—when the public is robbed by the substitution of an inferior article on demand, and victimised in the shape of poor's-rates to make up for the inadequate wages given to the producers,—when this gigantic evil has entrenched itself, like the wolf in the story of Red Riding Hood, in the very inmost chambers of the houses of the British public,—and whilst the wives and daughters of the land are gathering the flowers that bedeck the pathway of life, the monster is lying carefully concealed under the mantles of fashion upon the beds of indolence, ready to spring forth at an unexpected time and devour the luxurious triflers. Surely it is well to warn the public against the dangerous pet they are fostering in their dwellings; and, however timid the Legislature may be of encountering the insidious foe, every one may hunt it out of their own houses. I believe that the most pressing necessity of this country at the present crisis lies in a satisfactory solution of the problem, How we are to provide work that will afford wholesome food, clothing, and shelter for our increasing population, and yet enable us to compete in the market with our less scrupulous—because less enlightened—neighbours of the world, who are favoured with a better climate? I believe that that which we are advocating for Plain Needlework, viz. the shaking off of unnecessary clogs in the form of investment of capital, or the undue interference of the capital in gold with the capital in time and sinews, lies at the root of the whole matter; but in trades where the assistance of capital is essential, to prevent its present despotism without prostrating its energies is one of the gravest subjects a nation ever had to deal with; yet it must be handled sooner or later. Justice to the capitalist,—justice to the producer,—and justice to the consumer, can alone sweep away from our entire trade the disgrace of the slop system, and banish the cry of starvation from the land. Are our capitalists so honest that not one law needs to cumber the statute-book, providing for the fair remuneration of time? We have laws against usury; and can no usury in labour be wrung from the starving operative? When we hear of a great West or East End House retiring from business with its £100,000 cleared in a few years, it would look well if we heard of some fifty out of the thousand producers of that wealth who were also retiring with a modest competency; but I believe that, could we trace them, we should oftener learn that hundreds of the producers of that wealth have died, or are dying, in the workhouse. Happily for Plain Needlework it has no need of the aid of capital, and it depends on the will of the public to emancipate it from its bondage without legislative interference.

To accomplish this end **A Plan for Registration Offices for Needlewomen** is submitted, the intention of which is to improve their condition and prevent their pauperism by securing to them the profits of their own work. The plan promises the consumer a superior article for his money, and to enable men, without any previous knowledge of the trade, to procure their garments as easily, and with as much economy, as experienced females can do. It also proposes to afford every facility to families in finding suitable needlewomen, either to work by the day or by the piece, and securing them against loss by damaged work or non-fitting garments. The expenses of Registration to be defrayed for the first year by subscription. After the public has placed confidence in the Society it will require no pecuniary aid.

The Registration-Book.

To contain the names of Needlewomen alphabetically arranged—their ages, residence, and characters, as attested by the police and others—their qualifications, and whether they are cutters or not. Thus:—

Name.	Age.	Residence.	Character.	Attestators.	Qualifications.
Allwork, Agnes	29	Skinner-street	Very timid; honest. Keeps an aged aunt.	Police	Slop-sewer; cannot cut.
Bodkin, Mary.	28	Batty-street	Respectable and honest; judicious in purchasing. Married; 2 children.	Mr. Gentle, Clergyman of Shepherd's Chapel	Fine worker and cutter.
Cutter, Susan	18	Holloway-street	Idle; not to be trusted to purchase. Keeps a young brother.	Mrs. Lumsden, Grocer's wife, Crown-alley.	Pretty good needlewoman; cuts common work.
Darnaway, Rose.	40	19, Garlic-row	Honest and respectable; not judicious. Widow; five children.	Mrs. Wise, of Fenchurch-street.	Beautiful worker and cutter.

Book of Patterns and Prices.

Wherein every house in town is invited to enter their patterns of materials, with prices and widths affixed.

Book of Fashions and Price of Work.

Showing the most approved cuts of garments in general use; and these, being reduced to a scale, are sufficiently distinct for all cutters to follow without difficulty. To each drawing is attached a number, and the price of making the garment.

Book of Calculation.

Referring by numbers to the preceding book; thus:—

Shirt pattern No. 5, of linen; height, 5 ft. 10 in.; 2¾ yards . .
½ yard of cambric for the front . . . .

It is evident that, knowing the quantity of material, the price per yard, and the cost of making, any one with common sense can arrive at the correct estimate of the just price of their garment, without any previous knowledge of the trade.

Estimate of the Expenses of a Registration Office.

Rent of premises, fuel, and cleaning . . . . .
Salary of Clerks . . . .
Salary of Matron . . . .
Incidental expenses . . . .

Cutters would have no salaries, but be entitled to a fixed drawback from the price of the work.

When a lady wants a needlewoman, she can suit herself with one from the office without trouble, whether she desires her to cut out the garment or merely to make it,—whether she wishes her to purchase materials or to make them up. She can get a fine needlewoman at four shillings per shirt, or one to do coarse work at one shilling. She can get a trustworthy character; or, if she is willing to run the risk for a hitherto more unsteady fellow-creature, she can give her fewer things at a time and make the Christian experiment. But gentlemen want shirts, and they don't know what stuff they should be made of; they know that the one they have on—a cotton shirt, linen necks and wrists, cambric fronts—cost ten shillings and sixpence at a fashionable shop. The clerk hands the book of patterns; the matron matches the fabric—asks the gentleman's height—says, "Sir, I see by the Calculation-book, to which you can refer yourself (the clerk hands it), your shirt ought to cost so and so, because it takes so and so; have you any preference for a particular needlewoman?" Yes.—No. "Miss Bodkin will do them well; she is unemployed." A stamp sends Miss Bodkin notice; she repays it on being paid for the work. Along with the shirts, when finished, Miss Bodkin must hand the shop bill (paid) and her own. The gentleman, when he gives the order, deposits the money for the materials. When he gets home his shirts he pays Miss Bodkin, who signs a discharge. The gentleman may fairly be said, on the transaction, to save twenty per cent. If he bought shirts formerly of a fashionable shop at 10*s.* 6*d.*, he will now certainly get a superior article for 8*s.* 6*d.*, and, withal, have the satisfaction of improving the condition of the fiftieth part of our population. Supposing the books do not exhibit a trustworthy Miss Bodkin unemployed, Miss Scissors (the cutter up stairs) takes the job in hand, buys the cloth, cuts out the shirts, and subtracts what the Calculation-book allows her for her time from Polly Flighty's pay who does the work.

If the shirts do not fit, the matron passes her opinion upon the alterations required, and the needlewoman must do them. Some work may even be returned altogether for gross mistakes. This must be submitted to the Committee, who decide to what extent the mistake is to lower the recommendations of the worker; but in no case can more than one penny per shilling be subtracted from future wages for a fault of this nature. The Society must in all cases instantly remunerate the loser; but if needlework is lost or burnt, the culprit must refund it. Supposing gentlemen do not choose to come to the office to try on their shirts, a man will be sent to see them on in the mornings or evenings; but the gentleman must pay his time extra—only, he does not pay for the alteration. If a person wants six dozen shirts for an outfit, and he cannot wait more than a certain number of days, the clerk and matron must divide the shirts amongst all the hands for that class of work; and if these prove too few, the better hands whose work in hand is not pushed for must take them, whether they like it or not, to keep up the credit of the establishment. In all such cases the clerk and matron must be cautious of forcing work, and it must be reported to the Committee, and entered in the books. It is obvious the establishment is meant only to suit cash payments, and cannot speculate; but it may undertake export orders, the cloth or price being deposited, if the payment suits the Calculation-book. It is impossible, in the limited space which a page of a Catalogue affords, to enlarge upon the benefits of this system. The aim of introducing the subject here is to give it as much publicity as possible, and, by directing general attention to a plain and practicable scheme, to endeavour to secure the blessing of independence **for those who live by their Needle, and who form the most numerous Producing Class in every Civilized Nation.** [I 250

GREAT WESTERN FURNITURE WAREHOUSES,

J. DENT & Co.,

Cabinet-makers, Carpet & Bedding Manufacturers, Decorators, and General Furnishing Warehousemen, 30, 31, 32, and 99, CRAWFORD-STREET, BRYANSTONE-SQUARE, MARYLEBONE.

SUBSTANTIAL NEW AND SECONDHAND FURNITURE.—Every one in search of really good and cheap Furniture would do well, before purchasing elsewhere, to visit the unequalled spacious GREAT WESTERN FURNITURE WAREHOUSES, by very far the most extensive in the Metropolis (the smallest of which being upwards of 300 feet in length). The proprietors, relying upon a reputation acquired during a period of 25 years, confidently invite the attention of the public to their immense Superior Stock of Cabinet Furniture, Carpets, Upholstery, and Bedding, the whole of which is manufactured of the best seasoned materials, by first-rate workmen, and at one-third the prices usually charged at the west end of the town. Every article is warranted, the price marked in plain figures, and will be exchanged or money returned if not approved of. [I 288

MELNOTTE'S

LADIES' SHOE AND FANCY WAREHOUSE,

23, OLD BOND-STREET, LONDON,

Formerly 114, REGENT-STREET.

LADIES' BOOTS and SHOES, superior ELASTIC and RIDING BOOTS, and a variety of FANCY SLIPPERS; French Silk Stockings, Plain and Embroidered Cambric Handkerchiefs, Fans, Reticules, and Purses of Crochet and other work, and a most varied selection of Imitation Gold, Diamond, and Pearl Bijouterie, and other Parisian novelties.

CHEILLE'S unequalled Paris Kid Gloves kept exclusively. India and Wedding orders executed on the shortest notice. The high-standing reputation of Melnotte's house (established 35 years in London) renders all encomiums superfluous. Specimens to be seen in the French division at the Great Exhibition. MELNOTTE'S, 23, Old Bond-street, London. *See Catalogue.* [1 26

PEAL'S WATERPROOF BOOTS.—CAUTION! —Gentlemen are requested to observe that BOOTS of PEAL'S WATERPROOF LEATHER can only be obtained of the Manufacturer, NATHANIEL PEAL, 11, Duke-street, Grosvenor-square; and that this leather is not, under any circumstances, supplied to the trade. [1 58

MORTLOCK'S,

18, REGENT STREET, NEAR PICCADILLY.

By special appointment to the Queen.

WILLIAM MORTLOCK begs most respectfully to call the attention of the Nobility and Gentry to his extensive assortment of CHINA, GLASS, and EARTHENWARE, comprising every description, both decorative and useful, and particularly adapted for foreign as well as home trade.

18, *Regent-street, near Piccadilly.* [1 13

IF you desire really well polished Boots, use BROWN'S ROYAL MELTONIAN BLACKING. It renders them beautifully soft, durable, and waterproof, while its lustre equals the most brilliant patent-leather. Price the same as common Blacking. Made only by E. BROWN, the inventor and sole manufacturer of the De Guiche Parisian Polish for Dress Boots and Shoes, and Waterproof Varnish for Hunting Boots. *Manufactory*, 25, *Broad-street, Golden-square, London.* Patronized by the Court and Nobility, and to be had of all the principal Bootmakers throughout the kingdom. [1 17

ROYAL VICTORIA FELT CARPETING.

THE PUBLIC ATTENTION is particularly directed to this manufacture. The Carpeting combines beauty of design, durability, imperviousness to dust, and economy in price—costing half that of Brussels. It has now been in general use many years, and become well established with the trade and the public, and can be purchased at all respectable Carpet-houses in London, and in nearly every town of the United Kingdom. The PATENT WOOLLEN CLOTH COMPANY, 8, Love-lane, Aldermanbury, also manufacture Printed and Embossed Table-covers, in the newest designs, Window Curtains, Cloths for Upholsterers, Thick Felt for Polishing, &c. &c.—Manufactories at LEEDS, and BOROUGH-ROAD, LONDON. [1 71

THE PATENT DESICCATING COMPANY invite the attention of the Public to their Drying and Seasoning Process. By it, wood of the finest description can in the course of a few days be more thoroughly seasoned, and rendered less liable to subsequent shrinkage, than if dried or seasoned by the ordinary method of exposure to the atmosphere for six or seven years. The floor of the new Coal Exchange, which is composed of 4000 specimens of twelve different kinds of wood, some of which were growing, and all of which were seasoned, within three weeks of their being used, is adduced in proof of the above statement. The Company's process is very extensively used in Manchester and other manufacturing districts, where clean, uniform, expeditious, and certain drying is required; and it is equally fitted for the finest as for the coarsest kind of goods, and ensures a controllable temperature of any required degree of heat.—Certificates of the successful application of this invention to the drying of Wood, Flax, Paper, Printed Paper, Cotton, Grain, Coffee, Calico, Starch, Wool, Yarns, Fabrics, Wadding, Manure, &c., can be obtained by applying either personally or by letter to the Secretary,

41, GRACECHURCH-STREET, LONDON. [1 156

JEAN MARIE FARINA, COLOGNE, 23, RHEINSTRASSE; LONDON, 1, SALTERS'-HALL-COURT (by 82, CANNON-STREET, CITY); recommends his newly-exhibited EXTRAIT D'EAU DE COLOGNE. 1*l.* per Box of six Bottles (duty paid).—STOCK IN BOND FOR EXPORTATION—

Extrait d'Eau de Cologne		24/.	per doz.

It is agreeable, economical, and effectual. ¼ lb. bottles, 1*s.* 6*d.*; ½ lb. bottles, 2*s.* 6*d.* each. Prepared and sold by JOHN MACKAY, Chemist, 121, George-street, Edinburgh. Wholesale Agent, W. S. RUMSEY, 3, Queen-street-place, London. [1 120

HITCHCOCK & CO., CHYMISTS, of TAUNTON, beg to inform their Friends and the Public generally that the increasing demand for their delicious and permanent perfume "*The Italian Bouquet*," has rendered it necessary to establish a depôt for its sale in London; it will therefore be always on sale at GIFFORD and LINDER'S, 104, STRAND, where also all H. and Co's., valuable preparations may be obtained.

To those who never used the Italian Bouquet, H. & Co. will only say it really is fully entitled to the name given it by those who have patronized it, as being the "*ne plus ultra*" of perfumes.–Dated, North-street, Taunton, March 1851. [1 177

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES.—The Tooth-Brush searches thoroughly between the divisions of the Teeth, and cleans them in the most efficient manner, the Hairs never coming loose.—Penetrating Hair Brushes, with the durable unbleached Russia bristles, and every description of Brush and Comb for the Toilet, only at METCALFE, BINGLEY, and Co.'s, Brushmakers, by special appointment, to H.R.H. Prince Albert, 130B, Oxford-street.--Beware of the word "from" (Metcalfe's) adopted by some Houses.—Metcalfe's Alkaline Tooth Powder, 2*s.* per box. [1 110

A CABINET with SECRETARY and SECRET DRAWERS of BURNT BRITISH WOODS, so disposed as to show the different grades of colour, either for new or old work.—This beautiful and much-admired product has been manufactured at the Wood-carving premises, RANELAGH-ROAD, THAMES-BANK, PIMLICO, where the art has been brought to perfection at an outlay exceeding 40,000*l.* in France and England. The present Proprietor of the Factory, Mr. THOMAS HARRISSON, owned the patent and plant in France, which is now joined to the plant in England, with great additions; and is well worthy the attention of a responsible, competent person to take an interest and the management of the concern. There is a show-room on the premises, under the management of Mr. THOMAS THOMSON, who designed and produced the above cabinet.

See page in Catalogue for drawing and description. [1 123

THE WORCESTERSHIRE SAUCE, prepared by LEA & PERRINS, from the recipe of a Nobleman in the country, imparts the most exquisite relish to steaks, chops, and all roast meat, gravies, fish, game, soup, curries, and salad; and by its tonic and invigorating properties enables the stomach to perfectly digest the food. The daily use of this condiment has proved most conducive to health, and established its fame throughout the world. Sold wholesale by the proprietors, Lea & Perrins, 6, Vere-street, Cavendish-square; Crosse & Blackwell, Soho-square; and other merchants, London; and retail by the principal dealers in sauces. [1 8

"QUEEN OF BRITISH WATERING-PLACES."

SHARPIN'S CROWN HOTEL,

ESPLANADE,

CONTIGUOUS TO THE SPA, SANDS, CLIFF-BRIDGE, AND PLEASURE-GROUNDS.

Families will find the above extensive Establishment most agreeably situated, commanding a splendid view of the ocean, combining every comfort and convenience.

TABLE D'HOTE AT FIVE O'CLOCK.

BILLIARD-TABLE AND BATHS IN THE HOUSE.

An Omnibus and Cabs at the Railway Station. [1 293

HARROGATE,

THE

METROPOLIS OF BRITISH WATERING-PLACES.

HARROGATE is situated in Yorkshire, within six hours of London, a short distance from York and the far-famed Fountains' Abbey, about equi-distant between the Northern Ocean and the Irish Channel. Its position on a table-land—a great height above the level of the sea—and its dry, sandy, highly-drained soil, combine to render it a peculiarly healthy and bracing residence. It is on account of the benefits which are to be gained from its different celebrated MINERAL SPRINGS and BATHS that Harrogate is chiefly frequented. These springs are many in point of number: as regards their properties and effects, they are no less various. They may, however, be subdivided into five great classes:—

- I. *The strong Sulphureous*
- II. *The mild Sulphureous.*
- III. *The pure Saline.*
- IV. *The pure Chalybeate.*
- V. *The Saline Chalybeate.*

The two first classes are valuable, not only in Cutaneous, but also in various Dyspeptic Complaints, in derangements of the Liver, in Gout and Rheumatism, and in some particular cases of Female Diseases. In fact, as many or most Cutaneous diseases depend more or less upon one or another of these diseases above named, the cure of the former (*the effect*) is more or less consequent upon the removal of those diseases which are the *cause.*

There are many cases where the third class above mentioned (the pure Saline springs) are highly useful.

It would be out of place in this notice to enumerate the numerous derangements of the system which are benefited by the fourth and fifth classes, viz.—the pure Chalybeate and the Saline Chalybeate. Suffice it to say that the Chalybeate springs are much stronger than most of a similar kind in this country, while the Saline Chalybeate springs are unique in Great Britain, and in point of analysis, as well as in their physiological and therapeutic effects, are closely analogous to the famous Ragozzi spring at Kissingen.

A case may now be seen at the Exhibition of all Nations, containing specimens of some of the principal Waters, with their respective analyses.

It only remains to be added that the accommodation for visitors, both at the hotels and lodging-houses, is of a first-rate description. [1 183

HOTEL DE LILLE and ALBION, in PARIS, 323, RUE ST. HONORE, and RUE DE RIVOLI.—Hotel for Families and Gentry. Baths, Stables, and English Attendance.—The gardens of this Hotel conduct to the Tuileries. [1 187

HOTEL DE FOLKSTONE, 9, RUE CASTELLANE, PARIS; L. OLIVIER, Proprietor.—This establishment, situated in the handsome quarter of the Madeleine, near the Boulevards, the Tuileries, and the Champs Elysées, is specially frequented by English travellers. It is particularly noted for its elegant furniture, good management, cleanliness, and moderate charges. The attendance is made by English servants, and nothing is spared by the Proprietor to render this Hotel one of the most comfortable in Paris. Table d'Hôte at three Francs; Bedrooms and Apartments at all prices. Interpreters for all languages. [1 141

THE ISLE OF MAN,

SITUATED in the centre of the United Kingdom (within six hours' sail by steam from Liverpool, five from Fleetwood, seven from Dublin, and twelve from Glasgow), though comparatively so little known as such, is, in most respects,

UNEQUALLED AS A WATERING-PLACE

and Residence. It is exempt from taxation. Its waters are pellucid—sea-bathing unrivalled—scenery magnificent—climate equable and salubrious—Collegiate and Scholastic Establishments excellent—the luxuries and necessaries of life attainable at moderate prices. The Island is well provided with first-rate Hotels and Lodging-houses, excellent Roads, cheap Conveyances, &c.; whilst there are no Turnpikes or Toll-bars to fret the temper of the Traveller on land, nor Harbour Dues to discourage the Yachtman. To the Capitalist, the Annuitant, and the Valetudinarian a more agreeable, healthful Residence can scarcely be found in Her Majesty's dominions than in this Island. First-class Steamers, carrying Her Majesty's Mails, and commanded by able officers, leave Prince's Pier-head, Liverpool, every morning (Sundays excepted) at eleven o'clock during the summer months; and from Fleetwood, Dublin, and Glasgow, weekly. [1 235

CHELTENHAM,

QUEEN'S HOTEL.

TO FOREIGNERS AND OTHERS VISITING THE EXHIBITION.

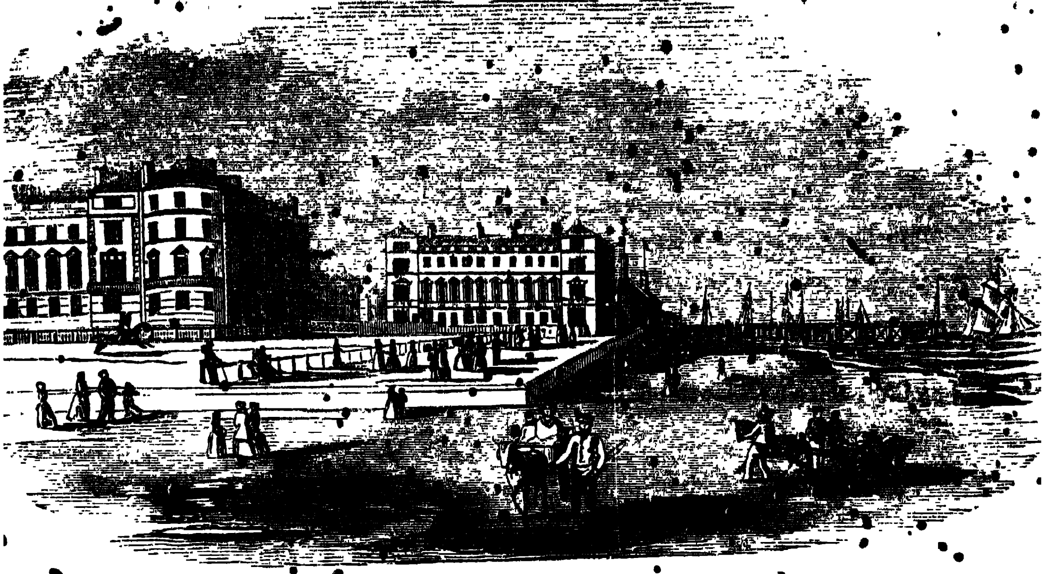
THIS HOTEL is situated in the most fashionable part of the town (in the immediate vicinity of the SPAS), and is one of the largest in England, having nearly 100 Bed-rooms, with Sitting Apartments fitted up in a style combining comfort with elegance; and from the retired situation of the Hotel there is no annoyance to visitors from the continual rattle of carriages, &c.; it is therefore admirably adapted for invalids.

It has now been determined to reduce the scale of charges as follows, in order to obtain an extensive patronage from the public:—

	£.	s.	d.
Board and Lodging, Table d'Hôte, per week each	2	7	6
,, ,, in Private Apartments ,,	3	0	0
,, ,, ,, if more than two persons . . . . ,,	2	12	6
,, ,, for a Servant . . . . ,,	1	1	0
Dressing-room . . . . ,,	0	7	0
Fires (when required) . . . . ,,	0	5	0
Sitting-room from 42s. to 10s. 6d. per week.			
Beds . . . . per night	0	2	0
Breakfast, with meat or eggs	0	2	0
,, without ,, ...	0	1	6

A MODERATE FIXED CHARGE FOR SERVANTS.

Omnibuses, Flys, Post-horses, Carriages, &c. &c. [1 147



[VICTORIA ESPLANADE AND JETTY, GREAT YARMOUTH.]

GREAT YARMOUTH, NORFOLK.

THERE are few places in the Kingdom which present greater attractions to those in pursuit of health or recreation than the Town of GREAT YARMOUTH. This ancient SEAPORT is placed at the extreme Eastern point of the English Coast, and has long been celebrated for the great purity and bracing quality of the air, which acts as a powerful yet wholesome stimulant to the human frame, whether worn down by care, anxiety, or disease. It has therefore been strongly recommended by the most eminent of the faculty, especially in cases of debility or of paralytic complaints. SEA-BATHING can here be enjoyed in perfection. The Sands are firm and shelving, free from rock and mud, perfectly safe for children, and are the best adapted of any around Great Britain for walking and riding. Great Yarmouth has now become a Bathing-place of great resort; and numerous HOTELS and LODGING-HOUSES, commanding Marine Views of considerable extent and beauty, have been erected, affording suitable accommodation to Families of Rank, as well as for all classes of Visitors, at reasonable charges. The Sea View is unrivalled, and presents an ever-changing Panorama, the charms of which it is impossible to exaggerate, as the number of Vessels which pass through Yarmouth Roads CLOSE INSHORE is greater than on any other part of the Coast, or perhaps of the world; and during the Mackerel Fishery, from April to July, and the Herring Fishery, from September to December, this part of the Coast has a very animated appearance, and the labours of the Fishermen are a constant source of amusement and interest to Visitors; whilst for Marine Excursions, Yawls of a very superior build, combining swiftness with safety, are in constant readiness, and every facility for Boating is afforded by the Rivers Yare, Waveney, and Bure.

The Market is abundantly supplied with Meat, Fish, Poultry, and Game at moderate prices; and Yarmouth is celebrated for its Ale.

The old town of Great Yarmouth is of considerable antiquity, is built on a plan unseen in any other part of the Kingdom, and presents many peculiar features.

The principal objects of interest and amusement in the town and neighbourhood are the Parish Church of St. Nicholas, a magnificent structure of the thirteenth century (where there is a daily service); St. Peter's Church, St. George's Chapel, a Roman Catholic Church, and other places of religious worship; the Column erected to the memory of Lord Nelson; the Jetty extending into the sea, and affording a delightful promenade; the Victoria Esplanade and Britannia Terrace, facing the ocean; the Denes (or Downs) and Race-course, with ample space for equestrian exercise; the Quay, of unequalled extent and beauty; the Royal Military Lunatic Asylum; the Theatre; the Bath and Reading Rooms; Public Library; Gorleston Cliffs and Piers; the Roman Camp, called Garianonum, at Burgh Castle; the ruins of the castellated mansion of Sir John Fastolfe, K.G., at Caister; many curious and highly interesting Churches in the adjoining parishes, some of them with the round towers peculiar to the district; whilst the ancient City of NORWICH, with its Castle, Cathedral, and numerous Churches, is within half an hour's distance by railway.

A MARINE REGATTA will take place in July, and the annual RACES on the 9th and 10th September.

There is a direct Railway and Telegraphic Communication to all the most important towns in the kingdom. Trains leave by the Eastern Counties Railway at Shoreditch, and Steamers leave London Bridge every Wednesday and Saturday (fares—first cabin, 8s.; second, 5s.). The Hull, Newcastle, Leith, Aberdeen, and Inverness Steamers pass weekly through Yarmouth Roads.

The Principal HOTELS *fronting the Sea are*

SPECIMENS OF HOPS (as prepared for Sale by J. M. PAINE) of the true GOLDING VARIETY, grown at Farnham, upon the Phosphoric Strata of the Lower Chalk Marl and Upper Green Sand. Hops abstract from the soil more phosphoric acid than any other cultivated crop; hence the suitableness of this remarkable soil for their perennial growth. Nearly the whole of Mr. J. M. PAINE's extensive Hop Plantations are thus situated.

Agents for sale, Messrs. S. GIBBONS & Co., 253, High-street, Southwark. [1 43

Under Patronage of Royalty and the Authority of the Faculty.

KEATING'S COUGH LOZENGES.

A CERTAIN REMEDY for Disorders of the PULMONARY ORGANS, In Difficulty of Breathing—in Redundancy of Phlegm—in Incipient CONSUMPTION (of which COUGH is the most positive indication), they are of unerring efficacy. In ASTHMA, and in WINTER COUGH, they have *never* been known to fail.

KEATING'S COUGH LOZENGES are free from every deleterious ingredient; they may, therefore, be taken at all times, *by the most delicate female and by the youngest child;* while the PUBLIC SPEAKER and the PROFESSIONAL SINGER will find them invaluable in allaying the hoarseness and irritation incidental to vocal exertion, and consequently a powerful auxiliary in the production of MELODIOUS ENUNCIATION.

Prepared and sold in Boxes, 1*s.* 1½*d.*, and Tins, 2*s.* 9*d.*, 4*s.* 6*d.*, and 10*s.* 6*d.* each, by THOMAS KEATING, Chemist, &c., *No.* 79, *St. Paul's Churchyard, London.* [1 226

WHITE'S SACCHARIZED HYDRATE OF MAGNESIA.

THIS new and elegant Preparation is now offered to the Medical Profession and the Public. After having devoted several years to the preparation of the article, the Manufacturer with confidence, under the sanction of eminent Physicians, introduces it as a mild aperient and corrector of the acid of the stomach. From its agreeable, pleasant taste, it will be found much more palatable than any other preparation of Magnesia. Being most useful for Children, and peculiarly adapted for them, it may be relied on as a perfectly safe remedy in all cases where this medicine may be required. The Manufacturer has received testimonies of the efficacy of this medicine from some of the first Physicians.

Sold in bottles at 1*s.* each.

Agents in London: BARCLAY and SONS, 95, Farringdon-street; EDWARDS, 67, Paul's-churchyard; SANGER, 150, Oxford-street; HANNAY and Co., 63, Oxford-street; BELL, 338, Oxford-street; W. S. RUMSEY, wholesale agent, 3, Queen-street-place. Agents for Ireland: J. G. BOILEAU and Co., Mary's Abbey, Dublin. [1 203

50,000 CURES by DU BARRY'S REVALENTA ARABICA FOOD, without medicine, inconvenience, or expense (as it saves fifty times its cost in other remedies).—Cure No. 180: "Twenty-five years' nervousness, constipation, indigestion, and debility, from which I had suffered great misery, and which no medicine could remove or relieve, have been effectually cured by Du Barry's Revalenta Arabica Food in a very short time.—W. R. Reeves, Pool Anthony, Tiverton." Cure No. 4208: "Eight years' dyspepsia, nervousness, debility, with cramps, spasms, and nausea, for which my servant had consulted the advice of many, have been effectually removed by Du Barry's delicious health-restoring food in a very short time. I shall be happy to answer any inquiries.—Rev. John W. Flavell, Ridlington Rectory, Norfolk." Cure No. 1609: "Three years' excessive nervousness, with pains in my neck and left arm, and general debility, which rendered my life very miserable, have been radically removed by Du Barry's health-restoring food.—Alex. Stuart, Archdeacon of Ross, Skibbereen." Cure No. 49,832: "Fifty years' indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach, and vomitings, have been removed by Du Barry's excellent food.—Maria Jolly Wortham, Ling, near Diss, Norfolk." Copies of testimonials of 50,000 cures (including those of Lord Stuart de Decies, Major-General Thomas King, Drs. Ure, Shorland, and Harvey) gratis. In canisters, with full instructions, 5 lb., 11*s.*; 12 lb., 22*s.* Superrefined, 5 lb., 22*s.*; 10 lb., 33*s.* The 10 lb. and 12 lb. carriage free.—DU BARRY and Co., 127, *New Bond-street, London.* [1 273

SIR JAMES MURRAY'S FLUID MAGNESIA.

PREPARED under the immediate care of the Inventor, and established for upwards of thirty years by the Profession, for removing BILE, ACIDITIES, and INDIGESTION, restoring APPETITE, preserving a moderate state of the bowels, and dissolving uric acid in GRAVEL and GOUT; also as an easy remedy for SEA-SICKNESS, and for the febrile affection incident to childhood, it is invaluable.

On the value of Magnesia as a remedial agent it is unnecessary to enlarge; but the Fluid Preparation of Sir James Murray is now the most valued by the Profession, as it entirely avoids the possibility of those dangerous concretions usually resulting from the use of the article in powder.

Sold by the sole Consignee, Mr. WILLIAM BAILEY, of Wolverhampton, and by all wholesale and retail Druggists and Medicine Agents throughout the British Empire,

In bottles, 1*s.*, 2*s.* 6*d.*, 3*s.* 6*d.*, 5*s.* 6*d.*, 11*s.*, and 21*s.* each.

The Acidulated Syrup, in bottles, 2*s.* each.

N.B.—Be sure to ask for "Sir James Murray's Preparation," and to see that his name is stamped on each label *in green ink*, as follows:—"James Murray, Physician to the Lord Lieutenant."

Drugs, Chemicals, Pharmaceutical and Medicinal Preparations of every description supplied to Merchants for shipment on the best possible terms. [1 204

W. CULVERWELL'S
Portable Domestic Vapour Bath,

TO BE SEEN AT THE GREAT EXHIBITION.

It is sold by most Chemists. Tin, 12*s.* 6*d.*; *Copper,* 21*s.*

Ladies and Gentlemen who may be desirous of possessing so valuable a remedial agent as the Vapour Bath is acknowledged to be, are respectfully invited to see the above apparatus in action at

16, CHARLOTTE-STREET, BLACKFRIARS-ROAD,
NEAR ROWLAND HILL'S CHAPEL.

TESTIMONIALS.

"31, *George-street, Hanover-square.*

"I bear willing testimony to the efficacy of Mr. W. Culverwell's Portable Domestic Vapour Bath; and as its price is very moderate, I beg to recommend its use to all those who are in the habit of employing a vapour-bath.

"*December* 31, 1850." "B. G. BABINGTON, M.D.

"I can testify to the advantages that I have seen result from the use of Mr. Culverwell's Portable Domestic Vapour Bath; it has the advantages of being taken in bed, and of enabling the patient to be independent of a nurse."

"JOHN C. W. LEVER, M.D.,
"*Physician-Accoucheur to Guy's Hospital.*
"*December* 31, 1850."

"I hereby certify that I have made use of Mr. Culverwell's Portable Vapour Bath, which I consider a very convenient, efficient, and economical, as well as ingenious apparatus, for the medicinal use of steam.

"*St. Thomas's Hospital, Jan.* 3, 1851." "JOHN F. SOUTH.

"Having used Mr. Culverwell's Apparatus for the application of warm vapour to the body, I am pleased with its simplicity and efficiency; all the requirements of vapour, simple or medicated, appear to be capable of fulfilment through its means.

"JOSEPH MOORE, M.D.,
"*Consulting Physician to Queen Charlotte's*
"10, *Saville-row, Jan.* 11, 1851." *Lying-in-Hospital.*

"The Vapour-Bath constructed by Mr. Culverwell has been used in the Fever Hospital, and appears to answer every purpose. Its simplicity and easy application are recommendations in its favour.

"A. TWEEDIE, M.D.,
"*Physician to the London Fever Hospital.*
"*April* 11, 1851."

Testimonials in its favour have also been received from Drs. Barlow and Oldham, J. Hilton, Esq., and J. Stocker, Esq., of Guy's Hospital; H. Hancock, Esq., and J. Avery, Esq., of Charing-cross Hospital; R. D. Grainger, Esq., Lecturer on Physiology, &c.; Dr. Hodgkin; and Dr. Munk, Physician to the Royal Infirmary for Diseases of the Chest, &c. [1 218

EAST INDIA AND COLONIAL AGENCY.

MESSRS. HENRY CASSIN AND Co., 9, OLD BROAD STREET, LONDON, act as CONSIGNEES for MERCHANTS, SHIPOWNERS, and others; undertake to procure the English Staples of every description from the most eminent houses in Europe, with whom they are in constant communication; and at the instance of many distinguished members of the East India Company's service, the Agency is available for the supply of Stores for Regimental Messes, Public Institutions, Officers of the Naval, Military, and Civil Services, Native and European Residents.

Messrs. H. C. and Co. continue to receive periodical Consignments of the finest Champagne, Clarets, and German Wines of the most favourite vintages, direct from growers of known repute (the corks bearing the proprietors' brand). They also continue to supply the splendid Cabinet Champagne of Madame V^{VE} CLICQUOT PONSARDIN; and as especial attention is paid to the corking and packing before leaving the Vineyards, parties in India and the Colonies may confidently rely upon receiving their Wines in perfect condition.

Complete instructions should be given, and all Orders accompanied by a remittance or reference for payment in England.

Insurances effected at Lloyd's, at moderate premiums.

[1 14

CHICORY

in all its stages, from the Raw Root to the Ground Dust, as used in mixing with, and instead of, COFFEE; also

PASTEL, or IMITATION WOAD,

made from the leaves of the Chicory plant, and as used in the Dye Vat for the fastening of different colours in Woollen Cloths.

CHICORY, or "CICHORIUM," a tap-rooted plant of the Endive family, the root of which is largely used as a substitute for COFFEE.

From its medicinal qualities, it is considered a valuable admixture to COFFEE, as it counteracts the astringent effects thereof.

It can also be sold at a much lower price, and, being of home produce, is recommended to the public, in connexion with COFFEE, as a wholesome and nutritious beverage, the consumption of which is now becoming very general. Though formerly believed to be a prejudicial admixture with COFFEE, it is now positively proved to be quite the contrary.

The leaves of this plant are also applicable to the manufacture of a valuable Dye-Stuff called "PASTEL," or "IMITATION WOAD," of which they form a principal ingredient.

This article is very largely used by Wool Dyers, and is a valuable agent in the Dye Vat, for fastening colours in cloths.

The application of this plant to the above joint purposes is of recent date in Ireland. The first of the above-mentioned articles produced from this plant were manufactured and introduced into the English market with success by Mr. PAUL KING BRACKEN, from his manufactory in the neighbourhood of Dublin.

The samples now exhibited were grown and manufactured by ARTHUR HILL GRIFFITH, Esq., Gortmore, Ballymore, County Westmeath, under Mr. BRACKEN's directions.

Mr. GRIFFITH has established a Factory for the combined produce of CHICORY and WOAD, which is promising to be very successful, and gives very considerable employment to the poorer classes in the vicinity.

As an Agricultural Crop, and one suited to the soil and climate of Ireland, together with the large quantity of labour required for the bringing of these articles to perfection, this plant is considered of great national importance.

In an economic view, the advantages can be ascertained by a comparison of the respective prices of those articles with the present prices of COFFEE and WOAD, neither of which can be produced at double the remunerative prices of CHICORY OR IMITATION WOAD, both of which substitutes are in most respects quite as efficient, and some superior to, their originals.

JOHN WOOLLAMS & CO.,

No. 69, MARYLEBONE LANE, OXFORD STREET, LONDON,

PAPER-HANGING MANUFACTURERS.

BLOCK-PRINTING

AND BY

STEAM CYLINDER MACHINERY.

JOHN WOOLLAMS & CO.,

Having been engaged for the last two years in erecting and perfecting their additional works for printing Paper Hangings by steam cylinder machinery, by which they are now enabled to supply a greatly improved article of the cheaper kind of goods, invite Merchants, Shippers, and the Trade in general to inspect their new patterns manufactured by this process. They will be found unequalled by any other house, either English or foreign, for superiority of workmanship, for elegance of design and colouring, and for cheapness compared with quality.

The wholesale price is from 8d. to 15d. per piece.

JOHN WOOLLAMS & Co. continue to produce as usual their

BLOCK-PRINTED

PAPER HANGINGS AND DECORATIONS

from designs by the first Artists.

"322. WOOLLAMS, JOHN, & Co., 69, *Marylebone-lane, Oxford-street*—Manufacturers.

"A general assortment of paper-hangings and decorations by block printing:—Damasks. Flower patterns and decoration borders. Flock and metal, and two flock patterns. Bronze patterns. Panel decoration, consisting of the orange and white datura, from drawings by Miss Palmer, of the School of Design, London.

"Specimens of machine printing:—Paper hangings printed by steam cylinder machinery, exhibited for cheapness and quality. From one to eight colours printed at one operation, and at the rate of 200 pieces, or 2400 yards, per hour. Registered designs."—*Exhibition Official Illustrated Catalogue*, Class 26, p. 758.

Note.—In buying Paper Hangings by piece or roll reference should be had to the dimensions; the English size is 12 yards long by 21 inches wide, each piece covering one-half more wall than the foreign. [1 344

J. & J. COLMAN,

MANUFACTURERS OF

MUSTARD, STARCH, BLUES, AND BRITISH GUM,

9, COLLEGE HILL, UPPER THAMES STREET, LONDON.

MUSTARD.—J. & J. COLMAN invite the attention of English and Foreign Merchants, and traders in general, to the qualities of their Mustard (manufactured from the best description of English Brown Seed), and in so doing would observe that they have invariably directed their energies to the production of an article *warranted genuine in its character*, and which should combine the strength and pungency of the Seed with a certain pleasantness of flavour, whereby to render it one of the most agreeable of condiments; and it ever having been a source of complaint that Mustard when sent to foreign countries has, by the influence of climate and other causes, been considerably deteriorated, and at times so far damaged as to render it unfit for use, J. & J. Colman beg to announce that their Double Superfine quality has stood the severest tests of climate and every contingency of transit; they have, therefore, the utmost confidence in recommending it for Foreign and Colonial supply as well as for Home consumption. It is packed in bottles of 1 lb. and ½ lb. of the largest sizes, for Foreign markets.

In addition to the above, J. & J. Colman manufacture the three following kinds of Mustard, viz.—Superfine, Fine, and Seconds, which qualities are warranted good, and will be found available for general purposes. These kinds are packed either in casks, tins, or jars, as well as in the usual sized bottles.

STARCH has been for a considerable time offered to the public in qualities so various and dissimilar, that it has been found difficult to determine what to purchase, in order to secure at a low price an article of uniform good quality, which can be prepared by ladies and laundresses with the least possible trouble; and it having been discovered from experience that **RICE STARCH** is more to be depended upon in its application than any other, J. & J. Colman have devoted their best attention to the subject, and spared neither pains nor expense to bring the article to perfection. They have much pleasure to inform the trade that they have secured by Letters Patent a process for manufacturing a **No. 1 PATENT RICE STARCH,** of a quality superior to every other made from Rice, being quite free from all mucilaginous matter. It is **SOLUBLE,** and can be used with greater ease and facility than the common Starch. Sold in Packets of 5 lb., 1 lb., ½ lb., and ¼ lb. each.

As many persons, however, may still prefer the **WHEATEN STARCHES,** J. & J. Colman *continue to manufacture with the same care and attention their usual kinds, viz.—No. 1 London Starch. Patent White Starch. Soluble Satin Glaze Starch.*

Ladies are especially invited to test the **SOLUBLE SATIN GLAZE STARCH.** *Being used in a fluid state, it imparts an equality of stiffness and gloss to the finer fabrics, and produces a finish unequalled by any other yet offered. Sold in packets of 1 lb., ½ lb., and ¼ lb.*

BLUE.—This article is manufactured of various shades of colour from Indigo and Prussian Blue, the former being used principally for Laundress purposes, the latter by the Manufacturers of Flannels, &c. &c., and when made genuine they impart a colour which cannot be obtained from other ingredients. J. & J. Colman *warrant* the genuineness of their Blues, and the trade are respectfully invited to purchase them.

BRITISH GUM and Gum Substitute, used by Silk and Calico Printers, in every variety of shade and colour, need only to be tried to insure satisfaction.

N.B.—The attention of English and Foreign Merchants, and the Trade in general, is specially directed to the above articles, and all orders, addressed as above, will meet with prompt attention. [1 345

J. M. BLASHFIELD,

AGRICULTURAL CHEMIST

AND

MANUFACTURER OF PATENT ARTIFICIAL MANURE,

No. 3, NEW LONDON-STREET, MARK-LANE, AND MILL-WALL, POPLAR.

THE Patent Manure is sold under the name of COPROS or KOPROS, and is made by combining the soluble nitrogenous matter found on the mud-banks of the Thames and other places with salts of ammonia, silicates, and phosphates. It is a dry innoxious powder, and may be used by the drill or broad-cast. It is lighter in point of bulk than any other manure in use, and contains more ammonia and other soluble matter.

It has been largely used during the past year for Wheat, Oats, Barley, Turnips, Swedes, and Potatoes; and the Testimonials which the Patentee has received in its favour are of the highest character.

Also SUPERPHOSPHATE of LIME, prepared only from Bones, and warranted free from Ashes, Gypsum, or any other adulterating substance—a fine Manure for Green Crops. Sulphate of Ammonia, Nitrate of Soda, Sulphate of Magnesia. Finely ground Gypsum, Coprolites, or Phosphates. [1 310

MR. CLAUDET'S DAGUERREOTYPE PORTRAIT ESTABLISHMENTS

Are Open Daily at No. 107, Regent Street (Quadrant); and at the Colosseum, Regent's Park.

NOTICE.—Mr. CLAUDET has removed his principal Establishment from King William Street, Strand, to larger and more convenient premises in Regent Street, No. 107, (Quadrant).

The Reception and Exhibition Rooms are on the ground floor, and Visitors have not to ascend higher than the first floor for having their Portraits taken.

The Exhibition Rooms contain a considerable collection of Portraits of Eminent Personages, English and Foreign.

N.B.—Mr. CLAUDET has on sale Engravings and Lithographs from Daguerreotype originals, taken by him of a number of distinguished persons, among which are the portraits of the Duke of Wellington, Lord Gough, Lord Rosse, Marquis of Northampton, Lord G. Bentinck, Lord Brougham, Monsieur Guizot, &c., &c., &c. [1 70

LIVERPOOL.—F. L. HAUSBURG, *Old Post-Office Buildings*, GOLDSMITH, JEWELLER, CABINET-MAKER, Manufacturer of CLOCKS, WATCHES, CHANDELIERS, LAMPS, &c.

For more than twenty-six years this Establishment has stood unrivalled in Europe for the extent, excellence, and variety of its Stock and Manufactures, all of which have been purchased by F. L. Hausburg for cash, or made and finished under his own orders, and in his own workshops, on these premises, by the most experienced workmen, and of the very best materials and highest finish. To form an idea of this vast assemblage of useful and beautiful articles a visit is indispensable, and, whether for business or pleasure, is most respectfully solicited, with an assurance that, in either case, the utmost politeness and attention will be shown.

F. L. HAUSBURG begs permission to direct attention to some few of the leading articles of his stock, viz. CLOCKS, beautiful in exterior, suitable for every description of apartment, of the most excellent finish, and approved-of principles—warranted by the guarantee of the *resident* manufacturer. WATCHES, Gold and Silver, made on the best constructions, jewelled and finished on the premises by the most talented workmen. DESKS and DRESSING-CASES, of every possible variety and suitable material, elaborately inlaid and lined with Velvet, Satin, or Silk; or perfectly simple, fitted with Gold, Silver, or Steel necessaries of the best description; or made of the most convenient sizes for travelling, and yet containing every requisite. BRONZES,—the finest Models, and finished to bear the most close observation, under the immediate superintendence of a resident agent in Paris. ITALIAN SCULPTURE—by artists of the highest standing; original works in Ewers and Vases; and copies of the finest Groups of the Ancient and Modern Schools. ELECTRO-PLATE—warranted to be by the Patentees, Elkington & Co. Every article of JEWELLERY—comprising a brilliant and beautiful display, and consisting of suits of Jewels in precious stones and fine gold; Necklets, Brooches, Rings, Pins, Studs; Mourning Jewellery, Jet Ornaments; Hair in every fancy device, &c. &c. CHANDELIERS—in Glass, Bronze, Or-molu, and Porcelain—for Gas, Oil, or Candles, suitable for every style of residence. The Celebrated AUREOLE, CARCEL, and CANDLE LAMPS, in China, Or-molu, and Bronze. WORK and WRITING TABLES, in Papier Maché, Rosewood, and Mahogany, and fitted with every requisite for ladies' work or writing, in Silver, Mother-of-Pearl, Ivory, and Steel. Bohemian and French Glass Vases, Tazzas, Lustres, Scent-Bottles, Flower-Glasses, &c. &c. &c. Sèvres and Dresden China; Powerful and Fine-toned Musical Boxes; Fans of every description, &c. &c. &c.—F. L. HAUSBURG, LIVERPOOL. [1 300

[1 175

ROMAN and other CEMENTS, manufactured by J. M. BLASHFIELD, successor to the Patentees, PARKER & WYATT, who in 1796 first introduced PARKER'S ROMAN CEMENT, which has now for upwards of fifty years been extensively used in most of the public and private buildings and other Works in this Country and throughout the World. Among the more recent Works in this Country, where it has been largely employed since the present proprietor became the manufacturer, may be named the Lyceum and St. James's Theatres; the Carlton, Reform, and Army and Navy Club-houses; the London Docks; the Thames Tunnel; the Winter Palace, St. Petersburgh; the British Museum; the York Minster; the Royal Exchange; the Nelson Column; and the New Houses of Parliament.

When properly applied, it is the most perfect and economical cement for Hydraulic Works known; and when used as a stucco it will resist the action of heat and frost and preserve walls from damp. As a Mortar for Brickwork it surpasses any other material, and is *nearly as cheap for such work as Mortar made of ordinary lime.* TARRAS, an Hydraulic Lime for setting masonry where slow induration is important so as to allow for the settlement of work—a cement of extraordinary tenacity and hydraulic properties, and with which the most ancient works in Lancashire have been executed. Hamelin's Patent Mastic or Oil Cement, which may be pounded immediately after use; Keene's Cement, Portland Cement, Martin's Cement, &c. Genuine Plaster of Paris, prepared from the purest Gypsum, and of any degree of fineness required. Chimney-pots, Trusses, Paving Tiles, &c. *Manufactory*—MILL WALL, POPLAR; *Depôts*—COMMERCIAL ROAD, LAMBETH, and PADDINGTON BASIN; *Counting-house*—No. 3, NEW LONDON-STREET, MARK-LANE, CITY. [1 311

[1 325

BURFORD'S PANORAMA ROYAL,

LEICESTER SQUARE.

NOW OPEN, in the Large Rotunda, the Views of the astounding FALLS OF NIAGARA and of the eminently interesting CITY OF JERUSALEM. Admission, 1s.—in order to meet the present unprecedented season—to the two Views. The Views of the LAKES OF KILLARNEY and of LUCERNE are also now open. Admission, 1s. to each Circle, or 2s. 6d. to the Three Circles.—Open from 10 till dusk. Mr. Burford's is the oldest establishment of the kind in London, having been founded in 1786; and he, being desirous of producing two works in one circle, worthy of the present great period, has on this occasion divided the Large Rotunda, so as to present at the same time the Views of the Falls of Niagara and of Jerusalem—the two most grand and majestic in the world, and requiring such space as the vast extent and appliances of his Panorama can alone supply, with such effect and fidelity, and on a scale of such sufficient magnitude, as to do them justice; the Falls of Niagara being the most wonderful and magnificent of Nature's works—and the City of Jerusalem, beautiful in its ruins, and eminently interesting to every Christian as the scene of most of the principal events in the Life of our Blessed Saviour, of his Humiliation, and of his death. [1 270

INDIA, MALTA, EGYPT, IONIAN ISLES.—Her Britannic Majesty's PACKETS, possessing every requisite accommodation for passengers, keep up a regular communication between England and India, viâ Marseilles, Malta, and Egypt. Leave Marseilles for Malta 9th and 26th of the month, Malta for Marseilles about the 12th and 24th, performing the passage in about 68 hours. Leave Malta for Alexandria 13th, and Alexandria for Malta about the 21st, the passage performed in about 90 hours; the packet for England viâ Marseilles, and the Peninsular and Oriental Company's steamer for Southampton, wait her arrival. Leave Malta for Ionian Isles 2nd and 15th, returning on the 12th and 25th with passengers for England, viâ Marseilles or Gibraltar. Freight on specie—one per cent. on silver, ⅜ths on gold or jewels.

Every information may be obtained of A. and W. GALIGNANI, Paris; T. WOODLEY, Patras; JEAN BOUVET, 4, Rue de la Paix, Marseilles; Mr. DAVIDSON, Alexandria; BOMBAY TIMES OFFICE, Bombay; Mr. LAGAN, Singapore; G. MUIR, 247, Strada Reale, Malta, Superintending and Booking Agent to Her Britannic Majesty's Packets in the Mediterranean.

N.B.—Passengers leaving England by the Company's steamer from Southampton on the 29th are conveyed on to Alexandria by her Majesty's packet leaving Malta on the 13th. Mr. MUIR, the agent, will be on board to tranship their luggage, and give them any information. There is no expense attending it. London Referees, Messrs. G. W. WHEATLEY & Co., 156, Leadenhall-street; and Mr. G. W. DE BERNARDY, 20, John-street, Adelphi. [1 337

THE CASTLE MONA HOTEL,

DOUGLAS, ISLE OF MAN (*formerly a Ducal Residence*).

GEO. HERON has the honour to inform the Nobility, Gentry, and Public generally, that this magnificent and truly elegant edifice (originally built by the late Duke of Athol for his own private residence, at an expense of 40,000*l.*) has been, during the winter months, re-modelled and newly fitted up, so as to carry out the views of the proprietor to make it in every respect deserving of the extensive and liberal patronage it has hitherto been favoured with, for which he begs to return his sincere and grateful thanks.

It is now acknowledged to stand unrivalled for beauty of situation, comfort, style, and elegance, being situate on the margin of the beautiful and picturesque Bay of Douglas, surrounded by extensive pleasure-grounds, tastefully laid out, and abounding with the choicest plants, flowers, and shrubs, communicating with the woods and plantations by sheltered, romantic, and secluded walks, several miles in extent, and elevated several hundred feet above the level of the sea. The Castle Mona consists of a private Hotel, with suites of elegant and richly-furnished apartments, a table d'hôte, splendid and capacious dining-room and magnificent saloon, coffee-room, billiard-room, baths of every description, and close to the hotel every accommodation for sea-bathing, which is acknowledged to be the finest in the world, and may be enjoyed any hour of the day.—The culinary department is under the superintendence of a grand *chef* and the best *assistans de cuisine* that could be engaged. The wines are recherché, and selected from the first houses and most approved brands.—In the stable department will be found horses and vehicles of every description, with lock-up coachhouses and extensive livery.

The Proprietor respectfully solicits parties going on pleasure excursions to give to Castle Mona a trial, and flatters himself they will find every comfort and luxury combined with a moderate scale of charges, including attendance of every kind.

Board at the table d'hôte, 35*s.* per week; in private, 42*s.*; bed-rooms according to size and situation, from 7*s.* to 18*s.*; sitting-rooms from 3*s.* to 6*s.* per day. Servants' board and lodging, 21*s.* per week. Attendance, 1*s.* 6*d.* per day, 7*s.* per week each. Port and sherry, 4*s.*; claret, 4*s.*, 5*s.*, and 7*s.*; champagne, 7*s.*; Madeira, 5*s.* [1 322

MORISON'S VEGETABLE UNIVERSAL MEDICINES,

Depôt, 344, STRAND.

THE Partnership of MORISON, MOAT, & Co., of the "BRITISH COLLEGE OF HEALTH," having expired on the 25th of March last,

MR. MOAT

manufactures the above-named Medicines ("MORISON'S PILLS") from the Recipes of the late "James Morison, the Hygeist."

MR. MOAT is duly qualified, and has devoted many years to the study of Medicine; by the employ of a matured judgment in the selection of drugs, and attention to the thorough combination and uniformity of mixture, he ensures certainty of effect with the least possible unpleasantry. He offers the Pills, thus made by himself, as a perfectly safe and efficient purgative, and recommends them to be taken in those cases of illness where the services of an immediate Medical Adviser are not felt to be requisite.

Sold, with directions, in the usual priced boxes, by all Medicine Venders. Foreign Houses dealt with in the most advantageous manner. [1 276

GLENFIELD STARCH.

The Ladies are respectfully requested to make a trial of the

GLENFIELD

PATENT DOUBLE-REFINED POWDER STARCH,

which, for Domestic use, now stands UNRIVALLED.

"Royal Laundry, Richmond, near London,
"15th May, 1851.

"Mr. Wotherspoon, 40, Dunlop-street, Glasgow,—The Glenfield Patent Powder Starch has now been used for some time in that department of the Royal Laundry where all the finest goods are finished for Her Majesty, Prince Albert, and the Royal Family, and I have much pleasure in informing you that it has given the highest satisfaction. (Signed) "M. WEIGH,
"Laundress to Her Majesty."

See also Testimonials from laundresses of the Countess of Eglinton, Marchioness of Breadalbane, and Countess of Dartmouth.

Sold Wholesale, in London, by Messrs. Pantin & Turner; Hooper Brothers; Batty & Co.; Croft & Innocent; Petty, Wood, & Co.; Twelvetrees Brothers; Charles C. B. Williams; Yates, Walton, & Co.; Mr. Snelling; and R. Wakefield, 35, Crown-street: and Retail by all Shopkeepers.

Agents wanted—apply to Mr. R. WOTHERSPOON, 40, *Dunlop-street, Glasgow.* [1 323

PATENT RICE STARCH, manufactured under the PATENT of WM. THOS. BERGER, granted 1850.—Messrs. SAMUEL BERGER & Co. beg to draw attention to the above article, as being very superior in all the essential requisites, viz. Purity, Strength, Colour, and Transparency, and being perfectly soluble without boiling.

Works, BROMLEY-BY-BOW, LONDON. [1 105
